At the opposite extreme from systems of religious ethics preoccupied with the control of economic affairs within the world stands the ultimate ethic of world-rejection, the mystical illuminative concentration of authentic ancient Buddhism (naturally not the completely altered manifestations Buddhism assumed in Tibetan, Chinese, and Japanese popular religions). Even this most world-rejecting ethic is "rational," in the sense that it produces a constantly alert control of all natural instinctive drives, though for purposes entirely different from those of inner-worldly asceticism. Salvation is sought, not from sin and suffering alone, but also from ephemeralness as such; escape from the wheel of *karma*-causality into eternal rest is the goal pursued. This search is, and can only be, the highly individualized task of a particular person. There is no predestination, but neither is there any divine grace, any prayer, or any religious service. Rewards and punishments for every good and every evil deed are automatically established by the *karma*-causality of the cosmic mechanism of compensation. This retribution is always proportional, and hence always limited in time. So long as the individual is driven to action by the thirst for life, he must experience in full measure the fruits of his behavior in ever-new human existences. Whether his momentary situation is animal, heavenly, or hellish, he necessarily creates new chances for himself in the future. The most noble enthusiasm and the most sordid sensuality lead equally into new existence in this chain of individuation (it is quite incorrect to term this process transmigration of souls, since Buddhist metaphysics knows nothing of a soul). This process of individuation continues on as long as the thirst for life, in this world or in the world beyond, is not absolutely extinguished. The process is but perpetuated by the individual's impotent struggle for his

personal existence with all its illusions, above all the illusion of a distinctive soul or personality.

All rational purposive activity is regarded as leading away from salvation, except of course the subjective activity of concentrated contemplation, which empties the soul of the passion for life and every connection with worldly interests. The achievement of salvation is possible for only a few, even of those who have resolved to live in poverty, chastity, and unemployment (for labor is purposive action), and hence in mendicancy. These chosen few are required to wander ceaselessly—except at the time of the heavy rains—freed from all personal ties to family and world, pursuing the goal of mystical illumination by fulfilling the injunctions relating to the correct path (*dharma*). When such salvation is gained, the deep joy and tender, undifferentiated love characterizing such illumination provides the highest blessing possible in this existence, short of absorption into the eternal dreamless sleep of *Nirvana*, the only state in which no change occurs. All other human beings may improve their situations in future existences by approximating the prescriptions of the rule of life and by avoiding major sins in this existence. Such future existences are inevitable, according to the *karma* doctrine of causality, because the ethical account has not been straightened out, the thirst for life has not been "abreacted," so to speak. For most people, therefore, some new individuation is inevitable when the present life has ended, and truly eternal salvation remains inaccessible.

There is no path leading from this only really consistent position of world-flight to any economic ethic or to any rational social ethic. The universal mood of pity, extending to all creatures, cannot be the carrier of any rational behavior and in fact leads away from it. This mood of pity is the logical consequence of contemplative mysticism's position regarding the solidarity of all living, and hence transitory, beings. This solidarity follows from the common *karma*-causality which overarches all living beings. In Buddhism, the psychological basis for this universal pity is the religion's mystical, euphoric, universal, and acosmistic love.

Buddhism is the most consistent of the salvation doctrines produced before and after by the intellectualism of educated Indian strata. Its cool and proud emancipation of the individual from life as such, which in effect stood the individual on his own feet, could never become a popular salvation faith. Buddhism's influence beyond the circle of the educated was due to the tremendous prestige traditionally enjoyed by the *shramana*, i.e., the ascetic, which possessed magical and anthropolatric traits. As soon as Buddhism became a missionizing popular religion, it duly transformed itself into a savior religion based on *karma* compensation, with hopes for the world beyond guaranteed by devotional techniques,

cultic and sacramental grace, and deeds of mercy. Naturally, Buddhism also tended to welcome purely magical notions.

In India itself, Buddhism succumbed, among the upper classes, to a renascent philosophy of salvation based on the Vedas; and it met competition from Hinduistic salvation religions, especially the various forms of Vishnuism, from Tantristic magic, and from orgiastic mystery religions, notably the *bhakti* piety (love of god). In Lamaism, Buddhism became the purely monastic religion of a theocracy which controlled the laity by ecclesiastical powers of a thoroughly magical nature. Wherever Buddhism was diffused in the Orient, its idiosyncratic character underwent striking transformation as it competed and entered into diverse combinations with Chinese Taoism, hus becoming the region's typical mass religion, which pointed beyond this world and t e ancestral cult and which distributed grace and salvation.

At all events, no motivation toward a rational system for the met odical control of life flowed from Buddhist, Taoist, or Hindu piety. Hindu piety in particular, as we have already suggested, maintained the strongest possible power of tradition, since the presuppositions of Hinduism constituted the most consistent religious expression of the organic view of society. The existing order of the world was provided absolutely unconditional justification, in terms of the mechanical operation of a proportional retribution in the distribution of power and happiness to individuals on the basis of their merits and failures in their earlier existences.

All these popular religions of Asia left room for the acquisitive drive of the tradesman, the interest of the artisan in sustenance (*Nahrungs-Interesse*), and the traditionalism of the peasant. These popular religions also left undisturbed both philosophical speculation and the conventional status-oriented life patterns of privileged groups. These status-oriented patterns of the privileged evinced feudal characteristics in Japan; patrimonial-bureaucratic, and hence strongly utili arian fea ures in China; and a mixture of knightly, patrimonial, and intellectualistic traits in India. None of these mass religions of Asia, however, provided the motives or orientations for a rationalized ethical transformation of a creaturely world in accordance with divine commandments. Rather, they all accepted this world as eternally given, and so the best of all possible worlds. The only choice open to the sages, who possessed the highest type of piety, was whether to accommodate themselves to the Tao, the impersonal order of the world and the only thing specifically divine, or to save themselves from the inexorable chain of causality by passing in o the only eternal being, the dreamless sleep of Nirvana.

"Capitalism" existed among all these religions, of the same kind as

in Occidental Antiquity and the medieval period. But there was no development toward modern capitalism, nor even any stirrings in that direction. Above all, there evolved no "capitalist spirit," in the sense that is distinctive of ascetic Protestantism. But to assume that the Hindu, Chinese, or Muslim merchant, trader, artisan, or coolie was animated by a weaker "acquisitive drive" than the ascetic Protestant is to fly in the face of the facts. Indeed, the reverse would seem to be true, for what is distinctive of Puritanism is the rational and ethical limitation of the quest for profit. There is no proof whatever that a weaker natural "endowment" for technical economic rationalism was responsible for the actual difference in this respect. At the present time, all these people import this "commodity" as the most important Occidental product, and whatever impediments exist result from rigid traditions, such as existed among us in the Middle Ages, not from any lack of ability or will. Such impediments to rational economic development must be sought primarily in the domain of religion, insofar as they must not be located in the purely political conditions, the structures of domination, with which we shall deal later.

Only ascetic Protestantism completely eliminated magic and the supernatural quest for salvation, of which the highest form was intellectualist, contemplative illumination. It alone created the religious motivations for seeking salvation primarily through immersion in one's worldly vocation (*Beruf*). This Protestant stress upon the methodically rationalized fulfillment of one's vocational responsibility was diametrically opposite to Hinduism's strongly traditionalistic concept of vocations. For the various popular religions of Asia, in contrast to ascetic Protestantism, the world remained a great enchanted garden, in which the practical way to orient oneself, or to find security in this world or the next, was to revere or coerce the spirits and seek salvation through ritualistic, idolatrous, or sacramental procedures. No path led from the magical religiosity of the non-intellectual strata of Asia to a rational, methodical control of life. Nor did any path lead to that methodical control from the world accommodation of Confucianism, from the world-rejection of Buddhism, from the world-conquest of Islam, or from the messianic expectations and economic pariah law of Judaism.

5. *Jesus' Indifference Toward the World*

The second great religion of world-rejection, in our special sense of the term, was early Christianity, at the cradle of which magic and belief in demons were also present. Its Savior was primarily a magician

whose magical charisma was an ineluctable source of his unique feeling of individuality. But the absolutely unique religious promises of Judaism contributed to the determination of the distinctive character of early Christianity. It will be recalled that Jesus appeared during the period of the most intensive messianic expectations. Still another factor contributing to the distinctive message of Christianity was its reaction to the unique concern for erudition in the Law characteristic of Jewish piety. The Christian evangel arose in opposition to this legalistic erudition, as a non-intellectual's proclamation directed to non-intellectuals, to the "poor in spirit." Jesus understood and interpreted the "law," from which he desired to remove not even a letter, in a fashion common to the lowly and the unlearned, the pious folk of the countryside and the small towns who understood the Law in their own way and in accordance with the needs of their own occupations, in contrast to the Hellenized, wealthy and upper-class people and to the erudite scholars and Pharisees trained in casuistry. Jesus' interpretation of the Jewish law was milder than theirs in regard to ritual prescriptions, particularly in regard to the keeping of the Sabbath, but stricter than theirs in other respects, e.g., in regard to the grounds for divorce. There already appears to have been an anticipation of the Pauline view that the requirements of the Mosaic law were conditioned by the sinfulness of the superficially pious. There were, in any case, instances in which Jesus squarely opposed specific injunctions of the ancient tradition.

Jesus' distinctive self-esteem did not come from anything like a "proletarian instinct" but from the knowledge that the way to God necessarily led through him, because of his oneness with the Godly patriarch. His self-esteem was grounded in the knowledge that he, the non-scholar, possessed both the charisma requisite for the control of demons and a tremendous preaching ability, far surpassing that of any scholar or Pharisee. This self-esteem involved the conviction that his power to exorcise demons was operative only among the people who believed in him, even if they be heathens, not in his home town and his own family and among the wealthy and high-born of the land, the scholars, and the legalistic virtuosi—among none of these did he find the faith that gave him his magical power to work miracles. He did find such a faith among the poor and the oppressed, among publicans and sinners, and even among Roman soldiers. It should never be forgotten that these charismatic powers were the absolutely decisive components in Jesus' feelings concerning his messiahship. These powers were the fundamental issue in his denunciation of the Galilean cities and in his angry curse upon the recalcitrant fig tree. His feeling about his own powers also explains why the election of Israel became ever more problematical to him and

the importance of the Temple ever more dubious, while the rejection of the Pharisees and the scholars became increasingly certain to him.

Jesus recognized two absolutely mortal sins. One was the "sin against the spirit" committed by the scriptural scholar who disesteemed charisma and its bearers. The other was unbrotherly arrogance, such as the arrogance of the intellectual toward the poor in spirit, when the intellectual hurls at his brother the exclamation "Thou fool!" This anti-intellectualist rejection of scholarly arrogance and of Hellenic and rabbinic wisdom is the only "status element" of Jesus' message, though it is very distinctive. In general, Jesus' message is far from being a simple proclamation for every Tom, Dick, and Harry, for all the weak of the world. True, the yoke is light, but only for those who can once again become as little children. In truth, Jesus set up the most tremendous requirements for salvation; his doctrine has real aristocratic qualities.

Nothing was further from Jesus' mind than the notion of the universalism of divine grace. On the contrary, he directed his whole preaching against this notion. Few are chosen to pass through the narrow gate, to repent and to believe in Jesus. God himself impedes the salvation of the others and hardens their hearts, and naturally it is the proud and the rich who are most overtaken by this fate. Of course this element is not new, since it can be found in the older prophecies. The older Jewish prophets had taught that, in view of the arrogant behavior of the highly placed, the Messiah would be a king who would enter Jerusalem upon the beast of burden used by the poor. This implies no "social equalitarianism." Jesus lodged with the wealthy, which was ritually reprehensible in the eyes of the virtuosi of the law, and when he bade the rich young man give away his wealth, Jesus expressly enjoined this act only if the young man wished to be "perfect," i.e., a disciple. Complete emancipation from all ties of the world, from family as well as possessions, such as we find in the teachings of the Buddha and similar prophets, was required only of disciples. Yet, although all things are possible for God, continued attachment to Mammon constitutes one of the most difficult impediments to salvation into the Kingdom of God —for attachment to Mammon diverts the individual from religious salvation, the most important thing in the world.

Jesus nowhere explicitly states that preoccupation with wealth leads to unbrotherliness, but this notion is at the heart of the matter, for the prescribed injunctions definitely contain the primordial ethic of mutual help which is characteristic of neighborhood associations of poorer people. The chief difference is that in Jesus' message acts of mutual help have been systematized into *Gesinnungsethik* involving a fraternalistic sentiment of love. The injunction of mutual help was also construed

universalistically, extended to everyone. The "neighbor" is the one nearest at hand. Indeed, the notion of mutual help was enlarged into an acosmistic paradox, based on the axiom that God alone can and will reward. Unconditional forgiveness, unconditional charity, unconditional love even of enemies, unconditional suffering of injustice without requiting evil by force—these demands for religious heroism could have been products of a mystically conditioned acosmism of love. But it must not be overlooked, as it so often has been, that Jesus combined acosmistic love with the Jewish notion of retribution. God alone will one day compensate, avenge, and reward. Man must not boast of his virtue in having performed any of the aforementioned deeds of love, since his boasting would preempt his subsequent reward. To amass treasures in heaven one must in this world lend money to those from whom no repayment can be expected; otherwise, there is no merit in the deed. A strong emphasis upon the just equalization of destinies was expressed by Jesus in the legend of Lazarus and elsewhere. From this perspective alone, wealth is already a dangerous gift.

But Jesus held in general that what is most decisive for salvation is an absolute indifference to the world and its concerns. The kingdom of heaven, a realm of joy upon earth, utterly without suffering and sin, is at hand; indeed, this generation will not die before seeing it. It will come like a thief at night; it is already in the process of appearing among mankind. Let man be free with the wealth of Mammon, instead of clutching it fast; let man render unto Caesar that which is Caesar's—for what profit is there in such matters? Let man pray to God for daily bread and remain unconcerned for the morrow. No human action can accelerate the coming of the kingdom, but man should prepare himself for its coming. Although this message did not formally abrogate the law, it did place the emphasis throughout upon religious sentiment. The entire content of the law and the prophets was condensed into the simple commandment to love God and one's fellow man, to which was added the one far-reaching conception that the true religious mood is to be judged by its fruits, by its faithful demonstration (*Bewährung*).

The visions of the resurrection, doubtless under the influence of the widely diffused soteriological myths, generated a tremendous growth in pneumatic manifestations of charisma; in the formation of communities, beginning with Jesus' own family, which originally had not shared Jesus' faith; and in missionary activity among the heathens. Nascent Christianity maintained continuity with the older Jewish prophecies even after the fateful conversion of Paul had resulted in a breaking away from the pariah religion. As a result of these developments, two new attitudes toward the world became decisive in the Christian mis-

sionary communities. One was the expectation of the Second Coming, and the other was the recognition of the tremendous importance of charismatic gifts of the spirit. The world would remain as it was until the master would come. So too the individual was required to abide in his position and in his calling (κλῆσις), subordinate to the authorities, save where they demanded of him that he perpetrate a sinful deed.[6]

CHAPTER VII

THE MARKET: ITS IMPERSONALITY AND ETHIC *(Fragment)*[1]

Up to this point we have discussed group formations that rationalized their social action only in part, but for the rest had the most diverse structures—more amorphous or more rationally organized, more continuous or more intermittent, more open or more closed. In contrast to all of them stands, as the archetype of all rational social action (*rationales Gesellschaftshandeln*), consociation (*Vergesellschaftung*) through exchange in the *market*.

A market may be said to exist wherever there is competition, even if only unilateral, for opportunities of exchange among a plurality of potential parties. Their physical assemblage in one place, as in the local market square, the fair (the "long distance market"), or the exchange (the merchants' market), only constitutes the most consistent kind of market formation. It is, however, only this physical assemblage which allows the full emergence of the market's most distinctive feature, viz., dickering. Since the discussion of the market phenomena constitutes essentially the content of economics (*Sozialökonomik*), it will not be presented here. From a sociological point of view, the market represents a coexistence and sequence of rational consociations, each of which is specifically ephemeral insofar as it ceases to exist with the act of exchanging the goods, unless a norm has been promulgated which imposes upon the transferors of the exchangeable goods the guaranty of their lawful acquisition as warranty of title or of quiet enjoyment. The completed barter constitutes a consociation only with the immediate partner. The

preparatory dickering, however, is always a social action (*Gemeinschaftshandeln*) insofar as the potential partners are guided in their offers by the potential action of an indeterminately large group of real or imaginary competitors rather than by their own actions alone. The more this is true, the more does the market constitute social action. Furthermore, any act of exchange involving the use of money (sale) is a social action simply because the money used derives its value from its relation to the potential action of others. Its acceptability rests exclusively on the expectation that it will continue to be desirable and can be further used as a means of payment. Group formation (*Vergemeinschaftung*) through the use of money is the exact counterpart to any consociation through rationally agreed or imposed norms.

Money creates a group by virtue of material interest relations between actual and potential participants in the market and its payments. At the fully developed stage, the so-called money economy, the resulting situation looks as if it had been created by a set of norms established for the very purpose of bringing it into being. The explanation lies in this: Within the market community every act of exchange, especially monetary exchange, is not directed, in isolation, by the action of the individual partner to the particular transaction, but the more rationally it is considered, the more it is directed by the actions of all parties potentially interested in the exchange. The market community as such is the most impersonal relationship of practical life into which humans can enter with one another. This is not due to that potentiality of struggle among the interested parties which is inherent in the market relationship. Any human relationship, even the most intimate, and even though it be marked by the most unqualified personal devotion, is in some sense relative and may involve a struggle with the partner, for instance, over the salvation of his soul. The reason for the impersonality of the market is its matter-of-factness, its orientation to the commodity and only to that. Where the market is allowed to follow its own autonomous tendencies, its participants do not look toward the persons of each other but only toward the commodity; there are no obligations of brotherliness or reverence, and none of those spontaneous human relations that are sustained by personal unions. They all would just obstruct the free development of the bare market relationship, and its specific interests serve, in their turn, to weaken the sentiments on which these obstructions rest. Market behavior is influenced by rational, purposeful pursuit of interests. The partner to a transaction is expected to behave according to rational legality and, quite particularly, to respect the formal inviolability of a promise once given. These are the qualities which form the content of market ethics. In this latter respect the market inculcates, indeed, particularly rigorous conceptions. Violations

of agreements, even though they may be concluded by mere signs, entirely unrecorded, and devoid of evidence, are almost unheard of in the annals of the stock exchange. Such absolute depersonalization is contrary to all the elementary forms of human relationship. Sombart has pointed out this contrast repeatedly and brilliantly.[2]

The "free" market, that is, the market which is not bound by ethical norms, with its exploitation of constellations of interests and monopoly positions and its dickering, is an abomination to every system of fraternal ethics. In sharp contrast to all other groups which always presuppose some measure of personal fraternization or even blood kinship, the market is fundamentally alien to any type of fraternal relationship.

At first, free exchange does not occur but with the world outside of the neighborhood or the personal association. The market is a relationship which transcends the boundaries of neighborhood, kinship group, or tribe. Originally, it is indeed the only peaceful relationship of such kind. At first, fellow members did not trade with one another with the intention of obtaining profit. There was, indeed, no need for such transactions in an age of self-sufficient agrarian units. One of the most characteristic forms of primitive trade, the "silent" trade [cf. ch. VIII:ii:2], dramatically represents the contrast between the market community and the fraternal community. The silent trade is a form of exchange which avoids all face-to-face contact and in which the supply takes the form of a deposit of the commodity at a customary place; the counteroffer takes the same form, and dickering is effected through the increase in the number of objects being offered from both sides, until one party either withdraws dissatisfied or, satisfied, takes the goods left by the other party and departs.

It is normally assumed by both partners to an exchange that each will be interested in the future continuation of the exchange relationship, be it with this particular partner or with some other, and that he will adhere to his promises for this reason and avoid at least striking infringements of the rules of good faith and fair dealing. It is only this assumption which guarantees the law-abidingness of the exchange partners. Insofar as that interest exists, "honesty is the best policy." This proposition, however, is by no means universally applicable, and its empirical validity is irregular; naturally, it is highest in the case of rational enterprises with a stable clientele. For, on the basis of such a stable relationship, which generates the possibility of mutual personal appraisal with regard to market ethics, trading may free itself most successfully from illimited dickering and return, in the interest of the parties, to a relative limitation of fluctuation in prices and exploitation of momentary interest constellations. The consequences, though they are important for price formation, are not relevant here in detail. The

fixed price, without preference for any particular buyer, and strict business honesty are highly peculiar features of the regulated local neighborhood markets of the medieval Occident, in contrast to the Near and Far East. They are, moreover, a condition as well as a product of that particular stage of capitalistic economy which is known as Early Capitalism. They are absent where this stage no longer exists. Nor are they practiced by those status and other groups which are not engaged in exchange except occasionally and passively rather than regularly and actively. The maxim of *caveat emptor* obtains, as experience shows, mostly in transactions involving feudal strata or, as every cavalry officer knows, in horse trading among comrades. The specific ethics of the market place is alien to them. Once and for all they conceive of commerce, as does any rural community of neighbors, as an activity in which the sole question is: who will cheat whom.

The freedom of the market is typically limited by sacred taboos or through monopolistic consociations of status groups which render exchange with outsiders impossible. Directed against these limitations we find the continuous onslaught of the market community, whose very existence constitutes a temptation to share in the opportunities for gain. The process of appropriation in a monopolistic group may advance to the point at which it becomes closed toward outsiders, i.e., the land, or the right to share in the commons, may have become vested definitively and hereditarily. As the money economy expands and, with it, both the growing differentiation of needs capable of being satisfied by indirect barter, and the independence from land ownership, such a situation of fixed, hereditary appropriation normally creates a steadily increasing interest of individual parties in the possibility of using their vested property rights for exchange with the highest bidder, even though he be an outsider. This development is quite analogous to that which causes the co-heirs of an industrial enterprise in the long run to establish a corporation so as to be able to sell their shares more freely. In turn, an emerging capitalistic economy, the stronger it becomes, the greater will be its efforts to obtain the means of production and labor services in the market without limitations by sacred or status bonds, and to emancipate the opportunities to sell its products from the restrictions imposed by the sales monopolies of status groups. Capitalistic interests thus favor the continuous extension of the free market, but only up to the point at which some of them succeed, through the purchase of privileges from the political authority or simply through the power of capital, in obtaining for themselves a monopoly for the sale of their products or the acquisition of their means of production, and in thus closing the market on their own part.

The breakup of the monopolies of status groups is thus the typical

immediate sequence to the full appropriation of all the material means of production. It occurs where those having a stake in the capitalistic system are in a position to influence, for their own advantage, those communities by which the ownership of goods and the mode of their use are regulated; or where, within a monopolistic status group, the upper hand is gained by those who are interested in the use of their vested property interests in the market. Another consequence is that the scope of those rights which are guaranteed as acquired or acquirable by the coercive apparatus of the property-regulating community becomes limited to rights in material goods and to contractual claims, including claims to contractual labor. All other appropriations, especially those of customers or those of monopolies by status groups, are destroyed. This state of affairs, which we call free competition, lasts until it is replaced by new, this time capitalistic, monopolies which are acquired in the market through the power of property. These capitalistic monopolies differ from monopolies of status groups[3] by their purely economic and rational character. By restricting either the scope of possible sales or the permissible terms, the monopolies of status groups excluded from their field of action the mechanism of the market with its dickering and rational calculation. Those monopolies, on the other hand, which are based solely upon the power of property, rest, on the contrary, upon an entirely rationally calculated mastery of market conditions which may, however, remain formally as free as ever. The sacred, status, and merely traditional bonds, which have gradually come to be eliminated, constituted restrictions on the formation of rational market prices; the purely economically conditioned monopolies are, on the other hand, their ultimate consequence. The beneficiary of a monopoly by a status group restricts, and maintains his power against, the market, while the rational-economic monopolist rules through the market. We shall designate those interest groups which are enabled by formal market freedom to achieve power, as market-interest groups.

A particular market may be subject to a body of norms autonomously agreed upon by the participants or imposed by any one of a great variety of different groups, especially political or religious organizations. Such norms may involve limitations of market freedom, restrictions of dickering or of competition, or they may establish guaranties for the observance of market legality, especially the modes or means of payment or, in periods of interlocal insecurity, the norms may be aimed at guaranteeing the market peace. Since the market was originally a consociation of persons who are not members of the same group and who are, therefore, "enemies," the guaranty of peace, like that of restrictions of permissible modes of warfare, was ordinarily left to divine powers.[4] Very often the peace of the market was placed under the protection of a temple;

later on it tended to be made into a source of revenue for the chief or prince. However, while exchange is the specifically peaceful form of acquiring economic power, it can, obviously, be associated with the use of force. The seafarer of Antiquity and the Middle Ages was pleased to take without pay whatever he could acquire by force and had recourse to peaceful dickering only where he was confronted with a power equal to his own or where he regarded it as shrewd to do so for the sake of future exchange opportunities which might be endangered otherwise. But the intensive expansion of exchange relations has always gone together with a process of relative pacification. All of the "public peace" arrangements of the Middle Ages were meant to serve the interests of exchange.[5] The appropriation of goods through free, purely economically rational exchange, as Oppenheimer has said time and again, is the conceptual opposite of appropriation of goods by coercion of any kind, but especially physical coercion, the regulated exercise of which is the very constitutive element of the political community.

NOTES

1. The title is by the present editor; all notes are by Rheinstein. (R)

2. Die Juden und das Wirtschaftsleben (1911, Epstein tr. 1913, 1951, s.t. The Jews and Modern Capitalism); Der Bourgeois (1913); Händler und Helden (1915); Der moderne Kapitalismus, vol. III, Part I, p. 6; see also Deutscher Sozialismus (1934) (Geiser tr. s.t. A New Social Philosophy, 1937). Revulsion against the so-called "de-humanization" of relationships has constituted an important element in the German neo-romanticism of such groups and movements as the circle around the poet Stefan George, the youth movement, the Christian Socialists, etc. Through the tendency to ascribe this capitalistic spirit to the Jews and to hold them responsible for its rise and spread, these sentiments became highly influential in the growth of organized anti-Semitism and, especially, National-Socialism.

3. Such as the monopoly of guild members to sell certain goods within the city, or the monopoly of the lord of a manor to grind the grain of all peasants of the district, or the monopoly of the members of the bar to give legal advice, a monopoly which was abolished in most Continental countries in the nineteenth century.

4. On market peace, cf. S. Rietschel, Markt und Stadt (1897); H. Pirenne, Villes, marchés et marchands au moyen âge (1898).

5. On such medieval peace arrangements (*Landfrieden*), which were aimed at the elimination of feuds and private wars and which occurred either as non-aggression pacts concluded, often with ecclesiastical or royal coöperation, between barons, cities, and other potentates, or were sought to be imposed on his unruly subjects by the king, see Quidde, *Histoire de la paix publique en Allemagne au moyen âge* (1929), 28 Recueil des cours de l'Académie de droit international 449.

CHAPTER VIII

ECONOMY AND LAW (SOCIOLOGY OF LAW)[1]

i

Fields of Substantive Law

1. *Public Law and Private Law*

One of the most important distinctions in modern legal theory and practice is that between "public" and "private" law.[2] But the exact criteria of this distinction are surrounded by controversy.

(a) Sociologically, one might define public law as the total body of those norms which regulate state-oriented action, that is, those activities which serve the maintenance, development, and the direct pursuit of the objectives, of the state (*Staatsanstalt*), objectives which must themselves be valid by virtue of enactment or consensus. Correspondingly, private law would be defined as the totality of those norms which, while issuing from the state, regulate conduct other than state-oriented conduct. This kind of definition is rather non-technical and, therefore, difficult to apply. But it seems nevertheless to constitute the basis of almost all other attempted distinctions of the two great branches of the law.

(b) The distinction just stated is often intertwined with another one. Public law might be regarded as identical with the total body of the

"reglementations," i.e., those norms which only embody instructions to state officials as regards their duties, but, in contradistinction to what may be called "claim norms," do not establish any "rights" of individuals. This distinction, however, must be correctly understood. For the norms of public law can establish rights of individuals, for instance, the right to vote as established in a law on presidential elections. Such a law nonetheless falls within the domain of public law.

But today such a "public right" belonging to an individual is not regarded as a vested right in the same sense as a property right, which the legislator himself views as in principle inviolable. From a legal point of view, the public rights of individuals are but those spheres of activity in which he acts as an agent of the state for specifically delimited purposes. Thus, in spite of the fact that they formally appear as rights, they may still be regarded as but another aspect, a "reflex," of a "reglementation" rather than as the result of a "claim-norm." Furthermore, by no means all claims which exist in a legal system and which belong to private-law, as previously defined, are vested rights.[3]

Indeed, even those incidents of ownership which are fully recognized at any given time, may be looked upon as being but reflexes of the legal order. As a matter of fact, the question as to whether a given right is "vested" means frequently no more than whether or not it is liable to expropriation without compensation. Thus one might assert that all public law is in the legal sense no more than a body of reglementations, without asserting that reglementations belong exclusively to the sphere of public law. But not even such a definition would be correct. For in some legal systems the governmental power itself may be regarded as a patrimonial right belonging to the monarch, and in some others certain constitutional rights belonging to the citizen may be regarded as inalienable and, therefore, as vested rights.

(c) Finally, private law might be contrasted with public law as the law of coördination as distinguished from that of subordination. Private law would then be concerned with those legal affairs in which several parties are confronting each other so that the law treats them as being coördinated and that their legal spheres are to be "properly" defined against each other by the legislature, the judiciary or, by means of legal transactions, by the parties themselves. In the domain of public law, however, a holder of preëminent power, having authoritative power of command, is confronting those persons who are his subjects by virtue of the legal meaning of the norms. Yet not every functionary of the state has authority to command and not all those activities of the organs of the state which are regulated by public law are commands. Furthermore, the regulation of the relations among the various public organs,

i.e., among power holders of equal status, belongs to the proper sphere of "public law." Besides, one must include within the field of public law not only the relations between the organs of the state and those subject to them but also those activities of the subjects by which they create and control those organs. Once this is admitted, the definition here discussed leads us back to the one previously presented, i.e., the definition that does not regard as falling within the field of public law every regulation of the power to exercise authority or of the relations between those who exercise authority and those who are subject to it. For example, an employer's exercise of power would obviously be excluded because it originates in a contract between parties of equal legal status. Again, the authority of the head of a family will be regarded as falling within the sphere of private law—for no other reason than the fact that public law is only concerned with those activities within a given legal system which are directed toward the maintenance of the state as well as toward the realization of those objectives of the state which are its prime concern. Of course, the question as to what these particular objectives should be is answered in varying ways even today. Lastly, certain public activities may be intentionally regulated in such a way that, with respect to the same subject matter, rights vested in individuals and powers conferred upon state agencies coexist and compete with each other.

As we have seen, the delimitation of the spheres of public and private law is even today not entirely free from difficulty. It was even less clear in the past, and there was once a situation in which such a distinction was not made at all. Such was the case when all law, all jurisdictions, and particularly all powers of exercising authority were personal privileges, such as, especially, the "prerogatives" of the head of the state. In that case the authority to judge, or to call a person into military service, or to require obedience in some other respect was vested right in exactly the same way as the authority to use a piece of land; and just like the latter, it could constitute the subject matter of a conveyance or of inheritance. Under this condition of "patrimonialism," political authority was not organized as a compulsory association (*Anstalt*), but was represented by the concrete consociation (*Vergesellschaftung*) and compromises of individual power-holders, or persons claiming powers, and by the concrete arrangements made between them. It was a kind of political authority which was not essentially different from that of the head of a household, or a landlord, or a master of serfs. Such a state of affairs has never existed as a complete system, but, in so far as it did exist, everything which we legally characterize as falling within the sphere of "public law" constituted the subject mat-

ter of the private rights of individual power-holders and was in this respect in no way different from a "right" in private law.

2. *Right-Granting Law and Reglementation*

A legal system may also assume a character exactly opposite to the one just described, that is to say, "private law," of the kind defined above, may be completely absent in wide areas of social life which would today fall within its sphere. This occurs where there exist no norms having the character of right-granting laws. In such a situation, the entire body of norms consists exclusively of "reglementations." In other words, all private interests enjoy protection, not as guaranteed rights, but only as the obverse aspect of the effectiveness of these regulations. This situation, too, has never prevailed anywhere in its pure form, but in so far as it obtains, all forms of law become absorbed within "administration" and become part and parcel of "government."*

3. *"Government" and "Administration"*

"Administration" is not a concept of public law exclusively. For we must recognize the existence of private administration, as in the case of a household or a business enterprise, alongside the kind of administration carried on either by the state or by other public institutions (i.e., either institutional organs of the state itself, or heteronomous institutions deriving their powers from the state).

In its widest sense, the expression "public administration" includes not only legislation and adjudication but also those other residuary activities which here we want to call "government." "Government" can be bound by legal norms and limited by vested rights. In these respects it resembles legislation and adjudication. But there are two aspects to be distinguished. First, and in a positive sense, government must have a legitimate basis for its own jurisdiction; a modern government exercises its functions as a "legitimate" jurisdiction, which means legally that it is regarded as resting on authorization by the constitutional norms of the state. Secondly, and in a negative sense, the limitations on the power of the state by law and vested rights create those restraints upon its freedom of action to which it must adjust itself. One specific characteristic of government, however, resides in the fact that it aims not only at acknowledging and enforcing the law simply because the law exists and constitutes the basis of vested rights, but also in that it pursues

other concrete objectives of a political, ethical, utilitarian, or some other kind. To the government, the individual and his interests are in the legal sense objects rather than bearers of rights.

In the modern state, it is true, there exists a trend formally to assimilate adjudication to "administration" (in the sense of "government"). A judge is frequently instructed, either by the positive law or by legal theory, to render his decision on the basis of ethics, equity, or expediency. In the administrative field, on the other hand, the modern state has provided for the citizen, who, on principle, is only its object, a possibility of protecting his interests by granting remedies which are formally identical with those existing in the field of the administration of justice, namely, the right to resort to administrative tribunals.[5] But none of these guaranties can eliminate the basic contradiction between adjudication and "government." Law creation, too, is approximated by government wherever government promulgates general rules dealing with typical situations rather than merely intervening in specific cases —and, to a certain extent, even when it does not feel bound by them. After all, observance by the government of the rules is regarded as the normal thing and a total disregard of them would ordinarily be disapproved as "arbitrary" conduct.

The primeval form of "administration" is represented by patriarchal power, i.e., the rule of the household. In its primitive form, the authority of the master of the household is unlimited. Those subordinated to his power have no rights as against him, and norms regulating his behavior toward them exist only as indirect effects of heteronomous religious checks on his conduct. Originally, we are confronted with the coexistence of the theoretically unrestrained administrative power of the master and arbitration proceedings which originate in arrangements made between kinship groups and relate to the proof and composition of alleged injury. Only in the latter are "claims," i.e., rights, at issue and are verdicts rendered; and only in relations between kinship groups do we find established formalities, limitations as to time, rules of evidence, etc., that is, the beginnings of "judicial" procedure. None of these exist within the sphere of patriarchal power, which represents the primitive form of "government," in the same way as the inter-group arrangements represent the primitive form of adjudication. The two are distinct from one another also with regard to the spheres in which they operate. Even such a relatively late phenomenon as the ancient Roman administration of justice stopped at the threshold of the household.[6] We shall later see how domestic authority came to be diffused beyond its original sphere and was carried over into certain forms of political power, viz., patrimonial monarchy, thereby also entering into the administration of justice.

Whenever this happened, the distinctions between legislation, adjudication, and government were broken down. The consequences have been one or the other of the following:

In the first place, adjudication assumed the character of "administration," both formally and materially, and was operated simply through decrees or commands issued by the lord to his subjects according to considerations of mere expediency or equity, and without fixed forms and at arbitrary times. This situation, however, never obtained with full force except in extreme cases; but approximations to it have occurred in "inquisitorial" procedures as well as in all those systems of procedure in which the conduct of trial and proof is dominated by the judge.[7] The other, rather different, possible consequence of the diffusion of the pattern of domestic authority into extra-household spheres consists in "administration" assuming the form of judicial procedure, as happened to a large extent, and in some sense still happens today, to be the case in England. Parliament deals with "private bills," i.e., with such purely administrative acts as licensing, etc., in exactly the same way that it treats public bills. The failure to distinguish between the two types of legislation has been a general feature of older parliamentary procedure; for the English Parliament it was, indeed, a decisive factor in the establishment of its position.[8] Parliament arose originally as a judicial body, and, in France, it became such to the exclusion of all other activities. This confusion between legislative and judicial functions was conditioned by political circumstances. In Germany, too, the budget, which is a purely administrative matter,[9] is treated as a legislative act, in adherence to the English pattern as well as for political reasons.

The distinction between "administration" and "private law" becomes fluid where the official actions of the organs of official bodies assume the same form as agreements between individuals. This is the case when officials in the course of their official duties make contractual arrangements for exchange of goods or services either with members of the organization or with other individuals. Frequently such relationships are withdrawn from the norms of private law, are arranged in some way different from the general legal norms as to substance or as to the mode of enforcement, and are thus declared to belong to the sphere of "administration."[10] As long as claims treated in this way are guaranteed by some possibility of enforcement, they do not cease to be "rights," and the distinction is no more than a technical one. However, even as such, the distinction may be of considerable practical significance. But the total structure of (ancient) Roman "private law" is completely misunderstood if one regards as belonging to its sphere only those claims which were enforced in a regular jury trial and on the basis of a *lex*, and excludes from it all those rights which were enforced solely through the

magistrate's *cognitio* and which, at times, were of preponderant economic significance.[11]

4. *Criminal Law and Private Law*

The authority of magi and prophets and, under certain conditions, the powers of the priesthood, can, to the extent that they have their source in concrete revelation, be as unrestrained by rights and norms as the primitive power of the master of a household. Belief in magic is also one of the original sources of criminal law, as distinguished from "private law."[12] The modern view of criminal justice, broadly, is that public concern with morality or expediency decrees expiation for the violation of a norm; this concern finds expression in the infliction of punishment upon the evil doer by agents of the state, the evil doer, however, enjoying the protection of a regular procedure. The redress of the violation of private rights, on the other hand, is left to the injured party, and action by the latter leads not to punishment, but to the restoration of a situation which the law has guaranteed. But even today this distinction is not always applied in clear-cut fashion. It was certainly unknown in primitive administration of justice. Even in the late stages of otherwise complex legal developments, every action was simply looked upon as sounding in tort and the notions of "contract" and *obligatio* were completely unknown.[13] Indeed, Chinese law still manifests some traces of this situation,[14] which in the history of civilization has been of such great importance in legal development. Every infringement by an outsider upon a member of a kinship group or his property calls for either revenge or composition, the pursuit of which is left to the injured party, supported by his kin.

The procedure for obtaining composition either shows no trace at all or at most the mere beginnings of the distinction between felony that calls for vengeance, and tort that merely requires restitution. Furthermore, the absence of a distinction between actions for what we call "civil" redress and criminal prosecution aiming at punishment, and the subsumption of both under the single category of atonement for wrong imparted, is connected with two peculiarities of primitive law and procedure. There is a complete unconcern with a notion of guilt, and, consequently, with the idea of degrees of guilt reflecting inner motivations and psychological attitudes. He who thirsts for vengeance is not interested in motives; he is concerned only with the objective happening of the event by which his desire for vengeance has been aroused. His anger expresses itself equally against inanimate objects, by which he has been unexpectedly hurt, against animals by which he

has been unexpectedly injured, and against human beings who have harmed him unknowingly, negligently, or intentionally. This, for example, was the original sense of the Roman *actio de pauperie*, i.e., that an animal had behaved in a way other than it should have, as well as of the *noxae datio*, i.e., the surrender of the animal for vengeance.[15] Every wrong is, therefore, a "tort" that requires expiation, and no tort is more than a wrong that requires expiation.

The primitive indistinctiveness of crime and tort also found expression in the ways in which "judgments" were "enforced." Procedure did not vary, whether the suit was about a piece of land or about homicide. But even when that stage was reached when fairly well-established compositions began to be imposed, there was still a lack of "official" machinery for the enforcement of these judgments. It was rather believed that a judgment which had been arrived at by the interpretation of oracles or other magical devices, or the invocation of magical or divine powers, carried with it sufficient magical authority to enforce itself, since disobedience constituted a kind of serious blasphemy. Where, as a result of certain developments connected with military organization (to be dealt with shortly),[16] the trial took place before an assembly of the whole community, with all members participating in the making of the judgment (as was the case, for instance, in early Germanic recorded history), it might be expected that as a consequence of such coöperation in the rendering of a judgment, none of its members would obstruct its enforcement, provided it had not been publicly challenged in the assembly. Nevertheless, the victorious litigant could not depend on anything more than mere passivity on the part of those outside of his own kinship group. It was entirely incumbent upon him, by way of self-help, to enforce the judgment with the assistance of his kinfolk unless, of course, the unsuccessful party obeyed the judgment. Both in Rome and among the Germanic tribes, this self-help usually consisted in the capture of the condemned to remain as hostage for the payment of the composition, the amount of which was either fixed by the judgment itself or was to be agreed on by the litigants themselves. Nor did this self-help vary for different types of litigation: self-help was resorted to whether the suit had been about a piece of land or whether it had been about homicide. An official *machinery* for the enforcement of judgments did not become available until princes or magistrates saw the necessity, for political reasons and in the interest of public order, to use their *imperium* against persons interfering with the enforcement of a judgment and to threaten such persons with legal sanctions, especially outlawry.[17] All this, however, took place without any distinction between civil and criminal proceedings. In those legal systems in which under the influence of certain legal *honoratiores*[18] there remained some con-

tinuity with the ancient forms of expiatory justice, and in which there was a lesser degree of "bureaucratization," i.e., those of Rome and England, this original state of complete nondifferentiation continued to show itself in the rejection of specific performance for the restoration of concrete objects. Even in an action concerning title to land, the judgment was ordinarily rendered in terms of money.[19] This was not due at all to a highly developed market economy which would evaluate everything in terms of money. Rather was it a consequence of the primitive principle that every wrong, including the wrongful possession of property, demanded satisfaction and nothing but satisfaction, and that this liability attached to the culprit's own person. On the Continent, specific performance emerged relatively early in the early Middle Ages, owing to the rapidly growing power of the *imperium* of the princes.[20] English procedure, on the other hand, even down to recent times, had to resort to peculiar fictions in order to introduce the possibility of specific performance in actions concerning real property.[21] In Rome the persistence of condemnation to money damages instead of specific performance was the result of the general tendency to keep official activities to a minimum, which, in turn, was due to the system of rule by *honoratiores*.

5. *Tort and Crime*

Substantive law too was deeply influenced by the notion that litigation implied a wrong committed by the accused and not just the existence of a state of affairs objectively regarded as unlawful. Originally, all "obligations" were, without exception, obligations *ex delicto;* hence, contractual obligations were, as we shall see,[22] at first conceived as arising out of tort. In England, as late as the Middle Ages, a contractual action was formally connected with a fictitious tort.[23] The abatement of the debts upon the death of the debtor was as much because of this concept as of the absence of any notion of a "law of succession."[24] The heirs' liability for contractual debts was, as we shall see,[25] developed with varying results by means of the joint liability for wrongful acts, first of the kindred and later of the fellow members of the household or of the participants in a power relation as either subordinates or superiors. Even the principle of protection of bona fide purchasers, a principle allegedly indispensable for modern commerce,[26] has its origin in the ancient idea that no lawsuit could be anything but one *ex delicto* against a thief or his accessory. Only later, in consequence of the development of actions *ex contractu* and the distinction between "real" and "personal" actions, did the old rule undergo divergent developments in different

legal systems. Thus its place came to be occupied by the owner's action against every possessor (*rei vindicatio*)[27] in ancient Roman[28] and in English law[29] as well as in Hindu law,[30] which, in contrast to Chinese law, was relatively highly rationalized. Still later the protection of the bona fide purchaser was revived again in the case of purchasers in market overt in English[31] and Hindu law[32] on the rational grounds of providing security for business dealings. The absence of general protection of bona fide purchasers in English and Roman law, as contrasted with German law, is yet another instance of the adaptability of commercial interest to the most diverse systems of substantive law. It illustrates, moreover, the high degree of independence which characterizes the development of law. Perhaps another example of this delictual conception of legal obligation can be found in the expression *malo ordine tenes*[33] that occurs in the Frankish action for the restitution of land, although the correct interpretation of these words is a debatable matter.

It is quite possible, however, that entirely different ideas may have been at work in such legal institutions as the bilateral Roman *vindicatio*, the Hellenic *diadikasia*,[34] or the Germanic actions for land.[35] In all these cases one may conclude that they were originally regarded as *actiones de recursu*, i.e., actions tending to ascertain a person's full membership in a certain community as based upon his title to a certain piece of land.[36] After all, *fundus* involves "membership," and κλῆρος the "member's share." Again, originally, the regular *ex officio* prosecution for a delict was as nonexistent as the official enforcement of a judgment. Within the household, chastisement derived from the patriarch's authority over his household. Disputes among members of a kinship group were settled by the elders. However, in all these situations, the decision whether punishment was to be meted out or not, and, if it was, in what form and to what degree, was an entirely discretionary matter, for "criminal law" was nonexistent. A primitive form of criminal law did develop outside the boundaries of the household, particularly in situations in which the conduct of an individual endangered *all* the members of his neighborhood, kinship, or political association. Such situations could be brought about by two types of misconduct: religious blasphemy or military disobedience. The whole group was endangered when a magical norm, e.g., a taboo, was infringed and, in consequence, the wrath of magical forces, spirits or deities, threatened to descend with evil consequences not merely upon the blasphemer (or criminal) himself but upon the whole community which suffered him to exist within their midst. Stimulated by magi or priests, the members of the community would outlaw the culprit or lynch him, as for instance through stoning among the Jews. Or else they might conduct an expiatory reli-

gious trial. Blasphemous acts were thus the main source of what may be called "intra-group punishment" as distinguished from "inter-group vengeance." The second source for such punishment was political or, originally, military. Anyone endangering by treachery or cowardice the security of the collective fighting forces or, after disciplined combat had come into being, by disobedience, had to reckon with the punitive reactions of the war lord or the army.[37] And although, of course, a person's military misbehavior had first to be established as a fact, the procedure for the finding of this fact was very summary indeed.

6. *Imperium*

From the predominance of vengeance to the formation of a firmly fixed and formalized criminal procedure a direct line of development can be traced; the reasons will become clear below. The punitive reactions of the master of a domestic group, or of the religious or military authorities, were at first free from procedural formality or rule. It is true that the punitive powers of the master of a household became to some extent restricted by the intervention of the elders of his own kinship group or the religious or military authorities in charge of certain intra-group relations, but by and large the master remained a law unto himself within his sphere and he was bound by legal rules only in very special cases.

A slow, and in its result varying, subjection to rules occurred, however, as to the primitive nondomestic powers, i.e., the householdlike power exercised by patrimonial monarchy in relations quite different from those of a household, or, in other words, as to those powers which are contained in the concept of *imperium*. We shall not discuss here the origin of the process by which definite rules became established. Nor shall we discuss at present, whether the holder of *imperium* imposed them on himself in his own interest, or whether he had to do so in view of the factual limits within which he would find obedience, or whether they were imposed upon him by other powers. All these questions will be dealt with in our analysis of domination. *Imperium* has always included, however—and in the past to an even greater extent than today—the power to punish and, in particular, the power to crush disobedience not merely through the direct application of force but through the threat of detriment as well. The power to punish could be directed against certain subordinate "officials" who exercised *imperium* or against those who were subjected to its power. In the former case, we speak of *disciplinary power*, and in the latter, of the *power to inflict punishment*. In this context, "public law" is directly connected with

criminal law; at any rate, public law, criminal law, criminal procedure and sacred law do not begin to be systematically treated unless there are at least some rules which are recognized as factually binding.

7. *Limitation of Power and Separation of Powers*

Such norms as those just mentioned always act as restraints upon the *imperium* within the sphere in which they obtain. On the other hand, not every restraint possesses "normative" character. Now there are two kinds of restraints, viz., (1) limitations of power, and (2) separation of powers. Limitation of power exists where, due to sacred tradition or enactment, a particular *imperium* is restrained by the rights of its subjects. The power-holder may issue only commands of a certain type, or he may issue all sorts of commands except in certain cases or subject to certain conditions. Whether these limitations possess "legal," "conventional," or merely "customary" status, is to be answered in each case by ascertaining whether the maintenance of the limitations is guaranteed by a coercive organization (whose coercive means may be more or less effective) or whether they are maintained only by conventional disapproval or whether in the last analysis there is no *agreed* limitation at all. The other kind of restraint ("separation of powers") exists where one *imperium* conflicts with another *imperium*, either equal or in certain respects superior to it, but the legitimate validity of which is fully recognized as limiting the extent of its authority. Both limitation of power and separation of powers may exist together, and it is this coexistence which so distinctively characterizes the modern state with its distribution of competence among its various organs. Indeed, this modern state is essentially characterized by the following criteria: It is a consociation (*anstaltsmässige Vergesellschaftung*) of bearers of certain defined *imperia;* these bearers are selected according to established rules; their *imperia* are delimitated from each other by general rules of separation of powers; and internally each of them finds the legitimacy of its power of command defined by set rules of limitation of power.

Both separation of powers and limitation of power may assume structural forms quite different from those in which they appear in the modern state. Especially is this true of the separation of powers. Its structure was different in the ancient Roman law of intercession of *par majorve potestas*[38] as well as in the patrimonial, the estate-type, the feudal and the political organization. Nonetheless, there is truth in Montesquieu's assertion that it was only through the separation of powers that the very concept of public law was made possible.[39] But this proposition must be understood correctly in the sense that the

separation of powers need not necessarily be of the sort that he thought he had found in England. On the other hand, not every kind of separation of powers leads to the idea of a public law, but only that type which is peculiar to the idea of the state as a rationally organized institution. The reason why a systematic theory of public law was developed only in the Occident is simply that only in these countries had the political organization assumed the form of an institution with rationally dovetailed jurisdictions and a separation of powers. As far as Antiquity is concerned, it had a systematic theory of the state precisely to the extent that there existed a rational separation of powers: the doctrine of the *imperia* of the several Roman magistrates was elaborated in a systematic manner.[40] Everything else was essentially political philosophy rather than constitutional law. In the Middle Ages, separation of powers appeared only in the competition among privileges, feudal claims, and other rights; consequently, there was no separate treatment of constitutional law. Whatever there was of it was contained in feudal and manorial law. The decisive legal conceptions of modern public law owe their origin to a peculiar combination of several factors. As a matter of historical fact, they owe it to the consociation of privileged persons in public corporations of the *Ständestaat*, which increasingly combined both separation and limitation of powers with institutional structure. As a matter of legal theory, they owe it to the Roman concept of the corporation, the ideas of natural law, and, finally, French legal theory. We shall deal with this development of modern public law in our analysis of domination. In the following sections we shall deal mainly with lawmaking and lawfinding, but only in connection with those economically relevant spheres which today are left to private law and civil procedure.

8. *Substantive Law and Procedure*

According to our contemporary modes of legal thought, the activities of political organizations fall, as regards "law," into two categories, viz., lawmaking and lawfinding, the latter involving "execution" as a technical matter. Today we understand by lawmaking the establishment of general norms which in the lawyers' thought assume the character of rational rules of law. Lawfinding, as we understand it, is the "application" of such established norms and the legal propositions deduced therefrom by legal thinking, to concrete "facts" which are "subsumed" under these norms. However, this mode of thought has by no means been common to all periods of history. The distinction between lawmaking as creation of general norms and lawfinding as application of these

norms to particular cases does not exist where adjudication is "administration" in the sense of free decision from case to case. In such a situation, it is not only the legal norm that is lacking, but also the idea of a party's right to have it applied to his case. The same is true where law appears as "privilege" and where, accordingly, the idea of an "application" of legal norms as the foundation of a legal claim could not have arisen. Again, the distinction between lawmaking and lawfinding is absent wherever lawfinding is not conceived as an application of general norms to concrete cases. In other words, the distinction is absent in all cases of irrational adjudication, which has been not only the primitive form of adjudication but which, as we shall see [in sec. *iii*, below], has also prevailed, either in its pure or in some modified form, throughout all history in all parts of the world except those in which Roman law came to obtain. Similarly, the distinction between rules of law to be applied in the process of lawfinding, and rules regarding that process itself, has not always been drawn as clearly as that which is drawn today between substantive and procedural law. Where legal procedure rested upon the *imperium's* influence upon the pleadings, as, for instance, in early Roman law, or, in a technically quite different way, in English law, it is easy to hold the notion that substantive legal claims are identical with the right to make use of procedural forms of action such as the Roman *actio*[41] or the English writ.[42] In older Roman legal doctrine the line of demarcation between procedural and private law was thus not drawn in the way it is drawn by us. For quite different reasons, a similar mixture of problems which we would respectively call procedural and substantive was apt to arise where adjudication was based on irrational modes of proof, such as the oath or wager of law in their original magical significance, or upon ordeals. The right or duty to resort, or submit, to such significant acts of magic was then a component of a substantive legal claim or even identical with it. Nevertheless, the distinction between rules of procedural and of substantive law was inherent in the distinction made in the Middle Ages between *Richtsteige*, on the one hand, and "mirrors of law,"[43] on the other. This distinction was no less clear than that which was made in the Romans' early efforts at systematization,[44] although it was made in a somewhat different way.

9. *The Categories of Legal Thought*

As we have already pointed out, the mode in which the current basic conceptions of the various fields of law have been differentiated from each other has depended largely upon factors of legal technique and of political organization. Economic factors can therefore be said to have

had an indirect influence only. To be sure, economic influences have played their part, but only to this extent: that certain rationalizations of economic behavior, based upon such phenomena as a market economy or freedom of contract, and the resulting awareness of underlying, and increasingly complex conflicts of interests to be resolved by legal machinery, have influenced the systematization of the law or have intensified the institutionalization of the polity. We shall have occasion to observe this time and again. All other purely economic influences merely occur as concrete instances and cannot be formulated in general rules. On the other hand, we shall frequently see that those aspects of law which are conditioned by political factors and by the internal structure of legal thought have exercised a strong influence on economic organization. In the following paragraphs, we shall deal briefly with the most important conditions by which the formal characteristics of law, i.e., lawmaking and lawfinding, have been influenced. We shall be especially interested in observing the extent and the nature of the rationality of the law and, quite particularly, of that branch of it which is relevant to economic life, viz., private law.

A body of law can be "rational" in several different senses, depending on which of several possible courses legal thinking takes toward rationalization. Let us begin with the seemingly most elementary thought process, viz., generalization, i.e., in our case, the reduction of the reasons relevant in the decision of concrete individual cases to one or more "principles," i.e., legal propositions. This process of reduction is normally conditional upon a prior or concurrent analysis of the facts of the case as to those ultimate components which are regarded as relevant in the juristic valuation. Conversely, the elaboration of ever more "legal propositions" reacts upon the specification and delimitation of the potentially relevant characteristics of the facts. The process both depends upon, and promotes, casuistry. However, not every well-developed method of casuistry has resulted in, or run parallel to, the development of legal propositions of high logical sublimation. Highly comprehensive schemes of legal casuistry have grown up upon the basis of a merely paratactic association, that is, of the analogy of extrinsic elements. In our legal system the analytical derivation of "legal propositions" from specific cases goes hand in hand with the synthetic work of "construction" of "legal relations" and "legal institutions," i.e., the determination of which aspects of a typical kind of social or consensual action are to be regarded as *legally* relevant, and in which logically consistent way these relevant components are to be regarded as *legally* coördinated, i.e., as being in "legal relationships." Although this latter process is closely related to the one previously described, it is nonetheless possible for a very high degree of sublimation in analysis to be correlated with a very

low degree of constructional conceptualization of the legally relevant social relations. Conversely, the synthesis of a "legal relationship" may be achieved in a relatively satisfactory way despite a low degree of analysis, or occasionally just because of its limited cultivation. This contradiction is a result of the fact that analysis gives rise to a further logical task which, while it is compatible with synthetic construction, often turns out to be incompatible with it in fact. We refer to "systematization," which has never appeared but in late stages of legal modes of thought. To a youthful law, it is unknown. According to present modes of thought it represents an integration of all analytically derived legal propositions in such a way that they constitute a logically clear, internally consistent, and, at least in theory, gapless system of rules, under which, it is implied, all conceivable fact situations must be capable of being logically subsumed lest their order lack an effective guaranty. Even today not every body of law (e.g., English law) claims that it possesses the features of a system as defined above and, of course, the claim was even less frequently made by the legal systems of the past; where it was put forward at all, the degree of logical abstraction was often extremely low. In the main, the "system" has predominantly been an external scheme for the ordering of legal data and has been of only minor significance in the analytical derivation of legal propositions and in the construction of legal relationships. The specifically modern form of systematization, which developed out of Roman law, has its point of departure in the logical analysis of the meaning of the legal propositions as well as of the social actions.[48] The "legal relationships" and casuistry, on the other hand, often resist this kind of manipulation, as they have grown out of concrete factual characteristics.

In addition to the diversities discussed so far, we must also consider the differences existing as to the technical apparatus of legal practice; these differences to some extent associate with, but to some extent also overlap, those discussed so far. The following are the simplest possible type situations:

Both lawmaking and lawfinding may be either rational or irrational. They are *formally* irrational when one applies in lawmaking or lawfinding means which cannot be controlled by the intellect, for instance when recourse is had to oracles or substitutes therefor. Lawmaking and lawfinding are *substantively* irrational on the other hand to the extent that decision is influenced by concrete factors of the particular case as evaluated upon an ethical, emotional, or political basis rather than by general norms. "Rational" lawmaking and lawfinding may be rational in a formal or a substantive way. All formal law is, formally at least, relatively rational. Law, however, is "formal" to the extent that, in both substantive and procedural matters, only unambiguous general char-

acteristics of the facts of the case are taken into account. This formalism can, again, be of two different kinds. It is possible that the legally relevant characteristics are of a tangible nature, i.e., that they are perceptible as sense data. This adherence to external characteristics of the facts, for instance, the utterance of certain words, the execution of a signature, or the performance of a certain symbolic act with a fixed meaning, represents the most rigorous type of legal formalism. The other type of formalistic law is found where the legally relevant characteristics of the facts are disclosed through the logical analysis of meaning and where, accordingly, definitely fixed legal concepts in the form of highly abstract rules are formulated and applied. This process of "logical rationality" diminishes the significance of extrinsic elements and thus softens the rigidity of concrete formalism. But the contrast to "substantive rationality" is sharpened, because the latter means that the decision of legal problems is influenced by norms different from those obtained through logical generalization of abstract interpretations of meaning. The norms to which substantive rationality accords predominance include ethical imperatives, utilitarian and other expediential rules, and political maxims, all of which diverge from the formalism of the "external characteristics" variety as well as from that which uses logical abstraction. However, the peculiarly professional, legalistic, and abstract approach to law in the modern sense is possible only in the measure that the law is formal in character. In so far as the absolute formalism of classification according to "sense-data characteristics" prevails, it exhausts itself in casuistry. Only that abstract method which employs the logical interpretation of meaning allows the execution of the specifically systematic task, i.e., the collection and rationalization by logical means of all the several rules recognized as legally valid into an internally consistent complex of abstract legal propositions.

Our task is now to find out how the various influences which have participated in the formation of the law have influenced the development of its formal qualities. Present-day legal science, at least in those forms which have achieved the highest measure of methodological and logical rationality, i.e., those which have been produced through the legal science of the Pandectists' Civil Law, proceeds from the following five postulates: viz., first, that every concrete legal decision be the "application" of an abstract legal proposition to a concrete "fact situation"; second, that it must be possible in every concrete case to derive the decision from abstract legal propositions by means of legal logic; third, that the law must actually or virtually constitute a "gapless" system of legal propositions, or must, at least, be treated as if it were such a gapless system; fourth, that whatever cannot be "construed" rationally in legal terms is also legally irrelevant; and fifth, that every social action

of human beings must always be visualized as either an "application" or "execution" of legal propositions, or as an "infringement" thereof, since the "gaplessness" of the legal system must result in a gapless "legal ordering" of all social conduct. (This conclusion has been drawn particularly by Stammler, although not explicitly.)[46]

However, for the moment we shall not concern ourselves with these theoretical postulates, but shall rather investigate certain general formal qualities of the law which are important for its functioning.

NOTES

1. The Sociology of Law, edited by Max Rheinstein, is the most thoroughly annotated part of the manuscript. Much of the literature used by Weber in other chapters, too, is cited here. The English edition of the Sociology of Law was a group effort. In addition to Shils and Rheinstein, Mrs. Elizabeth Mann Borgese and Mr. Samuel Stoljar participated in the translation; the latter also worked on the annotations, together with Dr. Alise Vagelis and Dr. Stoyan Bayitch. Unless otherwise indicated, all notes in this chapter are by this group.

On the following pages we reproduce Rheinstein's list of books cited in abbreviated form in the annotation. Books marked by an asterisk appear to have been used extensively by Weber. For further guidance to the contemporary literature used by Weber or closely related to the thoughts developed in this chapter, see Part 2 of the bibliography compiled by Johannes Winckelmann for his latest German edition, RECHTSSOZIOLOGIE (2nd rev. ed.; Neuwied: Luchterhand, 1967), 404–423.

2. Weber refers here to Continental, and especially German, legal theory, where the distinction between public law and private law is given particular emphasis. The distinction was familiar to the Roman jurists and well known especially in Ulpian's definition (DIGEST 1.1.4.) of public law as that which "is concerned with the Roman state" (*quod ad statum rei Romanae spectat*) and of private law as that which "is concerned with the interest of individuals" (*quod ad singulorum utilitatem pertinet*). The distinction has been of practical significance where a government, although being prepared to guarantee a firm legal order with regard to the private relations among the citizens themselves, yet remained unwilling to fix those relations between them in hard and fast rules. This situation was typical of the late Roman Empire as well as of the absolute monarchies of the modern age. To the degree to which the organs of the state became subject to rules of law, the distinction between public and private law lost importance, ultimately to become no more than a convenient classification of certain legal rules, especially for the purposes of legal writing and education.

3. Cf. *infra*, sec. ii:1.

4. This description of the "ideal type" of the totalitarian state was written before it emerged in its modern form.—Weber's term "government" has been re-

tained here, although the term "executive" might bette correspond to American parlance.

5. An Anglo-American lawyer would regard this right as an ordinary instance of the "right" of access to the courts. But as a continental lawyer, Weber thinks of the protection of this right as that entrusted to the specially established administrative tribunals of either the French or the German type. This kind of protection of the citizen against abuses of governmental powers is organized on lines different from those known in the countries of the Common Law, ut it should not be regarded as less effective. *Cf.* E. Freund, *Administrative Law*, 1 Encyc. Soc. Sci. (1930) 452, and Garner, *Anglo-American and Continental European Administrative Law* (1929), 7 N.Y.U.L.Q. Rev. 387.

6. M. Kaser, *Zur altrömischen Hausgewalt* (1950), 67 Sav. Z. Rom. 474.

7. German, and generally continental, theory of procedure distinguishes between two types of trial: (1) the trial according to the *Offizialmaxime*, and (2) the trial according to the *Verhandlungsmaxime*. Under (1), the trial is dominated by the presiding judge whose function it is to ascertain what has really happened and who is, therefore, alone or primarily entitled to call and examine the witnesses and to require such proof as he thinks necessary. Under (2), the judge only assumes the ole of umpire in a trial mainly conducted by the parties; each party decides upon the witnesses he wishes to call, the questions he wishes to ask in examination and cross-examination, and the kind of evidence he wishes to submit. Actually, neither type of trial has in practice eve existed in a pure form. Continental procedure, both civil and criminal, follows today mainly the *Verhandlungsmaxime*, although the latter is modified, especially in criminal p ocedure, by certain concessions to the *Offizialmaxime*. Cf. Engelmann and Millar, 11; Millar, *Formative Principles of Civil Procedure* (1923) 18 Ill. L. Rev. 1, 94, 150; and his article on P ocedure in 12 Encyc. Soc. Sci. 439 (with list of further literature). Concerning modern continental procedure see also Schlesinger, Comparative Law (1950) 197, 510, 523; and Hamson, *Civil Procedure in France and England* (1950), 10 Camb. L.J. 411.

8. Cf. Jellinek, System 3; R. Gneist, History of the English Constitution (Ashwo th's tr. 1891) 338; Hatschek, 503; J. E. A. Joliffe, Constitutional History of Mediaeval England (1937) 337; also Anson, Law and Custom and the Constitution (1892) 262; on the present p actice, see Wade and Phillips, Constitutional Law (1950) 111.

9. Weber's classification of private bills and the budget as "purely administrative matte s" derives from German legal and constitutional theory, which distinguishes between laws in the *formal* and the *substantive* sense. A law in the substantive sense means an enactment authorizing interference by the state with the life, libe ty, or property of the citizens. A law in the formal sense is simply an act issuing from the legislature, irrespective of its contents. One of the postulates of the "rule of law" as understood on the Continent is that the state is not allowed to interfere with life, liberty, or property without the consent of the people or their duly elected representatives. Hence, any law in the substantive sense must be, or at least have its basis in, an act of the legislature, *i.e.*, a law in the formal sense. It is this political theory of the rule of law which constitutes the basis of the principle so firmly held in the continental countries, which requires that all law be expressed in a code or statute, and which thus excludes the recognition as legitimate of any "common law" which would not be based on statute ut solely on judicial p ecedent. The notion that law could be made or applied y courts without approval of the legislature expressly given in a statute, so that there could be a government y the judiciary rather than y the people's duly elected

representatives, appears repugnant to the traditional continental notions of the rule of law and democracy.

On the other hand, measures which do not constitute public interference with the life, liberty, or property of the subjects are classified as "administrative acts" which generally do not require for their validity a law in the formal sense. But modern constitutional law often requires that even an "administrative act" be embodied in a formal law, that is, be properly passed by the legislature. As regards the budget, it is, in theoretical analysis, only a program of public revenue and expenditure, and thus an administrative act. This analysis does not, of course, apply to the tax and customs provisions which constitute interferences with property. But even for the budget as such, positive constitutional law requires that it be embodied in an act of the legislature. The budget, therefore, albeit an administrative act, constitutes also a law in the formal sense. Cf. JELLINEK, SYSTEM 226; also KELSEN 123, 131; JELLINEK, VERWALTUNGSRECHT (1949) 8, 385; FLEINER, INSTITUTIONEN DES DEUTSCHEN VERWALTUNGSRECHTS (1922) 17; LABAND, DEUTSCHES REICHSSTAATSRECHT (1912) 130.

10. Cf. the special rules applying in this country to government contracts and the enforcement of contractual claims against the government. The special status of government contracts is even more pronounced in France, where they are subject to a body of special rules to a large extent judicially elaborated, not by the ordinary courts, but by the Council of State and the administrative tribunals subordinate to it. Cf. GOODNOW, COMPARATIVE ADMINISTRATIVE LAW (1893) I, 86, 107; II, 217; WALINE, LA NOTION JUDICIAIRE DE L'EXCÈS DU POUVOIR (1926) 7–10, 76 *et seq.*; F. A. OGG, EUROPEAN GOVERNMENTS AND POLITICS (2nd ed. 1943) 572, 768. On the other hand, under the fisc theory, which prevails in Germany and the other countries following the German system, government contracts are treated like contracts concluded between private parties and are subject to the jurisdiction of the ordinary courts. The same treatment applies to torts committed by public officials in the course of their official duties. Cf. E. Borchard, *State Liability*, 14 ENCYC. SOC. SCI. 338, with bibliography; also 2 GOODNOW, *op. cit.* 240, 258–261; as to government contracts in England, see Wade and Phillips, *op. cit. supra* n. 8 at p. 309.

11. Following GAIUS IV. 103, 105, it has become customary to distinguish between *iudicium legitimum* and the *iudicia quae imperio continentur*. The former is the regular civil procedure in which the issue is defined before the praetor, formally stated in the *formula*, and then tried before and decided by the lay judge (*iudex*). The latter term covers a variety of special proceedings in which, as a common feature, the issue is not only formulated by the magistrate but also tried before and decided by him or, under his authority, by a substitute (*subrogatus*, surrogate). One of these procedures was the so-called bureaucratic *cognitio*, which applied to the litigation concerning the lands owned by the state as *ager publicus*. This procedure differed from the ordinary civil procedure not only through the absence of a *iudex*, but also through the fact that judgment could be rendered not only for money damages but also for specific performance. As Weber indicates, its significance has been commonly neglected in the literature on Roman law. For further information on the legal aspects of the bureaucratic *cognitio*, see WENGER, 28, 62 *et seq.*, 239, 250, 255 *et seq.*; as to its significance in connection with the *ager publicus*, see WEBER, RÖMISCHE AGRARGESCHICHTE (1891), 167 *et seq.*; *cf.* also MOMMSEN, 290.

12. On the role of magic in legal development, see G. Gurvitch, *Magic and Law* (1942), 9 SOCIAL RESEARCH 104, and same, ESSAIS DE SOCIOLOGIE (1939) 204. For a general account of the role of magic in primitive societies as regards

the criminal law and the peculiar nature of private or civil law, see MALINOWSKI, CRIME AND CUSTOM IN SAVAGE SOCIETY (1926) 50–59, 67–68, 98–99, 119–121. See also HOEBEL, LAW AND ORDER IN POLYNESIA (1934) and Malinowski's introduction thereto, especially pp. xvii–lxxii; LOWIE, PRIMITIVE RELIGION (1925); TYLOR, PRIMITIVE CULTURE (6th ed. 1920); RADCLIFFE-BROWN, THE ANDAMAN ISLANDERS (1922); WESTERMARCK, RITUAL AND BELIEF IN MOROCCO (1926). Usually regarded as the basic work is SIR JAMES FRAZER, THE GOLDEN BOUGH, vols. I and II; THE MAGIC ART (3rd ed. 1911, abridged ed. 1925). For a short introduction to the problem, see ROBSON, CIVILISATION AND THE GROWTH OF LAW (1935) 74 *et seq.*

13. See on all this in general: ENGELMANN AND MILLAR, 118, 129, 211, 652; R. DE LA GRASSERIE, THE EVOLUTION OF CIVIL LAW (1918) 609; DIAMOND 301, 307; LOWIE, PRIMITIVE SOCIETY (1920) 397, 425. See also as regards:

(a) Roman law: NOYES 201–207; A. HÄGERSTRÖM, DER RÖMISCHE OBLIGATIONSBEGRIFF (1927) 600; KASER 308–316, 322–336.
(b) Greek law: P. Vinogradoff, *Greek Law*, in COLLECTED PAPERS, vol. 2 (JURISPRUDENCE, 1928) 43, 44.
(c) Oriental law: Articles "law" in 9 ENCYC. SOC. SCI. (1933) and literature there cited, especially the articles by Seidl on Egyptian Law, p. 109; Koschaker on Cuneiform Law, p. 211; and Gulak on Jewish Law, p. 219.
(d) Slavic law: L. J. STRACHOVSKY, A HANDBOOK OF SLAVIC STUDIES (1949); R. DARESTE, ÉTUDES D'HISTOIRE DU DROIT (1889) 198–222 (L'ANCIEN DROIT SLAVE).
(e) Germanic law: AMIRA 280–282; 2 BRUNNER, RECHTSGESCHICHTE 328.

In English law the distinction between tort and contract developed at a rather late stage. Cf. MAITLAND, FORMS 8, 48, 53 *et seq.*; HOLDSWORTH, II, 43 *et seq.*, III, 375 *et seq.*, 412 *et seq.*; PLUCKNETT.

14. The reference is to Chinese law as it existed before the reforms following the revolution of 1912; see J. H. WIGMORE, WORLD'S LEGAL SYSTEMS (1928) 141; W. S. H. HUNG, OUTLINES OF MODERN CHINESE LAW (1934) 5, 249; ALABASTER.

15. On the *actio de pauperie* and *noxae datio* see SOHM 280, 331 (*actio de pauperie*); and 191, 194, 280, 331 (*noxae datio*); WENGER 153, where further literature is cited.

16. See *infra*, sec. *iii*:6, under (c).

17. As to Rome, see WENGER 8 *et seq.*; as to Germanic law, see HUEBNER, 427, 477, 478. Cf. also the source materials collected in SONE AND SIMPSON, LAW AND SOCIETY (1948) 132 *et seq.*, 284 *et seq.*

18. *Honoratiores* (Lat. "those of higher honor"). In German the word *Honoratioren* is used, often with a slight implication of friendly ridicule, to mean the more respectable citizens of a town. In the present context Weber means by "legal *honoratiores*" (*Rechtshonoratioren*), those classes of persons who have (1) in some way made the occupation with legal problems a kind of specialized expert knowledge, and (2) enjoy among their group such a prestige that they are able to impress some peculiar characteristics upon the legal system of their respective societies. The context makes it clear, however, that persons of this kind can be *honoratiores* even though they receive a more than nominal remuneration for their activities. As to the role of legal *honoratiores* in general, see *infra*, sec. *iv*.

19. As to the Roman rule that *omnis condemnatio est pecuniaria*, see WENGER 143 *et seq.*

20. Cf. ENGELMANN AND MILLAR 166–168; also, M. Esmein, *L'origine et la logique de la jurisprudence en matière d'astreintes* (1903), 2 REVUE TRIMESTRIELLE DE DROIT CIVIL 5.

21. Here Weber seems to be mistaken. What he may have had in mind are the fictions resorted to in the action of ejectment; cf. MAITLAND, FORMS. For the doctrine of specific performance in English law, see MAITLAND, EQUITY (1936) 301–317; H. HAZELTINE, *Early History of Specific Performance of Contract in English Law* (FESTGABE FÜR KOHLER, 1913) 68–69.

22. *Infra*, sec. *ii*:2, point 4.

23. This statement is too broad. It applies to the action of assumpsit, but not to the actions of covenant, debt, and detinue.

24. See Goudy, *Two Ancient Brocards*, in P. VINOGRADOFF, ESSAYS OF LEGAL HISTORY (1913) 216–227; HOLDSWORTH, III, 576 *et seq.*

25. Cf. *infra*, sec. *ii*:6.

26. Weber cites here the ancient German maxim of *Hand muss Hand wahren* ("hand must warrant hand"). It means that where a bailee has transferred the chattel to a third party, the bailor has an action only against the bailee. See HUEBNER, 407, 421, 448; 2 BRUNNER, RECHTSGESCHICHTE 512; (1928), 668; HOLMES, COMMON LAW (1951), 164; 2 POLLOCK AND MAITLAND (1899) 155. As to the alleged indispensability for modern business of the protection of bona fide purchasers far beyond the modest scope of protection existing in American law, see 3 MOTIVE ZU DEM ENTWURFE EINES BÜRGERLICHEN GESETZBUCHES FÜR DAS DEUTSCHE REICH (1888) 344.

27. The action which Weber means here is, as indicated by his reference to the *rei vindicatio*, that action which has been developed in all more elaborate systems and which is now constituted in American law by the action of replevin. It is the remedy by which the owner as such, and without reference to any contract or tort, can obtain restitution of a chattel to which he has the title, but which he finds in the hands of another person to whom he has not given a special permission or right to hold or to use it.

28. As to the Roman *rei vindicatio*, see WENGER 127; SOHM 189, 248, 269; BUCKLAND, MANUAL 139–142; JOLOWICZ 142–144.

29. Cf. MAITLAND, FORMS, 22 *et seq.*; POLLOCK AND MAITLAND, 107, 137, 146–148, 166; HOLDSWORTH, III, 318 *et seq.*

30. Cf. Jolly, *Recht und Sitte*, in BÜHLERS, GRUNDRISS DER INDO-ARISCHEN PHILOLOGIE (1896) 8.

31. On the history of market overt in English law see HOLDSWORTH V, 98, 105, 110–111.

32. See 1 MILL AND WILSON, HISTORY OF BRITISH INDIA (1858) 160.

33. Lat.—literally: "You are holding by bad order," i.e., "unlawfully."

34. *Diadikasia* is a dispute between two claimants aiming at a judicial declaration as to who is "really" the holder of the title. It is thus not an action for damages brought by an alleged title holder against an alleged wrongdoer. Cf. MEIER UND SCHOEMANN, DER ATTISCHE PROCESS (1824) 367; 2 BONNER AND SMITH 79, 101.

35. These, as Weber adds, "are of a totally different structure." As to these actions, see AMIRA 192–199, 266; GIERKE, GENOSSENSCHAFTSRECHT II, 268–325; R. Sohm, *Fränkisches Recht und römisches Recht* (1880), 1 SAV. Z. GERM. 27.

36. See also WEBER'S GENERAL ECONOMIC HISTORY (1950), c. I. [WIRTSCHAFTSGESCHICHTE (1923) 17, 19] and literature there cited.

37. For the military punishment imposed by the Roman *comitia centuriata*

see MAINE 374–382; LOWIE, ORIGIN OF THE STATE (1927) 102–108; and the same author's PRIMITIVE SOCIETY (1920) 385, 394–396.

38. An official of equal or higher power (*par maiorve potestas*) could, through his "stepping in" (*intercessio*), stop the activities of other officials; cf. MOMMSEN 22; L. HOMO, ROMAN POLITICAL INSTITUTIONS (1929) 29, 45, 221–223; JOLOWICZ II, 43, 45, 47, 337.

ii

Forms of Creation of Rights

1. *Logical Categories of "Legal Propositions"—Liberties and Powers—Freedom of Contract*

The fusion of all those organizations which had respectively engendered their own bodies of law into the *one* compulsory association of the state, now claiming to be the sole source of all "legitimate" law, is characteristically reflected in the formal mode in which the law serves the interests, especially the economic interests, of the parties concerned. We have previously defined the existence of a right as being no more than an increase of the probability that a certain expectation of the one

to whom the law grants the right will not be disappointed. We shall continue to consider the creation of a right as the normal method of increasing such probability, but we must recognize that, in a sociological analysis, there is but a gradual transition from this normal case to the situation where the legally secured interest of a party is but the "reflex" of a "regulation" and where the party does not possess a "right" in the strict sense.[1]

To the person who finds himself actually in possession of the power to control an object or a person the legal guaranty gives a specific certainty of the durability of such power. To the person to whom something has been promised the legal guaranty gives a higher degree of certainty that the promise will be kept. These are indeed the most elementary relationships between law and economic life. But they are not the only possible ones. Law can also function in such a manner that, in sociological terms, the prevailing norms controlling the operation of the coercive apparatus have such a structure as to induce, in their turn, the emergence of certain economic relations which may be either a certain order of economic control or a certain agreement based on economic expectations. This occurs when law is expressly created for a particular purpose. Such a situation presupposes, of course, a specific stage of legal development about which it will be appropriate to make some observations.

From the juridical point of view, modern law consists of "legal propositions," i.e., abstract norms the content of which asserts that a certain factual situation is to have certain legal consequences. The most usual classification of legal propositions distinguishes, as in the case of all norms, between prescriptive, prohibitory, and permissive ones; they respectively give rise to the rights of individuals to prescribe, or prohibit, or allow, an action vis-à-vis another person.[2] Sociologically, such legally guaranteed and limited power over the action of others corresponds to the expectation that other persons will either engage in, or refrain from, certain conduct or that one may himself engage, or fail to engage, in certain conduct without interference from a third party. The first two expectations constitute claims, the latter constitutes a privilege.[3] Every right is thus a source of power of which even a hitherto entirely powerless person may become possessed. In this way he becomes the source of completely novel situations within the community. Nevertheless, we are not at present concerned with this phenomenon, but rather wish to deal with the qualitative effect of legal propositions of a *certain* type inasmuch as they expand an individual right-holder's power of control. This type with which we shall deal is constituted by the third kind of legally guaranteed expectations previously mentioned, i.e., the

privileges. In the development of the present economic order they are of particularly great importance. Privileges are of two main kinds: The *first* is constituted by the so-called freedoms, i.e., situations of simple protection against certain types of interference by third parties, especially state officials, within the sphere of legally permitted conduct; instances are freedom of movement, freedom of conscience or freedom of disposition over property. The *second* type of privilege is that which grants to an individual *autonomy* to *regulate* his *relations with others* by his own transactions. Freedom of contract, for example, exists exactly to the extent to which such autonomy is recognized by the legal order. There exists, of course, an intimate connection between the expansion of the market and the expanding measure of contractual freedom or, in other words, the scope of arrangements which are guaranteed as valid by the legal order or, in again different terms, the relative significance within the total legal order of those rules which authorize such transactional dispositions. In an economy where self-sufficiency prevails and exchange is lacking, the function of the law will naturally be otherwise: it will mainly define and delimit a person's non-economic relations and privileges with regard to other persons in accordance, not with economic considerations, but with the person's origin, education, or social status.

2. *Development of Freedom of Contract—"Status Contracts" and "Purposive Contracts"—The Historical Origin of the Purposive Contracts*

1. "Freedom" in the legal sense means the possession of rights, actual and potential, which, however, in a marketless community naturally do not rest predominantly upon legal transactions but rather directly upon the prescriptive and prohibitory propositions of the law itself. Exchange, on the other hand, is, within the framework of a legal order, a "legal transaction," viz., the acquisition, the transfer, the relinquishment, or the fulfillment of a legal claim. With every extension of the market, these legal transactions become more numerous and more complex. However, in no legal order is freedom of contract unlimited in the sense that the law would place its guaranty of coercion at the disposal of all and every agreement regardless of its terms. A legal order can indeed be characterized by the agreements which it does or does not enforce. In this respect a decisive influence is exercised by diverse interest groups, which varies in accordance with differences in

the economic structure. In an increasingly expanding market, those who have market interests constitute the most important group. Their influence predominates in determining which legal transactions the law should regulate by means of power-granting norms.

That extensive contractual freedom which generally obtains today has, of course, not always existed; and even where freedom of contract did exist, it did not always prevail in the spheres in which it prevails today. Freedom of contract once existed indeed in spheres in which it is no longer prevalent or in which it is far less prevalent than it used to be. We shall survey the main stages of development in the following brief sketch.

In contrast to the older law, the most essential feature of modern substantive law, especially private law, is the greatly increased significance of legal *transactions*, particularly *contracts*, as a source of claims guaranteed by legal coercion. So very characteristic is this feature of private law that one can *a potiori* designate the contemporary type of society, to the extent that private law obtains, as a "contractual" one.

a. From the legal point of view, the juridico-economic position of the individual, i.e., the totality of his legitimately acquired rights and valid obligations, is determined on the one hand by *inheritance* based upon a legally recognized family relationship, and, on the other hand, by contracts concluded by him or for him in his name. The law of inheritance constitutes in contemporary society the most important survival of that mode of acquisition of legitimate rights which was once, especially in the economic sphere, the exclusive or almost exclusive one. In the case of inheritance the operative facts generally occur independently of the interested individual's own conduct. These facts constitute the starting-point for his further legally relevant activities; a person's membership in such a group as a given family is based upon natural relationship, which is socially and economically regarded as a special and intrinsic quality and is attributed to him by the law independently of his own acts of consociation.

Obviously the contrast is only relative, for claims of inheritance may also be based on contract;[4] and in testate succession the legal basis of acquisition is not the membership in the kinship circle but rather the unilateral disposition of the testator. However, contracts to devise or bequeath are infrequent nowadays. The normal and, in many systems of law, for example, the Austrian, the only possible case is that of the marriage settlement.[5] Mostly such a settlement is made before marriage in order simultaneously to regulate succession upon death and marital property rights *inter vivos*. In other words, the contract regulates the property incidents of a family relationship about to be created. As re-

gards wills, the great majority of them nowadays aim, in addition to munificence regarded as an obligation of decency, at the balancing of interests among family members in view of special economic needs created either by the peculiar nature of the assets of the estate or by peculiar circumstances of the persons concerned. Besides, at least outside of the area of Anglo-American law, freedom of testation is narrowly limited by the rights of certain near relatives to indefeasible portions.[6] The significance of the wider freedom of testation in certain ancient and modern systems of law and the greater significance of contractual family agreements in the past, as well as the causes of their decline, are discussed in another place.[7] At the present time, legal transactions with freely chosen content and freely concluded according to the free choice of the parties are of but limited importance in the sphere of family and inheritance law.

b. In *public law* the role of contractual transactions is, quantitatively at any rate, by no means slight. Every appointment of an official is made by contract and some important phenomena of constitutional government, especially the determinations of the budget, presuppose in substance, if not formally, a free agreement among a number of independent organs of the state, none of which can legally coerce the other. Yet, in the legal sense, the public official's legally fixed obligations are not regarded as flowing from a contract of appointment, as would happen in the case of a freely made contract of private law, but from his act of submission to the authority of the state as a public servant.[8] Similarly a freely arrived at agreement preceding the budget is not treated as a "contract"; nor is the agreement as such treated as a legally essential event. The reason is that, for good juristic reasons, "sovereignty" is accepted as the essential attribute of the modern state, conceived as a "unity," while the acts of its organs are looked upon as instances of the exercise of public duties. Thus, in the sphere of public law the domain of free contract is essentially found in international law. This conception, however, has historically not always been the prevailing one and it would not accurately describe political organizations in the past. Formerly the position of a public official was less based upon a free contract than it is today; indeed, as we shall see, it rested rather upon his entire submission to the personal, quasi-familial, authority of a lord.[9] But other political acts, for instance those intended to provide means for public purposes as well as many other administrative acts, were, under the conditions of the corporately organized political structure, nothing but contracts between the prince and the estates, who, as the owners of their powers and prerogatives, constituted the political community. Legally, their joint acts were looked upon in precisely this

manner.[10] The feudal bond, too, was in its innermost essence based upon contract, and the expression "*pactus*" was applied with all seriousness to such a collection of existing laws as the *leges barbarorum*, which at the present time we would call statutory codifications.[11] Real "innovations" in the law could at that time indeed by brought about only by freely made agreement between the official authorities and the whole community assembled in the "thing."

The last example we may give of the use of the contract concept is the primitive political associations which, at any rate as far as their legal form was concerned, were based on freely concluded agreements between autonomous groups, such as, e.g., the "houses" of the Iroquois.[12] The so-called "men's houses," too, were in the first place voluntary associations which were intended, however, to be of permanent duration, and differed in this respect from those earlier voluntary associations established for the purpose of adventure and entirely based upon free agreement.[13] The phenomenon of free agreement also appears at quite primitive levels in the field of *adjudication*. Indeed, it marks its very beginnings. The arbitration agreement which developed out of the agreement for composition between kinship groups, i.e., the voluntary submission to a verdict or an ordeal, is not only the source of all procedural law but also the point of departure to which even the oldest contracts of private law can, very broadly speaking, be traced.[14] Furthermore, most of the important technical advances of procedure have, at least formally, been products of voluntary agreement among the parties. Thus the intervention of the sovereign authorities, e.g., the Lord Chancellor or *praetor*, took the very characteristic form of compelling the parties to make certain agreements designed to facilitate the progress of the cause.[15] They therefore are but instances of the "compulsory contract" (*Rechtszwang zum Kontrahieren*); the compulsory feoffment, too, played a considerable role in the sphere of feudal, i.e., political, law.

2. The "contract," in the sense of a voluntary agreement constituting the legal foundation of claims and obligations, has thus been widely diffused even in the earliest periods and stages of legal history. What is more, it can also be found in spheres of law in which the significance of voluntary agreement has either disappeared altogether or has greatly diminished, i.e., in public law, procedural law, family law, and the law of decedents' estates. On the other hand, however, the farther we go back in legal history, the less significant becomes contract as a device of economic acquisition in fields other than the law of the family and inheritance. The situation is vastly different today. The present-day significance of contract is primarily the result of the high degree to which our economic system is market-oriented and of the role played

by money. The increased importance of the private law contract in general is thus the legal reflex of the market orientation of our society. But contracts propagated by the market society are completely different from those contracts which in the spheres of public and family law once played a greater role than they do today. In accordance with this fundamental transformation of the general character of the voluntary agreement we shall call the more primitive type "status contract" and that which is peculiar to the exchange or market economy "purposive contract" (*Zweck-Kontrakt*).

The distinction is based on the fact that all those primitive contracts by which political or other personal associations, permanent or temporary, or family relations are created involve a change in what may be called the total legal situation (the universal position) and the social status of the persons involved. To have this effect these contracts were originally either straightforward magical acts or at least acts having a magical significance. For a long time their symbolism retained traces of that character, and the majority of these contracts are "fraternization contracts." By means of such a contract a person was to become somebody's child, father, wife, brother, master, slave, kin, comrade-in-arms, protector, client, follower, vassal, subject, friend, or, quite generally, comrade (*Genosse*). To "fraternize" with another person did not, however, mean that a certain performance of the contract, contributing to the attainment of some specific object, was reciprocally guaranteed or expected. Nor did it mean merely that the making of a promise to another would, as we might put it, have ushered in a new orientation in the relationship between the parties. The contract rather meant that the person would "become" something different in quality (or status) from the quality he possessed before. For unless a person voluntarily assumed that new quality, his future conduct in his new role could hardly be believed to be possible at all. Each party must thus make a new "soul" enter his body. At a rather late stage the symbolism required the mixing and imbibing of blood or spittle or the creation of a new soul by some animistic process or by some other magical rite.[14]

One whose thinking is embedded in magic cannot imagine any other than a magical guaranty for the parties to conform, in their total behavior, to the intention of the "fraternization" they contracted. But as the notion of the divinity gradually replaces animism, it is found necessary to place each party under the dominion of a supernatural power, which power constitutes not only their collective protection but also jointly and severally threatens them in case of antifraternal conduct. The *oath*, which originally appears as a person's conditional self-surrender to evil magical forces, subsequently assumes the character of a conditional self-

curse, calling for the divine wrath to strike.[17] Thus the oath remains even in later times one of the most universal forms of all fraternization pacts. But its use is not so limited.

3. In contrast to the true magical forms of fraternization, the oath is also technically suited to serve as a guaranty for "purposive" contracts, i.e., contracts neither affecting the status of the parties nor giving rise to new qualities of comradeship but aiming solely, as, for instance, barter, at some specific (especially economic) performance or result. This type of contract, however, does not appear in the most primitive society. In earliest times, *barter*, the archetype of all merely instrumental contracts, would seem to have been a general phenomenon among the comrades of an economic or political community only in the noneconomic sphere, particularly as barter of women between exogamous sibs whose members seem to confront each other in the strange dual role of being partly comrades and partly strangers. In the state of exogamy barter appears also as an act of fraternization; however much the women may be regarded as a mere object, there will rarely be missing the concurrent idea of a change of status to be brought about by magical means.[18] The peculiar duality in the relations between the exogamously cartelized sibs, created by the rise of regulated exogamy, may perhaps help to explain a much discussed phenomenon, namely, the phenomenon that certain formalities were sometimes required for the marriage with secondary wives while the marriage with the chief wife might be entered into without any formalities. It may be that the latter remained formless because it was the original and pre-exogamous type of marriage, and barter in pre-exogamous times did not yet have anything to do with fraternization. It is more plausible, however, that fixed contractual formalities were necessitated by the need for special arrangements regarding the economic security of the secondary wives who lacked the generally fixed economic status of the chief wife.

Economic barter was always confined to transactions with persons who were not members of one's own "house," especially with outsiders in the sense of non-kinsmen, non-"brothers"; in short, non-comrades. For precisely this reason barter also lacked in the form of "silent" trade any trace of magical formalism. Only gradually did it acquire religious protection through the law of the market. Such protection, however, would not arise as a set of settled forms until a belief in gods had taken its place alongside those magical conceptions which had provided appropriate means of direct guaranty only for status contracts.[19] Occasionally it would also happen that a barter transaction might be placed under the guaranty of the status-contract through some special act of fraternization or some equivalent. This would not generally happen, however,

unless land were involved. Normally, barter enjoyed practically no guaranty, and the conception was nonexistent that barter could mean the assumption of an "obligation" which would not be the product of a natural or artificial all-inclusive fraternal relationship. As a result, barter at first took effect exclusively as a set of two simultaneous and reciprocal acts of immediate delivery of possession. Possession, however, is protected by the claim for vengeance on, and expiation by, the thief. Thus, the kind of "legal protection" accorded to barter was not the protection of an obligation, but of possession. Where, at a later time, the obligation of warranty of title came to develop at all, it was protected only indirectly in the form of an action for theft against the seller who lacked title.[20]

Formal legal construction of barter does not begin until certain goods, especially metals, have acquired a monetary function, i.e., where sale has arisen. This development does not depend upon the existence of chartal or even state money,[21] but, as shown especially in Roman law, on mere pensatory means of payment. The transactions *per aes et libram* constitute one of the two original forms of legal transaction in ancient Roman *ius civile*. Under Roman city law this form of cash purchase acquired an almost universal function for the most diverse classes of private legal transactions, regardless of whether they involved questions of family or inheritance law or of exchange proper.[22] The agreements of fraternization as well as other forms of status contract were oriented toward the total social status of the individual and his integration into an association comprehending his total personality. This form of contract with its all-inclusive rights and duties and the special attitudinal qualities based thereon thus appears in contrast to the money contract, which, as a specific, quantitatively delimited, qualityless, abstract, and usually economically conditioned agreement, represents the archetype of the purposive contract.[23] As a non-ethical purposive contract the money contract was the appropriate means for the elimination of the magical and sacramental elements from legal transactions and for the secularization of the law. In Roman law, for example, the civil marriage form of *coemptio* thus came to confront the sacred marriage form of *confarreatio*.[24] The money contract was, it is true, not the only suitable means, but it was the most suitable. Indeed, as a specific cash transaction it was of a rather conservative nature since, originally at least, it was completely devoid of any promissory elements oriented towards the future. For the effect of this transaction, too, was solely to provide secure possession as well as a guaranty that the goods were properly acquired; however, at any rate originally, the transaction did not constitute a guaranty that the promises involved in it would be fulfilled.

4. The concept of obligation[25] through contract was entirely alien to primitive law; it knew but one form of obligation and claim, viz., that arising *ex delicto*. The amount of the claim of an injured party was rigorously fixed by the practice of composition and its attendant conventions. The *wergilt* debt as set by the judge was the most ancient true debt and all other forms of obligation have derived from it.[26] Conversely it can be said that only such actions were cognizable by the courts as arose from an obligation. As regards disputes between members of different kinship groups, no formal procedure existed for the restitution of chattels or the surrender of immovables. Every complaint was necessarily based upon the argument that the defendant had personally done the plaintiff a personal wrong which would have to be expiated. Hence there was no place for an action *ex contractu* or for the recovery of a chattel or a piece of land or for actions to determine personal status.

a. The problem of whether a person was properly a member of a household, a kinship group, or a political association could, as an internal affair, be decided solely by the group itself. But things underwent a change in this very respect. It was the basic norm of every type of brotherhood or loyalty-bound relationship that a brother should neither summon into court, nor bear witness against, his brother, nor kinsman against kinsman, nor guild brother against guild brother, nor patron against client, and vice versa, in the same way as there was no possibility of blood vengeance in any of these relationships. Vengeance for felony amongst them was a matter for the spirits or gods, the priestly power of excommunication, the master of the household, or the lynching procedures of the group. But when political association had come to constitute the military community, and when military duty and political rights had become intertwined with birth in legitimate wedlock, so that unfree persons or those born in inferior station were to have no military rights and thus no rights to share in booty, there had to be a legal procedure for the determination of a person's disputed status.

The emergence of actions concerning land was closely connected with this situation. Power over certain areas of usable land became, as scarcity increased, an increasingly important element in the life of every corporate body, both political associations and house communities. The right of full membership in the group provided a claim to a share in the land and, conversely, only the landholder was a full member of the group. Disputes between the groups about land thus always meant that the victorious group would receive the disputed land. As the individual appropriation of the land developed, the role of plaintiff devolved from the group to the individual member who would sue another, both plaintiff and defendant claiming the land by virtue of their right of member-

ship. In any such dispute concerning membership right in land the subject matter had of necessity to be found to belong to one party or the other, as it constituted the very basis of his entire political and social existence. Only one of the two could as a group member be legitimately entitled thereto, just as a person could only be a member or a non-member, a freeman or unfree. Especially in militarist associations, like the ancient *polis*, the litigation about the *fundus* or *kleros* had to assume the form of a bilateral dispute. Instead of one party's being charged by an allegedly injured person as a wrongdoer, who would then have to seek to establish his innocence, each of the parties had to claim to be in the right at the risk of being in default. Thus, where the dispute turned about a membership right as such, the pattern of the tort action was inapplicable. Nobody could steal a *fundus*, not just because of natural obstacles, but because one could not steal from a person his status as a member of the group. Hence, there developed for disputes about status or land, alongside the unilateral tort action, the bilateral action, such as the Hellenic *diadikasia*, or the Roman *vindicatio* with necessary cross-action of the defendant against the claim of the plaintiff.[27] In this litigation involving status, which included the conflict over a group member's right to his share in the land, we have to find the root of the distinction between rights *in rem* and rights *in personam*. This distinction was the product of a development and appeared only with the disintegration of the old personal groups, especially the decline of the strict dominion of the kinship group over property. One might locate it approximately at the developmental stage of the *Mark* association[28] and the "hide" system or a corresponding stage of property organization. Primitive legal thought was characterized not by the distinction between rights *in rem* and rights *in personam* but by two types of fundamental facts. The first was that an individual would say: By virtue of having been born or brought up in the house of *X*, by marriage, adoption, fraternization, military consociation, or initiation I am a member of the *Y* group and am entitled thereby to claim the use of the piece of property called *Z*. Or, secondly, one would say *X*, a member of Group *Y*, has committed against me, *A*, or my fellow group member, *B*, a wrong of the type of *C*, and for this reason he and his comrades owe expiation to us, the fellow members of *A*. (In Arabic legal parlance one does not say: "the blood of *A* has been shed," but "*our* blood has been shed.") With the increasing individual appropriation of property the former configuration developed into the claim of a right *in rem* against everyone, especially actions of the type of the *hereditatis petitio*[29] and the *rei vindicatio*. The latter fact-situation developed into the right *in personam* against a particular person, viz., that one is held to be bound to perform

a certain duty toward the obligee; and the duty exists only toward the obligee. The clarity of the original situation and the directness of the line of development are blurred by the dualism of legal relations within the kinship group and between different kinship groups. Among kinship members, we have seen, there could be neither vengeance nor litigation but only arbitration by the group elders; against those who resisted, only the sanction of boycott or ostracism could be applied. All the magical formalities of procedure were lacking; arbitration of disputes within the kinship group was an administrative matter. Legal procedure and law in the sense of claims guaranteed by judicial decision and the coercive power attached thereto existed only between those different kinship groups and their members who belonged to the same political community.

When the kinship group disintegrated and gave place to a combination of house communities, neighborhood bodies, and the political association, the question arose as to how far the legal procedure of the political association would intrude into the relations among members of the same kinship group or even the same community. To the extent that this was the case, individual claims to land also became the object of litigation before the judge even between group members, at first, in the above-mentioned form of the bilateral vindication. On the other hand, the political power could assume patriarchal form, and the method of dispute settlement would then more or less generally become a case of "administration," a procedure formerly applicable only to internal disputes. Then this type could also influence the characteristics of the legal procedure of the political association. As a result, the clearcut classification of the old as well as the newer conception of the distinction between the two categories of claims was blurred. The technical form of the distinction shall not concern us here, however. We shall rather return to the question of how the personal responsibility for delicts produced the contractual obligation, and how the delictual fault as a cause of action gave rise to the obligation *ex contractu*. The connecting link consisted in the liability for composition as determined by, or acknowledged in, the legal procedure.

h. One of the earliest type situations in which the acknowledgment of an *obligation* from a purposive contract had to become an economic need is the debt arising out of a *loan*. It is in this very situation, moreover, that we can perceive the gradualness of the process of emancipation from the original stage of exclusive liability of the debtor's person. The loan originally was an interest-free form of emergency aid among brothers, as we have seen. Hence it could not be actionable, as no action at all would be admissible among brothers, i.e., between members of a

kinship group or a guild, or as between patron and client, or within any other type of relationship of personal loyalty. A loan made to someone outside the fraternal group, if it occurred at all, was in itself not legally subject to the prohibition of taking interest. But within the scheme of personal liability it was at first not actionable. As means of enforcement the disappointed creditor had only available to him magical procedures, sometimes of a rather grotesque character, remnants of which have survived for long periods. In China the creditor would threaten suicide and sometimes even commit it in the expectation of pursuing his debtor after death.[30] In India the creditor would seat himself in front of the debtor's house and there either starve or hang himself; in this way he could compel his sib to revenge him against the debtor; and where the creditor was a Brahmin, the debtor, as the murderer of a Brahmin, would even become subject to the intervention of the judge.[31] In Rome, the *improbitas* of the XII Tables and the later *infamia*, incurred in cases of severe breaches of the *fides*, were probably survivals of the social boycott which had served as a substitute for the lacking actionability in case of disrespect for the rules of good faith and fair dealing.

c. The development of a unified law of obligations was certainly derived from the action of tort. The delictual liability of the entire kinship group was, for instance, the source of the widespread joint liability of all kin or house community members for the performance of the contract made by one of them.[32] However, the development of the various actionable contracts largely proceeded along its own ways. The entry of money into economic life often played the decisive role. Both primitive forms of contract in Roman *ius civile*, viz., *nexum*, the debt contracted *per aes et libram*, and *stipulatio*, the debt contracted by symbolic pledge,[33] were money contracts. This fact, which is clear for the *nexum*, seems also to be certain for the *stipulatio*. As to both, the connections with the precontractual stage are clear. They were rigorously formal oral transactions and they required that the necessary acts be performed by the parties themselves. Both have the same origin. As to the *stipulatio* we may agree with Mitteis[33a] who, on the basis of analogies in Germanic law, regards it as having originated in procedure, outside of which it originally played only a very modest role, essentially in connection with agreements on such collateral terms as interest and similar matters. In addition to barter, the composition agreement, which formed the basis of the trial, also constituted a step on the way to the purposive contract in the sense that, being a contract among enemies rather than one of fraternization, it required a precise formulation of the issue and, quite particularly, of the point or points to be proved. As the trial formalities became more and more fixed, increasingly numerous occasions

occurred for incidental transactions creating contractual obligations. The giving of security by one party to the other is one of the most important of these transactions. In many legal systems the very procedure which was intended to eliminate self-help had to be initiated by some act of self-help. The plaintiff would drag the defendant into court and would not release him unless he received security that the defendant, if found guilty, would not evade the payment of the composition. Such self-help was always directed against the body of the adversary, as the action was based upon the allegation that a felony had been committed by the defendant against the plaintiff, for which the defendant had to answer with his person, rather than on a complaint that the defendant's conduct constituted an objective wrong. The security which the defendant had to give in order to remain unmolested until the time of judgment was provided through sureties or by way of pledge.[34]

It is thus in the course of procedure that these two legal institutions appear for the first time as compulsorily enforceable transactions. Later on, in the place of a third party surety, the defendant himself was allowed to warrant the fulfillment of the judgment. The legal view was that the defendant was his own surety, just as the oldest juridical form of the free labor contract was everywhere the sale of oneself into temporary slavery taking the place of the formerly normal sale by father or master. The most ancient contractual obligations consisted in the transposition of certain procedural arrangements into the common legal life. In Germanic law the giving of a pledge or a hostage was the most ancient means of contracting debts, not only economically but also as far as legal formalities are concerned. However, suretyship, from which the pledging of oneself was derived in both Roman and German law, was in the latter undoubtedly connected in legal thought with the solidary personal liability of the members of the kinship group and the house community. The second form of security for future obligation, i.e., the pledge, was both in Roman and in Germanic law[35] at first either taken as a distress or given to avoid the personal liability of being sued and taken in execution; hence it was not, as it is today, a security for a claim existing separately. The giving of the pledge rather constituted a transfer of possession of goods which, as long as the debt remained unpaid, were to be in the creditor's possession lawfully, while upon timely payment of the debt his possession was to become unlawful and thus to constitute a wrong towards the former debtor. It thus easily fitted in with the usual pattern of the most ancient causes of action, viz., actual injury to the person or to his possessions. The very widespread legal transaction of the conditional self-sale into slavery for debt also attached itself in part directly to the possible modes of execution and partly to

the giving of a hostage, which, as we have seen, was also connected with procedure. The body of the debtor was to constitute the creditor's pledge and was to be forfeited into his lawful possession if the debt was not properly paid. Originally the liability for contracted debt, like liability for vengeance and composition, from which it derived, was not a personal liability with one's assets but a liability of the debtor's physical body and of it alone. Originally there was no execution upon the debtor's assets at all. In the event of nonpayment, the creditor's only resort was execution upon the person, whom he could kill or imprison as a hostage or hold as a bond-servant or sell as a slave; where there were several creditors, they could, as the Twelve Tables show, cut him into pieces.[36] The creditor could also establish himself in the home of the debtor, and the latter would have to serve and provide for him (*Einleger*);[37] hut this already marks the transition to liability of the debtor's assets. Yet, the transition proceeded but slowly, and liability of the person for nonpayment of debt disappeared in Rome only in the course of the status conflicts,[38] while in Germany it did not disappear until the nineteenth century.[39] The most ancient purely obligatory contracts, i.e., *nexum* and *stipulatio*, and, among the Germans, *vadiatio*,[40] obviously signified the voluntary submission to a [conditional liability of the person as security for the] delivery of goods promised for the future.[41] Immediate liability of the person was thus avoided. But if the promise remained unfulfilled, the only recourse possible was again that of resorting to the debtor's person.

Originally all contracts were contracts relating to a change in the possession of goods. Hence, all those legal transactions which really represented old forms of contractual liability, especially those particularly rigid and formal ones which were universally required for the creation of a money debt, were symbolically connected with the legal forms of transfer of possession.[42] Some of these symbolic forms undoubtedly rested upon magical conceptions. Of permanent influence, however, was the fact that legal thought did not at first recognize as relevant any such intangible phenomena as simple promises but was interested only in wrong, i.e., a misdeed against the gods or a violation of life or limb or visible possession. A contract, to be legally relevant, had thus to contain a disposition over tangible goods, or had at least to be susceptible of such an interpretation.[43] If this was the case, it could, in the course of development, come to incorporate the most diverse contents. A transaction, on the other hand, which could not be formulated in this way could not become legally effective except as a transaction against cash or, at least, against the deposit of a part payment which would preclude a change of mind on the part of the promisor. Thus arose the principle which is basic in many legal systems, namely, that only purposive contracts in-

volving payments can be binding. This attitude was so effective that even at the end of the Middle Ages the English doctrine of "consideration" was derived from it: where a consideration, even though it be only a nominal one, was actually paid the contract could assume any content which was not legally frowned upon; it would be valid even where, without that fact, there would be no legal pigeonhole into which it would fit. The provision in the Twelve Tables on *mancipatio*, the meaning of which has been much disputed,[44] probably constituted a more primitive method of sanctioning a kind of freedom of disposition; while its possibilities of development were more limited, the underlying formal concept was essentially similar.

In addition to the patterns developed from the formalistic monetary transactions on the one hand, and procedural suretyship on the other, the law has evolved a third possibility for making purposive contracts legally enforceable: the artificial creation of new contractual actions out of actions *ex delicto*. This method was resorted to even in a legal system so highly developed technically as the English of the late Middle Ages. The economic rationalization of the law favored the rise of the conception that the liability for composition was not so much, as it had been conceived originally, a buying off of vengeance but rather a compensation for the harm suffered. Thus nonperformance of a contract could now be characterized as a harm requiring compensation. Since the thirteenth century the lawyers and judges of the royal courts of England declared in an ever increasing number of contractual situations that nonperformance constituted a "trespass" and thus provided legal protection, especially by means of the *writ of assumpsit*,[45] just as in a technically quite different manner the praetorian practice of the Romans extended the sphere of legal protection first through the extensive application of delictual actions and then through the concept of *dolus*.[46]

3. *Institutions Auxiliary to Actionable Contract: Agency; Assignment; Negotiable Instruments*

Even after the creation of actionable contractual claims capable of assuming any content we are still far from that legal state of affairs which is required by advanced and completely commercial social intercourse.

Every rational business organization needs the possibility of acquiring contractual rights and of assuming obligations through temporary or permanent agents. Advanced trade, moreover, needs not only the possibility of transferring legal claims but also, and quite particularly, a method by which transfers can be made legally secure and which elimi-

nates the need of constantly testing the title of the transferor. The development of those legal institutions, indispensable for a modern capitalistic society, will be discussed elsewhere.[47] In the present connection we shall do no more than briefly touch upon the developments of early times. In contrast to Greek law, where direct representation was well known in the creation of obligations, "agency" was almost impossible in Roman law.[48] It seems that this legal situation, which was related to the formalism of the civil actions, made possible the use of slaves in those really capitalistic enterprises for which representation was widely acknowledged in practice. Again, as a result of the highly personal character of the debt-relationship, assignment of choses in action was unknown in both ancient Roman and Germanic law.[49] At a rather late time Roman law created a substitute by means of indirect representation and also ultimately arrived at a law of assignment, the utility of which for business transactions was impaired, however, by the substantive ethical tendencies of the later Imperial legislation.[50] As a matter of fact, up to the beginning of modern times, no strong practical demand existed for the assignability of choses in action, except for those which were the subject matter of regular trade or which directly served the purpose of transferring claims to third parties. To meet these needs commercialization was achieved through instruments payable to the order of the payee or to the bearer, which served for the transfer both of claims, especially monetary claims, and of powers of disposition over commercial goods and membership rights in commercial enterprises. They had been utterly unknown in Roman law, and it is still uncertain whether, as Goldschmidt believed, the Hellenistic, or, as Kohler thinks, the Babylonian instruments which go back as far as Hammurabi and were payable to the bearer, were really genuine negotiable instruments.[51] At any rate, however, they facilitated payment to and through third parties in a way which was possible only indirectly under official Roman law. True right-creative instruments are completely unknown to Roman law, unless one considers as such the *contractus literalis*, i.e., the book entry by a banker.[52] In Hellenistic and late Roman law the use of instruments in writing, which had been so highly developed in the Orient even in the most ancient times, was developed into the compulsory documentation of certain transactions and the use of certain quasi-negotiable instruments, perhaps through the state's insistence upon recordation, which at first had been meant essentially to serve fiscal purposes.[53] In the Hellenic and Hellenistic cities the technique of documentation was carried on, for the sake of publicity, by two officials who had been unknown to the Romans, viz., the courts' remembrancer and the notary.[54] The institution of the notary was taken over from the Eastern part of the Empire by the West. But in the Occident the late Roman practice of using instru-

ments in writing was not really promoted before the seventh century and in connection with post-Roman practices, possibly through the strong influx of Oriental, especially Syrian, traders. Then, however, the instrument in writing, both as the instrument payable to the order of the payee and to the bearer, developed very rapidly,[56] a fact which is surprising in a period whose intensity of commerce we have to visualize as extremely limited in comparison to classical Antiquity. As has been the case so often, the particular legal techniques adopted seem also in this connection to have followed their own paths. Probably the decisive factor was that, after the disappearance of legal unity, developments were determined by the centers of commerce and their merely technically trained notaries and that the notariat constituted the only remaining bearer of the commercial traditions of Antiquity and thus was the only creative force. However, with respect to the very use of instruments, the development was favored also by the irrational modes of thought of Germanic law. In popular ideas the instrument appeared as a sort of fetish, by the formal delivery of which, at first made before witnesses, specific legal effects were produced, just as by other, originally quasi-magical symbols such as the throwing of the spear or the *festuka* of Germanic, or the corresponding *bukannu* of Babylonian law.[56a] Originally one did not deliver, as the symbol, the instrument with the writing upon it but the parchment without writing, and only afterwards was the record entered upon it.[57] But while in Italian law, owing to the concomitance of German legal symbolism and the practices of the notaries, the development of documentary evidence was greatly favored even in the early Middle Ages,[58] it remained unknown for a long time in English law, where the decisive legally constitutive role was played by the seal.[59] The development of the types of commercial paper characteristic of modern commerce took place in the Middle Ages to a large extent, however, under Arabic influence, as a result of partly administrative and partly commercial needs.[60] Ancient Roman commerce apparently could and had to get along without these technical devices, which today seem to us to be indispensable.

4. *Limitations of Freedom of Contract*

1. IN GENERAL. Today it is fundamentally established that any content whatsoever of a contract, in so far as it is not excluded by limitations on the freedom of contract, creates law among the parties and that particular forms are necessary only to the extent that they are prescribed for reasons of expediency, especially for the sake of the unambiguous demonstrability of rights, and thus of legal security. This stage was

reached only quite late: in Rome, by means of the gradual internationalization of the law and in modern times under the influence of the Civil Law doctrine and the needs of trade. Yet, despite this generally existing freedom of contract, modern legislation does not content itself with the general rule that parties to a contract may agree to whatever they please, provided they do not violate certain specially established restrictions. Instead, it rather regulates various types of agreements by certain special rules of *ius dispositivum*, i.e., rules which are to be operative only where the parties have not provided otherwise.[61] However, this phenomenon is, in general, due to considerations of mere expediency. As a rule, the parties do not think of really taking care of all the possibly relevant points, and it is also convenient to be able to stick to tried and well-known types. Without these, modern commercial intercourse would scarcely be possible. But the significance of the enabling norms and of freedom of contract are by no means exhausted in this respect. They can have an even more fundamental significance.

In certain situations the normative control through enabling rules necessarily extends beyond the task of the mere delimitation of the range of the parties' individual spheres of freedom. As a general rule, the permitted legal transactions include a power of the parties to the transaction to affect even third parties. In some sense and to some degree almost every legal transaction between two persons, inasmuch as it modifies the mode of the distribution of disposition over legally guaranteed powers of control, affects relations with an indeterminately large body of outsiders. This effect takes place in many different ways. To the extent that, from a purely formalistic point of view, the agreement creates claims and obligations only between the immediate parties, no external effects at all seem to result, as in that case nothing appears legally guaranteed except the prospect that the promise will be fulfilled. Again, to the extent that the transaction only concerns legal transfer of possession from one hand to another, as is usually the case, the interest of third parties seems to be hardly affected. The goods remain as inaccessible to them as they were before and all they have to do is to recognize a new person as the proprietor. In truth, however, this lack of effect on third parties' interests is never more than relative. The interests of every creditor of a person contracting a debt are affected by the latter's increased liabilities, and the interests of the neighbors are affected by every sale of land, for instance, through the changes in its use which the new owner may, or may not, be economically able to introduce. These are empirically possible repercussions of rights that are generally admitted and guaranteed by law. These repercussions are by no means always ignored by a legal system; for an illustration we may refer to the prohibition of the assign-

ment of claims to "a more powerful creditor" as existed in late Roman law.[62]

There are, moreover, cases in which the interests of third parties can be affected in still another way through the utilization of freedom of contract. When, for example, someone sells himself into slavery, or a woman through contracting marriage, submits to the marital power of her husband, or when a parcel of land is subjected to a family settlement (*fidei commissum*), or when a corporation is formed by a number of individuals, interests of third persons are thereby affected in a way which is qualitatively different from that in which they are affected in the cases stated earlier, although the actual degree of affectedness may be quantitatively lesser and its actual manner may greatly vary from case to case. In the second group of cases there is created for the benefit of the contracting parties an entirely new *special law* which binds every third person's claims and expectations to the extent to which legal validity and coercive guaranty are ascribed to the arrangements of the contracting parties. This situation is thus different from the former, since the rules of the new special law take the place of the hitherto prevailing general rules—e.g., on matters such as the validity of agreements, or a creditor's power to seize assets of property. The entirely new rules of a special law now apply not only to all new but often also to the already existing contracts of the person who has become a slave, a married woman, or an estate owner under a family entailment, and, in the case of the persons who have become stockholders of a corporation, a new special law applies to at least some of their contracts. The peculiar technique of juridical expression may frequently obscure the meaning of the situation and the way in which the interests of third parties are affected by it. A corporation, for example, must legally possess a certain declared capital, which may be reduced, under certain precautions, by a decision of a stockholders' meeting. In practice this means that the persons who have combined to form a corporation are compelled by the law to declare a certain surplus of the common property in goods and claims over and above the "debts" to be permanently available for creditors and members acquiring stock at a later date. When they compute the profits annually to be distributed, the managers and members of the corporation are bound to this declaration by the threat of criminal prosecution for the infringement of the rule which provides that no profits may be distributed unless the fund, which has been declared as "capital," remains covered by the value of tangible goods or claims computed under the rules of proper evaluation and accounting. Provided that certain precautions are observed, the members of the corporation are allowed, however, to withdraw their declaration and thus to reduce

the corresponding guaranty for the creditors and later stockholders. In other words, they may henceforth distribute profits despite the fact that the originally declared amount is not covered. It is obvious that the possibility of creating a corporation as it is provided by such enabling special rules of law affects the interests of third parties who are not at the moment members of the corporation, viz., creditors and later purchasers of stock. The same is true of the significance for third parties of the limitations of contractual freedom which arise from a person's voluntary entry into slavery, or of the creation of the mortgage in favor of the wife on all the assets of the husband as it arises under several legal systems where, upon marriage, the wife becomes a mortgagee even with priority over older mortgages.[63] It is clear that this mode of influencing the legal situation of third parties, which deviates from the otherwise valid legal rules, goes beyond those "repercussions" which can arise outside the circle of the immediate participants from almost any legal transaction. We shall not discuss here the various transitional stages by which these two classes of phenomena are connected with one another. In the sense in which we discuss it now, "freedom of contract" means the power to participate effectively in such legal transactions as extend beyond the immediate circle of the participants not only by indirect repercussions but by the creation of special law. Even where this power is subject to some restrictions protecting interests of third parties, it means more than the mere concession of a "right of freedom" in the sense of a simple empowerment to perform, or to abstain from the performance of, certain concrete acts.

On the other hand, the law can refuse legal validity to agreements which do not appear at all directly to affect the interests of outsiders, or which at least do not involve any sort of special law apart from the generally valid law, and which even seem to confer upon third parties advantages rather than harm. The reasons for such *limitations of contractual freedom* may be very diverse. Thus classical Roman law did not admit the creation of a corporation or resort to any other device which would amount to affecting the interests of third parties through the establishment of special law, it refused to admit that in the establishment of a partnership the general law could be modified through the creation of a special partnership fund or the assumption of joint and several liability by the partners. It also refused validity to the creation of permanent rent charges through rent purchase or emphyteusis even though they would affect third parties only indirectly. The use of the last named institution was denied, at least to private persons, as the institution of the *ager vectigalis* was originally available only to the municipalities and only later became available to the owners of landed

estates.[64] Classical Roman law also did not know negotiable instruments and originally did not even allow the assignment of choses in action. Modern law not only prevents the creation of special law through a contract by which an individual would subject himself to a relationship of slavery but, like Roman law, also for a long time excluded the encumbering of landed property with perpetual rent charges; only quite recently and under strictly limited conditions did the latter become permissible in Germany.[65] Modern law, furthermore, regards many agreements which were regarded as quite normal in Antiquity as violating good morals and thus invalid, even though they affect third parties neither through the creation of special law nor by indirect repercussion. Excluded are, in particular, individual agreements as to sexual relations for which full freedom of contract existed in ancient Egypt,[66] since legitimate marriage is the only form today. The same observation obtains for other family arrangements, such as the major part of those agreements on paternal and domestic authority which were common in Antiquity.[67]

The reasons for these differences in the ways of limiting freedom of contract are of many different kinds. Certain empowerments may be lacking simply because the legal recognition of the particular commercial institutions was not felt at the time as a real need. This would probably explain the absence of negotiable instruments in ancient law, or, more exactly, in the official law of the Roman empire; instruments of an at least externally similar sort were not altogether unknown in Antiquity; they occur, for instance, as early as in Old Babylonian times.[68] The same explanation may hold true of the absence of modern capitalistic forms of association, for which Antiquity had no parallels other than the various forms of state capitalist associations, as ancient capitalism was essentially living off the state. But the absence of an economic need is by no means the only explanation of the lack of certain legal institutions in the past. Like the technological methods of industry, the rational patterns of legal technique to which the law is to give its guaranty must first be "invented" before they can serve an existing economic interest. Hence the specific type of techniques used in a legal system or, in other words, its modes of thought are of far greater significance for the likelihood that a certain legal institution will be invented in its context than is ordinarily believed.

Economic situations do not automatically give birth to new legal forms; they merely provide the opportunity for the actual spread of a legal technique if it is invented. Many of our specifically capitalistic legal institutions are of medieval rather than Roman origin, although Roman law was much more rationalized in a logical sense than medieval

law. While this fact has certain economic reasons, it is also due to a variety of reasons deriving entirely from differences of legal technique. The modes of thought of western medieval law were in many respects "backward." Thus it was not logic but a sort of legal animism or magic when the instrument in writing was conceived as a tangible embodiment of "rights" rather than as a rational mode of proof. Not logical either was the customary practice, derived from legal particularism, of imposing upon all sorts of groups solidary responsibility towards outsiders for all their members; or the readiness to recognize separate funds in the most diverse spheres,[69] a phenomenon which, like the one mentioned just before, is explicable only in the light of purely political conditions. These very elements of "backwardness" in the logical and governmental aspects of legal development enabled business to produce a far greater wealth of practically useful legal devices than had been available under the more logical and technically more highly rationalized Roman law. Quite generally one may observe that those special institutions which, like those of medieval commercial law, were particularly well suited for the emerging modern capitalism, could arise more easily in the context of a society which, for political reasons, produced a variety of bodies of law corresponding to the needs of different concrete interest groups. However, it was also important that the "scientific" treatment of law could not then exist, that is, that for a principle to have legal validity it had to be "construed" out of a system of given concepts, and that nothing outside such logical construction could juristically even be "conceived." Under certain circumstances, legal rationalism may indeed imply an impairment of creative ability, although this point should not be so exaggerated as it has occasionally been done in recent times [see sec. *viii*]. Predominantly ethical or political interests and considerations are responsible for such other limitations on the freedom of contract as its exclusion or restriction in family matters, such as is characteristic of most modern legal systems, or the prohibition of contractual submission to slavery.

2. CONTRACT AND THE ORIGIN OF MARRIAGE.[70] Freedom of contract in sexual affairs is not primitive. Those tribes which are most backward technologically and are least differentiated economically and socially live in *de facto* lifelong patriarchal polygamy. The disgustful rejection of endogamy obviously began in the narrowest circle, within the household community, in connection with the relative diminution of the sexual urge through common upbringing. The exchange of one's own sister for the sister of another is probably the oldest kind of sexual contract. From this then developed the barter of the woman by her kinship group in return for commodities and ultimately the normal form of

marriage, namely, wife purchase,[71] which both in India and in Rome continued to exist as the specifically plebeian fonn of marriage together with the aristocratic forms of marriage, i.e., abduction or sacramental ceremony.[72] However, both marriage by abduction and by sacramental ceremony are products of the formation of certain social organizations. The former arose as a result of the formation of military consociations, which not only tore the young men from their families but also consolidated the women and their children into maternal groups. In the men's house, abduction was the heroic way of obtaining a wife, but the men who lived in such a community might also purchase wives from outside. Combined with the custom of abduction, these practices led to the formation of cartels for the exchange of women and thus apparently to the emergence of exogamy. It came to be regulated totemistically where animistic conceptions of a certain sort became established, especially and originally among peoples whose phratries were also hunting groups and subsequently became magical cult-communities with sacramental rites. The less developed the phratries were, or the more they disintegrated, the more prominent became patriarchal marriage, especially among the chiefs and *honoratiores*. In their case it easily resulted in polygyny with full control of the master of the household over its members, whom he could use at will for his own purposes; or, where the kinship groups remained strong, the chief could at least use them for barter, but he had to give a share of the yield to the members of the kin group. Limits to this use of the members of the household were first imposed upon the headman by the sib of his wife. A family of high status would not sell its daughters as beasts of burden or for unlimited exploitation; they would be given to outsiders only upon reassurances as to their personal status and as to a preferred status for their children vis-à-vis the children of other wives or female slaves. In consideration of such assurances, the daughter would be endowed, upon being given away, with a dowry. It was in these ways that there arose the notion of the legitimate principal wife and legitimate children, i.e., the legal characteristics of legitimate marriage. Dowry and agreement in writing concerning continuous support for the wife, her dower, the payment to be made to her upon abandonment, and the legal position of her children became the test by which full marriage was to be distinguished from all other sexual relationships.

Simultaneously, however, the freedom of the sexual contract unfolded in many different forms and degrees. Service marriage (*Dienstehe*),[73] trial marriage, and temporary companionate marriage[74] can be found, and daughters of noble families in particular were anxious to avoid the subjection to the patriarchal power of the husband. Con-

currently there existed all the forms of prostitution, i.e., the rendering of sexual services for a tangible return as distinguished from the continuous support specifically provided by marriage.[76] Prostitution, both heterosexual and homosexual, is as old as the possibility of obtaining a return for it. On the other hand, there has hardly ever existed any community in which this way of earning a living would not have been regarded as dishonorable. This discrimination was not so much created as fortified by the specifically ethical and political evaluation of formal marriage for the sake of the militarily and religiously important purpose of procreating legitimate children. Halfway between marriage and prostitution there was, especially among the nobility, the institution of concubinage, i.e., a permanent sexual relation with a maid servant, a co-wife, a hetaera, a *bayadère*[76a] or some other kind of woman living outside of marriage or in "free" marriage of the common or the refined type. The status of the children of such a union was mostly left to the discretion of the father, limited only by the monopoly rights of the children of the principal wife. Greater restrictions were established, however, by those who wielded the monopoly of citizenship, the politico-economic privileges of citizenship being reserved to the sons of male and female citizens. This principle was observed with peculiar force by the democracies of Antiquity. Other limitations were imposed by prophetic religion, for reasons previously discussed [ch. VI:xiv]. In contrast to the freedom of the sexual contract of ancient Egypt, which had its cause in the absence of all political rights of the populace, the oldest Roman law disapproved as *causae turpes* of all sexual contracts except marriage and concubinage, which was recognized as a kind of marriage of lower legal status for certain special situations.[77] But the latter was finally proscribed in the Occident by the Lateran Council [1215/16] and the Reformation. The father's right of disposition over the children was seriously limited first by sacred law, then subjected to additional limitations, and finally abolished for military, political, and ethical reasons.

Today the chances of a return to freedom of sexual contract are more remote than ever. The great mass of women would be opposed to sexual competition for the males which, as we can conclude from the Egyptian sources, strongly increases the economic opportunities of the women of superior sex appeal at the expense of the less attractive; it would also be opposed by all traditional ethical powers, especially the churches. Yet, while such absolute freedom seems impossible, a similar state of affairs may be produced within the framework of legitimate marriage by a system of easy or completely free divorce combined with a system whereby the position of the wife remains both free and secure with respect to property rights. Such relative freedom has obtained, in

varying degrees, in late Roman, Islamic, Jewish, as well as modern American law; it also obtained, though only for a limited period, in those legislations of the eighteenth century which were influenced not only by the contract theory of the rationalist Natural Law but also by considerations of population policy.[78] The results have varied greatly. Only in Rome and in the United States has the legal freedom of divorce been actually accompanied, for a time, by a high divorce rate.[79] As once in Rome, both economic freedom and freedom of divorce are strongly desired by the women in the United States where their position in the home as well as in society has come to be secure. The majority of Italian women, on the other hand, who are strongly bound by tradition, have rejected freedom of divorce even in recent times, probably because they are afraid that female competition for the male would become more acute and certainly because they do not wish to jeopardize their economic security, especially in old age, just as an aging worker would be afraid of losing his daily bread. Generally both men and women seem to favor a formally rigid or even indissoluble type of marriage where loose sexual behavior is regarded as permissible for the members of one's own sex; men may also be content with such kind of marriage where, because of weakness or opportunism, they are apt to condone a certain female license. But the decisive reason for the repudiation of freedom of divorce by bourgeois public opinion is the real or imagined danger to the children's educational chances; besides, authoritarian instincts on the part of the men have also played their part, especially where women have become economically emancipated to such a degree that the men are concerned about their position in the family and their male vanity is thus aroused. There are, furthermore, the authoritarian interests of the political and hierocratic powers, strengthened by the idea which has become powerful through the very rationalization of life in the contractual society, that is to say, the idea that the formal integrity of the family is a source of certain vaguely specified irrational values or is the supporting supra-individual bond for needful and weak individuals. In the last generation all t ese heterogenous motives have resulted in a backward movement away from freedom of divorce and in some respects even from economic freedom within marriage.

3. FREEDOM OF TESTATION, i.e., freedom of economic and normally intra-familial disposition, has also met in modern times with restrictive tendencies. But we shall not try to trace here the formal course of legal history of testamentary disposition. Evidence of complete or almost complete substantive freedom of testation can be found only twice in history, viz., in Republican Rome and in England, i.e., among two peoples both of which were strongly expansive and governed by a stratum of land-

owning *honoratiores*. Today its principal area of application is the United States, i.e., the area of optimal economic opportunities. In Rome freedom of testation increased with the policy of military expansion which offered to disinherited sons the prospect of material well-being in the conquered territories, while it was cut down through the practice of breaking "unnatural" wills taken over from Hellenic law as the age of colonization was coming to an end.[80] In English law freedom of testation aimed at the stabilization of the fortunes of the great families, which was also served by the very opposite institutions of feudal succession to real estate, primogeniture, and entailed estate (*fidei commissum*).[81] In modern democratic legislations the restriction or elimination of freedom of testation by means of generous indefeasible shares, or the prevention of primogeniture in the French Code through compulsory physical partition has been and still is largely politically determined. In the case of Napoleon, the intention of destroying the old aristocracy by compulsory partition of their estates was accompanied by the desire to establish fiefs as bearers of the new aristocracy which he was trying to create; this latter institution was referred to in his famous assertion that the introduction of the *Code* would place in the hands of the government the distribution of social power.[82]

4. CONTRACTUAL CONSTITUTION OF SLAVERY. The suppression of *slavery*[83] by the prohibition of even a voluntary submission to formally slavelike relations was the product of the shift of the center of gravity of world economic rule into areas where several elements happened to coincide: slave labor was unprofitable because of high maintenance costs; the wage system with its threat of dismissal and unemployment had come to provide indirect coercion to work; and direct coercion was regarded as less effective than indirect pressure to obtain work of high quality and to extort labor from the dependent strata without the great risks involved in large investments in slave labor. The religious communities, especially Christianity, played a very slight role in the suppression of slavery in Antiquity, less, for example, than the Stoa; in the Middle Ages and in modern times, its role was somewhat greater but by no means decisive. In Antiquity, it was rather with the pacification of the foreign relations of the Empire, which left peaceful slave trade as the only major source of slave import for the West, that capitalistic slavery came to decline. The capitalistic slavery of the Southern United States was doomed once the supply of free land was exhausted and the cessation of the importation of slaves had raised slave prices to monopolistic levels. Its elimination through the Civil War was accelerated by the purely political and social antagonism of the democratic farmers and the Northern plutocratic bourgeoisie against the Southern planter aristoc-

racy. In Europe it was the purely economic evolution of the medieval organization of work and labor, especially the growth of the guild system, which resulted in keeping the crafts free of slave labor even though slavery never completely disappeared from southern Europe during the Middle Ages. As far as agriculture was concerned, more intensive production for export led even in modern times at first to greater servitude in the status of the agricultural laborer; but unfree labor was finally found to be unprofitable with the emergence of modern techniques of production. However, for the final and complete elimination of personal servitude, strong ideological conceptions of natural law were ultimately decisive everywhere. The patriarchal slavery of the Near East, the ancient seat of this institution which was much less intensively spread in East Asia and India, is on the verge of extinction as a result of the suppression of the African slave trade. Once its military significance, which was great in ancient Egypt as well as in the late Middle Ages, was rendered obsolete by the military technique of the mercenary armies, its economic significance, which had never been very great, also began to decline rapidly. As a matter of fact, in the Orient slavery never enjoyed a role corresponding to that played by the plantation slavery on the estates of Carthage and of late Republican Rome. In the Orient most of the slaves were domestic servants just as they had been in the Hellenic and Hellenistic regions. Some, on the other hand, constituted a sort of interest-bearing capital investment in industrial workers, as had also been the case in Babylonia, Persia, or Athens. In the Near East, and still more in Central Africa, this patriarchal slavery approximated a free labor relationship more closely than the legal form would lead one to suppose. Yet, Snouck Hurgronje's observation in Mecca that a slave would not be bought in the market unless he approved of the personal qualities of the master, and that the master would resell the slave if the latter should turn out to be grossly dissatisfied with the former,[84] seems to be the exception rather than the rule and to be brought about by the great dependence of the master on the good will especially of his domestic slaves. In Central Africa, even today, a slave who is dissatisfied with his master knows how to compel the master to give him, by way of *noxae datio*,[85] to another master for whom he has a greater preference.[86] But this, too, is certainly not universally true. Yet the nature of oriental theocratic or patrimonial authority and its inclination toward the ethical elaboration of the patriarchal side of all dependence relationships have created at least in the Near East a highly conventionalized security for the slave vis-à-vis his master. Consequently, unrestrained exploitation in the manner of late Roman slavery is practically excluded. The beginnings of this trend can be found already in ancient Jewish law, and the

decisive motivation for this conduct was provided by the very circumstance that the ancient institutions of levying execution upon the debtor's person and of debt slavery entailed the probability of enslavement of one's fellow citizens.

5. OTHER LIMITATIONS OF FREEDOM OF CONTRACT. Finally, the social and economic interests of the influential, especially "bourgeois," strata of society also constitute the cause of such limitations on the freedom of contract as the prohibition to put feudal or other permanent encumbrances upon land for the benefit of private parties. Such transactions were excluded in the law of Republican Rome just as they were again prohibited in the Prussian Land Redemption Laws.[87] In both instances the operative factors were bourgeois class interests and the economic conceptions associated with them. Roman legislation, which during the Republic did not recognize the emphyteusis except as *ager vectigalis* on public lands, like the present *de facto* limitation in Germany of the creation of similar tenures in lands owned by the state or by state-approved colonization corporations,[88] was a product of the concern of the bourgeois landed interests for legal marketability of land and for the prevention of the development of seigneurial rights or similar obligations tied to the land.

5. *Extension of the Effect of a Contract beyond Its Parties—"Special Law"*

Just as in Roman law, so in the modern rationalized law that type of regimentation of freedom of contract which results from the combination of all the factors just mentioned is generally achieved not by prohibiting the proscribed agreements but simply by the failure of the legal order to provide the particular type-contract or, in Rome, the particular *actio*, and by so regulating the available type-contracts that their norms are incompatible with the disapproved types of agreement. On the other hand, the technical form in which the law provides the power in a legally valid way to engage in those transactions which, like the formation of a business corporation, affect the interests of third parties, consists in the official establishment of certain standard terms which must be incorporated in every such arrangement by individual parties if it is to be legally effective not only between these parties but also against outsiders; for if there are no other reasons for denying its validity, the arrangement itself can have legal effects upon the participants, even if third parties are not bound by them. This modern technique of leav-

ing it to the interested parties thus to create law not only for themselves but also with operative effects as regards third parties gives those interested parties the advantages of a legal institution of *special law*, provided they comply with the substantive requirements as expressed in those terms which they have to incorporate in their arrangement. This modern type of special law differs from that type of special law which was allowed to develop in the past. The modern technique is a product of the unification and rationalization of the law; it is based on the official monopoly of law creation by, and the compulsion of membership in, the modern political organization.

In the past, special law arose normally as "volitive law" (*gewillkürtes Recht*), that is, from tradition, or as the agreed enactment of consensual status groups (*Einverständnisgemeinschaften*) or of rational associations. It arose, in other words, in the form of autonomously created norms. The maxim that "particularistic law" (i.e., volitive law in the above sense) "breaks" (i.e., takes precedence over) the "law of the land" (i.e., the generally valid common law) was recognized almost universally, and it obtains even today in almost all legal systems outside the Occident, and in Europe, for example, to some extent for the Russian peasantry. But the state insisted almost everywhere, and usually with success, that the validity of these special laws, as well as the extent of their application, should be subject to its consent; and the state did this in just the same manner in which it also transformed the towns and cities into heteronomous organizations endowed by the state with powers defined by it. In both cases, however, this was not the original state of affairs. For the body of laws by which a given locality or a group were governed was largely the autonomously arrogated creation of mutually independent communities between which the continuously necessitated adjustment was either achieved by mutual compromise or by imposition through those political or ecclesiastical authorities which would happen at the given time to have preponderant power. With this observation we return to phenomena which have already been touched upon, in a different context, earlier in this section.

Prior to the emergence and triumph of the purposive contract and of freedom of contract in the modern sense, and prior to the emergence of the modern state, every consensual group or rational association which represented a special legal order and which therefore might properly be named a "law community" (*Rechtsgemeinschaft*) was either constituted in its membership by such objective characteristics as birth, political, ethnic, or religious denomination, mode of life or occupation, or arose through the process of explicit fraternization. The primitive situation, as we have seen above, was that any lawsuit that would

correspond to our procedure could take place only in the form of composition-proceedings between different groups (sibs) or members of different groups. Within the group, i.e., among the members of the group, patriarchal arbitration prevailed. At the very origin of all legal history there thus prevailed, if viewed from the standpoint of the political power and its continuously growing strength, an important dualism, i.e., a dualism of the autonomously created law between groups, and the norms determinative of disputes among group members. At the same time, however, another fact intruded into this apparently simple situation: namely, that even at the earliest stages of development known to us the individual often belonged to several groups rather than to just one. But nevertheless, the subjection to the special law was initially a strictly personal quality, a "privilege" acquired by usurpation or grant, and thus a monopoly of its possessors who, by virtue of this fact, became "comrades in law" (*Rechtsgenossen*). Hence, in those groups which were politically integrated by a common supreme authority, like the Persian empire, the Roman empire, the kingdom of the Franks, or the Islamic states, the body of laws to be applied by the judicial officers differed in accordance with the ethnic, religious, or political characteristics of the component groups, for instance, legally or politically autonomous cities or clans. Even in the Roman empire, Roman law was at first the law for Roman citizens only, and it did not entirely apply in the relations between citizens and noncitizen subjects. The non-Moslem subjects of the Islamic states and even the adherents of the four orthodox schools of Islamic law live in accordance with their own laws; but when the former resort to the Islamic judge rather than to their own authorities, he applies Islamic law, as he is not obliged to know any other, and as in the Islamic state the non-Moslems are mere "subjects."

On the other hand, in the medieval *Imperium*, every man was entitled everywhere to be judged by that tribal law by which he "professed" to live.[89] The individual carried his *professio iuris* with him wherever he went. Law was not a *lex terrae*, as the English law of the King's court became soon after the Norman Conquest, but rather the privilege of the person as a member of a particular group. Yet this principle of "personal law" was no more consistently applied at that time than its opposite principle is today.

Under any such systems it was inevitable that difficulties were to arise in conflicts between persons subject to different bodies of law, and with them the need for a certain measure of common legal principles, which increased rapidly with the growing intensity of intercourse. There either emerges, then, as it did in Rome, a "jus gentium," which co-

exists together with the "ius civile" of each group; or, as occurred in England, the political or hierocratic ruler will by virtue of his *imperium*, impose upon his courts an "official law" which is to be the only binding one; or it may happen that a new political group, usually a local one, will fuse the substance of different legal rules into one new body of law. The oldest Italian city statutes were well aware that the citizens had "declared" that they were living under Lombard law, but in a characteristic divergence from older legal notions, it was the *civitas*, the personification of the total body of the citizens, which was said to have accepted as its *confessio iuris* either the Lombard law or, as its supplementary source, the Roman law; or it, *the civitas*, may have adopted the Roman law, and the Lombard law as its secondary system.[90] However, all volitionally formed associations always strove for the application of the principle of *personal* law on behalf of the law created by them, but the extent to which they were successful in this respect varied greatly from case to case. At any rate, the result was the coexistence of numerous "law communities," the autonomous jurisdictions of which overlapped, the compulsory, political association being only one such autonomous jurisdiction in so far as it existed at all. By virtue of their membership, "comrades in law" could monopolize the control of certain tangible things or objects, for example, land of a certain type such as copyholds or fiefs; however, when these "law communities" ceased to be closed shops under the pressure of certain interests, and when these communities increased so that any one individual member was simultaneously belonging to several groups, then the special law of any "law community" became almost identified with the ownership of the particular object so that now, in the reverse sense, such ownership became the test for membership in the particular special law community.[91] This was also a step towards the situation which prevails today, namely that those relations which are subject to a special law are formally and generally accessible to any person. Nevertheless, it was only one step in the transition to the modern situation. For all special law of the older type conferred enduring legal privileges either directly on certain persons belonging to a group or on certain objects the possession of which provided this membership. In modern society special legal regulation may also be occasioned by the existence of certain purely technical or economic conditions such as ownership of a factory or a farm, or the exercise of the profession of attorney, pharmacist, craftsman of a certain kind, etc.

Naturally every legal system has certain special norms that are bound up with technical and economic facts. But the special bodies of laws which we are discussing at this point were of a different character. The applicability of this type of special law was founded not on economic

or technical qualities but on status, i.e., qualities derived from birth, mode of life, or group membership ("nobleman," "knight," or "guild fellow") or certain social relationships with respect to material objects such as a copyhold or a manor. It has therefore always been the case that the applicability of a special law was conditional upon a particular quality of the person or upon his relationship to some material object.[92] In marginal cases, the "privilege" could even adhere to a single individual or object and it did so in fact quite frequently. In that case, the right coincided with the law; the privileged individual could claim as his right that he be treated in accordance with the special law. But even where it was significant that one belonged to a group of special corporate status or that one stood in a special relationship to a group of objects, it was natural to regard the application of the special legal norms as the personal right of the interested parties. The idea of generally applicable norms was not, it is true, completely lacking, but it inevitably remained in an undeveloped state; all law appeared as the privilege of particular individuals or objects or of particular constellations of individuals or objects. Such a point of view had, of course, to be opposed by that in which the state appears as the all-embracing coercive institution. At times, especially during the first period of the rising "bourgeois" strata in ancient Rome and in the modern world, the opposition was so strong that the very possibility of "privileges" was repudiated. The creation of privileges by vote of the popular assembly was regarded as impossible in Rome,[93] and the revolutionary period of the eighteenth century produced a type of legislation which sought to extirpate every form of associational autonomy and legal particularism.[94] This end was never achieved completely, however and we shall soon see how modern law has created anew a great mass of legal particularisms. But it has done so upon a basis which differs in many important respects from that of the privileges of the older corporate status groups.

The ever-increasing integration of all individuals and all fact-situations into one compulsory institution which today, at least, rests in principle on formal "legal equality" has been achieved by two great rationalizing forces, i.e., first, by the extension of the market economy and, second, by the bureaucratization of the activities of the organs of the consensual groups. They replaced that particularist mode of creating law which was based upon the private power or the granted privileges of monopolistically closed organizations; that means, they reduced the autonomy of what were essentially organized status groups in two ways: The first is the formal, universally accessible, but closely regulated autonomy of voluntary associations which may be created by anyone wishing to do so; the other consists in the grant to everyone of the power to create law of his own by means of engaging in private legal transac-

tions of certain kinds. The decisive factors in this transformation of the technical forms of autonomous legislation were, politically, the power-needs of the rulers and officials of the state as it was growing in strength and, economically, the interests of those segments of society that were oriented towards power in the market, i.e., those persons who were economically privileged in the formally "free" competitive struggle of the market by virtue of their position as property owners—an instance of "class position." If, by virtue of the principle of formal legal equality, everyone "without respect of person" may establish a business corporation or entail a landed estate, the *propertied* classes *as such* obtain a sort of factual "autonomy," since they alone are able to utilize or take advantage of these powers.

However, this amorphous autonomy merits the designation of "autonomy" only in a metaphorical sense; for, unless the word "autonomy" is to lack all precision, its definition presupposes the existence of a group of persons which, though membership may fluctuate, is determinable, and whose members are all, by consent or enactment, under a special law depending on them for its modification. The particular character of the group is irrelevant for the definition; it can be a club just as well as a business corporation, a municipality, an "estate," a guild, a labor union, or a circle of vassals. The phenomenon itself always denotes the beginning of the state's legal supremacy. It always entails the idea that the state either tolerates or directly guarantees the creation of law by organs other than its own. Qualitatively, too, the autonomy enjoyed by a group through consensus or by enacted norms differs from mere freedom of contract. The line between the two coincides with the limits of the concept of "norm"; in other words, it lies where the order whose validity depends upon the consensus or the rational agreement of the participants is no longer conceived as the objectively valid rule imposed upon a group but as the establishment of reciprocal subjective claims, such as occurs, for instance, in the agreement of two business partners concerning the division of work and profits between them and their legal position within and outside the firm. The absence of a clear dividing line between objective law and subjective right becomes apparent at this point. From the standpoint of our modes of thought, which have developed in regard to enacted law,[98] a distinction can be found, even theoretically, only in the proposition that in the sphere of private law, which alone concerns us here, autonomy is exercised where the enacted rule has its normal source in a resolution, while we have a special case of regulation by virtue of freedom of contract where the rule is supplied by an agreement between concrete individuals. This distinction was not insignificant in the past, but neither was it exclusively decisive.

As long as the distinction between objective norm and subjective

claim was but incompletely developed and as long as law was an attribute of a person determined by his membership in a group, one could speak of only two kinds of rules. The first were those which were valid in a group or organization because of the special status qualities of its members; the others were valid and binding because one had created them for oneself by directly participating in a purposive contract. All special law was indeed originally the law of a group in which membership was determined by status qualities. But this state of affairs changed, as we have already indicated, with the increasing differentiation and economic scarcity of those goods which were monopolistically appropriated by the several groups. The changes were indeed so pronounced that in the end an almost opposite rule came to obtain: namely, that special law was almost exclusively that which applied in a social or economic special relationship. To this conception certain approximations can already be found in the Middle Ages. We agree with Heusler on this score, but he went too far when he completely denied the existence of all state law (*Staatsrecht*).[96] But feudal law was indeed the law for the relation between lord and vassal and not the law of a "vassalic state" simply because such kind of state never existed. In the same sense manorial law was the law applicable to the relationships of manorial service; service law applied to service fiefs; the law merchant was the law for merchandise and mercantile transactions; and crafts law[97] is the law relating to the transactions and the establishments of craftsmen. Yet, outside of these special relationships, the vassals, merchants, the copyholders, the *ministeriales*, and freemen were subject to the general law of the land. An individual could own freehold and copyhold lands at one and the same time; as regards the former, he was under the jurisdiction of the common law of the land, and as regards the latter, under the law of the manor. Likewise, a non-merchant who had lent money in a *commenda* or *foenus nauticum* was subject to commercial law in this, but only this, regard. However, this objective mode of treatment was by no means universal. Almost all those relationships to which a special law applied had to some degree consequences implying corporate status, i.e., touching upon the total legal status of the person. This was the case with the possession of copyholds or other "unfree" lands. Many of them were regarded as mutually incompatible in one person and the tendency to break through such corporate-status restrictions was opposed time and again by the counter-tendency towards the closure of group membership. Which of the two tendencies would be stronger was entirely determined by the concrete constellation of interests in each specific instance. In Germany, as even Heusler acknowledges, borough law (*Stadtrecht*) was a corporate-status right of the citizens rather than a law

of tenure of urban land or other material relationship.[98] In England, however, the municipalities became almost entirely private corporations.

In general it is correct to say that there prevailed the tendency of treating special law as law for certain objects and situations. As a result, the integration of the special laws into the common law of the land, the *lex terrae*, as substantive special rules was greatly facilitated. The actual and final integration, however, depended predominantly on political conditions. Yet in those fields where this integration was not fully realized the problem of the relationship of the various special laws and their corresponding special courts to the common law of the land and its courts was resolved in a great variety of ways. Under the common law of the land seisin in copyhold land (*Gewere*) was vested in the lord rather than the copyholder. But as to land held in fee the situation was not so simple; in the *Mirror of Saxon Law*, for instance, the problem of seisin was in dispute between the author and the glossators.[99]

This particular problem has left traces in the Roman law, too. The Roman *ius civile* was the law of the Roman citizens insofar as a person who was neither a citizen nor an assimilated person by virtue of treaty could not appear as a party before a Roman court, engage in the specific transactions of the quiritarian law,[100] or be judged according to its rules. No Roman *lex* had any validity outside the circle of the citizenry. Its inapplicability to non-citizens was politically of considerable importance because it established the sovereign power of the officials and the Senate over the entire subjugated area which was not incorporated into the law. But on the other hand, the Roman citizen was never judged exclusively by *ius civile*, and he was never exclusively subject to the courts of the *ius civile*. The *ius civile* of historical times must rather be defined as that special law which was relevant for a person exclusively in his character as a citizen, i.e., as a member of that particular status group. Simultaneously with it we find some law spheres which covered either both citizens and non-citizens, or only a part of the citizens, and the law of which presents itself as special law either of status groups or of objective demarcation. In this context belong above all those numerous and important situations which were regulated by administrative law. Down to the time of the Gracchi, title by virtue of *ius civile* did not exist in any lands other than those which had been subjected to *ius civile* by express assignation.[101] Tenures in public lands (*ager publicus*) were neither regulated by *ius civile* nor protected by actions of *ius civile*, as they were accessible to both citizens and non-citizens. When, in the period of the Gracchi, it looked as if the citizenry would subject these lands to regulation by *lex*, i.e., by enactment of *ius civile*, the allies immediately demanded that they be made citizens. These tenures were

thus subject exclusively to the cognition of the magistrates, who proceeded in this respect according to rules different from those of the *ius civile*. The latter knew neither *emphyteusis* nor covenants running with the land nor copyholds. But all these institutions existed under the administrative law applicable to public lands. Furthermore, that law which applied in the relation between the public treasury and private individuals contained institutions which did not occur in the *ius civile*; even where the institutions of the former were the same as those of the latter, they were referred to by different names, as, for instance, *praes* and *praedium*, [rather than *fide-iussor* and *hypotheca*].[102] This objectively defined special law was thus determined by the scope of the jurisdiction of the administrative official. There did not exist any body of particular persons membership in which would have been the test of participation; if one would like to speak of any group one could only say that its membership consisted of all those who at a given moment would happen to be concerned with some matter subject to administrative jurisdiction. Another sphere of special law was constituted by the jurisdiction of that *praetor* who was to decide disputes between citizens and aliens. He might resort to some rule of *ius civile*, but not by virtue of a "law" of the *ius civile*, a *lex*, but simply by virtue of his magisterial power. He rather applied the *ius gentium*, a law which was derived from a different source and the validity of which rested upon different foundations. Yet, this kind of law must not be visualized as having arisen with the very establishment of the office of the *praetor peregrinus*. It rather was that international law of commerce according to which the disputes of the market had been settled from time immemorial and which probably had at first been protected only sacrally by means of the oath. Nor were the substantially feudal relations between patron and client,[103] which were of great practical importance in the early period, possible objects of litigation at *ius civile*. Just as in the Germanic law of seisin, the spheres of the *ius civile* and feudal law touched upon each other in the field of possession, viz., with respect to the *praecarium* [tenancy at will]; the *ius civile* took notice of the relationship also in other respects and dealt with it in criminal law. But it was not *regulated* by *ius civile*. Genuine spheres of special law within the *ius civile* were, on the other hand, formed by certain legal institutions accessible solely to merchants and certain persons engaged in industry, viz., the *actio exercitoria*,[104] the *receptum*,[105] and the special law of the *argentarii* [bankers].

A concept of great importance for future legal development, viz., that of *fides*,[106] was contained in both the general law of commerce and the law of patron and client. It included in a peculiar way not only the obligations following from relations of loyalty but also the

fides bona, the good faith and fair dealing of the pure commercial transactions. To the *ius civile* as such it was unknown. Yet even though technically unknown, there were elements of it in practice from the very beginning; for as regards certain fraudulent acts, the Twelve Tables already threatened with the status of *improbus intestabilisque*.[107] Numerous laws expressly decreed *infamia*, the general consequences of which were in private law exclusion from giving testimony, i.e., the incapacity to bear witness or to have one's actions witnessed, which in practice amounted to a commercial boycott. It led to a limitation of aquiring property by way of testate succession; it involved, furthermore, the denegation of certain actions by the *praetor*. In spite of their informal character, the principles of *fides* were by no means the products of a vague sentimentalism either in the field of the law of patron and client or in that of commercial transactions. The entire series of sharply defined contrasts on which the Roman law of commerce so essentially rested was developed on the basis of the principles of *fides*. Such ancient institutions as the *fiducia*[108] as well as the *fidei-commissum* of the imperial epoch[109] depended entirely upon *fides*. The fact: that the *fidei-commissum* developed because legacies in favor of non-citizens and "prohibited persons"[110] were not actionable in the *ius civile* and guaranteed only by convention does not prove that *fides* was never more than a stopgap device for the *ius civile* and that it arose only at a comparatively late stage. The legal institution of *clientela* is certainly as old as the legal conception of the *ius civile* itself, and yet it remained outside. Thus the coverage of *ius civile* was never coterminous with the "civil" law. But *fides* was not a uniform principle for the regulation of legal relations. What one owed to another according to *fides* depended on the peculiar nature of the concrete relationship, and even in this specialization the *fides* did not, in the event of infringement, always produce the same legal consequences. *Infamia* was the consequence of certain specific acts rather than of all infringements against *fides*. Of the various reactions against offensive conduct, e.g., censorial reproof, or consular refusal to list one as a candidate for office, each had its own particular preconditions, which were identical neither with cases of *infamia* nor with the principle of *fides*, and which, moreover, fluctuated; they were never bound up with infringements of *fides* purely and as such. Infringements of the obligations of clientship were originally subject to the sanctions of the patron in the household court. Later these obligations were guaranteed sacrally or conventionally and finally also by *ius civile* in the case of the purely commercial clientage of freedmen.

Of the original role of *fides* in commerce we have no knowledge. We do not know the means by which the *bonae fidei* contracts were

guaranteed before they were recognized in the praetorian forms of action by virtue of the magistrate's authority like other institutions of the *ius gentium*. Probably there were individual or general arbitration agreements under oath, which, if broken, produced *infamia* in the same way in which in later times *infamia* was the sanction for the breach of a sworn contract of compromise. But the creation of the forms of action for the institutions of the *ius gentium* did not mean that its distinction from the *ius civile* became eliminated; the *ius civile* remained the pure corporate status group law of the citizens. Occasionally the *praetor*, through the formula *si civis Romanus esset*, [let him be treated "as if he were a Roman citizen"] made a civil form of action available to non-citizens. Other institutions were imperceptibly received into the *ius gentium*. It was only during the Empire that the distinction disappeared entirely, together with other privileges of citizenship.

None of the groups of persons interested in the *fides* constituted a closed organization, although Mommsen incorrectly, as we shall subsequently see, identified the clients with the organization of the *plebs*.[111] Certainly those persons whose interests were involved in *bonae fidei* contracts or in *ius gentium*, which were quite indifferent with respect to personal status, did not form such an organization. The praetorian law as such was naturally quite far from being identical with the *ius gentium*, and the reception of the *ius gentium* was by no means brought about only by praetorian law; indeed it was to a great extent brought about by the integration of its fundamental principles into the *ius civile* through the jurists. Both during the Republic as well as during the Empire even the genuine status groups, i.e., the slaves, the freedmen, the knights, and the senatorial families, lacked any associational organization which could have been the bearer of a genuine autonomy. For reasons of politics and police, the Republic had repeatedly found itself compelled to intervene sharply against private organizations. Periods of repression alternated with periods of toleration. The period of the monarchy was naturally unfavorable to private associations. The democracy had reasons to be afraid of the associations of the socially and economically powerful; the monarchy had reasons to fear the political consequences of any sort of uncontrolled organization. The Roman law of both the Republican and the Imperial periods admitted, in effect, associational autonomy only as a law of voluntary associations (*Vereine*) or corporations in the modern sense. Autonomy existed to the very degree to which such associations and corporations were tolerated or privileged. Just to what extent they existed is to be examined in connection with the general discussion of another problem, namely, that of the *legal personality* of organizations.[112]

6. Associational Contracts—Juristic Personality

The general transformation and mediatization of the legally autonomous organizations of the age of personal law into the state's monopoly of law creation found its expression in the change of the forms in which such organizations were legally treated as the bearers of rights. Such treatment cannot be dispensed with when the autonomous organizations have become subject to a common body of law peacefully applied through an orderly system of adjudication within a compulsory political association, when there furthermore exist, on the one hand, monopolistically appropriated goods to be used solely by the members of the group (*Rechtgenossen*) as such and by them only for some common purpose, and when also, on the other hand, legal transactions involving these objects have become economically necessary. Where, however, this development had not yet occurred, the problem was settled in a simple way: the members of one organization held all the members of another solidarily responsible for the acts of any one of its members, including its organs. Alongside the primitive blood feud we thus find the reprisal as a universal phenomenon, i.e., the reprisal in the sense of the detention of the person or goods of a member of a group for the obligations of one or all of his fellows.[113] In the Middle Ages, negotiations about reprisals and their avoidance by reciprocal grant of access to the courts and mutual legal assistance were a constant object of discussion between the cities. Composition, too, is of the same primitive origin as the blood feud. The question of what person or persons could validly conclude a composition and represent the members of a group in dealings with outsiders was determined simply by the experiences of the outsider with respect to whose orders are in fact obeyed. The original conception, even in early medieval law, still was that a member of the group who had not participated in a particular resolution of the village, the guild, the rural commune or other collectivity, could not be bound by it, that the organization's transactions with the outside had to be based upon an agreement of the members as expressed in a general resolution in order to have any effect. One may thus agree with Heusler[114] that the necessity of a resolution and its binding force were characteristic elements in the development of the law of organizations. But, obviously, the distinction between resolution and contract remained as fluid as that between objective norms of law and subjective rights in general; normations arrived at through resolutions were often designated as *pactus*. But virtually the distinction was always present, quite particularly in the once universal idea that a resolution would not bind anyone except those persons who had participated in and associated themselves with it, and

that it had consequently to be unanimous. In appearance, at least, the idea is implied that a resolution could come into effect only as a contract. Actually, however, that conception was rather influenced by the element of revelation implied in all law, according to which only *one* law could be right. Once the magical and charismatic means for the discovery of the right law had disappeared, there could and did arise the idea that the right law was the one acknowledged by the majority and that, therefore, the minority had the duty to associate itself with it. But before the minority did so, occasionally under drastic compulsion, the majority resolution was not law and no one was bound by it.[116] Such was the practical significance of that outlook.

On the other hand, no one, of course, was considered to be obliged to conclude a contract with another. Hence, even under these modes of thought, including the conceptions of the earliest times, the distinction between enactment as the means of creating objective law and contract as the means of creating subjective rights was a familiar one, despite the great vagueness and fluidity of the transition between them. As its complement, the resolution required an organ for its execution. The mode of its selection, e.g., election from case to case or for a longer period or hereditary appropriation of the executive functions, etc., could assume many different forms. As the process of differentiation and appropriation among and within the various organizations advanced, as individuals came to be simultaneously members of several organizations, as in the internal relations among group members the relative degrees of power of officers and members came to be subject to fixed and increasingly rational rules, and as, finally, purposive contracts both of individuals and between the organization as a whole and outsiders became more frequent in consequence of a growing exchange economy, an unambiguous determination of the significance of every action of every member and every official of an organization became necessary, and the question of the position of the organization and of the legitimation of its organs in both contractual transactions and in procedure had to arise in one way or another.

The technical legal solution of this problem was found in the concept of the juristic person. From a legal standpoint the term is a tautology, since the very concept of person is necessarily a juristic one. When a child *en ventre de sa mère* is regarded as a bearer of rights and obligations just as a full citizen while a slave is not, both these rules are technical means of achieving certain effects. In this sense the determination of legal personality is just as artificial as the legal definition of "thing"—i.e., it is decided exclusively in accordance with expedientially selected juristic criteria. However, the more numerous alternatives available for

the determination of the legal position of organizations and associations were then to create a special problem.

The most rational actualization of the idea of the legal personality of organizations consists in the complete separation of the legal spheres of the members from the separately constituted legal sphere of the organization; while certain persons designated according to rules are regarded from the legal point of view as alone authorized to assume obligations and acquire rights for the organization, the legal relations thus created do not at all affect the individual members and their property and are not regarded as their contracts, but all these relations are imputed to a separate and distinct body of assets. Similarly, what the members as such may claim from or owe to the organization under its rules, belongs to or affects their own private assets, which are legally entirely separate from those of the organization. An individual member as such can acquire neither a right nor a duty for the organization. Legally this is possible only for the officers acting in the name of the organization, and only the assembly of qualified members called together and acting in accordance with fixed rules can, but need not, have the authority to make binding decisions. The concept of juristic personality can be extended even further to contain the control over economic goods the benefit of which is to accrue to a plurality of persons who, while they are determined in accordance with rules, are not to be associationally organized. When thus established as an *endowment*,[116] a separate bearer of rights, to be determined in accordance with fixed rules, becomes recognized as legitimated to represent the interests of those individuals. Where a consociation of persons is to be endowed with juristic personality, it can thus be constructed in two possible ways. It can be organized as a *corporation*. In that case the body of members is constituted as a fixed group of persons. The composition of that body can be changed in two ways, viz., either by succession to a position of membership in accordance with the general rules of private law, or by virtue of a resolution of a designated corporate organ. The persons designated in one of these two ways are the only ones who are entitled to any rights, and the administration is juristically carried on by virtue of their mandate. The other possible form in which a consociation of persons can be established as a juristic person is that of the *institution* (*Anstalt*), which is basically similar to the endowment. (When used as a juristic term of art, the concept of institution overlaps only in part with the one used in the field of social welfare.) The institution has no organized body of members but only an organ or organs by which it is represented. Membership is frequently based upon obligation, and the accession of new members is not dependent upon the will of the older

ones but rather upon objective criteria or upon the discretion of the organs of the institution. Furthermore, the "members" of the institution, such as, for instance, the pupils at a school, have no influence upon its management.[117]

The three forms of organization—endowment, institution, and corporation—are not separated from each other by absolutely clear-cut legal tests. The transitions between them are rather gradual and fluid. It can certainly not be a decisive test, as Gierke assumed, whether the organization is autocephalous or heterocephalous.[118] A church is an institution, although it can be autocephalous.

From the technical legal point of view, the concept of juristic personality can be dispensed with where an organization has no property concerning which contracts in the name of the organization would be necessary. Juristic personality is inappropriate for those societies which by their very nature comprehend only a narrowly limited number of partners and which are also limited in their duration, such as a certain business associations. For them the absolute separation of the legal spheres of the members from that of the collectivity would be injurious to credit since the specific credit-rating, while influenced by the existence of a separate fund, is based primarily upon the fact that all the partners are to answer for the debts of the collectivity. Likewise the establishment of separate organs for the representation of the latter would not always be expedient. For such organizations and associations the form most adequate to capitalistic credit interests is the principle of "joined hands" (*Gesamthand*),[119] which has been known, at least in an incipient state, to most legal systems of the past. It involved, first, that authority to represent the collectivity be vested in either all the participants acting jointly, or in every one, or some, or one particular participant acting in the name of all; the principle of joined hands involved, second, the liability of all with both their persons and their property. The configuration arose from the solidary responsibility of the household community. It acquired its specific character when in a community of heirs the legal separation of the collective property from the individual property of the participants made it necessary that a distinction be made between collective and individual debts.[120] This process occurred in that course of disruption of fraternal relationships by commercial influences of which we have earlier spoken [ch. IV:2].

From the community of heirs the institution spread and became the basis of numerous deliberately constituted communities for which the in- and out-group relations arising from the fraternal character of the household community were either basic or adopted out of considerations of legal-technical convenience.[121] The present-day law of the partner-

ship is, as we have seen, a direct rational development of the relations of the household community for purposes of the capitalistic enterprise. The various forms of the "société en nom commandite"[122] are combinations of this principle with the law of the *commenda* and the *societas maris* as they were found everywhere. The German "limited liability company"[123] is a rational invention to serve as a substitute for the regular joint-stock corporation (*Aktiengesellschaft*) which is legally inadequate for the purpose of smaller family-like enterprises, especially among co-heirs, and particularly inconvenient because of the many publications required by modern legislation.

The fraternity (*agermanament* in Spanish law) of merchants, shipowners, and seamen was, by the very nature of the matter, intrinsic to the joint enterprise of a sea voyage. Corresponding to the rise of the business firm from the household community, it developed in the field of shipping into an *association of joint hands* (*Gesamthandvergesellschaftung*) of the enterprisers, whereas, on the other side, in bottomry and in the rules of general average it resulted in a single community of risk among all those interested in the voyage. In all those cases, the typical element was the replacement of a fraternal by a business relationship, i.e., of a status contract by a purposive contract, saving, however, the legally technically expedient treatment of the total group as a separate and distinct legal subject and as the separate owner of joint assets. On the other hand, the formal bureaucratization of the apparatus that would have become technically necessary in the case of a corporation was avoided. In no other legal system were the rationally transformed relationships of joint hands developed so specifically as they were in that of the Occident of the Middle Ages and later. Their absence from Roman law was due more to certain elements of legal technique inherent to the nature of the national *ius civile* than to economic causes; we do not know details of the development of Hellenic commercial law, from which, especially its Rhodian species, certain special institutions of the commercial law of Antiquity were borrowed. The relative ease with which Roman Law could dispense with any development of such a rich variety of legal forms was connected with the peculiar character of ancient capitalism, which was both a slave capitalism and a predominantly political capitalism based upon the state. Slaves were used as business instruments through whose contracts the master could acquire unrestricted rights but only limited liabilities. The treatment of the *peculium* in the fashion of a separate fund made it possible to obtain at least part of the results which today are brought about by the various forms of limited liability.[124] Of course, the fact remains that this restriction, in connection with the complete exclusion of all forms

of joint hand from the law of the *societas* and the requirement of all solidary claims and obligations being created by express *sponsio correalis*,[125] is one of the legal symptoms of that absence of stable capitalistic industrial enterprises with continuous credit needs which is characteristic of the Roman economic system. The significance of the essentially political basis of ancient capitalism is indicated by the fact that those very legal institutions which were lacking for private business were recognized already in the private law of the early Empire with respect to publicans (*socii vectigalium publicorum*),[126] i.e., groups of private businessmen to whom the state farmed out the levying of taxes and the exploitation of the state-owned mines and salt works. The legal and economic structure of these associations was similar to the syndicates as they are customarily established today by banks coöperating in the issuance of bonds and other securities: one or more "leading" banks undertake toward the issuer the obligation of providing the full capital in question; other banks join the syndicate with internal liability for the full amount, while still others participate with only limited subscriptions. In Rome, the *socii* of the consortial leader (*manceps*), as they are mentioned in the *interdictum de loco publico fruendo* and in other sources,[127] were members of the *consortium*, while the *affines* subscribed only with limited liability in the manner of a modern *commanditista*;[128] both internally and externally the legal situation was thus quite similar to that of the modern phenomenon.

Whether the institution of *the state* itself should be treated *as a juristic person of private law*, would depend in each case upon both legal-technical and political considerations. If it is done, it means in practice primarily that the legal spheres of the organs of state authority are to be divided into a sphere of personal rights, with claims and obligations ascribed to them as individuals, and an official sphere in which property relations are regarded as separate institutional assets; it means, furthermore, that the sphere of official activity of the organs of the state is divided into a sphere of public and one of private legal relations and that in the latter sphere, which is exclusively concerned with property matters, the general principles of the law of private transactions are applicable.[129] It is a normal consequence of the juristic personality of the state that it has capacity to sue and to be sued in ordinary civil procedure, and on an equal footing with private parties, and that claims may be freely prosecuted against it. From a strictly legal point of view, it is true that the juristic personality of the state has nothing to do with this latter question. The *populus Romanus* had, without any doubt, the capacity to acquire private rights, for instance by way of testate succession, but it could not be sued. The two problems

are also different from a practical point of view. There seems to be no doubt that all compulsory institutional, and thus political, state structures have a juristic personality in the sense of being capable of acquiring rights, even where they avoid being subject to the ordinary process of law. Likewise the juristic personality of the state and its amenability to the process of law may be recognized while different principles may obtain for government and private contracts. But the latter phenomenon has usually been associated, as for instance in Rome, with the exclusion of the ordinary courts and the decision by administrative officials of disputes arising out of government contracts. The capacity to sue and to be sued has been recognized not only for juristic persons but also for numerous groupings of joint hands. Nonetheless, the problem of juristic personality has usually appeared in legal history in close association with the problem of the capacity of organizations, especially public ones, to sue and be sued.

All the problems just discussed were bound to arise wherever the political authority could not deal with private persons as a master deals with his subjects but where it was compelled to obtain their services by free contracts. The problem had to be particularly acute where the political authority had to resort to transactions with capitalists whose credit or whose entrepreneurial organization it needed, and where, in consequence of the free movement of capital among several competing organizations, it could not coerce these services liturgically. The problems were finally bound to arise where the state had to deal with free craftsmen and workers, against whom it either could not, or did not wish to, apply liturgical coercion. The security of private interests was generally increased wherever the juristic personality of the state and the jurisdiction of the ordinary courts came to be recognized. But the denial of either one did not necessarily entail an impairment of this security, as the observance of the state's contractual obligations may be adequately guaranteed by other means. The fact that the king of England could always be sued in court did not protect the Florentine bankers against the repudiation of his enormous debt in the fourteenth century.[180] The lack of any means of procedural coercion against the Roman state treasury did not in general endanger its creditors, and when such a danger nonetheless arose during the Second Punic War, the creditors were able to obtain pledges for their loans which no one attempted to disturb. The French state has remained exempt from the compulsory jurisdiction of the courts even after the Revolution but without impairment of its credit.[181] To some extent the exemption of the public treasury from ordinary legal process has been connected with that principle of setting apart the state from other organizations which developed

in connection with the modern concept of sovereignty. This was certainly the case in France, and in Prussia too. Frederick William I, conscious of his sovereignty, tried by all sorts of chicanery to discourage his "obstinate nobles" from invoking the Imperial Chamber Court (*Reichskammergericht*).[182] The availability of the ordinary process of law was, on the other hand, beyond doubt wherever the corporate status structure of the political organization resulted in the treatment of all administrative grievances as disputes between the holders of privileges or vested rights and therefore as the subject matter of ordinary litigation, in which the prince appeared not as sovereign but as the possessor of a limited prerogative or as one bearer of privileges among others in the political organization. This was the situation in England and in the Holy Roman (German) Empire.

The denegation of actions against the state could, however, also be the result of essentially technical legal factors. Thus in Rome the *censor* was the authority for deciding all claims of individuals against the state or vice versa which, according to our modes of thought, would be claims of private law. But the *censor* was also the authority for disputes between private persons in so far as they turned on questions of law arising from relations touching state property.[183] All tenures in the *ager publicus* and all disputes between the capitalist owners of interests in the public lands and the state contractors (publicans), or between them and the subjects, were thus withdrawn from the high jurisdiction of the juries and referred to simple administrative cognition. This was in effect a positive rather than a negative privilege of the tremendously powerful state capitalists. The lack of jury trial and the dual quality of the magistrate as judge and party representative persisted and was transferred in effect to the fisc of the imperial administration when, since Claudius, following a brief fluctuation under Tiberius, the fisc increasingly acquired the character of state property and ceased to be looked upon as the personal property of the emperor.[184] The distinction, it is true, was not complete and residues remained both terminologically (although such old terms of administrative law as *manceps*, or *praes*[185] came gradually to be replaced by the terms of private law) and in the maxim that the fisc was capable of suing and being sued. Fluctuations between the patrimonial and the institutional conceptions of the imperial property, i.e., of the conceptions of it as belonging to the emperor personally or to the state as an institution, together with considerations of administrative technique and the economic interests of the dynasty, also influenced the various transformations of and differentiations between the several kinds of imperial assets which in theory were all regarded as having a regular standing in court.

Actually the distinction between the emperor as a private person and as a magistrate (ruler) was carried out only under the first emperors. Finally all the property of the emperor was regarded as property of the crown and hence it became customary for the emperor, when he acceded to the throne, to transfer his private fortune to his children. The treatment of acquisitions by way of confiscation and of the numerous legacies which were left to the emperor as a means of reinforcing the validity of testaments, was not clearly elaborated from the standpoint of either private or constitutional law.

Within the structure of Medieval estate corporatism, which we shall discuss later, it was out of the question that the prince as a ruler would be differentiated from the prince as a private individual or that those of his assets which served political ends would be differentiated from those which were to serve his private ends. As we have seen, this lack of differentiation resulted in the acknowledgment of the possibility of suing the British king, or the German emperor. Quite the opposite effect occurred, however, when the claims to sovereignty led to the withdrawal of the state from the jurisdiction of its own organs, although in this connection, too, legal technicalities were used for rather effective resistance to the political aspirations of the princes. The Roman concept of the fisc, which was received in Germany, was used there to serve as the instrument of legal technique which made it possible to sue the state. Consequently, and as a result of the traditional corporate estate concept of the state, it also had to serve as a first basis for a genuine administrative justice far beyond the scope of private law disputes. The concept of the fisc should have produced the concept of the state as an institution already in Antiquity. However, this conceptual step was never taken by the classical jurists because it would have been alien to the existing categories of ancient private law. Not even the "*Auflage*," as it is understood in modern law, was developed so that it could have served as a substitute.[126]

Likewise the concept of *endowment* thus remained entirely alien to Roman law. The only way available was that of establishing a corporative fund, the actual use of which is demonstrated by inscriptions. The true concept of endowment both in its substantive and technical aspects was almost everywhere developed under religious influences. The great mass of endowments have been dedicated from times immemorial to the cult of the dead or to works of religiously meritorious charity. The main interest in the definition of the legal status of such endowments was thus found among those priests to whom the supervision of the endowments' activities was entrusted. Hence a "law of endowments" arose only where the priesthood was sufficiently independent of the lay au-

thority to develop a special body of sacred law. In Egypt, for this reason, endowments have existed from times immemorial.[137] Purely secular endowments, and particularly family endowments, however, were practically unknown everywhere, not only because of technical legal reasons but, without doubt, also for political reasons, unless they used the form of feoffment or similar forms and thus created a dependence of the privileged families on the prince. In the *polis* they were thus completely absent. A change occurred for the first time in Byzantine law, where sacral norms were used as a technical means, after late Roman law had already made the first limited steps in this direction by means of the *fidei commissum*. For reasons which we shall discuss later, in Byzantium the creation of perpetual rents took the form of monastic foundations in which the management and rights to revenue were reserved for the family of the founder. The next phase in the development of this type of endowment was the *wakf* of Islamic law, which has played there a role of immense importance economically as well as in other respects. In the West, the saint was at first treated, from the legal-technical viewpoint, as the owner of the endowment fund.[138] The concept of the secular endowment of the Middle Ages began to develop once the canon law had prepared it for ecclesiastical purposes.[139]

The concept of the *institution* (*Anstalt*) was not fully developed in the purely legal sense until the period of modern theory. In substance it, too, is of ecclesiastical origin, derived from late Roman ecclesiastical law. The concept of institution was bound to arise there in some manner as soon as both the charismatic conception of the bearer of religious authority and the purely voluntary organization of the congregation had finally yielded to the official bureaucracy of the bishops and the latter had begun to seek for a legal-technical legitimation for the exercise of the ecclesiastical rights of property.

No concept of ecclesiastical institution at all had existed in Antiquity. Ever since the secularization of the cult by the *polis*, the temple assets were legally regarded as its, the polis', property. Ancient legal technique aided the Christian church by means of its corporative concept; the early Middle Ages, in so far as church funds were not regarded as the property of the private owner of the church, resorted to the idea of the saint's being the owner and the church's officers his agents. After the declaration of war on the private ownership of churches in the Investiture Conflict,[140] canon law elaborated a peculiar ecclesiastical corporation law, which, in consequence of the authoritarian and institutional elements of Church structure, had to differ from the corporation law of both voluntary associations and corporate status organizations.[141] But this very ecclesiastical corporation law, in turn, markedly influenced

the development of the secular corporation concept of the Middle Ages. It was the essentially technical needs of administration in the modern institutionalized state which led to the establishment as separate juristic persons of innumerable public enterprises such as schools, poorhouses, state banks, insurance funds, savings banks, etc.; having neither members nor membership rights but only heteronomous and heterocephalous organs, they could not be construed as corporations, and thus there was developed for them the *legal* concept of the "institution."

The rational concept of the *corporation* in the more developed form of Roman law was a product of the Imperial period, quite particularly of the law of municipal corporations.[142] Municipalities distinct from the state appeared in large numbers only after the Latin War, when hitherto sovereign cities were received into the community of Roman citizens, without impairment, however, of autonomy. In a definitive way these relations were regulated by laws of the first emperors. In consequence of their mediatization the municipalities were deprived of their status as political institutions; *civitates privatorum loco habentur* ["Cities are deemed to be private persons"] was said already in the second century and Mitteis properly points out that the adjective *commune* began at that time to replace *publicum* with reference to municipal property.[143] Of their litigations, some were treated as administrative, e.g., the *controversia de territorio*, and others as private, especially those arising out of contracts, for which ordinary civil procedure was apparently available. The typical form of the municipal officialdom spread over the Empire; indeed, the titles of municipal magistrates appear also in the private corporations of the Imperial period. This is probably the origin of the bureaucratization of the concept of the corporation according to the pattern of the once political institution of the municipality, for which the absolute separation of the municipal property from that of the individuals was as self-evident as the maxim: *quod universitati debetur singulis non debetur* ["That which is owed to the collective is not owed to its members."—Ulpian in D. 3.4.7.1.]. At the same time, the establishment of voluntary associations in the Julian monarchy was conditional upon a license, undoubtedly for political reasons. Whether at that time the license conferred, as it did in the later period, full, or only partial, juristic personality, is doubtful. It is probable, although not certain, that the expression *corpus collegii habere* referred to full legal capacity. The term typically used in later theory was *universitas*.[144] If it is correct, as Mitteis plausibly asserts, that the internal relations of private corporations were subject only to administrative cognition,[145] it would well fit in with that bureaucratization of the corporations which runs through the entire law of the Imperial period, and it would at the

same time constitute one of those secularizing adaptations of the previously prevailing situation which are characteristic of this entire development. In the Republican period the situation was obviously different. While it is not certain it is also not improbable that the Twelve Tables, just like the laws of Solon, recognized the autonomy of existing corporations. A common purse was, as shown by later prohibitive laws, a matter of course. On the other hand, there was no legal technical possibility of a civil action. It is not even certain that it was available in the Edict before the Imperial period. There was no form of action for disputes between members concerning membership rights. The reason apparently lay in the fact that the private corporations were at that time subject in part to sacral law and in part to administrative law, priestly or magisterial cognition; this fact, in turn, was related to the status structure of the ancient *polis*, which tolerated slaves and metics in the *collegia* [voluntary associations] but not in the political body of the citizenry.

Like the Hellenic phratries,[146] the voluntary organizations of the earlier period, and most other permanent associations of all legal systems as far back as the totemic clans, the oldest known Roman voluntary associations were fraternities (*sodalicia, sodalitates*)[147] and, as such, cult-communities. One brother could no more summon another brother into court than he could summon anyone else to whom he was bound by ties of loyalty. Traces of this state of affairs are retained even in the law of the Pandects, where criminal actions are prohibited between such brethren. In private law, these fraternal relations were significant primarily in their negative consequences, i.e., as situations excluding actionability.[148] For the same reasons, the guilds and trade associations, the existence of which in early Republican Rome is definitely established, were constituted as *collegia cultorum*.[149] Like the Chinese and medieval organizations of the kind, they were fraternities under the protection of their special patron god, who was then acknowledged as legitimate in Rome by the recognition of the *collegium* by the state; thus it was, for instance, with Mercury and the *collegium mercatorum*, which tradition marks as having been very old.[150] The obligation of mutual aid in emergencies and the cult meals, which are as characteristic of them as of the Germanic guilds or all other organizations based on fraternity, were later transformed into rationally organized assistance and burial funds. Quite a few of these *collegia* are known to have been organized during the Empire as funds of this kind.[151] They had nothing to do with the law of the citizens. As long as the sacral organization was more than a mere form, its property was probably protected sacrally; disputes among members were settled by arbitration and conflicts with outsiders probably

by cognition of the magistrate. The magistrate's right of interference was obvious as to those occupational organizations which were important for state liturgies (*munera*). This fact explains the easy transition to the bureaucratization of the Imperial period. It is also probable that the relationships of those agricultural organizations, the persistence of which may only be surmised from our sources, remained outside of the regular jury procedure. The *ager compascuus* was a rudimentary commons, and the *arbitria*, which are mentioned by the agricultural writers,[152] were the residue of a state-regulated but nonetheless autonomous arbitration of disputes among neighbors. Once the *municipium* had arisen as a type that was to be increasingly influential for the entire law of corporations, the law applicable to those corporations which were still permitted grew increasingly uniform during the Imperial period. The remnants of the rights of sodality membership, as far as one could find them at all, disappeared; they remained possible only outside the area of Roman imperial law, e.g., in the craftsmen's phylae of Hellenistic small towns.[153] The latter are not mentioned, it is true, in the Imperial Law. This omission does not prove, however, that there had not existed certain forms of organizations which it did not pretend to regulate. To draw such a conclusion would be as unjustified as it would be to conclude from the absence in the ancient *ius civile* of any regulation of *emphyteusis* or other tenures that they actually did not exist in lands other than those which made up the *ager optimo iure privatus* and which were thus the only ones to be listed in the census rolls.

Medieval continental law stood under the threefold influence of the Germanic forms of sodality, the Canon Law, and Roman Law as received in legal practice. The Germanic forms of sodality were rediscovered by Gierke and are described in all their richness and development in his magnificent work, but we shall not deal with their details, which belong into the context of agrarian history and the history of the enterprise. In the present context a few remarks must suffice to explain those formal principles of treatment with which we are exclusively concerned here. We find there a continuous series of structures ranging from the simple relationships of joint hands to the purely political community, and that meant in the Middle Ages, the municipality. From the point of view of legal technology they all have in common the capacities to sue and to be sued and to own property; the relationships between the entity and the individuals were worked out, however, in the most manifold ways conceivable. The individual might be denied any share in the common fund or he might be regarded as the private owner of a share as his free property, transferable, perhaps, by some form of commercial paper, but representing a share in the total fund

rather than in any one of its particular assets; or, on the very contrary, every member might be regarded as owner of a share in every particular asset. To an ever varying extent the rights of the individuals might be limited and determined as to their content by the community or, on the contrary, disposition by the community might be limited by the rights of the individuals. In varying ways, too, the community could externally be represented and internally managed by one of its officers or a particular member as such or, perhaps to a certain extent at least, by all members. Contributions might have to be made by the members in kind or through personal services. Membership might be open or closed so that it could be acquired only through a resolution of the members. The administration approximated, in varying degrees, those forms which were found in the political organizations, often to such an extent that the coercive powers within the organization or toward outsiders were distinguishable from the coercive power of the political organization only by the nature of the coercive means or by its heteronomy as to the political organization. On the other hand, the collectivity was also treated as the bearer of personal rights and obligations. Like any private person it could have the right to a name, rights of status (*Standesrechte*), or the monopoly of the exclusive use of certain inventions; it could be held liable for certain unlawful acts, especially certain acts and omissions of its agents. The latter situation was so far from being exceptional that there were entire epochs, especially in England, when collective personalities were regarded as the bearers of certain duties and in the event of failure of performance were regarded as the debtor of the fine imposed by the king.[154] The collectivities could assume almost every one of the forms which we shall encounter in the course of our examination of political organizations: e.g., direct administration or representative management in the name of the participants, resting on either equality or inequality; with office holders selected by rotation or election; or management could be a lord's right, possibly limited by norms or tradition but otherwise autocratic, pertaining either to a single individual or to a firmly delimited group of persons, and acquired through periodic election or some other type of appointment or through inheritance or through other acquisition as a transferable right, title to which could be connected with that to some piece of property. The position of the organs of the collectivity could tend toward constituting a prerogative composed of clearly defined rights, i.e., a bundle of concrete but strictly limited privileges to exercise certain particular authoritative powers as subjective rights; or it could be more like a governmental power limited by objective norms but free within its scope in the choice of means, and in that case the organization could approximate either the type of the as-

sociation or that of the institution. As to its powers, management could be strictly bound to the particular ends of the organization or it could enjoy a greater or lesser freedom of choice. The latter factor was also important for the degree of autonomy enjoyed by the organization as such; it could be lacking entirely, and the acquisition of rights and obligations could be regulated automatically according to fixed rules, as, e.g., in the case of certain liturgical organizations in England; or the organization could possess broad powers of autonomous enactment, limited by elastic norms of a conventional, statutory or otherwise heteronomous character.

Which of these numerous alternatives was realized in any particular instance was, and under a system of freedom of association still is, determined by the concrete ends and, quite particularly, by the economic means of the particular organization. The organization may be a predominantly economic community. In that event the structure is essentially determined by economic factors, especially the extent and the role of "capital" and of its inner structure, on the one hand, and the basis of credit and risk, on the other.

In an organization aiming at capitalistic profit, such as a business corporation, a mining or a shipowners' company, or a company for financing state needs or colonial enterprise, capital is of predominant significance for the efficiency of the whole, and the prospect of a share in the profits for the interests of the members. Such an organization thus requires that, at least as a general rule, membership be closed and that the purposes be fixed in a relatively stable way; also, that the membership rights be formally inviolable and transferable upon death and, at least usually, *inter vivos;* that the management be carried on bureaucratically; that the members participate either themselves or through proxies in an assembly that is *de iure* organized democratically but in fact plutocratically, and that adopts its resolutions, after discussion, by a vote proportionate to capital shares. The special aim of such organizations, furthermore, does not require personal liability of the members externally, since it is irrelevant for the credit standing of the enterprise. It can also be dispensed with internally, except, however, in the mining company, in consequence of the peculiar structure of mining capital.[165]

All this is different in the case of an organization aiming at self-sufficiency without the use of money; the more comprehensive its purposes are, the more it requires the preponderant authority of the collectivity, the absence of fixed membership rights, and an approximation to communist economy upon either a directly democratic or a patriarchal basis, such as is found in the household community, the *Gemeinderschaft,*[165a] or a system of strict communal tillage (*Feldgemeinschaft*).

As membership in the organization becomes increasingly closed and internally connected with fixed appropriation, as is the case in the village and commons community, the membership rights will come more to the foreground, whereas the land remaining under communal control becomes part of the individually appropriated rights; it will be administered by members in rotation, by hereditary bodies, or by lordly authority. Finally, in voluntary organizations established for the communal supplementation of individual production or consumption, as, for instance, in the modern cooperatives, membership is usually closed since membership rights, although firmly appropriated and, like membership duties, firmly delimited, are ordinarily not freely alienable; although personal liability tends to become more significant for the credit standing of the organization, it is usually limited, unless the risk can be clearly determined, in which case it may be unlimited; administration is formally bureaucratic but in practice is conducted quite frequently by *honoratiores*.[156] Individual membership rights in the collective fund increasingly lose their structurally determinative significance the more the organization comes to serve an indefinite plurality of interests and, particularly, of privileged persons, while the contribution of capital becomes less significant relative to periodical contributions or payments by the interested parties for the services rendered by the collectivity. Such a situation has arisen in the case of the purely economically oriented insurance mutuals, but even more so, in the case of institutions serving ends of social security or charity.[157] Where, finally, the organization appears as an economic unit meant to serve primarily noneconomic ends, the guaranteed property rights of the members become insignificant and economic considerations lose their importance in the determination of the structure of the organization.

Generally it appears, however, that the development of the legal structure of organizations has by no means been predominantly determined by economic factors. This fact is proved primarily by the sharp contrast between medieval and also modern English developments, on the one hand, and the Continental, especially the German, development on the other. In English law the sodality, as defined by Gierke, did not exist after the Norman invasion, and no concept of corporation of the Continental type was developed until modern times.[158] Apart from rudimentary beginnings, there was no group autonomy in the sense and scope in which it was taken for granted in medieval Germany, and there was no normatively and generally regulated juristic personality of associations. Sodalities of the kind of Gierke's theory, have, as shown by Maitland, and later by Hatschek,[159] found almost no place in English legal life, except in that form which Gierke designated as authoritarian asso-

ciations (*Herrschaftsverbände*);[160] significantly, however, these latter can be, and in England have been, subsumed under juristic categories different from those formulated by Gierke. This absence in England of the allegedly Germanic form of the law of organizations (*Verbandsrecht*) occurs not only in spite of the non-reception of Roman law but was caused, at least in part, by this very fact. The absence of the Roman corporation concept facilitated the development of a situation in England in which, through the canon law, at first only ecclesiastical institutions possessed effective corporate rights, while later on all English organizations tended to be ascribed a similar character. The theory of the "corporation sole," i.e., the *dignitas* represented by the succession of officers,[161] gave in English legal doctrine the possibility of treating state and communal administration as juristic persons in the same way in which ecclesiastical authorities were treated in canon law. Until the seventeenth century the king was regarded as a "corporation sole,"[162] and if even today it is neither the state nor the exchequer (*Fiskus*) but the crown which is regarded as the bearer of all the rights and obligations of the political organization,[163] it is a consequence of the canon law influence as well as of the earlier absence of the German corporation concept as influenced by Roman law, which absence, in turn, was brought about by the political structure of the estate corporative state (*Ständestaat*). In modern times the English corporation, once it had come to exist at all, essentially retained its character as an institution rather than a voluntary association; it never, at any rate, became a sodality of the German type. These facts make us suspect that on the Continent Roman law was less responsible for the decline of the medieval law of sodalities than has frequently been believed. The medieval organizations were, it is true, quite alien to the law of Justinian. But the Romanist jurists, by whom it was interpreted, were compelled to accommodate the existing needs. Their theories had thus to use conceptual tools of frequently questionable character, but even so they were hardly sufficient to undermine the existence of the medieval organizations. At any rate, that the concept of the corporation came to take the place of the vague German forms of thought was not entirely due to their efforts, although they contributed a good deal. The real reasons for the developments both in England on the one side and on the Continent, specifically Germany, on the other, were primarily political ones. This statement applies to the Middle Ages as well as to the early modern period. The essential difference was this: In England royal power was strong and centralized and, under the Plantagenets and their successors, disposed of highly developed technical means of administration. In Germany, on the other hand, no political center was in existence.

Another factor was constituted by the continued effectiveness of certain feudal notions in the English law of real property.

This extremely institutional and autocratic structure of the corporation was, however, not the only relevant form in England. As substitute for the Continental corporation, we find the technique of treating certain persons or bearers of office as "trustees," i.e., persons to whom certain rights are entrusted for the benefit of either some certain beneficiary or of the public at large. Since the end of the seventeenth century not only the king but also certain municipal and parish officers have every now and then been regarded as trustees. Indeed, wherever we are presently using the concept of "special purpose fund" (*Zweckvermögen*),[164] English law resorts to trusteeship as the most adequate technical device. The characteristic element in this institutional approach is that the trustee not only may but must do what is in his jurisdiction; it is, thus, a substitute for the concept of public office (*Amtsbegriff*). The origin of the trust in this sense lay, just as in similar cases that of the Roman *fidei commissum*, primarily in the need to circumvent certain prohibitory laws, especially the laws of mortmain and certain other limitations imposed by the legal system.[165] A second cause was the absence in the earlier Middle Ages of any concept of corporation. When English law did finally develop such a concept, the trust continued to apply to those institutions which could not be construed as corporations; but a similar institutional trend has continued persistently to play an important role in the entire English law of corporations.

It was the last mentioned situation which accounts for the fact that the structure of the village community (*Markgenossenschaft*) was much more authoritarian in English than in German law and that the landlord was usually regarded as the owner of the commons, while the peasants were looked upon as mere grantees of *iura in re aliena* ["rights in another person's land (or chattel)"]. In view of this consistently held theory their right of access to the king's courts was of little use. The final result was the recognition of the fee simple as the fundamental form of English real property in a far more extreme form than that in which the *ager optimo iure privatus* of Roman law [cf. sec. iv, n. 64] ever prevailed in practice. Undivided communities of heirs and all the other forms which were derived from it in German law were excluded already through the feudal principle of primogeniture. The principle of tracing all land titles ultimately to a royal grant necessarily resulted in the view that the dispositive powers of all organizations were but special titles of certain persons and their legal successors which could be acquired only by way of privilege. Maitland's studies[166] have shown that, as a result of the purely automatic distribution of rights and duties to each individual

in accordance with his share, which was derived from the old hide system and transferred to all similar organizations, English practice had little need to deal as an independent legal subject with the totality of the individuals participating in a community. The situation was intensified because the state was in part feudal and in part specifically *ständisch*. It was brought about first by the laws of mortmain which prohibited, in the interests of the king and the nobility, all alienation of land to the "dead hand" including the municipalities.[107] Exemptions from this prohibition could be obtained only through special privilege, and in fact, the city privileges of the fifteenth century which, beginning with the privilege of Kingston of 1439, granted corporation rights with positive content to the cities in question, were striven for by the cities as the very means of escape from these prohibitions. But the law of corporations thus remained a law of privileges and subject to the general influences of a legal development peculiar to a society of estates. From the king and Parliament downward all authority was regarded as a complex of specific privileges and prerogatives. Whoever claimed to exercise a right acquired otherwise than through private contract had to derive it legally from a valid grant and could thus have it only within certain definitely established limits. Positive proof of grant could be dispensed with only in the case of immemorial custom. Even after the emergence of the concept of the corporation there persisted into modern times the doctrine, in all its rigor, according to which every organization, if it were to transcend in its legal actions the range of the privileges explicitly granted to it, would be acting *ultra vires*, hence be guilty of an abuse of privilege and thus subject to dissolution as it was actually exercised on a large scale by the Tudors and Stuarts.[108]

The results were that neither a public nor a private corporation could be established in any way other than that of special grant; that no such grant would be given except for a limited purpose and upon grounds of public utility; and that all corporations were political, or politically authorized, limited purpose corporations, which were to remain under constant control and supervision. In the last analysis, the origin of this legal situation can be traced to the liturgical character of the Norman administration. The king assured himself of the contributions needed for the government and the administration of justice by forming compulsory organizations with collective duties similar to those of the Chinese, the Hellenistic, the late Roman, the Russian, or other legal systems. A *communaltie* existed exclusively as an organization with liturgical duties toward the royal administration, and it had its rights only by virtue of royal grant or indulgence. Otherwise all such communities legally remained *bodies non coporate*, even into modern times.

In consequence of the rigorous patrimonial central administration this integration of all associations in the state was at its maximum at the beginning of English legal history and had to undergo a gradual weakening from then. In Continental legal history, on the other hand, it was the bureaucratic princely state of modern times which broke the bonds of the traditional corporative autonomy; subjected to its own supervision the municipalities, guilds, village communities, churches, clubs, and other associations of all kinds; issued patents; regulated and controlled them; canceled all rights which were not officially granted in the patents; and thus for the first time introduced into actual practice the theory of the "legists,"[169] who had maintained that no organizational structure could have juristic personality or any rights of its own except by virtue of a grant by the *princeps*.[170]

Within those territories where it had lasting effects the French Revolution destroyed not only every formation of corporations but also every type of voluntary association which could not be expressly licensed for narrowly defined special ends, as well as all associational autonomy in general. This destruction was motivated primarily by those political reasons which are characteristic of every radical democracy, but some part was also played by doctrinaire conceptions of natural law as well as considerations of bourgeois-economic orientation which in their doctrinairism also tended towards ruthlessness. The Code excludes the very concept of juristic person by simply saying nothing about it. The trend was reversed, however, by the economic needs of capitalism and, for the noncapitalistic classes, the needs of the market economy on the one hand, the agitational needs of the political parties on the other, and, finally, the growing substantive differentiation of the cultural aspirations in connection with the personal differentiation of cultural interests among individuals.[171]

Such a sharp break with the past was never experienced in the English corporation law. English legal theory began in the sixteenth century to elaborate, at first for the cities, the concept of "organ" and of "acting as an organ" as legally distinct from the private sphere, and in doing so it used the concept of the ***body politic***, i.e., the Roman concept of *corpus*.[172] It brought the guilds into the domain of corporation types, conferred upon the municipalities the possibility of procedural and contractual autonomy, provided they had a seal, and gave the licensed corporations a limited autonomy by allowing them to have their own by-laws on the basis of the majority principle rather than unanimity. In the seventeenth century it came to deny the delictual capacity of corporations but, until the eighteenth century, corporations were treated in matters of property merely as trustees for the individual members, whose

claims against the corporation were enforced only in equity. It was not until the end of the eighteenth century that English law permitted, and even then only reluctantly, the termination of a stockholder's liability for the debts of the corporation after he had transferred his shares, and even then the law still excepted the case of the company's insolvency. Blackstone at last was the first to make the real distinction between corporate and private assets, referring to Roman law in doing so.

The gradually increasing influence of the needs of capitalistic enterprisers played an important role in this development. The great Companies of the mercantilist Tudor and Stuart periods were legally still state institutions, as was also the Bank of England.[173] The medieval requirements of the use of the seal for every instrument to be issued by the corporation, the treatment of the shares of stock as real property whenever some part of the corporate assets consisted of land, and the limitation of corporate purposes to public tasks or tasks of public utility were completely impracticable for business corporations and had thus to be dropped in the course of the eighteenth century. But it was only in the nineteenth century that limited liability was generally introduced for business corporations and that a system of general normative regulation was established for all joint-stock companies, together with certain special norms for friendly and benevolent societies, learned societies, insurance companies, savings banks, and, finally, labor unions. In all these cases the norms are by and large similar to the corresponding norms of the Continent.[174] The old forms, however, were not entirely discarded. Even today the appointment of trustees is still required for the appearance in court for a whole range of recognized voluntary associations, for instance a friendly society,[175] while for an unincorporated voluntary association (club) a unanimously granted power of attorney is necessary for every legal transaction.[176] The doctrine of *ultra vires* is still alive, and an individual charter is still required for every corporation which cannot be fitted in with any one of the statutory patterns. In practice, however, the situation is not much different from that which has existed in Germany ever since the Civil Code took effect.

Not only this brief comparative sketch but every glance at the great legal systems shows that none of the great variations in legal development can be explained by the all too frequently invoked slogan of the individualistic character of the Roman law as contrasted with the social character of Germanic law.[177]

The great wealth of forms of German medieval sodalities was conditioned by quite particular, predominantly political, factors, and it was and still is unique. Russian and Oriental law, including Hindu law, have recognized liturgical collective liability and the corresponding

collective rights of the compulsory organizations, especially of village communities, but also of craftsmen.[178] They also have, although not everywhere, the solidary liability of the family community and quite frequently of familylike work fraternities like the Russian *artel*. But they never found a place for such a richly differentiated law of sodalities as that of the medieval Occident or for the rational concept of the corporation as it was produced in the confluence of Roman and medieval law. The Islamic law of endowments was, as we have seen, prefigured by the ancient Oriental, particularly Egyptian, and above all Byzantine, legal developments, but it contained no germs of a theory of corporations. Finally, Chinese law shows in a typical way the concomitance of the authority of patrimonial princes and the maintenance of the family and kinship groups in their significance as guarantors of the individual's social status. A conception of the state as independent of the private person of the emperor did not exist any more than a law of private corporations or voluntary associations, apart from the politically motivated police prohibitions against all organizations which would be neither familial, fiscal, nor specially licensed. Municipalities were recognized in official law only as organizations for carrying the family liability for taxes and charges. On the basis of the kinship group membership, they still exercise the strongest conceivable authority over their members, organize common institutions of all sorts of economic activity, and manifest a degree of cohesion towards outsiders with which the officials of the imperial authority had to reckon as with the strongest local authority. These phenomena, which are no more recognized in the legal concepts of official Chinese law than they were elsewhere, have often enough impeded its effectiveness. For no clearly defined content could be acquired by an autonomy which expressed itself externally in blood feuds of kinship groups and towns but was never recognized by the official law. The situation of the private organizations other than the kinship groups and families, especially of the highly developed mutual loan and burial societies and the occupational organizations, corresponds in part to the situation of the Roman imperial period and in part to that of Russian law of the nineteenth century. Despite that, the concept of juristic personality in the sense of the law of Antiquity is completely absent and the liturgical function has disappeared, if it ever existed at all, which is by no means certain. The capitalistic property communities (*Vermögensgemeinschaften*) have come to be emancipated from formal dependence on the household just as they did in medieval southern Europe, but in spite of the *de facto* use of such institutions as the firm name, they never reached the point of becoming definite legal types as they did in Europe in the thirteenth

century. Collective liability, corresponding to the general state of the law of obligations, took as its origin the delictual liability of the kinship groups, which still persists in fragmentary form. But contractual liability, which is still a purely personal liability, has not assumed the form of solidarity but is limited to the duty of group members to bring forward an absconding fellow member; in all other respects co-debtors are liable only *pro rata* rather than solidarily. Only fiscal law recognized the solidary liability of the family and its property, while collective property did not legally exist for private associations any more than it did in Roman Antiquity. Like the ancient companies of publicans, the modern Chinese business associations are legally treated as consortia or as *sociétés en commandite* with personally liable directors. Just as in Antiquity and in the Orient, this underdeveloped state of the Chinese law of private associations and business organizations was caused by the continuing significance of the kinship group, within which all economic association is taking place, also by the obstruction of autonomous corporations by political patrimonialism, and finally by the general reluctance to invest capital in anything other than fiscal enterprises and trade.

The different course of medieval Occidental development was caused primarily by the fact that here patrimonialism was of a corporate status rather than a patriarchal character, which, in turn, was caused essentially by political and, particularly, military and fiscal reasons. In addition there was the development and maintenance of the form of administration of justice associated with the folk community. Wherever it was lacking as, for example, in India ever since the rise to predominance of the Brahmins, the actual variety of corporate and sodality forms of associations was never accompanied by a correspondingly rich legal development. The long and persistent absence of rational and strong central authorities, as it constantly recurred after temporary intervals, did indeed produce an autonomy of mercantile, occupational, and agricultural communities, which is explicitly recognized by the law. But no legal development of the German type arose therefrom. The practical consequence of the folk community type of the administration of justice was that pressure came to be exercised upon the lord, both the political and the landlord, to render judgment or pronounce customals not in person or through friends but through members of the popular assembly or at least under their decisive influence, lest they be regarded as not really binding. No such determination could be made without the participation of the groups affected by the particular body of law. Copyholders, serfs, and retainers (*Dienstmannen*) had to be called in whenever the rights and obligations arising from their economic and personal dependence relations were involved; and vassals or townsmen, whenever

rights and obligations concerning their political and contractual dependence were in issue.[179] This situation derived originally from the military character of the public court community, but with the decay of the central authority it was taken over by all organizations with granted or usurped administrations of justice. It is clear that this system constituted the strongest possible guaranty of both autonomous lawmaking and corporate or sodalian organization. The origin of this guaranty and of that *de facto* autonomy of the groups of legally affected parties in the formation of their own laws, which was necessary to make possible the development of the Occidental law of corporations and sodalities as well as of the specifically capitalistic forms of association, was conditioned by essentially political and technical administrative considerations. Quite generally the lord was preoccupied with military activities and he hardly had at his disposal a rational administrative apparatus which would have been dependent on him and which he could have used to supervise his subordinates; thus he had to depend on their good will and on their coöperation in meeting his claims and thus had to meet the traditional or usurped counterclaims of his dependents against him. The typification and appropriation of the rights of these dependent strata as sodality rights had their source in this situation. The guaranty of the associational norms was increased through a custom which stemmed from the form of lawfinding by the popular assembly, namely, that of periodically ascertaining the prevailing law of the consociation by oral testimony and recording it in customals, combined with the tendency of the dependents at propitious moments to ask the lord for the confirmation of this law as their privilege.[180] Such occurrences within seigneurial, political and economic organizations naturally increased the probability of maintaining corporate autonomy also for the free and voluntary associations. No such situation could prevail in England, because the royal courts of the strong patrimonial power suppressed the old administration of justice by the popular assemblies of the counties, municipalities, etc. Hence the development of a law of sodalities was inhibited; customals and privileges of autonomy were rare, and those few which existed lacked the peculiar character of their Continental counterparts. In Germany, too, sodalian autonomy, and with it, the law of the sodalities, declined rapidly as soon as the political and seigneurial authorities had become able to create the administrative apparatus that allowed them to dispense with the folk type of administration of justice.[181]

It was, of course, no accident that this development coincided with the intrusion of Romanist traits into the system of government, but Roman law as such did not play the decisive role. In England the rise

of a law of sodalities was prevented by devices of Germanist legal technique. Besides, those associations which could not be fitted into the categories of the corporation sole or the trust or the patented forms of organization were regarded as purely contractual relations of their members, with the statutes being accorded validity only in the sense of a contractual offer to be accepted by joining membership. Such a view closely corresponds to a construction of the Romanist type. The political structure of the lawmaking organizations and the peculiar characteristics of the professional bearers of the legal structure, whom we shall discuss later [*infra*, sec. *iv*], were the decisive factors.

7. *Freedom and Coercion*

The development of legally regulated relationships toward contractual association and of the law itself toward freedom of contract, especially toward a system of free disposition within stipulated forms of transaction, is usually regarded as signifying a decrease of constraint and an increase of individual freedom. It is clear from what we have been saying, in how relative a sense this opinion is formally correct. The possibility of entering with others into contractual relations the content of which is entirely determined by individual agreement, and likewise the possibility of making use in accordance with one's desires of an increasingly large number of type forms rendered available by the law for purposes of consociation in the widest sense of the word, has been immensely extended in modern law, at least in the spheres of exchange of goods and of personal work and services. However, the extent to which this trend has brought about an actual increase of the individual's freedom to shape the conditions of his own life or the extent to which, on the contrary, life has become more stereotyped in spite, or, perhaps, just because of this trend, cannot be determined simply by studying the development of formal legal institutions. The great variety of permitted contractual schemata and the formal empowerment to set the content of contracts in accordance with one's desires and independently of all official form patterns, in and of itself by no means makes sure that these formal possibilities will in fact be available to all and everyone. Such availability is prevented above all by the differences in the distribution of property as guaranteed by law. The formal right of a worker to enter into any contract whatsoever with any employer whatsoever does not in practice represent for the employment seeker even the slightest freedom in the determination of his own conditions of work, and it does not guarantee him any influence on this process. It rather means, at least

primarily, that the more powerful party in the market, i.e., normally the employer, has the possibility to set the terms, to offer the job "take it or leave it," and, given the normally more pressing economic need of the worker, to impose his terms upon him. The result of contractual freedom, then, is in the first place the opening of the opportunity to use, by the clever utilization of property ownership in the market, these resources without legal restraints as a means for the achievement of power over others. The parties interested in power in the market thus are also interested in such a legal order. Their interest is served particularly by the establishment of "legal empowerment rules." This type of rules does no more than create the framework for valid agreements which, under conditions of formal freedom, are officially available to all. Actually, however, they are accessible only to the owners of property and thus in effect support their very autonomy and power positions.

It is necessary to emphasize strongly this aspect of the state of affairs in order not to fall into the widely current error that that type of "decentralization of the lawmaking process"—a quite suitable phrase of Andreas Voigt's[182]—which is embodied in this modern form of the schematically delimited autonomy of the parties' legal transactions is identical with a decrease of the degree of *coercion* exercised within a legal community as compared with other communities—for instance, one organized along "socialist" lines. The increasing significance of freedom of contract and, particularly, of enabling laws which leave everything to "free" agreement, implies a relative reduction of that kind of coercion which results from the threat of mandatory and prohibitory norms. Formally it represents, of course, a decrease of coercion. But it is also obvious how advantageous this state of affairs is to those who are economically in the position to make use of the empowerments. The exact extent to which the total amount of "freedom" within a given legal community is actually increased depends entirely upon the concrete economic order and especially upon the property distribution. In no case can it be simply deduced from the content of the law. Enabling laws of the sort discussed here would certainly play a slight role in a "socialist" community; likewise, the positions from which coercion is exercised, the type of coercion, and those against whom it is directed, will also be different from what they are in a private economy. In the latter, coercion is exercised to a considerable extent by the private owners of the means of production and acquisition, to whom the law guarantees their property and whose power can thus manifest itself in the competitive struggle of the market. In this type of coercion the statement "*coactus voluit*"[183] applies with peculiar force just because of the careful avoidance of the use of authoritarian forms. In the labor market, it is

left to the "free" discretion of the parties to accept the conditions imposed by those who are economically stronger by virtue of the legal guaranty of their property. In a socialist community, direct mandatory and prohibitory decrees of a central economic control authority, in whichever way it may be conceived, would play a much greater role than such ordinations are playing today. In the event of disobedience, observance will be produced by means of some sort of "coercion" but not through struggle in the market. Which system would possess more real coercion and which one more real personal freedom cannot be decided, however, by the mere analysis of the actually existing or conceivable formal legal system. So far sociology can only perceive the qualitative differences among the various types of coercion and their incidence among the participants in the legal community.

A (democratically) socialist order (in the sense current in present-day ideologies) rejects coercion not only in the form in which it is exercised in the market through the possession of private property, but also the direct coercion exercised on the basis of purely personal claims to authority. It would recognize only the validity of agreed abstract laws, regardless of whether they are called by this name. Formally, the market community does not recognize direct coercion on the basis of personal authority. It produces in its stead a special kind of coercive situation which, as a general principle, applies without any discrimination to workers, enterprisers, producers and consumers, viz., in the impersonal form of the inevitability of adaptation to the purely economic "laws" of the market. The sanctions consist in the loss or decrease of economic power and, under certain conditions, in the very loss of one's economic existence. The private enterprise system transforms into objects of "labor market transactions" even those personal and authoritarian-hierarchical relations which actually exist in the capitalistic enterprise. While the authoritarian relationships are thus drained of all normal sentimental content, authoritarian constraint not only continues but, at least under certain circumstances, even increases. The more comprehensive the realm of structures whose existence depends in a specific way on "discipline"—that of capitalist commercial establishments—the more relentlessly can authoritarian constraint be exercised within them, and the smaller will be the circle of those in whose hands the power to use this type of constraint is concentrated and who also hold the power to have such authority guaranteed to them by the legal order. A legal order which contains ever so few mandatory and prohibitory norms and ever so many "freedoms" and "empowerments" can nonetheless in its practical effects facilitate a quantitative and qualitative increase not only of coercion in general but quite specifically of authoritarian coercion.

NOTES

1. See sec. *i*:1(a). As to the distinction between claim norms and reglementations, cf. JELLINEK, SYSTEM, esp. 63–76 (*Reflexrecht und subjektives Recht*); W. JELLINEK, VERWALTUNGSRECHT (1948) 200, 305. The validity of the distinction is denied by LABAND, STAATSRECHT (1911) I, 331; III, 207. A synthesis is tried by H. KELSEN, REINE RECHTSLEHRE (1934) 39; THEORY 77, 78, 84. The influence on Weber of Georg Jellinek, his Heidelberg colleague and personal friend, was considerable, not only in matters of detail but in giving support to Weber's sociological approach to law in general. It was applied by Jellinek especially in his ALLGEMEINE STAATSLEHRE, 3rd ed. 1914.

2. For a typical presentation of this trichotomy see ENNECCERUS 56; 1 AUSTIN, LECTURES ON JURISPRUDENCE (1885) 39, 92, 684, 710 *et seq.* As to the third kind of right the text is not entirely clear. What is meant is not the situation in which *A* can allow B to engage in certain conduct but, as the following sentences show, the situation in which *A* can engage in certain conduct without being subject to legally justified interference by one, or more, or all, others.

3. Weber is using the term *Freiheitsrecht* ("privilege") in the sense in which it had been developed by G. JELLINEK in SYSTEM 89. It might be noted that Jellinek's and Weber's use of the terms "claim" and "privilege" resembles Hohfeld's terminology; cf. HOHFELD, FUNDAMENTAL LEGAL CONCEPTIONS (1923).

4. Weber is thinking here of the contract to devise or bequeath. In American law such a contract binds the promisor to make a certain will which, in turn, creates the right of the devisee or legatee. In German law the "contract of inheritance," if properly concluded, is as such the basis for the beneficiary's right upon the death of the promisor; it does not thus need to be implemented by a will. See German Civil Code, Secs. 2278–2302.

5. See Austrian Civil Code, Sec. 1249.

13. On men's houses, see LOWIE, PRIMITIVE SOCIETY (1925) 197, 299, 306, 315, 368; H. SCHURTZ, ALTERSKLASSEN UND MÄNNERBÜNDE (1902); W. SCHMIDT und W KOPPERS, GESELLSCHAFT UND WIRTSCHAFT DER VÖLKER (1924) 224. Cf. also *infra*, ch. IX:2.

14. This view of the origin of procedural law was also maintained by MAINE, at 385. The opposite view that the law of procedure originated in the power of rulers to command their subjects to submit to arbitration has been advanced especially by F. OPPENHEIMER, THE STATE (1914) 78–81, and L. GUMPLOWICZ, OUTLINES OF SOCIOLOGY (1899), 179; cf. SEAGLE 62. It is an oversimplification to say that all procedural law had its origin either in voluntary or in commanded submission, for many other factors must have been involved. Where the disputes between primitive kinship groups were mediated or arbitrated, some additional circumstance must have occurred to change voluntary submission into compulsory submission to adjudication. It is, therefore, perhaps more correct to say that different rules of procedure had different origins; that this was so in Roman law has been argued by so careful a scholar as WENGER (at 11); but see, for another differentiating view, EHRLICH 137 *et seq.* As to the controversy in general, see THURNWALD 145 *et seq.*; DIAMOND, cc. xxx, xxxi.

15. One example for many: The 1925 edition had "lord mayor" instead of Lord Chancellor, which resulted in a lengthy footnote in the English edition on the Mayor's Court. (R)—With respect to the Roman *praetor* Weber seems to be thinking primarily of the *litis contestatio* of the formulary procedure. Through the threat of property sequestration (*missio in bona*) the *praetor* could compel the parties to agree upon the formula proposed by him or worked out, with his coöperation, before him. Once the formula has been settled "the praetor gives the document to the plaintiff. . . And now follows the formal contract between the parties: the one who has now come out . . . as actor hands the document to the defendant, who accepts it." WENGER 139. As to the numerous controversies concerning the *litis contestatio* and its character as a compulsory contract, see WENGER 17, 139. Other compulsory contracts may be found in those various cases in which the *praetor* could compel one party to promise to give security to the other (*cautiones; stipulationes in iure*); cf. WENGER 102.

17. On the oath, see THURNWALD 176; WENGER 125, 336; POLLOCK AND MAITLAND I, 39; II, 600; DIAMOND 52, III, 336–339, 350–390.

18. SCHMIDT UND KOPPERS, *op. cit.* I, 497; 1 WESTERMARCK, HISTORY OF HUMAN MARRIAGE (1925) 233.

19. See M. EBERT, REAL-LEXIKON DER VORGESCHICHTE (1926) VI, sub tit. "Kauf," 246–248; VIII, sub tit. "Markt," 34.

20. In Roman law, at least with respect to the sale of *res mancipi* by way of *mancipatio* (see *infra*, n. 22) the original source of the seller's obligation arising in the case of a defect of title or quality is predominantly said to have consisted in a wrong committed by him (see E. RABEL, DIE HAFTUNG DES VERKÄUFERS WEGEN MANGELS IN RECHT [1902] 8/9). Jhering, whose opinion seems to have influenced Weber, believed that the wrong consisted in a *furtum* ("theft") which would be committed by the seller when he accepted the buyer's money as the price for goods which did not belong to him (GEIST DES RÖMISCHEN RECHTS, I, 157; III, Part i, 138). It is more probable, however, that the seller's wrong consisted in his failure to come to the buyer's defense when the latter's right to quiet possession and enjoyment was questioned by a third party's claim of supe-

rior title. A duty of the seller to defend the buyer against such attacks has been found to have existed in the archaic stages of Greek, Germanic, Slavic, and numerous other laws; cf. RABEL, *loc. cit.* 6; DARESTE, *op. cit.* 166, 184, 202, 232, 263; but compare now H. Coing, *Die* clausula doli *im klassischen Recht* (1951) FESTSCHRIFT FRITZ SCHULZ 97.

21. Chartal money: all types of money which is either stamped or coined, in contrast with the natural means of exchange or payment.

22. In transactions *per aes et libram* ("by copper and scales") the money was weighed for the recipient in the presence of five witnesses and a weigher (*libripens*); certain ritual words had to be spoken. This institution was principally used in the *mancipatio*, by which title to goods was transferred, i.e., goods which were the mainstay of a Roman farm household (land, slaves, and cattle), the so-called *res mancipi* (*supra* n. 20). Title to other goods could be transferred, at least in classical times, in the less formal way of simple *traditio*. Transaction *per aes et libram* was also used in connection with the *nexum*, the archaic way of creating a debt for a loan, and also for purposes of adoption, making wills, and marriage. See *infra* n. 24. Cf. BUCKLAND 236; JOLOWICZ, 151. As Weber states, the transactions *per aes et libram* were, or better seem to have been, one of the two principal methods by which legally binding transactions could be made in the archaic stage of Roman law. The other method was the *in iure cessio*, which, similar to the common law fine, seems essentially to have been a mock trial before the magistrate intended to result in an authoritative authentication of the fact that a grantor had yielded his title to his grantee.

23. The 1925, and still the 1956, edition read "*Zwangskontrakt*," which in English was rendered "coercing contract." However, this turned out to be a simple misreading of "*Zweckkontrakt*." The error obscured several passages in the old translation. (R).

24. *Coemptio* and *confarreatio* are usually stated as the two forms of marriage of early Roman law. The latter was an elaborate religious ceremony, which seems to have been impractical for anyone but the members of the patrician aristocracy. *Coemptio* was a transaction *per aes et libram* which seems to have been essential not so much for the creation of the marriage relation as such as for the acquisition by the husband of the old-style marital power (*manus*) over his wife. In later republican times both kinds of formality became obsolete. The marriage was regarded as validly concluded by the informal consent of the parties, usually evidenced by the celebration of the bride's entry into the groom's house (*in domum deductio*). In the old-style *coemptio* the head of the household to which the bride belonged seems to have transferred for a nominal price his power over her to the groom. In so far as *coemptio* was at all used in classical times, the *mancipatio* with the groom seems to have been performed by the bride herself. Cf. 1 BONFANTE, CORSO DI DIRITTO ROMANO (1925) 39 *et seq.*; Kunkel, 14 PAULY-WISSOWA, REALENZYKLOPÄDIE DER KLASSISCHEN ALTERTUMSWISSENSCHAFT 2259; F. SCHULZ, CLASSICAL ROMAN LAW (1951) 103; CORBETT, ROMAN LAW OF MARRIAGE (1930); for further literature, see JÖRS AND KUNKEL 271 *et seq.*, 416.

25. The term obligation is more commonly used in the civil law than in the common law jurisdictions. In civil law terminology obligation (Lat. *obligatio*) means personal duty of any kind, such as duty to pay money, to deliver goods, to convey a piece of land, to render services, to refrain from engaging in certain conduct, etc. The obligation can arise out of a contract (*ex contractu*), out of a tort (*ex delicto*), or directly out of a command of the legal order (*ex lege*); subdivisions of the latter category are the obligations *quasi ex contractu* and *quasi ex delicto*.

26. *Wergilt* (*wergeld*)—expiatory payment for wrong, especially as fixed by tradition. The word is Germanic, but the institution seems to have been almost universal. Weber follows here the theory primarily expressed by AMIRA, NORDGERMANISCHES OBLIGATIONENRECHT (1882).

27. The *rei vindicatio* was the action for the specific recovery of a chattel or a piece of land. It was brought against the possessor by the person who claimed to be the legal owner. It has been described by Gaius (iv, 16, 17) as follows: [transl. by L. Mears (1882), 518]:

"§ 16: If it was a real action in respect of movables or moving things, which could be brought or led into court, they were claimed before the praetor thus: The claimant, holding a staff, took hold of the thing, for example, a slave, and spoke as follows: 'I say this slave is mine, according to the law of the quirites, by the title which I have shown. Thus, upon him I place my lance.' at the same time placing the staff on the slave. His adversary then said and did the same, and when both had thus laid claim to the slave, the praetor said: 'Both claimants quit hold of the slave.' Upon this, they both let go. The first claimant then said: 'I demand of you the ground of your claim.' The other replied: 'I declared my right when I placed my lance upon him.' Then the first claimant said: 'Since you claim him in defiance of right, I challenge you to stake five hundred pounds of copper upon the issue of a trial.' His adversary replied by a similar challenge, but if the subject matter of the suit was of less value than one thousand pounds of copper, then they named fifty pounds of copper as the sum reciprocally staked. Then the same proceedings were gone through as in a personal action, after which the praetor temporarily assigned to one of the parties the subject matter of the suit, that is, appointed one of them to be interim possessor and ordered him to give security to his opponent for the subject matter of the suit and the interim possession, that is, for the thing in dispute, and the produce, whilst the praetor himself took security from both parties in respect of the penal sum for costs as that would be forfeited to the public treasury. A staff was used, as it were, in the place of the spear, which was the symbol of lawful ownership; since that was especially looked upon as a man's own property which had been taken from the enemy, and for this reason a spear is placed before the centumviral tribunal.

"§ 17: If the thing was of such a nature that it could not be conveniently brought or led into court, as for example, if it were a column, or a ship, or a herd of cattle of any sort, some part of it only was taken, and the claim was made in respect of that part as if the whole were before the court. . . . Similarly, when the dispute was about a piece of land, or a building, or an inheritance, some part was taken and brought into court, and the claim was made in respect of this portion, as if in the presence of the whole. . ."

WENGER, p. 127, adds the following observation: "That is a symbolic reminder of the manual struggle for the thing, of self-help, before the state established the order of peace. This last is represented by the Praetor: *cum uterque vindicasset, praetor dicebat: Mittite ambo hominem* ('since both of you claimed [him], leave both the man'). That is still clearer in the symbolic fight for a *fundus* (tract of land) from which the parties bring a clod, in order to enact with it the aforementioned reciprocal *vindicatio*-proceeding before the Praetor." As to the Greek *dikē* (*δικαία*), see 2 BONNER AND SMITH 79, 101, 163, 260, 265; LEIST 490. See also *supra*, sec. *i*, notes 27 and 28.

28. *Markgemeinschaft* or, more frequently *Markgenossenschaft* is the community of those who are entitled to share in the use of the commons, especially the common pasture and woodland. On the various forms of agrarian communities,

see Weber, ECONOMIC HISTORY (trsl. F. Knight, 1927) 3; cf. POLLOCK AND MAITLAND I, 560.

29. *Hereditatis petitio:* action for the recovery of the total estate of a decedent, brought by the person claiming heirship against one who is alleged to have no right to the estate.

30. Sternberg, *Der Geist des chinesischen Vermögensrechts* (1911) 26 Z.F. VGL. RW. 142/3; cf. ALABASTER 317.

31. On this institution of "sitting dharma" see MAINE, INSTITUTIONS 38 *et seq.*; 297–305; E. S. HARTLAND, PRIMITIVE LAW (1924) 186. A similar custom is reported for ancient Irish law by MAINE, *op. cit.* 280, 296, 303: If the debtor was of chieftain grade, the creditor had "to fast upon him," i.e., to go to his residence and wait a certain time without food.

32. A. Kocourek and J. Wigmore, *Sources of Ancient and Primitive Law* (1915) in 1 EVOLUTION OF LAW 28, on Fanti Customary Law; MAINE, INSTITUTIONS 187, on Irish law.

33. The *nexum* seems to have been the money loan contract which was formally created *per aes et libram*, i.e., by weighing the copper amount in the presence of five witnesses and a weigher (*libripens*); see *supra*, n. 22. It had disappeared in historical times, and the references in the sources are so fragmentary that its origin and nature are still obscure. The theory accepted by Weber is that of Mitteis (25 SAV. Z. ROM. 282), who believed that the *nexum* was a transaction by which the debtor symbolically sold himself to the creditor. This theory has, however, been attacked from various quarters. The extensive literature is listed at JÖRS AND KUNKEL 219; to this should be added Koschaker, *Eheschliessung und Kauf nach alten Rechten* [1951], ARCHIV ORIENTALNY 210, 288; and v. Lübtow, *Zum Nexumproblem* (1950) 67 SAV. Z. ROM. 112. *Stipulatio* was the contract which was bindingly concluded by the exchange of certain ritualistic words. Upon the creditor's question: *Sestertios mille dare spondesne* ("do you promise to pay 1,000 sestertii?" the debtor would answer, "spondeo" ("I promise"). Later it became permissible to use other terms instead of the words "*spondesne? spondeo*," especially, "*promittisne? promitto*," or "*dabisne? dabo*." Whether, as Weber believes, such a promise or stipulation could only relate to the payment of money, is controversial. The literature is listed at JÖRS AND KUNKEL 97. See also *ibid.* 218.

33a. "*Aus römischem und bürgerlichem Recht*" (FESTSCHR. F. BECKER) 109 *et seq.* Mitteis' theory of the origin of the *stipulatio* has been doubted by Segré, 108 ARCHIVIO GIURIDICO 179; Luzzatto, *Per una ipotesi sulle origini e la natura delle obbligazioni romane*, 8 FOND. CASTELLI 253; and Weiss, PAULY-WISSOWA, REALENZYKLOPÄDIE DER KLASS. ALTERTUMSWISSENSCHAFT, 2. REIHE, III, 2540; JÖRS AND KUNKEL 96. These authors declare the origin of the *stipulatio* has as yet not been cleared up.

34. Weber is thinking here of the *in ius vocatio*, by which an action was initiated in archaic Roman law and which is described by WENGER 96, as follows: "*In ius vocatio.* In the Twelve Tables it is placed at the head of the whole statute, and it is handed down to us in its crude archaic primitiveness: I, (1) *Si in ius vocat, ito. Ni it, antestamino: igitur em capito.* (2) *Si calvitur pedemve struit, manum endo iacito.* (3) *Si morbus aevitasve vitium escit, iumentum dato. Si nolet, arceram ne sternito* [translation by J. WIGMORE, SOURCES OF ANCIENT AND PRIMITIVE LAW (1915), vol. I. of EVOLUTION OF LAW, by Kocourek and Wigmore, p. 465]. "*If* [a man] *call* [another] *to law, he shall go. If he go not, they shall witness it; then he shall be seized. If he flee or evade, lay hands on him*

as he goes. If illness or age hinder, an ox-team shall be given him, but not a covered carriage, if he does not wish."

"In these provisions, probably handed down with later additions, appear already fundamental legal principles, special regulations which we today would leave to an enforcing ordinance. Further, such enforcing ordinances were indeed issued by the Praetor in great numbers.—The defendant may not personally offer resistance to the *in ius vocatio*, but it is possible for him to find an appropriate *vindex*, who frees him from the hands of the plaintiff who is applying force, and guarantees—in some manner no longer surely recognizable—the appearance of the defendant in court. If no appropriate *vindex* is found, then the defendant is, according to the Twelve Tables, dragged by force before the judicial magistrate. The calling of witnesses by the plaintiff means for the defendant at least a certain guaranty against the unlawful use of force."

35. As to Roman law, Weber obviously has in mind the archaic *legis actio per pignoris capionem*, which seems not to have been generally available, however, but only for certain claims of sacred law and public law, especially taxes; cf. WENGER 228. In the Germanic law distress seems to have been more generally available. As to both Roman and Germanic law, Weber seems to follow the exposition of MAINE, INSTITUTIONS 257 *et seq.*

36. The famous passage is related by Gellius XX, 48 (Bruns, Fontes juris romani antiqui; Tab. II. 6) to have read as follows: "Tertiis nundinis partis secanto. Si plus minusve secuerint, se fraude esto." ("After sixty days [60 days after the seizure of the defaulting debtor by one of his several creditors] let them cut parts. If they cut more or less, it shall be without prejudice.") The translation of the archaic Latin is not too certain and the meaning of the passage has been controversial. Weber follows the opinion which regards the passage as permitting the creditors bodily to cut the debtor in pieces. Joseph Kohler has used the same interpretation in his famous essay on Shylock's claim to his debtor's "pound of flesh," in which he sees a survival of a once general idea into a time when it came to clash with changed moral ideas. (SHAKESPEARE VOR DEM FORUM DER JURISPRUDENZ [2nd ed. 1919] 50.) An entirely different view has been expressed by Max Radin ("*Secare partis:* The Early Roman Law of Execution against a Debtor" [1922] 43 AMER. J. OF PHILOSOPHY 32), who applies the *secare* to the piecemeal alienation of the debtor's property. For further references to the extensive literature, see WENGER, § 21, n. 8.

37. The German text is as follows: "oder der Gläubiger setzte sich in das Haus des Schuldners, und dieser musste ihn bewirten (*Einleger*)."—There exists a German word "Einleger," but none of its meanings fits the passage of the text (see 2 PREUSSISCHE AKADEMIE DER WISSENSCHAFTEN, DEUTSCHES RECHTSWÖRTERBUCH [1934] 1422). Probably there has occurred an error of transcription or typography, and the word meant is *Einlager*. However, this term refers to the exactly opposite method of debt collection, viz., the exertion of pressure upon the debtor by exacting that he or his surety live away from home at some agreed place until the debt is paid (see the references in 2 DEUTSCHES RECHTSWÖRTERBUCH 1414). Ordinarily the duty to submit to such "quartering" had, in German law, to be assumed by special agreement (HUEBNER 482). Von Schwerin (*op. cit.*) describes the institution as follows: "Hostageship has survived terminologically in the institution of *Einlager* (*gisel-schaft, obstaghum*) which was taken over (sc. in Germany) from France in the 12th century. It was common, especially among knights; usually it was undertaken by contract, but there were also cases where it was provided by statute. It was a kind of captivity into which the surety surrendered himself by riding up to an inn and

remaining there together with a fixed number of retainers until the debt was paid. The institution was abolished by imperial legislation in the 16th century, but in certain regions, for instance, of Switzerland, it survived into the modern age."

The only instance of a situation in which, in the territory of German law, the creditor would have submitted to "quartering" is referred to in the following statement of R. His (*Gelobt r und g bot ner Friede im d utsch n Mittelalter* [1912] 33 SAV. Z. GERM. 169): "To p event an abuse of force, of the two parties, the Dutch and West-Frisian cities of the 15th century ordered *both* litigants—the creditor and the debtor—to submit themselves to 'quartering.'" For further references see M. Rintelen, *Schuldhaft und Einlager im Vollstreckungsverfahr n des alt-niederländischen und sächsischen Recht s* (1908); 1 AMIRA, *op. cit.* (1882) 362, 392 *et seq.*

While no reference could thus be found which would indicate a connection of the German *Einlager* with the mode of exacting a debt by the creditor's installing himself in the house of a debtor, the latter custom has, indeed, occurred as indicated by a remark of Kohler's about China (KOHLER AND WENGER 143).

38. T aditionally, a *lex Poetelia*, dated at 326 B.C., is cited as an important milepost of this development. It is reported to have prohibited the chaining and killing of the debtor and to have compelled the creditor to accept the debtor's willingness to work off the debt. The reports, which are all by historians who wrote centuries later (Livy, Dionysius, Cicero, etc.), are suspect as to the details of the development but probably accurate in so far as they represent the transition from liability of the person to liability of the property as an aspect of the struggle between pat icians and plebeians. As to literature on the problem, see WENGER, § 21, n. 10.

39. In the United States imprisonment for debt was gene ally abolished in the nineteenth century, when its prohibition was expressly stated in numerous state constitutions. It has nevertheless survived in the foun of punishment for contempt of court for nonobedience of equity decrees, as well as, in certain states, judgments for damages render at law upon a verdict which finds the debtor guilty of malice o of reckless or wanton negligence. For obligations to pay family support the threat of imprisonment in alimony row still constitutes one of the p incipal guaranties of enforcement.

In Germany, by Bundesgesetz of 29 May 1868, as in probably all count ies of Western and Central Europe (e.g., Bundesverfassung der Schweizerischen Eidgenossenschaft of 29 May 1874, Art. 59), imprisonment for debt has been radically and completely abolished by nineteenth-century legislation. Public opinion would not tolerate it even as a means of enforcement of duties of family support. Theoretically, but ha dly ever used, imprisonment is still possible as a means to induce a person to comply with certain judgments ordering him to do, or to refrain from doing, an act other than that of the payment of money. See German Code of Civil Procedure, § § 888, 890; cf. A. SCHONKE, ZWANGSVOLLSTRECKUNGSRECHT (1948) 168–189. On the abolition of imprisonment for money debt, see HEDEMANN, I; L. ROSENBERG, LEHRBUCH DES DEUTSCHEN ZIVILPROZESSRECHTS (1949) 806–807.

40. *Vadiatio* (Wadiation)—Germanic transaction establishing suretyship: a staff is hand by the debtor to the creditor, who hands it on to the surety, asking him to assume the suretyship for the debtor's debt. There exists a voluminous literature which is particularly concerned with the symbolism of the transaction. According to AMIRA (*Die Wadiation*, SITZUNGSBERICHTE DER BAYERISCHEN

AKADEMIE DER WISSENSCHAFTEN, PHILOS.-PHILOL. KLASSE [1911]), the staff constitutes an instance of the magically spelled messenger's staff, which is found to play a considerable role in the symbolism of the Germanic laws; see AMIRA, DER STAB IN DER GERMANISCHEN RECHTSSYMBOLIK (1909). For a different view about the *vadiatio* see O. GIERKE, SCHULD UND HAFTUNG (1910); see also HUEBNER 497.

41. Text in square brackets supplied by the translator. The interpolation seems to be the one called for by the context.

42. Cf. *supra*, sec. i:5.

43. As to the effects of this feature in the common law, where it remained influential into the very present, see STREET, THE FOUNDATIONS OF LEGAL LIABILITY (1916) II, 75; III; 129; RHEINSTEIN, STRUKTUR 55 *et seq.* 61.

44. Tab. VI.1: "Cum nexum facit mancipiumque, uti lingua nuncupassit, ita ius esto."—"When he makes a *nexum* and a *mancipium*, as the tongue has spoken, so it shall be the law." For attempts to explain this passage and the numerous controversies around it, see JÖRS AND KUNKEL 90 *et seq.*; BUCKLAND 426; JOLOWICZ 139, 145–150, 164; for a new and apparently well-founded theory, see KOSCHAKER, *op. cit. supra* n. 33, at 210, 288.

45. Of the extensive literature, see especially MAITLAND, FORMS, 2 POLLOCK AND MAITLAND 196, 214, 220, 348; HOLDSWORTH, I, 456; II, 379, 440, 442; III, 281, 323, 455, 457, 422, 430 *et seq.*

46. Weber is apparently following here the famous description given of the development by MITTEIS, 1, 315 *et seq.*, who finds one of the principal sources of what later came to be regarded as liability for breach of contract in the idea that a man who fails to live up to certain duties which he has assumed is not acting "like a gentleman," that he is guilty of *dolus*, and if so found officially, has incurred forfeiture of civil rights (*infamia*). For discussions of this theory, see SOHM 423; R. SOHM AND L. MITTEIS, INSTITUTIONEN (1949) 190, 460 ("infamia"); JÖRS AND KUNKEL 170, 222.

47. Viz., by A. Leist in GRUNDRISS DER SOZIALÖKONOMIK. IV Abt. "Spezifische Elemente der modernen kapitalistischen Wirtschaft." 1. Teil (1925), p. 27, s.t. *Die moderne Privatrechtsordnung und der Kapitalismus* (ed. by Hans Nipperdey).

48. In a general sense continental legal theory distinguishes between two types of representation or (broadly) agency, i.e., between (i) direct representation where the agent makes a contract or creates an obligation expressly in the name and on behalf of his principal, and (ii) indirect representation, in which the principal is neither mentioned nor disclosed. In the technical sense only the former is called agency. Roman law had, apart from *mandatum*, no term of art for "agency" in the technical sense. Indeed, according to Paulus, DIG. 45, 1, 126, 2, "per liberam personam obligationem nullam adquirere possumus"—the making of contracts through free persons (or agents) is impossible. Gaius is to the same effect: 1.2, 95. But in practice Roman law diverged from this negative position by creating exceptions which the Roman lawyers handled in their customary subtle manner. See WENGER, DIE STELLVERTRETUNG IM RECHTE DER PAPYRI (1906), esp. pp. 157–166 and p. 219 for the selling of a slave through an agent; cf. also SOHM, § 45 "Representation"; BUCKLAND 276 *et seq.*, 529. In Greek law, on the other hand, direct representation was well known not only because of the role which the slaves played in commerce but also because the concept of agency was used in the *tutela* and in other institutions; see WENGER 166–172; BEAUCHET, HISTOIRE DU DROIT PRIVÉ DE LA RÉPUBLIQUE ATHÉNIENNE (1897).

49. As to Roman law, see SOHM, § 87; BUCKLAND 518, 550; JÖRS AND

KUNKEL 205. In practice the effect of substituting a new creditor for an old one could be achieved by means of novation: by agreement with the debtor the old obligation toward the original creditor was extinguished, and a new one with a new creditor was substituted for it.

As to Germanic Law, see HUEBNER, §§ 78, 79.

As to the slow development of assignment in the Common Law, see 2 WILLISTON ON CONTRACTS 1164 *et seq.* and literature cited there.

50. By the Lex Anastasiana of A.D. 506 an assignee who had purchased the assignor's claim could recover from the debtor no more than the purchase price which he, the assignee, had paid the assignor; as to the surplus, the debt was discharged. Under a law of A.D. 422, which was restated in Codex 2, 13, 2, a creditor was prohibited to assign his claim to a socially more powerful (*potentior*) person. Cf. Mitteis, *Über den Ausdruck "potentiores" in den Digesten*, 2 MÉLANGES GIRARD (1911). On the role which the fear of maintenance and champerty played in the reluctance of the Common Law to recognize the assignability of choses in action, see WILLISTON, *op. cit.*

51. L. GOLDSCHMIDT 80, 82, 387, 390; see also his VERMISCHTE SCHRIFTEN (1901) II, 172; KOHLER AND PEISER, HAMMURABI'S GESETZ (1904) III, 237; compare this with the doubts in GOLDSCHMIDT, *loc. cit.* 167, as well as those of Koschaker, 9 ENCYC. SOC. SCI. 211, 217/8.

52. The *contractus literalis* (Roman law) was the contractual obligation created or, more probably, re-created, by the ledger entry by a banker or some such person; cf. BUCKLAND 459; see also Goldschmidt, *Inhaber-, Order- und executorische Urkunden im Classischen Altertum* (1889) 10 SAV. Z. ROM. 373, at 393. Many problems are as yet unsolved; cf. the literature listed by JÖRS AND KUNKEL 188, 410.

53. For the insistence of the state upon registration of title to land see Zachariae v. Lingenthal, *Zur Geschichte des römischen Grundeigenthums* (1888), 9 SAV. Z. ROM. 263 *et seq.*, 270 *et seq.*; H. LEWALD, BEITRÄGE ZUR KENNTNIS DES RÖMISCH-ÄGYPTISCHEN GRUNDBUCHWESENS IN RÖMISCHER ZEIT (1909). See the review of these last two books by Mitteis (1909), 30 SAV. Z. ROM. 457; see also MITTEIS, REICHSRECHT 465, 480, 493, 514–517, 532.

54. On the origin of the notary and his role in later Antiquity, see MITTEIS, REICHSRECHT 52, 95, 171; DRUFFEL, PAPYROLOGISCHE STUDIEN ZUM BYZANTINISCHEN URKUNDENWESEN (1915); STEINWENTER, BEITRÄGE ZUM ÖFFENTLICHEN URKUNDENWESEN DER RÖMER (1915).

55. GOLDSCHMIDT 390.

56. *Festuka* (Frankish)—"staff." See *supra* n. 38. On the Babylonian *bukannu* see KOHLER AND WENGER 60.

57. See Brunner, *Carta und Notitia, Commentationes philologae in honorem Theodori Mommseni* (1877) 570, 577, repr. 1 *Abh.* 458, 469.

58. GOLDSCHMIDT 151; BRUNNER, *loc. cit.* 458, 466 *et seq.*

59. POLLOCK AND MAITLAND II, 223 *et seq.*; on the seal see the articles by Hazeltine, Pollock, and Crane in ASS. OF AMER. LAW SCHOOLS, SEL. READINGS ON THE LAW OF CONTRACTS (1931) 1, 10, 598.

60. GOLDSCHMIDT 97, 99; n. 14a, 390.

61. The distinction between *ius dispositivum*—"permissive rules"—and *ius cogens*—"mandatory rules," i.e., rules which cannot be contracted out by the parties, is common in civilian legal theory. *Ius dispositivum* (stopgap law) will be applied when the parties have failed to provide for a contingency which has arisen and for which they should have provided and probably would have provided had they ever thought of it. It is thus constituted by those rules of law

which apply only where they have not been "contracted out" by the parties. A large number of the rules of the law of contracts and of the law of wills are of such character. The provisions, for instance, of the law of sales concerning the seller's "implied" warranty for defects of quality apply only where the parties have not made their own provisions for the case; in the law of wills the rules on lapse or abatement of legacies apply only where the testator has failed to provide for the contingency by dispositions of his own.

Since the time of the Roman jurists it has been characteristic for the Civil Law that elaborate rules of stopgap have been established for the various types of contract of daily life, such as sale, donation, lease, contract for services, suretyship, partnership, mandate, etc. All the modern Codes thus contain chapters respectively dealing with these various types of contract, giving for each those rules of stopgap law which apply in default of different arrangement by the parties. As the statutory rules correspond to the intentions of typical parties, few terms of a contract need to be spelled out expressly. Contractual instruments can thus be shorter and simpler than in this count y where contractual terms are not so easily assumed to be "implied."

62. *Supra*, n. 50.

63. Following the model of the Code of Justinian (C. 8. 18. 12) a legal mortgage is given to the wife in the assets of the husband by the French Civil Code (art. 2121) and numerous other codes patterned upon it, e.g., those of Belgium, Italy, Spain, Mexico, Brazil, and Quebec. It is meant to protect those claims for damages which may arise for the wife against the husband, especially out of the management by him of the community fund and certain assets of the wife. The mortgage arises automatically upon the ma riage, without need of recordation, and with priority over certain others of the husband's creditors. Cf. 2 PLANIOL, TRAITÉ ÉLÉMENTAIRE DE DROIT CIVIL (3rd ed. 1949) 1237 *et. seq.*; T. Rohlfing, *Hypothek*, 4 RECHTSVERGLEICHENDES HANDWÖRTERBUCH (1933) 274.

64. The ordina y lease (*locatio conductio rei*) of Roman law was a personal contract. Hence, if the lessor sold the land, the lessee had no right of continued use as against the purchaser but only a claim for damages against his lessor. In contrast, emphytheusis was the special kind of inheritable lease of land which gave the lessee a property interest in the land which he could enforce against everybody. It originated in Greece and, in the fourth century, became fused in a practical and modern manner, with the *ager vectigalis*, i.e., the Roman long-term lease (*ius perpetuum*) in public lands. Cf. KOHLER AND WENGER 228; BUCKLAND 275; WEBER, AGRARGESCHICHTE 170 *et seq.*; MITTEIS, ZUR GESCHICHTE DER ERBPACHT IM ALTERTUM (1901).

65. Perpetual rents were a common institution of medieval law. While canon law prohibited the lending of money upon interest, it did not prevent a person having capital to invest from "purchasing" a perpetual rent, secured by the possibility of levying execution upon a piece of, mostly urban, land in the case of nonpayment, and subject to termination upon repayment of the capital to the purchaser. Other perpetual rent charges came into being when ancient feudal and manorial claims to services or deliveries in kind were transformed into money rents. In France all these ancient charges were swept away by the Revolution of 1789. In Germany and the other countries of central and western Europe they were made subject to speedy amortization in the course of the so-called "liberation of the soil" ("Bodenbefreiung," see *infra* n. 87), which had been one of the principal postulates of Liberalism as it had become dominant in the nineteenth century. (Cf. HEDEMANN II, part ii, 9, 27.) The law of real property was re-

organized in a way which excluded the creation of new perpetual rents. To a strictly circumscribed and narrowly limited extent their creation was permitted again for certain special purposes by the German Civil Code of 1896 (§§ 1105–1112, 1199–1203) and a few special statutes of later date (see M. WOLFF, SACHENRECHT, 8th ed. 1929, 307).

66. On the freedom of sexual contract in Ptolemaic-Roman Egypt, see J. NITZOLD, DIE EHE IN ÄGYPTEN ZUR PTOLEMÄISCH-RÖMISCHEN ZEIT (1903).

67. Roman institutions of this kind were *arrogatio* (transaction to establish paternal power over an adult man not previously subject to the paternal power of any other *paterfamilias*), *adoptio* (transaction to transfer parental power over a *filiusfamilias* by one *paterfamilias* to another), and *emancipatio* (remission of a person from parental power). Similar institutions were common in Antiquity; cf. Robert H. Lowie, *Adoption*, in 1 ENCYC. SOC. SCI. 459, 463 (literature). On Germanic laws, see HUEBNER 660; L. Talheim, *Ado tion* in 1 PAULY-WISSOWA 396.

68. Cf. *supra* n. 51.

69. As to these "special funds" see HUEBNER 181.

70. Weber's principal sources for the following presentation of the role of contract in sex relationships seem to have been J. Kohler, *Zur Urgeschichte der Ehe* (1897), 12 Z.F. VGL. RW. 186; W. WUNDT, VÖLKERPSYCHOLOGIE (1917), vol. vii; and, above all, the book by his wife, MARIANNE WEBER, EHEFRAU UND MUTTER IN DER RECHTSENTWICKLUNG (1907). The bibliography in WEBER'S WIRTSCHAFTSGESCHICHTE (1923) 42, n. 1, does not list WESTERMARCK'S HISTORY OF HUMAN MARRIAGE, 3 vols. (5th ed. 1921). The more recent literature is listed in the bibliography following Robert H. Lowie's article on *Marriage* in 10 ENCYC. SOC. SCI. 146, 154, to which should be added C. C. ZIMMERMAN, FAMILY AND CIVILIZATION (1944); ROBERT BRIFFAULT, THE MOTHERS (1927); W. GOODSELL. HISTORY OF MARRIAGE AND THE FAMILY (1934); and P. Koschaker, *Die Eheformen der Indogermanen*, 11 Z.F. AUSL. U. INTERNAT. PRIVATRECHT (1937), Sonderheft 121.

71. The question of whether wife purchase has really been the "normal form of marriage" in primitive or archaic civilizations cannot be regarded as definitely settled. The results of the most recent research have been summarized by Koschaker (*loc. cit.* ARCHIV ORIENTÁLNY 210, 211) as follows: "Many ancient laws know a duality of marriage forms. It has long been known to have existed in Roman Law and more recently it has been found to have existed also in several other laws. One of these forms is characterized by the fact that no price is paid for the bride. This kind of marriage for which no special formalities are prescribed, is based in the last resort upon the consent of the spouses. On the other hand, however, the husband does not acquire marital power over the wife, and the children succeed to the mother to whose family they belong. . . . The normal form, however, is that kind of marriage in which the husband pays a 'bride price' and acquires marital power over her. The first-named type of marriage is the exception which occurs only in certain special type-situations, as, for instance, marriage between the abductor and the woman abducted by him, or the marriage with the woman who is the sole heir of her ancestor and through whom the husband enters the wife's family; in other words, situations in which, for one reason or another, the marriage with marital power is not suited for the particular purpose. An exceptional position is occupied by mature Roman law where marriage without marital power appears as the normal type. That in earlier times the situation may have been different and that in Rome the marriage without marital power

was to serve similar functions as in other laws, is possible, but impossible to prove from the fragmentary source material. . . .

"[As to marriage by purchase] we find in the literature an almost ho less confusion. I could mention scholars of several nations of whom everyone maintains that marriage by purchase may certainly have existed among other peoples, but that it is absolutely impossible as to his own nation that it should ever have been so barbaric as to purchase women like merchandise."

Cf. also the recent articles by R. Köstler, *Die Raub- u. Kaufehe bei den Germanen* (1943), 63 SAV. Z. GERM. 62; *Die Raub- u. Kaufehe bei den Hellenen* (1944), 64 SAV. Z. ROM. 200; *Die Raub- u. Kaufehe bei den Römern* (1947), 65 SAV. Z. ROM. 43.

72. As to Hindu forms of marriage, see JOLLY, ÜBER DIE RECHTLICHE STELLUNG DER FRAUEN BEI DEN ALTEN INDERN (1876); also, by the same author, RECHT UND SITTE (1896, transl. by G. Losh, 1928) 49. As to Roman marriage forms, *see supra* n. 24. The statement by Jolly (RECHT UND SITTE 51) and Westermarck (*op. cit.* 404) notwithstanding, it cannot be regarded as proved that marriage by purchase was the specifically plebeian form of marriage; cf. *supra* n. 71; also 1 HOWARD, HISTORY OF MATRIMONIAL INSTITUTIONS (1904) cc. 4 and 6, esp. p. 264.

73. Service marriage: see WESTERMARCK, *op. cit.* 491.

74. On trial and companionate marriage in Hellenistic Egypt, see MITTEIS, REICHSRECHT 223.

75. On prostitution see, in addition to the literature stated *supra*, n. 70, WEBER, GENERAL ECONOMIC HISTORY c. 4 § 2, and May's article q.v. in 12 ENCYC. SOC. SCI. 553, with literature cited there.

76. *Hetaera* (Greek): girl companion, ranging from the common harlot to the geisha-like woman companion of refinement and education, often contrasted with the commonly low status of the legitimately married wife. The hetaerae gave the Greek men that intellectual stimulus which they did not find in the family. Greek life would have been unthinkable without them. Contact with them was not regarded as socially disreputable (LAMER, WÖRTERBUCH DER ANTIKE [3rd ed. 1950] q.v., where one can also find a list of historically famous hetaerae, such as Aspasia, the companion of Pericles); see also H. LICHT, LIEBE UND EHE IN GRIECHENLAND (1933). *Bayadère*—Hindu dancing girl.

77. Cf. BUCKLAND 128 *et. seq.*; JÖRS AND KUNKEL 282 and literature cited there and p. 417.

78. Under the Prussian Code of 1794.

79. On divorce in Rome, see 1 FRIEDLÄNDER UND WISSOWA, SITTENGESCHICHTE ROMS (9thed. 1919) 283.

80. See JOLOWICZ, 125 *et seq.*, 248 *et seq.*; BUCKLAND 324; for further literature, see JÖRS AND KUNKEL 307, 327, 419, 421.

81. Cf. BRENTANO, ERBRECHTSKRITIK (1899) 198 *et seq.*; RHEINSTEIN, DECEDENTS' ESTATES 11 *et seq.* and literature cited there and at p. 412. Significantly, freedom of testation has now been limited in favor of needy dependents even in England by the Inheritance (Family Provision) Act, 1938, 1 & 2 GEO. 6 c. 45.

82. Letters of Napoleon to his brother Joseph, King of Naples, dated 8 March and 5 June 1806, 12 CORRESPONDENCE DE NAPOLÉON I^er^ 167, 432; RHEINSTEIN, DECEDENTS' ESTATES 17, n. 30.

83. On the following, see the literature cited in WEBER'S WIRTSCHAFTSGESCHICHTE 85, n. 1: CAIRNES, THE SLAVE POWER (1862); E. VON HALLE, BAUMWOLLPRODUKTION UND PFLANZUNGSWIRTSCHAFT IN DEN NORDAMERIKAN-

ISCHEN SÜDSTAATEN (2 vols. 1897, 1906); H. J. NIEBOER, SLAVERY AS AN INDUSTRIAL SYSTEM (1900); B. DU BOIS, THE SUPPRESSION OF THE AFRICAN SLAVE TRADE (1904); G. KNAPP, DIE LANDARBEITER IN KNECHTSCHAFT UND FREIHEIT (2nd ed. 1909); see also the articles in 14 ENCYC. SOC. SCI. 73 and literature cited there at p. 90.

84. MEKKA IN THE LATTER PART OF THE 19TH CENTURY (1888; transl. 1931), p. 14.

85. *Noxae datio* (Latin)—the surrender of a person, animal, or inanimate thing by which the father, master, or owner frees himself from the liability created by the child's, slave's, or animal's misdeed or the "act" of his spear, ax, or other thing. It existed in Rome and was widespread in archaic laws.

86. Cf. GIRARD, LES ACTIONS NOXALES (1888) 62, and the review of this book by Kipp in 10 SAV. Z. ROM. 398.

87. As to Rome, see WEBER, ACKERGESCHICHTE 114–117; in Prussia, legislation aiming at the abolition of land encumbrances standing in the way of intensive cultivation started in 1717, with an Edict of King Frederick William I. It was continued by the Prussian Code ("Allgemeines Landrecht," abbrev. ALR) of 1794 and was vigorously promoted after the defeat of the Prussian Army in 1806 during the administration of Baron vom Stein. Final regulation was initiated after the revolution of 1848 by the Regulation Law of 2 March 1850. See F. Gutmann, *Bauernbefreiung* in 2 HANDWÖRTERBUCH DER STAATSWISSENSCHAFTEN (4th ed. 1924) 378, 544; G. F. KNAPP, DIE BAUERNBEFREIUNG UND DER URSPRUNG DER LANDARBEITER IN DEN ÄLTEREN TEILEN PREUSSENS (1887); A. MEITZEN, DER BODEN UND DER PREUSSISCHE STAAT (1868); Skalweit, *Gutsherrschaft und Landarbeiter in Deutschland* (1911), 35 SCHMOLLERS J. B. 1339; HEDEMANN II, 34, and literature cited there.

88. That is, organizations to promote the settlement of German farmers in the predominantly Polish regions of the eastern provinces of Prussia as constituted before 1918.

89. This statement is correct as to the Carolingian empire but must be qualified for the later period. The "tribal" laws had lost their significance throughout the empire at the latest in the thirteenth century, if not earlier; cf. C. Calisse, *History of Italian Law*, 8 CONTINENTAL LEGAL HISTORY SERIES (1928) 18, 24, 57, 97, 100; HUEBNER 2–4; K. Neumeyer, DIE GEMEINRECHTLICHE ENTWICKLUNG DES INTERNATIONALEN PRIVAT- UND STRAFRECHTS BIS BARTOLUS (1901) I, 94, 155; E. Meijers, L'HISTOIRE DES PRINCIPES FONDAMENTAUX DU DROIT INTERNATIONAL PRIVÉ À PARTIR DU MOYEN AGE (Recueil des cours, [1934] III, 558); BRUNNER I, part ii, 382, 399.

90. Cf. CALISSE, *op. cit.*, 127–132, 165, 177; NEUMEYER, *op. cit.*, I, 159; ENGELMANN, *op. cit.* (1938) 97; MEIJERS, *loc. cit.*, 547, 560.

91. On the "law communities" and their development, see PLANITZ 176, and literature stated there.

92. On this characteristic feature of medieval law see POLLOCK AND MAITLAND I, 234–240; II, 182; HOLDSWORTH II, 35–40, 211, 379, 417, 464–466, 562; HUEBNER 4, 88–92, 96, 98, 102, 189, 334–341; A. ESMEIN, COURS ÉLÉMENTAIRE D'HISTOIRE DU DROIT FRANÇAIS (1925) 20, 159, 174, 221, 262–263, 280–282, 344.

93. See MOMMSEN 318, 322; JOLOWICZ 25.

94. Cf. BRISSAUD, HISTORY OF FRENCH PRIVATE LAW (Howell's tr. 1912) 900; BRISSAUD, HISTORY OF FRENCH PUBLIC LAW (Garner's tr. 1915) 548; HEDEMANN I, 39, 41.

95. Weber means the point of view of the modern continental jurist, for whom, in theory, all law is contained in the codes and statutes.

96. A. HEUSLER, DEUTSCHE VERFASSUNGSGESCHICHTE (1905) 138.

97. *Recht der Handwerker.* In Germany and other countries it has become customary to refer to the sum total of those rules of law which relate to the crafts and industries as *Gewerberecht, droit industriel, diritto industriale.* In Germany a part of these rules has been combined in a special code, the GEWERBEORDNUNG of 1869.

98. *Institutionen des deutschen Privatrechts* (1885/86).

99. MIRROR OF SAXON LAW (SACHSENSPIEGEL), treatise on the law of Lower Saxony, by Eike von Repgow, written between 1215 and 1235. Cf. *infra,* sec. iv:3. Glosses have been added since the early fourteenth century. The extensive literature on the SACHSENSPIEGEL is listed in PLANITZ 181.

100. Quiritarian law (*ius quiritium*), the law of the *quirites,* i.e., those who were members of the sibs (*gentes*) of which the Roman community seems to have been composed in its oldest period; in later times the term *ius quiritium* is frequently used as a synonym of *ius civile* as contrasted to *ius honorarium* and *ius gentium.*

101. On the following see WEBER'S AGRARGESCHICHTE and his article on *Agrargeschichte, Altertum,* in 1 HANDWÖRTERBUCH DER STAATSWISSENSCHAFTEN (3rd ed. 1909) 52; also ROSTOVTZEV.

102. *Fideiussor*—surety; *hypotheca*—mortgage. On the *praes* see literature stated by JÖRS AND KUNKEL 213, n. 4.

103. On the relationship between patron and client, see BUCKLAND, 89 *et seq.,* 375.

104. Action against the shipowner upon obligations contracted by the master.

105. *Receptum nautarum, cauponum et stabulariorum*—bailment by water carriers, innkeepers, and stable owners.

106. On *fides* see Kunkel, *Fides als schöpferisches Element im römischen Schuldrecht* (1939) 2 FESTSCHRIFT FÜR KOSCHAKER 1.

107. Loss of certain civil rights, including the right to make a will.

108. Roughly corresponding to the trust without, however, implying a right on the beneficiary's part to pursue the *res* into the hands of third purchasers.

109. A future interest created by imposing upon a testamentary devisee or legatee a personal obligation upon a certain term or condition to transfer the *res* to a third beneficiary.

110. These were primarily those unmarried and childless persons whom Augustus, for reasons of population policy, had declared to be either totally or partially incapable of receiving property by will.—*Lex Iulia de maritandis ordinibus,* of 18 B.C., and *Lex Papia Poppaea* of A.D. 9.

111. MOMMSEN 15.

112. On the following, see GIERKE, GENOSSENSCHAFTSRECHT, the classical work on the history of associations and juristic personality. The most significant English contribution is Maitland's Introduction to his translation of portions of Gierke's work, published as the POLITICAL THEORY OF THE MIDDLE AGES (1900) and his essays in 3 PAPERS 210 *et seq.* (repr. s.t. SELECTED ESSAYS, 1936). The leading discussion of the development of juristic persons in Rome is MITTEIS, I, 339. The most recent comprehensive presentations are given in SCHNORR V. CAROLSFELD, GESCHICHTE DER JURISTISCHEN PERSON (1933) and H. J. WOLF, ORGANSCHAFT UND JURISTISCHE PERSON (1933/34). For Rome, see DUFF, PERSONALITY IN ROMAN LAW (as to which, see DAUBE, 1943, 33 JOURNAL OF ROMAN STUDIES 86, and vol. 34, p. 125); for further literature on

Roman law, see JÖRS AND KUNKEL 73 *et seq.*, 400/401; and on medieval law, PLANITZ 151. As to Gierke's theories see also LEWIS, THE GENOSSENSCHAFT-THEORY OF OTTO VON GIERKE (1935); on "theories" of juristic personality see F. HALLIS, CORPORATE PERSONALITY (1930). For a survey, see C. S. Lobingier, *The Natural History of the Private Artificial Person* (1939) 13 TULANE L. REV. 41.

113. On reprisals cf. Jessup and Deák, 13 ENCYC. SOC. SCI. 15 and literature indicated there.

114. HAUSRATH, *op. cit.* (1885/86).

115. On the origins and development of the principle of majority decision, see KORKUNOV-CZYNSKY, 10 ENCYC. SOC. SCI. 55 and the literature indicated there.

116. The endowment (*Stiftung*) has been recognized as a special form of juristic person especially in modern German law (cf. Civil Code of 1896, §§ 80–88), while it has been defined as follows: "*Stiftung* is an organization for the pursuit of certain defined purposes, which does not constitute an association of persons and is endowed with juristic personality." Cf. ENNECCERUS 274; see also 3 MAITLAND PAPERS 280, 356, where he compares "Institution" or "Foundation" with "Anstalt," saying (p. 357): "I believe that the English term which most closely corresponds to the 'Anstalt' or the 'Stiftung' of German legal literature is 'a charity,' in the sense of 'charitable trust.'"

117. This legal concept of "Anstalt" is being used particularly in modern German administrative law. Cf. W. JELLINEK, VERWALTUNGSRECHT (1928) 174.

118. Cf. GIERKE, PRIVATRECHT I, 458.

119. Cf. HUEBNER 139–146, 150, 235; 3 MAITLAND, PAPERS 336, 361, 377.

120. At the time Weber wrote the general statement of the text, it was doubtful whether a community of heirs had ever existed in Rome. The insufficient evidence has now been strongly fortified, however, through the discovery, in 1933, of a hitherto unknown part of the Institutes of Gaius. See JÖRS AND KUNKEL 34, 240; SCHULZ, HISTORY 105/106.

121. As to the following, see WEBER'S GESCHICHTE DER HANDELSGESELLSCHAFTEN IM MITTELALTER (1891); Schmoller, *Die geschichtliche Entwicklung der Unternehmung* in SCHMOLLER'S JAHRBUCH, vol. 14 (1890), p. 1035, vol. 15 (1891), p. 963, vol. 16 (1892), p. 731, and vol. 17 (1893), p. 359. HOLDSWORTH viii, 192. C. T. CARR, GENERAL PRINCIPLES OF THE LAW OF CORPORATIONS (1905), c. ix, repr. s.t. *Early Forms of Corporateness* in (1909) 2 SEL. ESS. ANGLO-AMER. LEGAL HIST. 160; W. MITCHELL, ESSAY ON THE EARLY HISTORY OF THE LAW MERCHANT (1904) c. v, repr. s.t. *Early Forms of Partnership* 3 SEL. ESS. 182; S. Williston, *History of the Law of Business Corporations before 1800* (1888), 2 HARV. L. REV. 105, 149, repr. 3 SEL. ESS. 195; also A. B. DU BOIS, THE ENGLISH BUSINESS COMPANY AFTER THE BUBBLE ACT, 1720–1800 (1938); S. LIVERMORE, EARLY AMERICAN LAND COMPANIES (1939); GOLDSCHMIDT; P. REHME, GESCHICHTE DES HANDELSRECHTS (1914); K. LEHMANN, DIE GESCHICHTLICHE ENTWICKLUNG DES AKTIENRECHTS BIS ZUM CODE DE COMMERCE (1895).

122. *Société en nom commandite* (French)—that form of business association in which one or more partners with unlimited personal liability combine with one or more partners of limited liability; as to modern law, see French Commercial Code, art. 23–28 (*Code de Commerce*, 1807); German Commercial Code §§ 161–177 (*Handelsgesetzbuch*)

123. "Limited liability company" (*Gesellschaft mit beschränkter Haftung*, G.m.b.H.)—a business corporation which does not appeal for its capital to the

public and which does not have shares suitable for being bought and sold at the stock market. Invented in Germany (Law of 20 March 1898, R.G. Bl. 1898, 370), the G.m.b.H. has been adopted in numerous other countries. Cf. W. Hallstein, *Die Gesellschaft mit beschränkter Haftung in den Ausländischen Rechten* (1939), 12 ZEITSCHRIFT F. AUSL. U. INTERN. PRIVATRECHT 34; on the German G.m.b.H. see MANUAL OF GERMAN LAW (Great Britain, Foreign Office 1950) 247.

124. *Peculium*—a fund legally belonging to the head of a house (*paterfamilias*), but left by him for separate management to a member of the household, such as a son or slave. For debts incurred by the member of the house the *paterfamilias* was liable in the praetorian *actio de peculio*, but he was allowed to limit his liability to an amount corresponding to the value of the *peculium* (*dumtaxat de peculio*). See MICOLIER, PÉCULE ET CAPACITÉ PATRIMONIALE (1932).

125. INSTITUTES 3.16 pr. and Papinian in DIGEST 45.2. 11.1–2. This rule applied only to the promise of a divisible performance. The obligation of several debtors to make an indivisible performance seems in classical law to have been one of joint and several liability even without having been created by one joint promise. Our information of details is incomplete, however. See KERR WYLIE, SOLIDARITY AND CORREALITY (1925); Thayer, *Correality in Roman Law* (1943) 1 SEMINAR 11.

126. Cf. A. Arias Bonet, *Societas publicanorum* (1949), 19 ANUARIO DE HISTORIO DEL DERECHO ESPAÑOL 218.

127. DIGEST 43. 9.1.—injunction issued by the *praetor* to protect the lessee of the public lands and his associates in his possession.

128. The partner in a *société en nom commandite* (*supra* n. 122), who, in contrast to the "personally liable partner or partners" is not liable for the debts of the company beyond the amount of his share.

129. This kind of establishment of the state as a juristic person of private law, in which the state as fisc is regarded as separate from the state as sovereign, has been worked out particularly in German theory and practice. It stands in contrast to the French and the Anglo-American systems in which the state is regarded as the sovereign even where it enters upon contractual relationships with private persons or is engaged as the owner of property. In consequence of this latter approach in the French system, the legal relations of the state as contracting party or as property owner are subject to a body of rules which, at least in theory, are different from those of ordinary private law. Also, in both the French and the Anglo-American systems, the state cannot be sued in the ordinary courts in the same way as a private person. In France actions against the state must be brought in the administrative tribunals, which are separate from the ordinary courts, have the Council of State (*Conseil d'Etat*) as their own supreme court, and are not subject to control by the Court of Cassation, the supreme court in the administration of civil and criminal justice. Cf. A. UHLER, REVIEW OF ADMINISTRATIVE ACTS (1942); GOODNOW, *op. cit.*; F. BLACHLY AND M. OATMAN, ADMINISTRATIVE LEGISLATION (1934), and INTRODUCTION TO COMPARATIVE GOVERNMENT (1938); R. D. WATKINS, THE STATE AS PARTY LITIGANT (1927).

On the historical development of the theory and practice of the state as fisc see OTTO MAYER, DEUTSCHES VERWALTUNGSRECHT (1896), I, 47; FLEINER, VERWALTUNGSRECHT (2nd ed. 1912) 34; HATSCHEK, DIE RECHTLICHE STELLUNG DES FISCUS IM BÜRGERLICHEN GESETZBUCHE (1899) 24; see also S. BOLLA, DIE ENTWICKLUNG DES FISKUS ZUM PRIVATRECHTSSUBJEKT (1938); G. JELLINEK 383; KELSEN, ALLEGEMEINE STAATSLEHRE (1925) 240.

The basic investigations into the history of the juristic construction of the state in general are the following works of OTTO V. GIERKE: POLITICAL THEORIES

OF THE MIDDLE AGES (Maitland's tr. 1900), esp. c. viii; NATURAL LAW AND THE THEORY OF SOCIETY (Barker's tr. 1934); also THE DEVELOPMENT OF POLITICAL THEORY (Freyd's tr. 1939), *passim*. (The former two books are parts of GIERKE's DEUTSCHES GENOSSENSCHAFTSRECHT [1881 *et seq.*]; the latter is a translation of his JOHANNES ALTHUSIUS UND DIE ENTWICKLUNG DER NATURRECHTLICHEN STAATSTHEORIEN [1880].)

130. This statement needs qualification. In the first place, there was never a time in English medieval law when a writ could lie against the king. This followed from the fundamental theory, fully stated by Bracton, that the king could not very well issue a writ against himself or be summoned as defendant in his own court. In the second place, however, it came to be recognized in the thirteenth century that the king, being subject to the law as well as being the fountain of justice and equity, should not (or rather, ought not to) refuse to redress wrongs or satisfy claims against him. Such redress or satisfaction was sought through petitions addressed to the king or his council: but a petition, if given effect to, was substantially a remedy of grace and not one of right. Nevertheless, during the fourteenth century, petitions began to be distinguished between demands for some bonuses or some new remedy on the one hand, and claims embodying a definite legal right, enforceable by writ against anyone but the king. When this distinction was drawn, the "petition of right" grew into an effective remedy against the Crown, though perhaps not completely so before the fifteenth century. In the fourteenth century, the position was rather vague: although the petition of right had as yet not become, at any rate technically, a complete legal remedy, the king seems in practice almost always to have repaid his debts in one way or another. Such is the only conclusion that can be drawn from an examination of the fourteenth-century cases. See EHRLICH, PROCEEDINGS AGAINST THE CROWN, Oxford Studies in Social and Legal History VI, 120; POLLOCK AND MAITLAND 515; HOLDSWORTH IX, 11. As regards foreign merchants, their position was in this respect the same as that of the king's subjects. Indeed, it may actually have been better because of the close and friendly business relationship between the foreign merchants and the king. It is true that later some doubts arose whether aliens could, or could not, sue at common law; this, however, did not affect their right in the fourteenth century to address themselves to the king, to the council, or to the chancery either to recover a debt from the Crown or, indeed, for the redress of any other wrong. See HOLDSWORTH *loc.cit.*, 94–95; POLLOCK AND MAITLAND 464–467; Brodhurst, *The Merchants of the Staple*, SELECT ESSAYS IN ANGLO-AMERICAN LEGAL HISTORY 16 *et seq.* The repudiation of the king's debt to the Florentine bankers took place in January 1345. Edward III owed the leading Florentine houses, the Bardi and the Peruzzi, 1,500,000 gold florins (£500,000) so that they were now reduced to bankruptcy —"a catastrophe which plunged all Florence in distress." See SCHANZ, ENGLISCHE HANDELSPOLITIK (1881) I, 113, and authorities there cited; RAMSAY, A HISTORY OF THE REVENUES OF THE KINGS OF ENGLAND (1925) II, 189.

131. In this connection it must be kept in mind, however, that the guaranties of legal security and redress obtainable against the state in the administrative tribunals are in no way less effective than those obtainable against private persons in the civil courts. The former are as truly courts as the latter, and the Council of State is looking upon its functions as judicial ones no less than the Court of Cassation. Cf. OGG AND ZINK, MODERN FOREIGN GOVERNMENTS (1949) 583.

132. While no such incident could be verified for the reign of King Frederick William I (1713–1740), Margrave Johann is reported to have stated, in a "recess" concluded with the estates in 1552, that "in contravention to existing usage, some

have been so impudent against our judgments as to appeal to he Imperial Chamber Court and thus to tie our hands with the result that quite often one family completely squeezes out the other with such chicaneries." Hence, anyone who should henceforth dare to make such an appeal should be fined 200 fl. and lose his cause. (STÖLZEL, BRANDENBURG-PREUSSENS RECHTSVERWALTUNG (1888) I, 214.) On the Imperial Chamber Court, see *infra*, sec. vi, n. 51.

133. See 2 MOMMSEN 461 *et seq.*; also WENGER 56.

134. *Fiscus Caesaris* was, in he Principate, the public treasury in so far as it was managed by the emperor; as such it was distinguished from the emperor's private assets (*res privata*) and the special crown domains (*patrimonium Caesaris*); cf. 2 MOMMSEN 998; MITTEIS 347, VASSALLI, CONCETTO E NATURA DEL FISCO (1908); ROSTOVTZEV, 55, 172, 179, 186, 324, 326, 343, 357. On the fisc in the modern German system, see *supra* n. 129.

135. See *supra*, n. 102.

136. *Auflage* (Germ.)—Institution of German law practically amounting to a trust without a beneficiary; it can be used to charge the beneficiary of a testamentary disposition with a burden to be discharged for a charitable purpose: cf. German Civil Code, § 1940.

137. In accordance with the great concern for the care of the soul after death, it was a widespread practice to insure by contract the performance of sacrifices after death. "If for this purpose [a person] made over part of his alienable estate to a priest, the law allowed him to attach to the grant a condition of forfeiture valid in perpetuity. Thus as soon as the priest or his successor in office ceased to offer up the stipulated sacrifices he was to be deprived by the public authorities of the property which should then be given to another." To this description of the Egyptian transaction, E. Seidl (*Law, Egyptian*, 9 ENCYC. SOC. SCI. 209, 210) adds: "Whether there can be seen in such and similar trusts of proper y beginnings of the incorporated foundation is, however, still doubtful."

143. MITTEIS I, 348, n. 2.

144. According to Mitteis (*loc. cit. supra* n. 112), juristic personality could not be acquired by private organizations in any way other than by grant through imperial charter. This notion is generally rejected in the recent literature, where it is maintained that it was entirely left to the discretion of the organization itself whether or not it wished to have rights and obligations of its own and distinct from those of its members. "The notion of an express grant of juristic personality was totally alien to Roman law." The term *corpus habere* is said to mean no more

than "to form a club." KUNKEL in JÖRS AND KUNKEL, 75, see also now Bresslau in 1 STUDI RICCOBONO 317.

145. MITTEIS 347, n. 21.

146. About the Hellenic "phratries" and similar voluntary organizations see B. LEIST, 103–175; BONNER AND SMITH 118 n. 3; p. 160; and R. BONNER, ASPECTS OF ATHENIAN DEMOCRACY (1933) 91, 134, 157. These last two works were not yet accessible to Weber. The extensive literature on totemism and totemistic clans is stated in 14 ENCYC. SOC. SCI. 660. Weber seems to have relied primarily on W. WUNDT'S ELEMENTE DER VÖLKERPSYCHOLOGIE (1912) tr. by Schaub, 1916), c. II.

164. On "Zweckvermögen" see MAITLAND, PAPERS III, 359, repr. in SELECTED ESSAYS 179, and German li erature cited in the latter at p. 180, n. 2.

165. For the validity of a testamentary disposition it was essential in Rome that the testator should appoint one or more persons as heir (*heres*) or heirs, i.e.,

persons to whom the estate would pass in its entirety and who would become personally liable for the debts of the testator. Provided there was a valid appointment of an heir or heirs, the testator could also make special provision for legatees. He could either provide that a specific asset of the estate should pass directly to the legatee (*legatum per vindicationem*) or that the legatee should be entitled to claim from the heir or heirs the delivery of a specific object or the payment of a sum of money or some other act of performance (*legatum per damnationem*). In both cases it was necessary for the testator to comply with certain rigidly fixed formalities (presence of five witnesses and a *libripens*) and the validity of the legacy was hedged in by a variety of highly formalistic rules. In the later republican period it thus became usual to request the heir or some other person by formless precatory words (*verbis precativis*) to make a payment to a third person or to give him some specific object. Such a request, which would frequently be stated in a formless letter (*codicillum*), could only be charged upon the conscience (*fidei commissum*) of the person concerned, but would be unenforceable legally. For certain special kinds of *fidei commissa* Augustus provided enforcement, although not in the regular procedure of the *praetor* but in the administrative *cognitio* of the consuls. Under his successors this way of enforcement was broadened until finally in the law of Justinian *legatum* and *fidei commissum* were fused into one institution of regular law. Cf. BUCKLAND; SOHM, INSTITUTIONES (ed. 1949) 634.

175. The trustees whom a "friendly society" is required to have by the Friendly Societies Act, 1896, s. 25 (1), and who are the persons to sue or be sued, *ibid.* s. 94 (1), are, in fact, regular officers of the society.

176. The authorization may be made generally by the rules of the club; cf. 3 ENCYC. LAWS OF ENGL. (3rd ed.) 221.

177. In nineteenth-century Germany the division of labor between the historians of Roman and German law developed into an emotionally affected controversy of political significance. To the Germanists the Roman law, by which the legal system of Germany had been deeply affected since its reception in the fifteenth century, appeared as the expression of a rigid, cold-hearted, and egoistic individualism, while Germanic law, of which English law was regarded as just one branch among others, was extolled as the embodiment of a warm-hearted spirit of folk community. Among the principal representatives of this attitude was as great a scholar as Gierke, to whom the richness of forms of the German *Genossenschaft* (sodality) appeared as one of the most beautiful expressions of the peculiar spirit of Germanic neighborliness, comradeship, and creativeness. In presenting the total body of medieval German private law in his DEUTSCHES PRIVATRECHT, he hoped to help re-Germanize the law of the country at the time when the new German Civil Code was just to take effect. The draft of this Code, Gierke had passionately attacked because of its alleged Romanism. The alleged contrast between the warm-hearted, "social" German and the cold and egoistic Roman law became a stock argument of those political groups which tried to stem the tide of modern capitalism and to preserve other, more patriarchic patterns of social structure, or to create a "new," romantically conceived community of socialist or racist pattern or of the kind vaguely felt by the enthusiasts of the German Youth movement. The National-Socialist party, in which all these streams converged, increased the odiousness of the Roman law by labeling it as being in some unspecified way a product of the Jewish mind. The substitution of a new, truly German law for Roman law was thus established as a basic postulate in Article 19 of the Party Platform (see HITLER, MEIN KAMPF, New York: Reynal and Hitchcock, 1940, pp. 686, 690). Under the National-Socialist government, the newly established Academy of German Law initiated efforts to draft a new German Folk Code (*Deutsches Volksgesetzbuch*). The few parts which could be prepared before energies were diverted into other channels by the war indicate that the new law, if it could have been completed, might have constituted a well-drafted code likely to serve well the needs of modern life. It is difficult to see, however, in what respects it could have been of any peculiarly "German" character.

178. These ideas of Weber's are developed in his GENERAL ECONOMIC HISTORY. About the Russian *Mir*, cf. pp. 17–21; about Oriental laws, cf. p. 57; and about Hindu villages, cf. pp. 22–23; literature is stated on pp. 371/372. About compulsory organizations of craftsmen, see p. 136 and literature stated on p. 375.

179. See GIERKE, GENOSSENSCHAFTSRECHT II, 300ff, 457ff, 114, 93.

180. Cf. AMIRA 27; PLANITZ 188, with further literature.

181. See GIERKE, GENOSSENSCHAFTSRECHT II, 456.

182. Cf. A. Voigt, *Wirtschaft und Recht*, 2 Z. F. SOZIALWISSENSCHAFT (1911), 9–12, 99–108, 177–182, 238–249, 311–322, 387–397, 438–456; the same, *Die wirtschaftlichen Güter als Rechte*, 4 ARCHIV F. RECHTS- U. WIRTSCHAFTSPHILOSOPHIE (1913), 304–316.

183. "Coactus voluit" (it is his wish, although coerced)—Romanist phrase to describe the situation of an individual who has engaged in a legal transaction under the influence of coercion, in contrast to the situation in which a person is used as the mere physical tool of another, for instance, where the latter forcibly grabs the former's hand and moves it so as to go through the physical motion of writing a signature. Cf. *supra*, Part Two, ch. I:4:(5).

iii

Emergence and Creation of Legal Norms

1. *The Emergence of New Legal Norms—Theories of Customary Law Insufficient as Explanations*

How do new legal rules arise? At the present time, they usually arise by way of legislation, i.e., conscious human lawmaking in conformity with the formal constitutional requirements, be they customary or "made," of a given political society. Obviously, this kind of lawmaking is not aboriginal; it is not the normal one even in economically or socially complex and advanced societies. In England, the "common law" is regarded as the very opposite of "made" law. In Germany, non-enacted law is usually called "customary law." But the concept of "customary law" is relatively modern; in Rome it did not emerge before the very late period; in Germany it resulted from Civilian doctrine. Of such academic origin was especially that theory according to which custom, in order to be law, must be actually observed, commonly believed to be binding, and amenable to rational treatment.[1] All the modern definitions, too, are but theoretical constructs. For purposes of legal dogmatics, the concept of customary law is still indispensable, however, provided it is used in such refined ways as those formulated by Zitelmann or Gierke.[2] Otherwise we would have to confine our concept of law to statute law on the one side and judge-made law on the other. In my judgment, the violent struggle against the concept of customary law which the legal sociologists have carried on, especially Lambert and Ehrlich, is not only devoid of any foundation but also represents a confusion between the legal and sociological methods of analysis.[3]

However, matters are completely different with regard to our problem, viz., that of discovering empirical processes in which nonstatutory norms arise as valid customary law. On that problem the traditional doctrines tell us indeed little if anything. As a matter of fact, they are even incorrect where they purport to explain the actual development of law in the past, particularly in periods in which there was little or no enacted law. It is, of course, true that these doctrines find some support in late Roman as well as medieval conceptions, both continental and English, about the meaning and the presuppositions of *consuetudo* as a source of law.[4] There, however, the problem was that of finding an adjustment

between a body of rational law claiming universal validity and a multitude of actually prevailing systems of laws of locally or personally limited application. In the late Roman Empire the conflict was between the imperial law and the laws of the peoples of the provinces;[5] in England, between the law of the land (*lex terrae*), i.e., the Common Law, and the local laws;[6] on the Continent it was between the "received" Roman law and the indigenous bodies of law.[7] Only the various particularistic bodies of law were classified by the jurists as "customary law," and in order to give legal recognition to customary law the jurists devised certain tests of validity which customary law had to fulfill. This was a necessary step in view of the fact that the universal law claimed an exclusive applicability. But it would not have occurred to anyone to classify as customary law the English Common Law, which certainly was not statute law. Similarly, the definition of the Islamic *ijmā'* as the *tacitus consensus omnium*[8] is completely unconnected with "customary law" precisely because the *ijmā'* purports to be "sacred" law.

2. *The Role of Party Practices in the Emergence and Development of Legal Norms*

Theoretically, the origin of legal norms might, as we have already seen, be thought of most simply in the following way: The psychological "adjustment" arising from habituation to an action causes conduct that in the beginning constituted plain habit later to be experienced as binding; then, with the awareness of the diffusion of such conduct among a plurality of individuals, it comes to be incorporated as "consensus" into people's semi- or wholly conscious "expectations" as to the meaningfully corresponding conduct of others. Finally these "consensual understandings" acquire the guaranty of coercive enforcement by which they are distinguished from mere "conventions." Even on this purely hypothetical construction there arises the question of how anything could ever change in this inert mass of canonized custom which, just because it is considered as binding, seems as though it could never give birth to anything new. The Historical School of Jurisprudence tended to accept the hypothesis that evolutionary impulses of a "folk spirit" are produced by a hypostatized supra-individual organic entity.[9] Karl Knies, e.g., inclined toward this view.[10] Scientifically, however, this conception leads nowhere. Of course, empirically valid rules of conduct, including legal rules, have at all times emerged, and still emerge today, unconsciously, i.e., without being regarded by the participants as newly created. Such unconscious emergence has occurred primarily in the form

of unperceived changes in meaning; it takes place through the belief that a factually new situation actually presents no new elements of any relevance for legal evaluation. Another form of "unconscious" emergence is represented by the application of what actually is new law to old or somewhat different new situations with the conviction that the law so applied has always obtained and has always been applied in that manner. Nonetheless, there also exists a large class of cases in which both the situation as well as the rule applied are felt to be "new," although in different degrees and senses.

What is the source of such innovation? One may answer that it is caused by changes in the external conditions of social life which carry in their wake modifications of the empirically prevailing "consensual understandings." But the mere *change of external conditions* is neither sufficient nor necessary to explain the changes in the "consensual understandings." The really decisive element has always been *a new line of conduct* which then results either in a change of the meaning of the existing rules of law or in the creation of new rules of law. Several kinds of persons participate in these transformations. First we should mention those individuals who are interested in some concrete action. Such an individual may change his behavior, especially his social actions, either to protect his interests under new external conditions or simply to promote them more effectively under existing conditions. As a result, there arise "new" consensual understandings and sometimes new forms of rational association with substantively new meanings; these, in turn, generate the rise of new types of customary behavior.

It may also be, however, that, without any such reorientation of behavior by individuals, the total structure of social action changes in response to changes in external conditions. Of several kinds of action, all may have been well suited to existing conditions; but, when the conditions change one may turn out to be better suited to serve the economic or social interests of the parties involved; in the process of selection it alone survives and ultimately becomes the one used by all so that one cannot well point out any single individual who would have "changed" his conduct. In its pure form, such a situation may be a theoretical construct, but something of the kind does actually occur in the selective process which operates between ethnic or religious groups which cling tenaciously to their own respective usages. More frequent, however, is the injection of a new content into social actions and rational associations as a result of individual invention and its subsequent spread through imitation and selection. Not merely in modern times has this latter situation been of greatest significance as a source of economic reorientation, but in all systems in which the mode of life has reached at

least a measure of rationalization. The parties to the new arrangements are frequently unconcerned about the fact that their respective positions are insecure in the sense of being legally unenforceable. They regard legal enforceability by the state as either unnecessary or as self-evident; even more frequently do they simply rely upon the self-interest or the loyalty of their partners combined with the weight of convention. Prior to the existence of any coercive machinery, and prior even to the regulated enforcement of norms through the sib members' duty to participate in vengeance, the function later fulfilled by the "legal" guarantee of a norm was undoubtedly performed by the general convention that the person who was admittedly "in the right" could find others who would help him against an offender; and, where some special guaranty appeared desirable to the interested parties, magical self-malediction, i.e., the oath, largely superseded even at an advanced historical stage all other forms of guaranty, including an existing guaranty of legal coercion. In most periods, the preponderant part of the consensual order, including that of economic matters, has operated in this way and without concern for the availability of the legal coercive power of the state or of any coercive enforcement at all. Such an institution, however, as the Yugoslav *zadruga*[11] (household community), which is so often cited as evidence of the dispensability of legal coercion, actually dispensed only with the coercive legal power of the state, while during the period of its universal diffusion it undoubtedly enjoyed effective protection through the coercive power of the village authorities. Such forms of consensual action, once they have become firmly embedded in usage, may continue to exist for centuries without any recourse to the coercive power of the state. Although the *zadruga* was not recognized by, and was even contrary to many of the rules of, official Austrian law, it still dominated the life of the peasantry. But such instances should not be regarded as normal and should not be used as a basis for general conclusions.

Where several religiously legitimated legal systems coexist side by side on a completely equal footing, and with freedom of choice between them for the individuals, the fact that one of them is supported not only by the religious sanction but also by the coercive power of the state may well decide the rivalry between them, even if state and economic life are dominated by traditionalism. Thus, in Islam the same status is officially enjoyed by all the four orthodox schools of law.[12] Their application to the individuals is determined by the principle of personality in much the same way in which the application of the several tribal laws was determined in the Frankish empire.[13] At the University of Cairo[14] all four schools are represented. Nevertheless, the fact that

the Hanefite system was adopted by the Osmanic sultans and that, in consequence, its rules were enjoying the sanction of coercive enforcement by the secular officialdom and the courts,[15] condemned to a slow death the Malekite system, by which that support was once enjoyed in the past, as well as the other two law sects; and this development has taken its course despite the complete absence of any other negative factors. In business affairs proper, that is, in the contracts of the market, the interested parties' concern for the availability of the coercive power of the state is considerable. In this field, the development of new forms of association has taken place, and still does so through exact estimates of the probability of enforcement by the courts as organs of the political authority. The contracts to be concluded are being adapted to this estimate and the invention of new contractual forms proceeds by taking these estimates into account.

While changes in the meaning of the prevailing law are thus initiated by the parties or their professional counselors, they are consciously and rationally adapted to the expected reaction of the judiciary. As a matter of fact, this kind of activity, the *cavere* of the Romans,[16] constitutes the very oldest type of activity performed by "professional," rationally working lawyers. In a developing market economy, the calculability of the functioning of the coercive machinery constitutes the technical prerequisite as well as one of the incentives for the inventive genius of the cautelary jurists (*Kautelarjuristen*), whom we find as an autonomous element in legal innovation resulting from private initiative everywhere, but most highly developed and most clearly perceptible in Roman and English law.[17]

On the other hand, the spread of consensual and rational agreements of a certain type naturally exercises a marked influence upon the probability of their coercive enforcement by the law. While under normal circumstances only the unique case lacks the guaranty of enforcement, established custom and type agreement, once they enjoy universal diffusion, cannot be persistently ignored except under the compelling necessity of certain formal considerations or because of the intervention of authoritarian powers, or where the agencies of legal coercion have no contact with the life of business as is the case where they are imposed by an ethnically or politically alien authority, or where, in consequence of extreme vocational specialization, the organs of legal coercion have become far removed from private business as occasionally happens under conditions of sharp social differentiation. The intended meaning of an agreement may be in dispute or its use may be an as yet unstabilized innovation. In such situations the judge, as we shall call the agency of legal coercion *a potiori*, is a second autonomous authority. But even in

more normal cases the judge is doing more than merely placing his seal upon norms which would already have been binding by consensual understanding or agreement. His decision of individual cases always produces consequences which, acting beyond the scope of the case, influence the selection of those rules which are to survive as law. We shall see that the sources of "judicial" decision are not at first constituted by general "norms of decision" that would simply be "applied" to concrete cases, except where the decision relates to certain formal questions preliminary to the decision of the case itself. The situation is the very opposite: in so far as the judge allows the coercive guaranty to enter in a particular case for ever so concrete reasons, he creates, at least under certain circumstances, the empirical validity of a general norm as "law," simply because his maxim acquires significance beyond the particular case.

3. *From Irrational Adjudication to the Emergence of Judge-Made Law*

The phenomenon just described is in no way aboriginal or universal. It certainly does not exist at all in a primitive decision arrived at through the magical means of legal revelation. Indeed in all other adjudication which is not yet formally rationalized in a juristic way, even where it has passed beyond the stage of the ordeal, the irrationality of the individual case is still significant. No general "legal norm" is applied, nor does the maxim of the concrete decision, provided it exists and is perceived at all, obtain as a norm of decision in future cases. In the "suras" of the Koran, Mohammed repeatedly rejects earlier directives of his own, irrespective of their divine origin, and even Jehovah "regrets" some of his decisions, including some of a legal character. Through an oracle, Jehovah ordained the daughters' right of inheritance (Num. 27), but upon remonstration by the interested parties, the oracular pronouncement was corrected (Num. 36). Thus even a *Weistum*[18] of a general character is unstable, and where the individual case is decided by drawing lots (as among the Jews by the *Urim* and *Thummim*), combat, or some other ordeal, or by concrete oracular pronouncement, we cannot, of course, find any "rule-orientation" in a decision either in the sense of rule application or of rule creation. The decisions of lay judges, too, require a long development and much travail to reach the idea that they represent "norms" going beyond the individual case; this has been shown, for instance, by the investigations of Vladimirski-Budanov.[19] As a matter of fact, the greater the degree to which the

decision is a concern of "laymen," the less it proceeds upon purely objective lines and the more it takes into account the persons involved and the concrete situation. A certain measure of stabilization and stereotyping in the direction of the formation of norms emerges inevitably, however, as soon as the decision becomes the subject matter of discussion, or whenever rational grounds for the decision are being sought or presupposed. In other words, norm-formation occurs wherever there is a weakening of the originally purely oracular character of the decision. But, within certain limits, it was just the magical character of the primitive law of evidence which tended to more rational norm-formation, because it required that the question to be asked had to be precisely formulated.

There also exists another intrinsic element. Obviously, it is difficult, and often impossible, for a judge who wishes to avoid the charge of bias to disregard in a later case a norm which he has consciously used as his maxim in an earlier similar decision, and to deny his power of enforcement when he has once granted it before. The same considerations hold true for the judges who succeed him. The more stable the tradition, the more the judges will depend on those maxims which guided their predecessors, because it is just then that every decision, regardless of how it came into existence, appears as being derived from the exclusively and persistently correct tradition, as part of it or as its manifestation. It thus becomes a pattern which has, or at least lays claim to, permanent validity. In that sense, the subjective conviction that one is applying only norms already valid is in fact characteristic of every type of adjudication which has outgrown the age of prophecy, and it is in no way peculiarly modern.

New legal norms thus have two primary sources, viz., first, the standardization of certain consensual understandings, especially purposive agreements, which are made with increasing deliberateness by individuals who, aided by professional "counsel," thereby demarcate their respective spheres of interest; and, second, judicial precedent. In this way, for example, most of English common law developed.[29] The extensive participation in the process of juridically experienced and trained experts, who to an ever increasing degree devoted themselves "professionally" to the tasks of "counsel" or judge, has placed the stamp of "lawyers' law" upon the type of law thus created.

There is not excluded, of course, the role played in the development of the law by purely "emotional" factors, such as the so-called "sense of justice." Experience shows, however, that the "sense of justice" is very unstable unless it is firmly guided by the *pragma* of objective or subjective interests. It is, as one can still easily see today, capable of sudden

fluctuations and it cannot be expressed except in a few very general and purely formal maxims.[21] No national legal peculiarities, in particular, can be derived from any differences in the operation of the "sense of justice," at least not as far as present knowledge goes.[22] Being mainly emotional, that "sense" is hardly adequate for the maintenance of a body of stable norms; it rather constitutes one of the diverse sources of irrational adjudication. Only upon this basis can one ask to what extent "popular" attitudes, i.e., attitudes widely diffused among the legal clientele, can prevail against the "lawyers' law" of the professionals (attorneys and judges) who are continuously engaged in the invention of new contracts and in adjudication. The answer to this question depends, as we shall see, upon the type of adjudicative procedure prevailing in a given situation.

4. *Development of New Law Through Imposition from Above*

But aside from the influence and, mostly, the confluence of these factors, innovation in the body of legal rules may also occur through their deliberate imposition *from above*.[23] Of course, this took place at first in ways very different from those we know in our present society. Originally there was a complete absence of the notion that rules of conduct possessing the character of "law," i.e., rules which are guaranteed by "legal coercion," could be intentionally created as "norms." As we have seen, legal decisions did not originally have any normative element at all. Today, we take it for granted that legal decisions constitute the "application" of fixed and stable rules.[24] But where there had emerged the conception that norms were "valid" for behavior and binding in the resolution of disputes, they were at first not conceived as the products, or as even the possible subject matter, of human enactment. Their "legitimacy" rather rested upon the absolute sacredness of certain usages as such, deviation from which would produce either evil magical effects, the restlessness of the spirits, or the wrath of the gods. As "tradition" they were, in theory at least, immutable. They had to be correctly known and interpreted in accordance with established usage, but they could not be created. Their interpretation was the task of those who had known them longest, i.e., the physically oldest persons or the elders of the kinship group, quite frequently the magicians and priests, who, as a result of their specialized knowledge of the magical forces, knew the techniques of intercourse with the supernatural powers.

Nevertheless, new norms have also emerged through explicit imposi-

tion. But this could happen in one way only, viz., through a new charismatic revelation which could assume two forms. In the older it would indicate what was right in an individual case; in the other, the revelation might also point to a general norm for all future similar cases. Such revelation of law constitutes the primeval revolutionary element which undermines the stability of tradition and is the parent of all types of legal "enactment." The revelation could, and indeed often was, revelation in the literal sense; the new norms found their source in the inspiration or impulses, either actual or apparent, of the charismatically qualified person, and without being in any way required by new external conditions. But usually revelation was an artificial process. Various magical devices were used to obtain new rules when a change in economic or social conditions had created novel and unsolved problems. The men who normally used these primitive methods of adapting old rules to new situations were the magicians, the prophets, or the priests of an oracular deity. Of course, the line where interpretation of old tradition slides into the revelation of new norms is unprecise. But the transition must take place once the interpretative wisdom of the priests or elders proves inadequate. A similar need may also arise for the determination of disputed facts.

What is now of interest are the ways in which these modes of inventing, finding, or creating law affect its formal characteristics. The presence of the magic element in the settlement of disputes and in the creation of new norms results in the rigorous *formalism* so peculiar to all primitive legal procedure. For, unless the relevant question has been stated in the formally correct manner, the magical technique cannot provide the right answer. Furthermore, questions of right or wrong cannot be settled by any magical method indiscriminately or arbitrarily selected; each legal problem has its own technique appropriate to it. We can now understand the fundamental principle characteristic of all primitive procedure once it has become regulated by fixed rules, viz., that even the slightest error by one of the parties in his statement of the ceremonial formula will result in the loss of the remedy or even the entire case, as, for instance, in the Roman procedure by *legis actio* or in early medieval law.[25] The lawsuit, however, was, as we have seen, the oldest type of "legal transaction," because it was based upon a contract, i.e., the contract of composition.[26] Accordingly, we find the corresponding principle in the solemn private transactions of the early Middle Ages as well as in the Roman *negotia stricti juris*.[27] Even the slightest deviation from the magically effective formula renders the whole transaction void. Above all, however, a formalistic "law of evidence" constitutes the beginning of legal formalism in the lawsuit;

such law was not at all to regulate procedural proof in the modern sense. No proof was offered to show the allegation of a particular fact to be either "true" or "false." The issue was rather which party should be allowed or required to address to the magical powers the question of whether he was right and in which of the several ways this might or ought to be done.[28] The formal character of procedure thus stands in sharp contrast to the thoroughly irrational character of the technique of decision. Hence, the "law" that found expression in these decisions was entirely fluid and flexible, unless rigorously traditional norms had come to be generally acknowledged. Logical or rational grounds for a concrete decision were entirely lacking not only where the decision was given by a divine power or found through magical means of proof, but also where it consisted in the verdict of a charismatically qualified sage or, later, by an elder steeped in tradition, or an elder of the kinship group, or an arbitrator selected *ad hoc*, or a permanently elected expounder of the law (*lag saga*),[29] or a judge appointed by a political ruler. The verdict had to state that the particular problem had always been dealt with in the particular way; or it had to state that a divine power had decreed that the problem should be dealt with in that way in the specific case in hand or in all future cases, too. Such also was the nature of that great innovation of King Henry II, which was to become the origin of all civil trial by jury. The *assisa novae disseisinae*,[30] which was granted to the petitioning party by royal writ, replaced in real actions[31] the older magical-irrational modes of proof, i.e., wager of law and combat, by the interrogation of twelve neighbors sworn to tell whatever they knew about the seisin in question. The "jury" emerged when the parties voluntarily or, shortly afterwards, under the pressure of compulsion,[32] agreed in all types of litigation[33] to accept the verdict of twelve jurors rather than to derive the finding of guilt from the extraction of the assize and the old irrational modes of trial.[34] The jury, as it were, thus took the place of the oracle, and indeed it resembles it inasmuch as it does not indicate rational grounds for its decision. There was to be a distribution of functions between presiding "judge" and jury. The popular view which assumes that questions of fact are decided by the jury and questions of law by the judge is clearly wrong. Lawyers esteem the jury system, and particularly the civil jury, precisely because it decides certain concrete issues of "law" without creating "precedents" which might be binding in the future, in other words, because of the very "irrationality" in which a jury decides questions of law.

Indeed, it is this aspect of the civil jury's function which explains the very slow development in English law of certain rules of long-time practical validity to the status of fully recognized rules of law. As the

verdicts intermingled issues of law with questions of fact, it was only to the extent that the judges freed the properly legal from the factual portions of a verdict and articulated the former as legal principles, that these verdicts could become part of the growing body of law. It was in this manner that a major part of English commercial law was formulated by Lord Mansfield in the course of his judicial career. He endowed with the dignity of legal propositions what had hitherto been but the "feeling for law and justice" of the juries when they settled legal problems without distinguishing between law and fact.[35] Incidentally, the jury performed this task quite well, at least when it included experienced businessmen. Similarly, in Roman law the creative function of the "responding jurists" emerged from their giving advice to civil jurors; but in this case the legal problems were analyzed outside the court by an independent and legally competent agency.[36] This in due course produced a tendency to shift the work of the jurors onto the responding jurists and promoted in Rome the extraction of rational propositions of law from vaguely felt ethical maxims, just as in England the temptation to shift the work from the judge to the jury could, and probably often did, produce the opposite effect. Because of the jury, some primitive irrationality of the technique of decision and, therefore, of the law itself, has thus continued to survive in English procedure even up to the present time.[37]

Again, in so far as settled ways of judging typical fact situations have developed from the interaction of private business practices and judicial precedents, they do not possess the rational character of "legal propositions" as evolved by modern legal science. The legally relevant fact situations were distinguished from each other in a thoroughly empirical way in accordance with their objective characteristics rather than in accordance with their meanings as disclosed by formal legal logic. Certain distinctions were made, but only in the context of determining in a particular case which question should be addressed to the god or the charismatic authority, how this question should be put, and upon which of the parties it should be incumbent to apply the appropriate means of proof. As primitive legal coercion had for this purpose become rigorously formal and consistent, it always led to the "conditional judgment."[38] One of the parties was declared to have the right or the duty to furnish proof in a certain way, and success or failure in the case was, explicitly or by implication, declared to depend upon the result of his proof. Although different in many technical respects, the procedural dichotomy of both the praetorian formulary procedure[39] of Rome and the English procedure by writ and jury trial were connected with this basic phenomenon.

The problem of just what question was to be addressed to the magical powers constituted the first stage in the development of technical-legal concepts. But there is as yet no distinction between questions of fact and questions of law; or between objective norms and subjective "claims" of individuals which they guarantee; or between the claim for performance of an obligation and the demand for vengeance for a wrong—since originally everything which could constitute the basis of a suit was a wrong—; or between public and private rights; or between the making and the application of the law. Nor, in spite of what we have said earlier [sec. 1:2–3], is a distinction always made between "law," in the sense of norms which allot "claims" to the individual interested party, and "administration," in the sense of purely technical dispositions which "by reflection" benefit the individual by giving him access to certain opportunities.

Of course, all these distinctions exist in a latent and primitively inarticulate form. For, when seen from our point of view, the different kinds of coercion or of coercive authorities to some extent correspond to these distinctions. Thus the distinction between the religious lynch justice (employed by a community which feels threatened by magical dangers because of the conduct of one of its members) and the composition proceedings between kinship groups corresponds in a certain sense to the present-day distinction between criminal prosecution *ex officio* and civil proceedings initiated by private parties. Likewise we have come to see the original seed bed of "administration" in the arbitration of disputes by the master of the household, unbound by formal restraints or principles; and we distinguished this type of "administration" from the first steps toward an organized "administration of justice" which evolved in disputes between kinship groups by way of the rigorously formal composition procedure and its strict tendency to apply only existing rules. Furthermore, wherever there arose an *imperium* (i.e., an authority whose functions are specifically particularized as distinguished from the unlimited domestic authority), we find the beginnings of the distinction between "legitimate" command and the norms by which it is "legitimated." Both sacred tradition and charisma bestowed upon an individual command either an impersonal or a personal legitimacy, as the case may be, and thus also indicated the limits of their "lawfulness."[40] But since *imperium* conferred upon its holder a specific "legal quality" rather than impersonal jurisdiction, there was for a long time no clear-cut distinction between the legitimate command, the legitimate claim, and the norm by which both are legitimated. Again, what separated immutable tradition from *imperium* was also rather vague. The reason is that the *imperium*-holder made no important decision,

however great the power he might claim, without resorting as nearly as possible to the method of obtaining a revelation of the law.

5. *Approaches to Legislation*

(a) Even within the framework of tradition, the law that is actually applied does not remain stable. As long, at least, as the tradition has not yet fallen into the domain of a group of specially trained "preservers," who are at first usually the magicians and priests developing empirically fixed rules of operation, it will be relatively unstable in wide areas of social life. Valid "law" is what is "applied" as such. The decisions of the African "palavers" have been transmitted over generations and been treated as "valid law."[41] Munzinger reports the same phenomenon as to the Northeast African dooms (*buthas*).[42] "Case law" is the oldest form of changing "customary law." As far as subject matter is concerned, we have seen that, at first, this kind of legal development is limited to the tested devices of the art of magical inquiry. Only as the importance of the magicians declined did tradition acquire that character which it possessed, for example, in the Middle Ages and under which the existence of a legally valid usage could, just like a fact, become the subject matter of proof by the interested party.

(b) The most direct path of development led from the charismatic revelation of new commandments over the *imperium* to the conscious creation of law by compact or imposed enactment. The heads of kinship groups or local chieftains are the earliest parties to such compacts. Where in addition to villages and kinship groups, territorially more inclusive political or other associations come into existence for some political or economic reason, their affairs were managed through the regular or *ad hoc* meetings of the authorities just referred to. The compacts at which they arrived were of a purely technical or economic nature, that is, they concerned themselves, according to our notions, with mere "administration" or strictly private settlements. These compacts expanded, however, into the most diverse spheres. The assembled authorities might, in particular, incline toward imputing to their common declarations a particularly high authority for the interpretation of the sacred tradition. Under certain circumstances they might even dare to interfere, through their interpretation, with magically sanctioned norms, for instance, those ordering kinship exogamy. At first this process would be initiated mostly by the charismatically qualified magician or sage presenting the assembly with the revelation of the new principle with which he had been inspired in a state of ecstasy or in a dream; then the

members, acknowledging the charismatic qualification, would accept this revelation and would communicate it to their own groups as a new principle to be observed. However, the boundaries between technical decree, interpretation of tradition by individual decision, and revelation of new rules were vague and the magicians' prestige was unstable. Hence, the creation of law could, as for instance in Australia, be increasingly secularized[43] and revelation could be either completely excluded or applied only as an *ex post facto* legalization of the compacts. As a result, wide areas in which lawmaking was once possible only through revelation become subject to regulation by the simple consensus of the assembled authorities. This notion of "enactment" of law is thus frequently found to be fully developed even among African tribes, although the elders and other *honoratiores* may not always be able to impose upon their fellow tribesmen the new laws upon which they have agreed. Monrad[44] has found, for instance, that on the Guinea Coast the agreements of the *honoratiores* are imposed upon the economically weak by means of fines, but that the new norms are disregarded by the wealthy and the eminent unless they had assented to them—an exact analogy to the behavior of the "great of the realm" in the Middle Ages. On the other hand, the Ahanta and the Dahomey Negroes would, either periodically or incidentally, revise their enacted statutes and decide upon new ones.[45] Such a situation, however, can no longer be called primitive.

(c) As a general rule, enactment of statutes was either entirely nonexistent, or, where it existed, the absence of any distinction between finding and making law usually prevented the emergence of any idea of the legislative act as a general rule to be "applied" by the judge. The doom simply carried the authority of precedent. This type of intermediate stage between the interpretation of an already prevailing law and the creation of new law is still to be found in the German "customals" (*Weistümer*), which are pronouncements regarding either concrete or abstract legal problems, issued by an authority legitimated by either personal charisma or age, knowledge, honorific family status, or official position. It is also exemplified by the pronouncements of the Nordic *lag saga*. These Germanic sources did not distinguish between laws and rights,[46] or between statutory enactment and judicial decision, or between private and public law, or even between administrative decree and normative rule. Depending on the case at hand, they fluctuated from one to the other. Even English parliamentary resolutions retained such an ambiguous character almost up to the threshold of the present. As indicated by the term *assisa*, not only in the Plantagenet era but, at least basically, even well into the seventeenth century, a parliamentary

resolution had the same character as any other doom.[47] Even the king did not regard himself as unconditionally bound by his own *assisae*. By various means Parliament sought to counteract that tendency. The keeping of records and "rolls" of various kinds was meant to serve the purpose of conferring the status of precedent upon those Parliamentary resolutions which had met with royal assent. Consequently, the resolutions of Parliament have always retained, even until today, the character of mere amendments to the existing law, in contrast to the codifying character of the modern continental legislative enactment, which, unless otherwise indicated, always purports to constitute a complete regulation of the subject matter in question. Hence, the principle that old law is completely repealed by new law has not yet been fully accepted in England even today.[48]

(d) That concept of statute which in England was favored by the rationalism of the Puritans and later of the Whigs derives from Roman law, where it had its source in the *ius honorarium*, i.e., in the originally military *imperium* of the magistrate. *Lex rogata* was that decree of the magistrate which had been rendered binding for the citizens by the consent of the citizens in arms and which was thus binding also for the magistrate's successor in office.[49] The original source of the modern concept of statute was, accordingly, Roman military discipline and the peculiar nature of the Roman military community. In medieval continental Europe, Frederick I of Hohenstaufen was the first to utilize the Roman conception of statute,[50] apart from the Carlovingians, to whom it had been of a merely incipient significance.[51] But even the early medieval, particularly English, conception of the statute as an enacted amendment to the law was by no means reached quickly.

(e) Characteristics of the charismatic epoch of lawmaking and lawfinding have persisted to a considerable extent in many of the institutions of the period of rational enactment and application of the law. Remnants still survive even at the present day. As late a writer as Blackstone called the English judge a sort of living oracle;[52] and as a matter of fact, the role played by decision as the indispensable and specific form in which the common law is embodied corresponds to the role of the oracle in ancient law: What was hitherto uncertain, viz., the existence of the particular legal principle, has now, through the decision, become a permanent rule. The decision cannot be disregarded with impunity unless it is obviously "absurd" or "contrary to God's will" and therefore lacking charismatic quality. The only distinction between the genuine oracle and the English precedent is that the oracle does not state rational grounds, but it shares this very feature with the verdict of the jury. Historically, of course, the jurors are not the successors of

the charismatic legal prophets; quite to the contrary, the jury represents a displacement of the irrational means of proof used in adjudication before the folk assembly by the testimony of the neighbors, especially in matters concerning property. In the King's court it is thus a product of princely rationalism. True cases of descent from charismatic declaration of law we can see, on the other hand, in the relationship between the Germanic aldermen (*Schöffen*)[53] and the "judge," and in the institution of the *lag saga* of Nordic law.

6. *The Role of the Law Prophets and of the Folk Justice of the Germanic Assembly*

Of striking importance is a fundamental principle which has had an extraordinary influence upon the development of corporative (*genossenschaftlich*) and estate autonomy in the medieval West.

(a) This principle, which was consistently observed for the political reasons already mentioned, required that the lord of the court or his deputy would not participate in the decision of the case but would only occupy the chair and keep order in the court; the decision was to be arrived at by charismatic "declarers" of the law or, later, by aldermen appointed from the community within which the decision was to stand as law. In certain respects, this principle partakes of the nature of charismatic adjudication. The judge, by whom the court is convoked and held in his official capacity, cannot participate in the lawfinding simply because in the charismatic view his office as such does not confer upon him the charismatic quality of legal wisdom. His task is done when he has brought the parties to the point where they choose composition in preference to vengeance and the peace of the court in preference to self-help, and where they are ready to perform those formalities which both force them to adhere to the trial agreement and, at the same time, constitute the correct and effective way of putting the question to the deity or to the charismatically qualified sages. Originally, these legal sages were men of some general magical qualifications who were called upon in individual cases because of their very charisma; or they were priests, as the Brehons in Ireland[54] or the Druids among the Gauls,[55] or special juridical *honoratiores* acknowledged as such by election as *lag sagas* among the Nordic tribes or as *rachimburgi* among the Franks.[56] The charismatic *lag saga* later became a functionary whose position was legitimated as such by periodic election and eventually by appointment; the *rachimburgi* gave way to the aldermen legitimated as juridical *honoratiores* by royal patent. Yet, the principle still survived

that the law could not be disclosed by the lord himself but only by persons qualified by the possession of charisma. Thanks to his charismatic status, many a Nordic *lag saga* or German alderman was a politically influential spokesman for his district with the sovereign, especially in Sweden.[57] Always, these men were descended from eminent families and quite naturally the office was often hereditary in a family regarded to be charismatically qualified. The *lag saga*, for whom we have historical evidence from the tenth century on, never was a judge. He had nothing to do with the enforcement of any judgment; originally he had no coercive powers at all and only later did he acquire a limited coercive power in Norway. Coercive power, to the extent that it existed in legal matters at all, lay rather in the hands of political officials. From one called upon from case to case to find the law, the *lag saga* developed into a permanent official; and with the growing need for a rational calculability and regularity of the law, he became responsible for stating annually before the assembled community all those rules in accordance with which he would declare or "find" the law from case to case. The purpose was to make these rules known to the whole community but also to keep them alive in the memory of the *lag saga* himself. In spite of certain differences, the similarity with the annual publication of the praetorian edict is considerable. The succeeding *lag saga* was not bound by the *saga* of his predecessor, since, by virtue of his charisma, every *lag saga* could "create" new law. He could, of course, take into account suggestions and resolutions of the popular assembly, but he was not required to do so, and such resolutions were not law until they were received into the *lag saga*. Law could only be revealed; this fundamental principle as well as its implications in regard to the creation and declaration of law must now have become quite obvious. As in the *Lex Thuringorum*, traces of similar institutions can be found in most Germanic legal systems, especially in Frisia (the *âsega*).[58] The "editors" mentioned in the Preamble to the *Lex Salica*[59] probably were such prophets of the law, and we may also reasonably assume that the specific origin of the Frankish *Capitula legibus addenda*[60] is connected with the "nationalization" of such legal prophecy.

(b) Similar developments, or traces of them, can be found everywhere. The primitive method of deciding legal disputes by resorting to an oracle was frequent in civilizations of otherwise highly rationalized political and economic structure as, for instance, Egypt (the oracle of Ammon) or Babylonia.[61] Certainly the practice also contributed to the power of the Hellenic oracles.[62] Similar functions were performed by the legal oracles of the Israelites.[63] Indeed, legal prophecy seems to have been universal. Everywhere the power of the priests rested largely

upon their activities as dispensers of oracles or as the "directors" of the procedure in ordeals. Their powers thus increased considerably with the growing pacification of society due to the increased replacement of vengeance, at first by compulsion and eventually by complaint and trial. In Africa, the significance of irrational means of proof has been greatly reduced by the "chieftain's trial"; nevertheless, the terrifying power of the fetish-priest still rests upon the partial survival of the older practice of the sacred magical trial and ordeal, which was not only held under his supervision but which also allowed him to bring charges of sorcery and thus to deprive of life and property anyone who had incurred his displeasure or that of one who knew how to win him to his side. Even purely secular forms of the administration of justice have under certain conditions retained important traces of the old charismatic methods of adjudication. It is probably correct to regard the Athenian *thesmothetai*[14] as a body of persons who, through a process of formalization, changed from a group of charismatic legal prophets into an elective council of officials. But we cannot say with any certainty to what extent the participation of the Roman *pontifices* in legal matters was originally organized in a way similar to that of other forms of legal prophecy. The principle of separating the formal direction of the lawsuit from the finding of law applied in Rome as well, although the technical details were different from those of Germanic law. As regards the edict of the *praetor* and the *aedilis*, their similarity with the *lag saga* is also evident from the fact that its binding effect upon the individual official himself was preceded by a stage in which the official enjoyed wide discretionary powers. The principle that the *praetor* should be bound by his own edict did not evolve into a rule of law until the imperial period; and we must assume that both the pontifical disclosure of the law as resting upon an esoteric body of technical rules and the praetor's instruction to the *iudex* were at first rather irrational. It is customary to explain the demand of the *plebs* for the codification and publication of the law as a result of their opposition to both an esoteric law and the power of the magistrate.

(c) The separation of lawfinding from law enforcement has often been claimed to be a peculiar trait of German law as well as the source of the special power of the German sodalities (*Genossenschaften*). Actually, however, it is anything but a German peculiarity. The German board of aldermen simply took the place of the old charismatic prophets. The unique feature of German legal development can rather be found in the maintenance of that separation, the way in which it was technically worked out, and its connection with certain other important peculiarities of German law. Of these, one must mention

particularly the continuous importance of the so-called *Umstand.*[65] This was the participation in the process of adjudication by members of the legal community who were not juridical *honoratiores,* whose concurrence by acclamation was indispensable for ratification of the verdict as found by the "lawfinders," and every one of whom could, by way of *Urteilsschelte,* challenge the verdicts proposed.[66] The phenomenon of participating in adjudication by way of concurring acclamation can be found outside the area of Germanic procedure. One is justified in assuming, for instance, that elements of this practice are contained in Homer's description of a trial as depicted upon the shield of Achilles;[67] or in the trial of Jeremiah [Jer. 26:7–24], and elsewhere. The right of every freeman to challenge the decision of the lawfinders, i.e., the so-called *Urteilsschelte,* is a peculiar feature of German law, however. Yet it is by no means necessary to regard it as rooted in immemorial, aboriginal Germanic tradition. It seems rather to be a product of special developments, largely military in nature.

(1) Among the most important factors which secularized the thinking about what should be valid as a norm and furthered its emancipation from magically guaranteed traditions, were war and its uprooting effects. Although the conquering warrior chief could not exercise the *imperium* in important cases without the free consent of the army, it was inevitably very wide. It was in the very nature of the situation that this *imperium* was in the vast majority of cases oriented towards the regulation of conditions which in times of peace could have been regulated only by revealed norms, but which in times of war required that new norms be created by agreed or imposed enactment. The war lord and the army disposed of prisoners, booty, and particularly of conquered land. They thus created new individual rights and, under certain circumstances, new law. On the other hand, the war lord, both in the interest of common security and to prevent breaches of discipline and the instigation of domestic disorder, had to have more comprehensive powers than a "judge" possessed in times of peace. These circumstances would alone have been sufficient to increase the *imperium* at the expense of tradition. But war also disrupts the existing economic and social order, so that it becomes clear to everyone that the things one has been accustomed to are not absolutely sacred. It follows that war and warlike expansion have at all stages of historical development often been connected with a systematic fixation of the law both old and new. Again, the pressing need for security against internal and foreign enemies induces a growing rationalization of lawmaking and lawfinding. Above all, those various social elements by whom legal procedure is guided and presided over, enter into new relationships with each

other. If the political association assumes a permanently military character because of war and preparation for war, the military as such increases its decisive influence over the settlement of disputes between its members and, consequently, upon the development of the law. The prestige of age and, to a certain extent, the prestige of magic tend to decrease. But many different solutions can be found for the problem of how to adjust the various claims for a share in the making of new law of the war lord, of the secular and spiritual guardians of sacred tradition, and of a military community likely to be comparatively free from the restraints of tradition.

From this point of view, the type of military organization is a highly important factor. The Germanic *thing* of the district and also the *gemot* (*Landesgemeinde*) of the total political community were assemblies of the men who were able to bear arms and, consequently, were owners of land. Similarly, the Roman *populus* consisted of the property-holders assembled in their tactical units. During the great upheavals of the migration of the Germanic tribes, the assemblies of the Germanic political communities seem to have assumed, as against the war lord, the right to participate in the creation of new law. Sohm's contention that all enacted law was the King's law is quite improbable.[68] In fact, the bearer of the *imperium* does not seem to have played a predominant role in this kind of lawmaking. Among more sedentary peoples, the power of the charismatic legal sage continued unbroken; among those who were faced with new situations in the course of their warlike wanderings, especially the Franks and the Langobards, the sense of power of the warrior class increased. They claimed and exercised the right of active and decisive participation in the enactment of laws and the formation of judgments.

In early medieval Europe, on the other hand, the Christian Church, by its example of episcopal power, everywhere strongly encouraged the interference of the princes in the administration and enactment of the law. Indeed, the church often instigated this intervention for its own interests as well as in the interests of the ethics it taught. The capitularies of the Frankish kings developed in the same way as the semi-theocratic courts of the itinerant justices.[69] In Russia, very shortly after the introduction of Christianity, the second version of the *Russkaya Pravda* is evidence of the prince's intervention in adjudication and enactment which had been lacking in the first version; the result was the development of a considerable body of new substantive law having its source in the prince.[70] In the Occident, this tendency of the *imperium* clashed with the firm structure of charismatic and corporative adjudication within the military community. By contrast, the Roman

populus could, in accordance with the development of discipline in the hoplite army,[71] only accept or reject what was proposed by the holder of the *imperium*, i.e., apart from legal enactments, nothing but decisions in capital cases brought before it by *provocatio*.[72] In the German *thing* a valid judgment necessarily required the acclamation of the audience (*Umstand*).[73] The Roman *populus*, on the other hand, was at first not concerned with any judgment save its power to rescind, by way of grace, a death sentence rendered by a magistrate. The right of every member of the German *thing* assembly to challenge the decision proposed (*Urteilsschelte*) was due to its lesser degree of military discipline. The charismatic quality of adjudication was not the exclusive possession of a special occupational group, but every member of the *thing* community could at all times express his superior knowledge and attempt to have it prevail over the judgment proposed. Originally, a decision between them could only be arrived at by an ordeal, frequently with penal sanctions for the one whose "false" judgment constituted blasphemy against the divine guardians of the law. In fact, of course, the murmur of approval or disapproval by the community, whose voice was, in this sense, the "voice of God," would always carry considerable weight. The strict discipline of the Romans found expression in the magistrate's exclusive right of guiding the course of the lawsuit as well as in the exclusive right of initiative (*agere cum populo*) of the several magistrates who were competing with each other.

The Germanic dichotomy between lawfinding and law enforcement constitutes one type of separation of powers in the administration of justice; another is represented by the Roman system of concurrent powers of several magistrates entitled to "intercede" against each other and of division of functions in a law suit between magistrate and *iudex*. Separation of powers in the administration of justice was also guaranteed by the necessity of collaboration in various forms among magistrates, juridical *honoratiores*, and the military or political assembly of the community. It was on this basis that the *formalistic* character of the law and its administration was preserved.

(2) Where, however, "official" authorities, that is, the *imperium* of the prince and his officials or the power of the priests as the official guardians of the law, succeeded in eliminating the independent bearers of charismatic legal knowledge on the one side, and the participation of the popular assembly or its representatives on the other, the development of law acquired quite early that theocratic-patrimonialistic character which, as we shall see, produced peculiar consequences for the formal aspects of the law. Although a different course developed where, as for instance in the Hellenic democracies, a politically omnipotent

popular assembly completely displaced the old magisterial and charismatic agents of adjudication and set itself up as the sole and supreme authority in the creation and the finding of the law, the effects upon the formal qualities of the law were similar. We shall speak of "law-finding by the folk assembly" (*dinggenossenschaftliche Rechtsfindung*) whenever the folk assembly, while it participates in adjudication, does not have supreme authority over it but can accept or reject the decision recommended by the charismatic or official possessor of legal knowledge and can influence the decision in some particular way, for instance, through the challenge of the judgment proposed. Illustrations of this situation are the Germanic military community as well as, although in a highly rationally modified way, the military community of Rome. The type is not characterized, however, by the mere fact of the popular assembly participating in adjudication, examples of which occur frequently, e.g., among the Negroes of Togoland[74] or among the Russians of the period of the first pre-Christian version of the *Russkaya Pravda*.[75] In both these situations we can find a small body of "judgment finders"—twelve among the Russians—corresponding to the Germanic council of aldermen. Among the inhabitants of Togoland the members of this body are taken from among the elders of the kinship or neighborhood groups, and we may assume a similar basis more generally for the origin of the council of judgment finders. In the *Russkaya Pravda*, the prince did at first not participate at all; among the Togoland Negroes, however, he presides over the deliberations, and the judgment is arrived at by the joint and secret consultation between him and the elders. In neither case, however, does the participation of the people impart any charismatic character to the process of decision finding. Cases where popular participation does have that character seem to be rare in Africa and elsewhere.

(3) Where the community participates in the form of the *Umstand*, the formal character of the law and of lawfinding is largely preserved because the lawfinding is the product of revelation of the legal sage rather than the whimsical or emotional enunciation of those for whom the law is effective, i.e., those whom it purports to dominate rather than to serve. On the other hand, the sage's charisma, like every other genuine charisma, must "prove" itself by its own persuasive and convincing power. Indirectly, the sense of fairness and the everyday experience of the members of the legal community can thus make themselves felt strongly. *Formally*, the law remains here, too, "lawyers' law," for without specific expert knowledge and skill it cannot assume the form of a rational rule. However, as far as its *content* is concerned, it is at the same time also "popular law."

It is most probable that the origin of the institution of the "legal proverbs" may be ascribed to the epoch of administration of justice by the folk assembly. It should be realized, however, that the folk assembly was not a universal phenomenon, if we use the term in the precise sense of a peculiar variety of several possible ways of dividing power between the authority of legal charisma and ratification by the popular and military community. The specific feature of such legal proverbs is usually a combination of the formal legal norms with a concrete and popular reason, as, for example, in such sayings as these: "Where you have left your faith, there you must seek it again," or "Hand must warrant hand" [cf. sec. i:5, n. 26]. They originate, on the one hand, in the popular character of the law which arises both from the participation of the community and the relatively considerable knowledge which it has of the law. On the other hand, legal proverbs also originated in certain maxims formulated by individuals, who, either as experts or as interested observers, gave thought to the common features of frequently recurring decisions. It is certain that legal prophets must have coined many a maxim in this fashion. In short, legal proverbs are fragmentary legal propositions expressed as slogans.

7. *The Role of the Law Specialists*

Yet, formally elaborated law constituting a complex of maxims consciously applied in decisions has never come into existence without the decisive coöperation of trained specialists. We have already become acquainted with their different categories. The stratum of "practitioners of the law" concerned with adjudication comprises, in addition to the official administrators of justice, the legal *honoratiores*, i.e., the *lag sagas, rachimburgi, Schöffen,* and, occasionally, priests. As the administration of justice requires more and more experience and, ultimately, specialized knowledge, we find as a further category private counselors and attorneys, whose influence in the formation of the law through "legal invention" has often been considerable. The conditions under which this group has developed will be discussed further below [in the next section]. The increased need for specialized legal knowledge created the professional lawyer. This growing demand for experience and specialized knowledge and the consequent stimulus for increasing rationalization of the law have almost always come from increasing significance of commerce and those participating in it. For the solution of the new problems thus created, specialized, i.e., rational, training is an ineluctable requirement. Our interest is centered upon

the ways and consequences of the "rationalization" of the law, that is the development of those juristic qualities which are characteristic of it today. We shall see that a body of law can be rationalized in various ways and by no means necessarily in the direction of the development of its "juristic" qualities. The direction in which these formal qualities develop is, however, conditioned directly by "intrajuristic" conditions: the particular character of the individuals who are in a position to influence by virtue of their profession the ways in which the law is shaped. Only indirectly is this development influenced, however, by general economic and social conditions. The prevailing type of legal education, i.e., the mode of training of the practitioners of the law, has been more important than any other factor.

NOTES

1. The classical formulation of the German Pandectist doctrine of customary law is that by PUCHTA, DAS GEWOHNHEITSRECHT, 2 vols. (1828/37); for a concise modern treatment, see 1 ENNECCERUS, ALLGEMEINER TEIL (1928) 31, 64, 79; see also MAINE (1861), c. i; J. C. GRAY, NATURE AND SOURCES OF LAW (2nd ed. 1927), c. XII; Vinogradoff, *The Problem of Custom*, COLLECTED PAPERS, II, 410; furthermore, ALLEN (5th ed. 1951), cc. i and ii, where the rather different tests of the legal validity of customs in the common law are fully discussed.

2. E. Zitelmann, *Gewohnheitsrecht und Irrtum* (1883), 66 ARCHIV FÜR DIE CIVILISTISCHE PRAXIS, 323; O. GIERKE, PRIVATRECHT, I, 1569.

3. E. LAMBERT, LA FONCTION DU DROIT CIVIL COMPARÉ (1903), 172, 216; EHRLICH, 436; see also GRAY, *op. cit. supra* n. 1, at 297. Both Lambert and Ehrlich argued that the origin of custom was not to be found in VOLKSRECHT but predominantly in JURISTENRECHT. More particularly, their argument (especially Lambert's) was that custom becomes only then established when those who use the custom have become clearly convinced that the courts will not depart from the line of conduct which the judges have laid down and that it is better to adapt oneself to these rules in the same way as one has to adapt himself to the rules laid down by the legislature. This view of custom was meant to drive another nail into the coffin of the Historical School, whose arguments were that custom derived first and foremost from the *consensus utentium* before receiving judicial and legal recognition. Ehrlich was less radical than Lambert, although he too insisted strongly on the creative agency of judge-made law. He distinguished between *Rechtssätze*, i.e., rules for decision, and *Rechtsverhältnisse*, i.e., the legal arrangements actually existing in society, such as property, family, etc. In dealing with *Rechtsverhältnisse* the judge's function might be less original and more restricted, for the judge must always give due attention to the private arrangements or conventions existing in society; but according to Ehrlich, the process of judicial law-making was still clearly discernible.

4. On the medieval doctrines about *consuetudo* as a source of law, see BRIE, LEHRE VOM GEWOHNHEITSRECHT (1899), §§ 12 *et seq.*; ENGELMANN (1938) 81; for England, see POLLOCK AND MAITLAND 183; ALLEN; HOLDSWORTH, III, 167–170.

5. For a discussion of this conflict, see MITTEIS, REICHSRECHT (1891); JOLOWICZ, 66–71.

6. Cf. 1 POLLOCK AND MAITLAND 107, 184, 186, 220, 222; HOLDSWORTH I, 1–20; II, 3–21; 206–207; ALLEN, 86–88.

7. Cf. *supra* n. 4, see also SAVIGNY, GESCHICHTE DES RÖMISCHEN RECHTS IM MITTELALTER (2nd ed. 1850) esp. I, 115, 178.

8. *Ijmā'*—in Mohammedan law that consent of the scholars which has been held necessary to establish law supplementary to the word of the Prophet as expressed in the Koran and his other alleged sayings (*hadith*).

9. On the Historical School, see the full treatment by STONE, 421.

10. K. KNIES, DIE POLITISCHE OEKONOMIE VOM GESCHICHTLICHEN STANDPUNKTE (1883). Cf. also WEBER'S *Roscher und Knies und die logischen Probleme der historischen Nationalökonomie*, SCHMOLLERS JAHRBÜCHER (1903, 1905, 1906), reprinted in *GAzW*, 1–145.

11. *Zadruga* (accent on the first syllable) is the south-Slavic variety of the very widely spread phenomenon of the house community (cf. PEAKE, *Village Community*, 15 ENCYC. SOC. SCI. 253, 256). According to TROYANOVITCH, MANNERS AND CUSTOMS IN SERBIA, ed. Stead, London, 1909, c. xii, it was a large family or clan, organized on a patrilineal basis, dwelling in one large house and holding all its land, livestock, and money in common. These *zadrugas* continued for several generations without division, often including as many as 100 individuals. They were ruled by an elder (*stareshina*), usually the oldest member of the household capable of exerting authority, who apportioned the work among the different members. When a *zadruga* broke up, the stores were divided equally among all the members, but the land among the males only.

The *zadruga* has been regarded as evidence for the Marxist theory of "aboriginal" communal property or as a model for the communist society of the future (S. Marcovic, 10 ENCYC. SOC. SCI. 144). Quite particularly has the *zadruga* been used as the prime illustration for the superfluousness or ineffectiveness of state law as a means of social regulation. This notion seems to derive from the use which Ehrlich made of the investigation of South Slavic law by Bogišić (see Demelic, *Le droit coutumier des Slaves méridionaux d'après les recherches de v. Bogišić*, 6 REV. LÉGISL. ANCIENNE ET MODERNE (1876) 253). The famous passage in Ehrlich (at 371) is as follows:

"Bogišić's investigation revealed that among all the Southern Slavs within the territory within which the Austrian Civil Code is in effect the well-known South Slavic family community, the Sadruga, is in existence; this is altogether unknown to the Civil Code and absolutely irreconcilable with its principles."

This proposition, which has been taken over by Weber, is not tenable, however.

In the former Austro-Hungarian Monarchy the kingdom of Croatia-Slavonia, a semi-autonomous part of Hungary, constituted the area of principal occurrence of the *zadruga*. The Austrian Civil Code of 1811 was introduced there in 1852 (Law of November 29, 1852, Austrian REICHS-GESETZ-BLATT 1852, No. 246). In the course of the implementation of the Code as the law of Croatia-Slavonia, the Decree of the Austrian Minister of Justice of April 18, 1853 (R.G. Bl. 1853, No. 65) provided for the introduction of the Austrian system of registration of land titles. Section 29 of this decree provided expressly that in the case of lands owned by a "house communion" the family as such was to be entered as the owner rather than any single individual. This decree constituted a clear recognition of the *zadruga* by the official law. It continued a tradition which had been established by official Austrian legislation from the beginning of the Austrian rule over the regions of the so-called *Militär-Grenze* ("Military Border Region," i.e.,

the region adjacent to the Turkish border). The *zadruga* is expressly mentioned in the very statute of 1754 by which the *Militär-Grenze* was established (*Militär-Grentz-Recht für das Carlstädter und Varasdiner Generalat*, Part IV, § 37; see also *Grenz-Grundgesetz* of 1807; cf. M. STOPFER, ERLÄUTERUNGEN DER GRUNDGESETZE FÜR DIE CARLSTÄDTER 1, VARASDINER, BANAT, SLAVONISCHE UND CROATISCHE MILITÄRGRENZE [Vienna, 1830]; see also VANICEK, GESCHICHTE DER MILITÄRGRENZE, 4 vols. [1875]; HOSTINEK, DIE K.K. MILITÄRGRENZE, 2 vols. [1861]).

The Basic Law of 1850 (*Kaiserl. Patent v. 7. Mai, 1850, R.G. Bl. 1850, No.* 243) stated expressly that "The patriarchal life of the border population is placed under the protection of the law" (§ 31); in accordance with this maxim an extensive set of provisions was established to clarify the internal structure of the "family houses" and their relation to outsiders (§§ 16, 22, 27, 33–45). By a later Croatian Statute of 1870, the disciplinary powers of the family head and the village authorities over *zadruga* members were again expressly recognized and regulated (cf. Bidermann, *Législation autonome de la Croatie* [1876], 8 REV. DR. INTL. ET LEGISL. COMP. 215, 266). In Austria proper the *zadruga* existed only in the small district of White Carniola. There, too, judicial practice regarded *zadruga* lands as owned, not by individuals, but by the family. Official Austrian, including Croatian-Slavonian, law was thus far from hostile to the *zadruga*. It would also be difficult to see in what respects the *zadruga* would have been incompatible with any of the provisions of the Austrian Civil Code. Like all modern codifications, the Austrian code leaves wide room for private parties to regulate their affairs according to their own wishes. The majority of its rules on contracts are stopgap law (*ius dispositivum*) to be applied only in so far as the parties have failed to make their own arrangements. Its rules on real property and decedents' estates are so formulated that they can easily be adapted to various forms of joint tenancy. It is thus difficult to see how the *zadruga* can be used as an illustration for the ineffectiveness of legal regulation.

For further information on the *zadruga* see MAINE, EARLY LAW 232–282; WEBER, HISTORY (1950) 12, 47; Y. PERITCH, *Opposition between communism and bourgeois democracy as typified in the Serbian Zadruga Family* (1922) 16 ILL. L. REV. 423; S. H. CROSS, *Primitive Civilization of the Eastern Slavs* (1946) 5 AMERICAN SLAVIC AND EAST-EUROPEAN REV. 50; P. E. MOSELEY, *Adaptation for Survival: The Varzic Zadruga* (1942/43) 2 SLAVONIC AND EAST-EUROPEAN REV. 147–170; for recent developments concerning the *zadruga* see M. ISIC, LES PROBLÈMES AGRAIRES EN YOUGOSLAVIE (1926) 32, 48, 319.

12. The four orthodox schools of Islamic jurisprudence are the Hanefite, Shafiite, Malekite, and Hanbalite; see Schacht 8 ENCYC. SOC. SCI. 344, and literature there cited.

13. For the system of "personal laws" in the Frankish empire, see Maitland, *Prologue to a History of English Law* (1907) SELECTED ESSAYS IN ANGLO-AMERICAN LEGAL HISTORY 20; see also 1 BRUNNER, 259; SMITH, 115 *et seq.*; K. SCHRÖDER, DIE FRANKEN UND IHR RECHT (1881) 36.

14. The reference is to the school of El-Azhar, Islam's most celebrated center of learning, founded in Cairo in A.D. 988.

15. Weber's reference is to the old Turkey of the time before the Kemalist reforms of the 1920's; cf. VESEY-FITZGERALD, MUHAMMEDAN LAW (1931) 36ff.

16. Traditionally one enumerates three main types of lawyers' activity in ancient Rome: *respondere, agere* and *cavere*. *Respondere* was the exposition of a point of law, especially in the answer to a question addressed to the jurist (*responsa prudentium*); *agere* was the activity on behalf of a client in a court of law; *cavere* meant the drafting of contracts, wills, and other transactions. A distinction

was made between the "jurisconsult" and the "advocate" (orator, rhetor). The latter would act in those courts, especially criminal, in which oratory would be counted on to be helpful. Legal training was neither necessary nor usual for an orator. Cicero's knowledge of the law, for instance, does not seem to have surpassed that of the well-educated citizen and statesman in general. Cf. SCHULTZ, HISTORY; see also the popular account of "how the Roman law factory worked" by WORMSER, THE LAW (New York, 1949), c. ix; for further discussion by Weber, see *infra*, sec. *iv*:3.

17. *Kautelarjuristen*—those lawyers who, like the English conveyancer or the modern American corporation lawyer, are using their skill in drafting instruments and especially in inventing new clauses for the purpose of safeguarding their clients' interests and of preventing future litigation. The term has been used with special reference to the German seventeenth- and eighteenth-century specialists in that art, and also to characterize the early period of Roman legal development (cf. *infra*, ch. XI, n. 5).

18. *Weistum* (pl. *Weistümer*), similar to the costumals or customaries of England, is a collection of legal customs of a particular locality, especially a manor. "As far back as into the Carlovingian period we can trace the practice of an *inquisitio* into existing customs to be made annually by an officer of the manor. The materials so collected were recited every year or, later, reduced to writing and annually read in public. From the manorial communities this custom spread to communities of free peasants and to free villages." (VON SCHWERIN, DEUTSCHE RECHTSGESCHICHTE [2nd ed. 1915], with bibliography).

19. Vladimirski-Budanov, Mikhail Flegontovich, 1838–1916, Russian legal historian; cf. the biographical article on him in 15 ENCYC. SOC. SCI. 271; see his Russian Legal History (OBZOR ISTORII RUSSKAGOPRAVA, 1907) 59, 88.

20. For the latest and most comprehensive presentation of the development of the principle of *stare decisis* in English law, see ALLEN 43, 150ff, 525ff.

21. For recent discussions of the "sense of justice," see E. N. CAHN, THE SENSE OF INJUSTICE (1949); E. RIEZLER, DAS RECHTSGEFÜHL (2nd ed. 1946); HOCHE, DAS RECHTSGEFÜHL IN JUSTIZ UND POLITIK (1932); H. COING, GRUNDZÜGE DER RECHTSPHILOSOPHIE (1950) 48.

22. Weber's remark is directed against those scholars of the historical school of jurisprudence who regarded all law as the emanation of every nation's peculiar "national spirit" (*Volksgeist*), see especially SAVIGNY, VOM BERUF UNSERER ZEIT FÜR GESETZGEBUNG UND RECHTSWISSENSCHAFT (1814), translated by HAYWARD (ON THE VOCATION OF OUR AGE FOR LEGISLATION AND JURISPRUDENCE, 1831); cf. STONE 421. The theory of the national peculiarity of the sense of justice was taken up by the National-Socialists and used by them as one of the foundations of their legal theory.

23. On the slow development of conscious creation of new law by legislation in England, see ALLEN 354, 365 *et seq.*; S. THORNE, INTRODUCTION TO A DISCOURSE UPON THE EXPOSITION AND UNDERSTANDING OF STATUTES, WITH SIR THOMAS EGERTON'S ADDITIONS (1942).

24. The view expressed here by Weber is typically that of continental legal thinking; for the radically different view of the American realists, see especially JEROME FRANK, LAW AND THE MODERN MIND (1930); for a more realistic description of the American approach, see EDWARD LEVI, INTRODUCTION TO LEGAL REASONING (1949); cf. also STONE 192; and see *infra*, sec. *viii*:2.

25. For the formalistic features of the *legis actio*, see JOLOWICZ 87, 181; WENGER 123; ENGELMANN AND MILLAR 269, 281; 2 JHERING, 496–695. As to formalism in medieval procedure, see Brunner, *Wort und Form im altfranzösischen Prozess* in SITZUNGSBER. DER AKAD. DER WISS. ZU WIEN, PHIL-HIST.

CLASSE LVII (1867), 655; ENGELMANN AND MILLAR 174, 386, 649; O. v. ZALLINGER, WESEN UND URSPRUNG DES FORMALISMUS IM ALTDEUTSCHEN PRIVATRECHT (1898); SCHROEDER, §§ 13, 25, 37, 63. See also *infra*, sec. iv:1 and n. 4 (*fautes volent exploits*).

26. See *supra*, sec. i:5.

27. In classical Roman law a distinction was made between *negotia stricti iuris* and *negotia bonae fidei*. In the former the debtor has to perform exactly as he has promised, no more and no less. The principal example is the formalized promise of the solemn *stipulatio*. In the latter, which are a product of later development, the debtor has to do whatever is required by good faith and fair dealing, especially in view of local or mercantile custom. Cf. SOHM, 367; JÖRS AND KUNKEL 165 (with bibliography); see also SCHULZ, PRINCIPLES 223 *et seq.*

28. Among the historians of the Germanic laws it has become customary to speak of the "right" to offer proof and to contrast it with the modern "burden" of proof. Cf. 2 BRUNNER, RECHTSGESCHICHTE §105; SCHROEDER 84; AMIRA, 130, 161; MAURER, GESCHICHTE DES ALTGERMANISCHEN GERICHTSVERFAHRENS (1824); see also 1 POLLOCK AND MAITLAND 39; 2 HOLDSWORTH 107, 112. In England the right of the defendant in the more archaic forms of action to prove his case by wager of law survived, at least formally, until its official abolition by the statute 3 and 4 William 4 c. 42, Sec. 13 (1833). On proof in archaic procedure in general, see Declareuil, *Preuves judiciaires dans le droit franc* (1898) 22 NOUVELLE REVUE HISTORIQUE DE DROIT 220.

29. "Lag saga" was the recitation of the laws, occasionally in poetic form, at the periodically held popular assemblies of Scandinavia and Iceland. The same word applies to the person by whom the law is thus recited. See BRYCE, 327; see *infra* n. 57.

30. For the Assize of Novel Disseisin, established at the Assize of Clarendon in 1166, see POLLOCK AND MAITLAND 145–147; PLUCKNETT 339–342; cf. also JOÜON DES LONGRAIS, LA SAISINE (1925), and by the same author, *La portée politique des réformes d'Henri* II (1936) REVUE HISTORIQUE DE DROIT 540.

31. The "real actions" were those common law actions which were brought for the recovery of land. They were cumbersome and subject to numerous delays (*essoins*) and became obsolete in the sixteenth century, when the action of ejectment largely took their place. Cf. MAITLAND, FORMS 7; PLUCKNETT 336–337, 354.

32. The form of compulsion referred to is the *peine forte et dure*. This was first imposed by the Statute of Westminster (1275) upon felons who refused to submit to trial by jury. In the sixteenth century, the *peine* became a form of torture: the accused was placed between two boards and weights were piled upon him until he accepted trial by jury or finally succumbed.

33. Compulsion was only used in the case of felonies. Jury trial soon became the normal mode of trial in civil cases. See especially PLUCKNETT 125; BRUNNER, SCHWURGERICHTE (1876); HOLTZENDORFF'S RECHTSLEXICON 559, repr. 1 ABHANDLUNGEN ZUR RECHTSGESCHICHTE (1931) 82.

34. The classical work on the origins of the jury is BRUNNER, ENTSTEHUNG DER SCHWURGERICHTE (1872); for a comprehensive presentation see 1 POLLOCK AND MAITLAND 138; 1 HOLDSWORTH 298; THAYER, THE JURY AND ITS DEVELOPMENT (1892) 5 HARV. L. REV. 249; see also RADIN, 204.

35. On Lord Mansfield, see 12 HOLDSWORTH 464–560; also C. H. S. FIFOOT, LORD MANSFIELD (1936), esp. 82–117.

36. *Infra* sec. iv:3 and n. 39.

37. Cf. in this respect the opinion of Jerome Frank as expressed in LAW AND THE MODERN MIND, c. xvi and App. 5; also in COURTS ON TRIAL (1949), c. viii.

38. The conditional or proof-judgment of early German procedure (i.e., before the reception of Roman law) merely decided which allegations were decisive of the cause, which allegations had therefore to be proved, and which of the parties was to make the proof. Failing proof, judgment went automatically to the other party. In other words, "the legal consequences of such success or failure in the proof needed no express statement: the nature of the proof-judgment was such as to leave not the slightest doubt on this score" (ENGELMANN AND MILLAR 143–144). This type of judgment differed from Roman procedure, where the plaintiff sought to establish conclusively his claim and thus to secure authority to have his claim enforced in case judgment was given in his favor. In the Germanic system, the claim and its enforcement were, as it were, left open, and the defendant, in case he was unsuccessful as against the plaintiff's proof, was bound to give satisfaction not by virtue of the judgment itself but by virtue of his undertaking to accept the results of the proofs which were directed by the court. ENGELMANN AND MILLAR, *ibid.*

In his text, Weber continues as follows: "in close correspondence to our present practice in those cases where one party is charged with swearing a decisory oath." The reference is to Sections 445–463 of the German Code of Civil Procedure in its original version of 1877. Under these provisions the party who has the burden of proof and would otherwise be unable to prove a material fact within the knowledge of the other, could challenge the latter to swear that the former's factual allegation is not true. In such cases the court would render a conditional final judgment to the effect that decision would go to the party challenged if he would swear the oath, but to the challenger if the oath were not sworn. One or the other alternative would take effect immediately depending on whether or not the oath would be sworn. This kind of procedure was abolished by the Law of October 27, 1933 (R.G. Bl. 1933 I 779, 781).

39. The parallel drawn by Weber is first that between the Roman *litis contestatio* on the one hand and the Germanic *Urteilserfüllungsgelöbnis* on the other. The similarity between them is that both constituted, as it were, agreements between the parties to submit to the decision that would be rendered. The second parallel seems to be that between the Roman *litis contestatio* and the Germanic conditional or proof judgment (see n. 38 *supra*), which also existed in England until trial by jury replaced the other modes of proof such as the ordeal and trial by combat.

40. Cf. *infra*, ch. IX:1 and ch. X:3.

41. *Palaver*—"A talk, parley, conference, discussion; chiefly applied to conferences, with much talk, between African or other uncivilized natives, and traders or travellers," 7 OXFORD ENGLISH DICTIONARY (1933) 390; cf. LETOURNEAU, L'ÉVOLUTION JURIDIQUE (1891) 78, 89.

42. W. MÜNZINGER, OSTAFRIKANISCHE STUDEN (1864) 478.

43. See A. ELKIN, THE AUSTRALIAN ABORIGINES (1938) 28–31, 36–37, 102; and literature there cited; SPENCER, THE ARUNTA (1927) I, 11–13.

44. Hans Christian Monrad, *Gemälde der Küste von Guinea und der Einwohner derselben.* Trans. from the Danish by H. E. Wolf, 1824 (describes a journey in 1805–1809). (W)

46. In the German language this distinction is obscured by the fact that the same word "Recht" means both "law" and "right."

47. On the slow development of the English "statute" from a specific royal grant or command into an act of legislation in the modern sense, see ALLEN 357; PLUCKNETT, STATUTES AND THEIR INTERPRETATION IN THE FIRST HALF OF THE 14TH CENTURY (1922); THORNE, *op. cit. supra* n. 23; Richardson and Sayles, *The Early Statutes* (1934) 50 L.Q. REV. 201, 540; see also the concise survey in RADIN 327 *et seq.*

48. "Statutes in derogation of the common law are to be interpreted narrowly!"

49. The decree of a Roman magistrate was not binding upon his successor; the *praetor's* edict had thus to be repromulgated whenever a new *praetor* took office. The situation was different, however, where the magistrate had asked for (*rogare*) and obtained the assent of the popular assembly (*comitia*). In that case his act was formally elevated to the rank of a *lex* or, more specifically, a *lex rogata*. It was distinguished from the *lex data*, which was a decree issued by the magistrate alone and without the assent of the popular assembly. It was used mostly for purposes of provincial and local government and of emergency legislation. It was characteristic of the Roman legislative process that the popular assemblies could neither initiate legislation nor discuss it. The draft law was placed before the assembly by the moving magistrate (*rogatio*) and the assembly would only express its assent (*uti rogas*) or its refusal. Cf. 3 MOMMSEN, 310 *et seq.*

50. Frederick I (Barbarossa), Emperor 1152–1190. Whether it can really be said that he was "the first" to utilize the Roman conception of statute is open to doubt. The idea that the Germanic emperors were the successors of the Roman caesars can be found ever since the renewal of the Empire by Charlemagne in A.D. 800; cf. C. DAWSON, THE MAKING OF EUROPE (1935) 214 *et seq.*; P. KOSCHAKER, EUROPA UND DAS RÖMISCHE RECHT (1947) 6–54, and the vast literature cited there.

Frederick I was particularly outspoken in this idea and in his insistence upon Roman law constituting the continuing law of the Empire, in which his own *constitutiones* were to occupy the same position as those of his predecessors of Antiquity. Cf. 1 STOBBE 617.

51. For a concise account of the "written law" in the Frankish Empire see SMITH 124 *et seq.*

52. BLACKSTONE I, 172, 173.

Haff, *Der germanische Rechtsprecher als Träger der Kontinuität* (1948) 66 SAV. Z. GERM. 364.

58. The elected *iudex—ôsega—*had to find the appropriate law and to submit

it to the community for approval. BRUNNER I, 205; SMITH 37; see also SCHRÖDER 221. (On the *âsega* in Fiisia and "law speakers" in other German territories of the Carolingian period, cf. also P. Heck, DIE ALTFRIESISCHE GERICHTSVERFASSUNG (Weimar 1894); *id.*, "Die friesische Gerichtsverfassung u. die mittelfriesischen Richtereide," MITT. D. INSTITUTS F. ÖSTERR. GESCHICHTSFORSCHUNG, Suppl. VII (1907), 741ff.; *id.*, ÜBERSETZUNGSPROBLEME IM FRÜHEN MITTELALTER (Tübingen 1931), 36–43 and *passim*.—[Wi])

59. Weber speaks of the Introduction to the "Lex Salica." The older version of the Salic Laws, which alone is prefaced by the Introduction mentioned in the text, is more correctly referred to as the "Pactus legis Salicae." Its text is as follows:

"Between the Franks and their great ones it was agreed and resolved that one should cut down all causes of quarrels in order to preserve the zeal for peace among them. As they surpass all neighboring tribes by the strength of their arms, so they should also surpass them by the authority of their laws. Claims for amends should thus be terminated according to the kinds of dispute. Hence there were chosen from among several men those called Visogast, Salegast, Arogast, and Vidogast, from places on the other side of the Rhine, to wit, Bodoheim, Saleheim, and Vidoheim. They assembled at three gemots, carefully discussed all causes of disputes, and decreed the decisions for every one of them." (Prologue to the "Lex Salica," translated from the Latin text in K. A. ECKHARDT, DIE GESETZE DES MEROWINGERREICHES (1935) 481.

60. *Capitula legibus addenda*—royal acts (*capitula*) amending those popular laws which had been officially compiled, such as the *lex Salica* or the *lex Ribuaria*; cf. BRUNNER I, 543–550; on the Frankish capitularies in general, see POLLOCK AND MAITLAND I, 16.

61. P. CARUS, ORACLE OF YAHVEH (1911) 22–26, 32; S. A. STRONG, ON SOME ORACLES TO ESARHADDON AND ASURBANIPAL (1893).

62. F. W. H. Myers, *Greek Oracles* (in E. ABBOTT, HELLENICA, 1880) 425, 453–465; W. HALLIDAY, GREEK DIVINATION (1913), cc. iv, x; BOUCHÉ-LECLERQ, HISTOIRE DE LA DIVINATION DANS L'ANTIQUITÉ (1879), 4 vols; see esp. III, 147, 149–152, 156–161.

63. See CARUS, *op. cit.* 1–21, 33, 35. For a comparison of Israel and Egypt, *ibid.*, pp. 11–12.

64. The college of *thesmothetai* seems to have been a judicial body in Athens, created for the purpose of relieving the executive magistrates (*archontes*) of some of the burden of their judicial duties. See I BONNER AND SMITH, 85.

65. The *Umstand* are the members of the popular assembly (*thing, gemot*) who surround the judgment place and give or refuse their assent to the judgment proposed.

66. On *Urteilsschelte* see BRUNNER II, 471.

67. This is Homer's famous description in the *Iliad* (Σ497–508); cf. MAINE, 385, and note "S" (by F. POLLOCK) at 405–407; and especially, H. J. Wolff, *The Origin of Judicial Litigation among the Greeks* 4 TRADITIO (1946) 34–49, with bibliography on p. 82.

68. Sohm, *Fränkisches Recht und römisches Recht* (1880) 1 SAV. Z. GERM. 1, 9.

69. Annual visitation of the diocese by the bishop seems to have been an ancient custom in the church. In the Frankish empire this custom seems to have been neglected during the later Merovingian period. It was revived under the Carlovingians in the seventh century, and there was separated from the general visitation a special institution for the discovery and punishment of ecclesiastical crimes, the so-called itinerant court (*Sendgericht*). It was held as an inquest at

which in each parish a group of "mature, honest, and truthful men" (*iuratores*) were required under oath to inform the bishop's itinerant judge of all crimes of which they had knowledge. Cf. 5 HINSCHIUS, SYSTEM DES KATHOLISCHEN KIRCHENRECHTS (1895) 425. On the role of the ecclesiastical *Sendgericht* as a model for the royal inquest and thus for the development of the jury system, see BRUNNER, SCHWURGERICHTE (1876).

70. Weber's assumption of the existence of successive versions of the RUSSKAYA PRAVDA seems to be based upon the writings of Goetz (*Das russische Recht* [1910] 24 Z.F. VGL. RW. 241; [1914] 31 Z.F. VGL. RW. 1) and Kohler (*Die Russkaja Prawda und das altslawische Recht* [1916] 33 Z.F. VGL. RW. 289). Upon these studies doubt has been thrown by the latest investigation (Academy of the U.S.S.R., PRAVDA RUSSKAYA 1940, I, 29, 55), where it is pointed out that the oldest existing manuscript dates from 1282 and that all earlier dates ascribed to later editions have been purely conjectural. Controversy also exists with reference to the nature of the RUSSKAYA PRAVDA. According to KLUCHEVSKY (HISTORY OF RUSSIA, trans. Hogarth [1911], cc. ix and x) the book is neither a princely enactment nor a private law book but a collection of secular customs which was made by the Church to be applied in its courts when they had to exercise general jurisdiction over its nonclerical subjects. For an English translation of the RUSSKAYA PRAVDA see VERNADSKY, MEDIEVAL RUSSIAN LAWS (1947).

71. Hoplite army (Greek): an army composed of heavily armed soldiers. The term is used by Weber as a term of art.

72. *Provocatio*—the right of a Roman citizen convicted of a capital crime to appeal to the people assembled in the *comitia centuriata*. See JOLOWICZ 320 *et seq.*

73. See BRUNNER I, 204; SMITH 38; ENGELMANN AND MILLAR 96.

74. Cf. L. ASMIS, *Die Stammesrechte der Bezirke Misahöhe, Anecho und Lomeland (Schutzgebiet Togo)* (1911) 26 Z.F. VLG. RW. 1.

75. See *supra* n. 70; cf. J. Kohler, *Die Russkaja Pravda und das altslawische Recht* (1916) 33 ZEITSCHRIFT FÜR ÖFFENTLICHES RECHT 289; but see *infra* sec. *vi*:1 and n. 8.

IV

The Legal Honoratiores and the Types of Legal Thought[1]

FOR the development of a professional legal training and, through it, of specifically legal modes of thinking two different lines are possible. The first consists in the empirical training in the law as a craft; the apprentices learn from practitioners more or less in the course of actual legal practice. Under the second possibility law is taught in

special schools, where the emphasis is placed on legal theory and "science," that is, where legal phenomena are given rational and systematic treatment.

1. *Empirical Legal Training: Law as a "Craft"*

A fairly pure illustration of the first type is represented by the guildlike English method of having law taught by the lawyers. During the medieval period a sharp distinction was made between advocate and attorney.[2] The need for an advocate was due to the peculiarities of procedure before the popular assemblies; the attorney emerged when procedure began to be rationalized in the royal courts with their jury trial and the increasing evidentiary importance of the record.[3] In the French procedure, the verbal formalism which grew out of the strict application of the accusatorial principle before the popular assembly, gave rise to the need of an *avant-rulier* (*avant-parlier*). The legal maxim *fautes volent exploits*[4] and the formalistic effect of the words spoken compelled the layman to seek the assistance of an *avant-rulier* or *prolocutor* who, upon the party's request, would be assigned to him by the judge from among the judgment-finders,[5] and who would publicly "speak for," and in the name of, the party the words required for the progress of the case. Among other advantages there was thus conferred upon the litigant, since the formalistic words had not been pronounced by the litigant himself, the advantage that he could "amend" the verbal mistakes that might have been committed.[6] Originally, the advocate stood before the court next to the party litigating. His position was thus quite different from that of the attorney (*avoué, Anwalt, procurator*, solicitor), who assumed the technical tasks of preparing the case and obtaining the evidence. But the attorney could not assume these functions until procedure had undergone a considerable degree of rationalization. Originally an attorney in the modern sense was not possible at all. He could not function as the "representative" of the party until procedural representation had been made possible, as in England and France, by the development of the royal law; as a general rule, an attorney's appointment to such a representative function rested upon special privilege.[7] The advocate was not prevented by his acting for the party from participating in the actual finding of the judgments; indeed, he would not have been able to propose a judgment unless he was one of the judgment-finders. The attorney, however, became exclusively the representative of the party and nothing else. In the

royal courts of England, attorneys were originally recruited, almost without exception, from among those persons who could write, i.e., the clergy, for whom this activity constituted a major source of income.[8] But the preoccupations of ecclesiastical service on the one hand, and the expansion of legal training among the upper classes on the other, resulted not only in the progressive exclusion of the clergy from the legal profession, but also in the organization of the lay lawyers in the four Inns of Court, and in the pronounced movement on their part to monopolize the judicial positions as well as those other official jobs which required legal knowledge; the lawyers indeed succeeded in the course of the 15th and 16th centuries. With the coming to the fore of rational modes of procedure, the old *prolocutores* disappeared. But a new aristocracy of legal *honoratiores* came into being, consisting of counsels, serjeants, and barristers, i.e., of those admitted to represent, and plead for, litigants before the royal courts.[9] Indeed, this new type of lawyer took over many of the characteristics of the old "prolocutors." He was subject to a strict professional etiquette. He refused to have anything to do with the technical services required in the case, and ultimately he lost all personal contact with the party whom he would not even see face to face.[10] The handling of the case lay in the hands of "attorneys" or "solicitors," a stratum of business people, neither organized in guilds nor possessing the legal education provided by the guilds; they were the intermediaries between the party and the "barrister" to prepare the "brief" or *status causae* so that the barrister could present it before the court. The practicing barristers lived together in communal fashion in the corporate and closed guildhouses. The judges were exclusively chosen from among them and continued to share the communal life with them. "Bar" and "bench" were two functions of the corporate and later highly exclusive legal profession; in the Middle Ages its members came largely from the nobility, and admission to the guild was regulated with an ever increasing measure of autonomy. There was a four-year novitiate, connected with instruction at the guild school; the call to the bar conferred the right to plead; for the rest, training was purely practical. The profession insisted on the maintenance of the code of etiquette, especially with regard to the observance of minimum fees, all fees, however, to be paid voluntarily and not to be actionable. The lecture courses in the Inns were only introduced as the result of the competitive struggle with the universities.[11] As soon as the monopoly was achieved, the lectures began to decline, to be ultimately discontinued altogether. Thereafter, training was purely empirical and practical and led, as in the craft guilds, to pronounced specialization.

This kind of legal training naturally produced a formalistic treatment of the law, bound by precedent and analogies drawn from precedent. Not only was systematic and comprehensive treatment of the whole body of the law prevented by the craftlike specialization of the lawyers, but legal practice did not aim at all at a rational system but rather at a practically useful scheme of contracts and actions, oriented towards the interests of clients in typically recurrent situations. The upshot was the emergence of what had been called in Roman law "cautelary jurisprudence," as well as of such practical devices as procedural fictions which facilitated the disposition of new situations upon the pattern of previous instances.[12] From such practices and attitudes no rational system of law could emerge, nor even a rationalization of the law as such, because the concepts thus formed are constructed in relation to concrete events of everyday life, are distinguished from each other by external criteria, and extended in their scope, as new needs arise, by means of the techniques just mentioned. They are not "general concepts" which would be formed by abstraction from concreteness or by logical interpretation of meaning or by generalization and subsumption; nor were these concepts apt to be used in syllogistically applicable norms. In the purely empirical conduct of legal practice and legal training one always moves from the particular to the particular but never tries to move from the particular to general propositions in order to be able subsequently to deduce from them the norms for new particular cases. This reasoning is tied to the word, the word which is turned around and around, interpreted, and stretched in order to adapt it to varying needs, and, to the extent that one has to go beyond, recourse is had to "analogies" or technical fictions.[13]

Once the patterns of contracts and actions, required by the practical needs of interested parties, had been established with sufficient elasticity, the official law could preserve a highly archaic character and survive the greatest economic transformations without formal change. The archaic case analysis of the law of seisin, for example, which originally corresponded to the conditions of peasant tenure and manorial lordship of the Norman period, persisted to the very threshold of the present epoch with, what were from a theoretical point of view, often grotesque results in the American Middle West.[14] No rational legal training or theory can ever arise in such a situation. Wherever legal education has been in the hands of practitioners, especially attorneys, who have made admission to practice a guild monopoly, an economic factor, namely, their pecuniary interest, brings to bear a strong influence upon the process not only of stabilizing the official law and of adapting it to changing needs in an exclusively empirical way but also of preventing

its rationalization through legislation or legal science. The lawyers' material interests are threatened by every interference with the traditional forms of procedure, and every interference menaces that situation in which the adaptation of the scheme of contracts and actions to both the formal norms and the needs of the interested parties is left exclusively to the legal practitioners. The English lawyers, for example, were largely successful in preventing both a systematic and rational type of lawmaking and a rational legal education, such as exists in the Continental universities;[15] the relationship between "bar" and "bench" is still fundamentally different in the English-speaking countries from what it is on the Continent. In particular, the interpretation of newly made laws lay, and still lies, in the hands of judges who have come from the bar. The English legislator must, therefore, take special pains with every new act to exclude all sorts of possible "constructions" by the lawyers which, as has so frequently happened, would be directly contradictory to his intentions.[16] This tendency, partly immanent, partly caused by economic considerations, and partly the result of the traditionalism of the legal profession, has had the most far-reaching practical consequences. For example, the absence of a system of registration of title, and consequently the absence of a rationally organized system of real estate credit, has been largely due to the lawyers' economic interest with regard to the fees for that title examination which must in every transaction be made because of the uncertainty of all land titles. It has also had a deep influence upon the distribution of land ownership in England and, quite particularly, upon the peculiar form of the land lease as a "joint business."[17]

In Germany this type of legal profession with a clearly defined status or guild organization did not exist; for a long time it was not even necessary for a litigant to be represented by a lawyer. In France the situation was similar. It is true that the formalism of the procedure before the popular tribunals had necessitated the use of a *prolocutor*, and the regulation of their duties had become universally necessary; the earliest such regulation was promulgated in Bavaria in 1330. But the separation of the counsel from the attorney was achieved in Germany quite early, as the result essentially of the spread of Roman law.[18] The requirement of special legal training established itself relatively late and was usually caused by complaints of the Estates at a time when the Roman-law oriented university education already determined the standard of the upper-class legal practitioners.[19] A powerful guild organization was prevented from arising because of the decentralization of the administration of justice. Thus the status of the lawyers was determined by governmental regulation rather than by professional autonomy.[20]

2. *Academic Legal Training: Law as a "Science"—Origins in Sacred Law*

Modern legal education in the universities represents the purest type of the second way of legal training. Where only law-school graduates are admitted to legal practice, the universities enjoy a monopoly of legal education.[21] At the present time it is supplemented by apprenticeship in legal practice and another examination; it is in this manner that legal education is nowadays everywhere combined with empirical training. The Hanseatic cities were the only places in Germany where the academic degree alone was sufficient for admission to the bar, but even there the requirement of apprenticeship has recently been introduced.[22]

The legal concepts produced by academic law-teaching bear the character of abstract norms, which, at least in principle, are formed and distinguished from one another by a rigorously formal and rational logical interpretation of meaning. Their rational, systematic character as well as their relatively small degree of concreteness of content easily result in a far-reaching emancipation of legal thinking from the everyday needs of the public. The force of the purely logical legal doctrines let loose, and a legal practice dominated by it, can considerably reduce the role played by considerations of practical needs in the formation of the law. It took some effort, for instance, to prevent the incorporation into the German Civil Code of the principle that a lease is terminated by the sale of the land.[23] That principle had originated in the distribution of social power in Antiquity. However, the plan of taking it over into the new Code was entirely due to a blind desire for logical consistency.

A peculiar special type of rational, though not juristically formal, legal education is presented in its purest form in the legal teaching in seminaries for the priesthood or in law schools connected with such seminaries. Some of its peculiarities are due to the fact that the priestly approach to the law aims at a material, rather than formal, rationalization of the law. This point will be discussed at a later stage [see section v]; at this place we shall only deal with those results which are produced by certain general characteristics of this type of legal education. The legal teaching in such schools, which generally rests on either a sacred book or a sacred law fixed by a stable oral or literary tradition, possesses a rational character in a very special sense. Its rational character consists in its predilection for the construction of a purely theoretical casuistry oriented less to the practical needs of the groups concerned than to the needs of the uninhibited intellectualism of scholars

Where the "dialectical" method is applied it may also create abstract concepts and thus approximate rational, systematic legal doctrine. But like all priestly wisdom, this type of legal education is bound by tradition. Its casuistry, inasmuch as it serves at all practical rather than intellectual needs, is formalistic in the special sense that it must maintain, through re-interpretation, the practical applicability of the traditional, unchangeable norms to changing needs. But it is not formalistic in the sense that it would create a rational system of law. As a rule it also carries with it elements which represent only idealistic religious or ethical demands on human beings or on the legal order, but which involve no logical systematization of an actually obtaining legal order.

The situation is similar in the case of law schools which, while not, or not entirely, under immediate priestly control, are yet bound to a sacred law.

In their purely external form, all "sacred" laws tend to approximate a type which is shown most purely in Hindu law.[24] Insofar as commandments are not fixed, as in scriptural religion, by revelation in writing or by an inspired recording of revelations, sacred law must be transmitted "authentically," i.e., by a closed chain of witnesses. But in the scriptural religion, the authentic interpretation of the sacred norm, as well as its supplementation by other traditions, must also be guaranteed in written form. This is one of the most important reasons why Hindu law, in common with Islamic law,[25] has rejected the purely scriptural tradition. The tradition must have passed by word of mouth directly from one reliable holy man to the next. Reliance on the written word would mean that one believed more strongly in parchment and ink than in the prophets and the teacher, i.e., those persons who are charismatically qualified. The fact that the Koran itself was a written work, whose chapters (*suras*) were believed to be promulgated by Mohammed, after consultation with Allah, in carefully written form, was explained in Islamic teaching by the dogma of the physical creation by Allah himself of the individual copies of the Koran. For the *hadiths*[26] orality was a condition of validity. It normally is only at a late stage that a scriptural text will come to be preferred, viz., when the unity of traditional interpretation is endangered by purely oral transmission. At this stage new revelations are then rejected, typically with the argument that the charismatic age has long since come to an end. In such situations great emphasis is laid upon the proposition which is basic to the "institutional" character of a religious community and which has well been formulated recently by Freiherr von Hertling,[27] namely, that it is not the holy writ which guarantees the truth of the tradition and of ecclesiastical doctrine but rather the holiness of the church and its tradition, to which God has given the truth in trust and which thus

guarantees the genuineness of the holy writ. This position is consistent and practical: the opposite principle, as it was held by the early Protestants, exposes the sacred writ to philological and historical criticism.

The Vedas are the sacred books of Hinduism. They contain little "law," even less than the Koran or the Torah. The Vedas were considered as *shruti* ("revelations"), while all derived sacred sources were viewed as *smriti* ("recollection" or tradition). The most important categories of secondary literature, the prose Dharma-Sutras and the versified Dharma-Shastras[28] (the last ranking entirely as *smriti*, while the former occupy a middle position), are, on the contrary, compendia of dogmatics, ethics, and legal teaching standing alongside the tradition of the exemplary lives and teachings of holy men. The Islamic *hadiths* correspond exactly to this latter source; they are traditions concerning the exemplary deeds of the prophet and his companions, and those sayings of the former which have not been incorporated into the Koran. The difference is that in Islam the prophetic age is regarded as having ended with the prophet.

For the Hindu Dharma books one can find a counterpart neither in Islam or Christianity, which are book religions with only one holy writ. The Dharma books, and especially one of the latest, viz, that of Manu, were important for a long time in the courts as "books of authority," i.e., private works of legal scholars, until they were displaced in legal practice by the systematic compilations and commentaries of the schools. This displacement was so complete that by the time of the British conquest legal practice was dominated by one such tertiary source, the *Mitakshara*, dating from the eleventh century. A similar fate befell the Islamic Sunna through those systematic compendia and commentaries which achieved canonical status. The same is also true, though to a somewhat lesser extent, of the Torah in relationship to the rabbinical works of Antiquity (the Talmud) and the Middle Ages. Rabbinical lawmaking in Antiquity, and, to a certain extent, even up to the present, and Islamic lawmaking in a great measure even today, have rested in the hands of the theologian jurists responding to concrete questions. This feature was unknown both to Hinduism and to the Christian church, at least after the extinction of charismatic prophecy and the Didaskalia, which were, however, of an ethical rather than a legal character.[29]

The reasons why Christianity and Hinduism did not have this type of lawmaking were quite different. In Hindu law, the house priest of the king is a member of his law court, and he atones for wrong judgments by fasting. All important cases have to come before the king's court. The unity of the secular and the religious administration of justice is thus guaranteed, and there is, therefore, no place for any

licensed class of responding legal honoratiores. The Occidental Christian church, on the other hand, had created for itself organs of rational lawmaking in the Councils, the bureaucracies of the dioceses, and the Curia, and, quite particularly, in the papal powers of jurisdiction and infallible exposition of doctrine. No other of the great religions has ever possessed such institutions. Thus in Occidental Christianity, the legal opinions and decrees of the ecclesiastical authorities, together with the Conciliar Canons and the papal decretals, have played the role which is played in Islam by the *fetwa* of the mufti, and in Judaism by the opinions of the rabbis.[30] Hindu legal erudition was to a great extent purely scholastic, theoretical, and systematizing; it was the work of philosophers and theorists and strikingly possessed those features of a sacrally bound, theoretical, and systematizing legal thinking which has little contact with legal practice. In all these respects it differs from Canon law. All typically "holy" laws, and thus quite particularly that of India, are products of the schools. The treatises always present an abundance of casuistry about completely obsolete institutions. Examples are provided by Manu's treatment of the four castes, or the presentation of all the obsolete parts of the *sharî'ah*[31] in the works of the Islamic schools.[32] But because of an overriding dogmatic objective and the rational nature of priestly thinking, the systematic structure of such law books frequently tends to be more rational than that of similar creations unconnected with priesthood. The Hindu law books, for example, are more systematic than the *Mirror of Saxon Law*. But the systematization is not a legal one but one concerned with the position of status groups and the practical problems of life. Since the law is to serve holy ends, these law books are therefore compendia not of law alone but also of ritual, ethics, and, occasionally, of social convention and etiquette. The consequence is a casuistic treatment of the legal data that lacks definiteness and concreteness, thus remaining juridically informal and but moderately rational in its systematization. For in all these cases, the driving force is neither the practicing lawyer's businesslike concern with concrete data and needs, nor the logical ambitions of the jurisprudential doctrinaire only interested in the demands of dogmatic logic, but is rather a set of those substantive ends and aims which are foreign to the law as such.

3. *Legal Honoratiores and the Influence of Roman Law*

The effects of legal training are bound to be different again where it is in the hands of *honoratiores* whose relations with legal practice are professional but not, like those of English lawyers, specifically

guild-like or income-oriented. The existence of such a special class of honoratiores is, generally speaking, possible only where legal practice is not sacredly dominated and legal practice has not yet become too involved with the needs of urban commerce. The medieval empirical jurists of the Northern European continent fall into this class. It is, of course, true that where commercial activity is intense the function of the legal honoratiores is merely shifted from the consultants to the cautelary jurists; and even this shift occurs under special conditions only. After the decline of the Roman Empire, the *notaries* were the only remaining group in Italy by whom the traditions of a developed commercial law could be perpetuated and transformed.[38] They were, for a long time, the specific and dominant class of legal honoratiores. In the rapidly growing cities they formed themselves into guilds and constituted an important segment of the *popolo grasso*, that is, they were also a politically important class of honoratiores. Indeed, mercantile relations operated here from the very beginning through notarial documents. The procedural codes of the cities, such as Venice, preferred the rationality of documentary evidence to the irrational means of evidence of the ancient procedure of the popular courts. We have already spoken of the notaries' influence upon the development of commercial paper [sec. *ii*:3], but the notaries were one of the most decisive strata in the development of the law in general, and until the emergence of the class of legally trained judges in Italy they were probably *the* most decisive stratum. Like their forerunners in the ancient Hellenistic East, they took a decisive part in the interlocal assimilation of the law and, above all, in the reception of Roman law, which, here as there, was first brought about in the documentary practice. Their own traditions, their long-lasting connection with the imperial courts, the necessity of quickly having on hand a rational law to meet the needs of the rapidly growing requirements of trade, and the social power of the great universities caused the Italian notaries to receive Roman law as the very law of commerce, especially since, in contrast to England, no corporate or fee interests were standing in the way. Thus the Italian notaries were not only the oldest but also one of the most important of the classes of legal honoratiores who were interested and directly participated in the creation of the *usus modernus* of Roman law. Unlike the English lawyers, they did not act as the bearers of a national body of law. Again, they could not compete with the universities through a guild system of legal education of their own simply because, unlike the English lawyers, they did not enjoy that nation-wide organization which was made possible in England by the concentration of the administration of justice in the royal courts. But thanks to the universities, Roman law in Italy continued as a world force, influencing the formal

structure of law and legal education even after its original political sponsor and interested protector, the Emperor, had become politically unimportant. The *podestà* of the Italian cities were often chosen from among the honoratiores who had been trained in the universities; the *signorie* were based completely on political doctrines derived from Roman law.[34] In the cities of the French and Eastern Spanish coasts the notaries' position was quite the same.[35] Essentially different, however, was the status of the honoratiores in Germany and Northern France. They were, at least at first, involved less in urban legal relations than as aldermen (*Schöffen*) or officials in the legal affairs and the administration of justice of rural manors.[36] Their most influential types, such as for example, Eike von Repgow or Beaumanoir,[37] created a systematization of the law which was based on the concrete problems of everyday practice and their essentially empirical concepts, slightly refined by abstraction. The "law books" which they compiled aimed at the restatement of the existing tradition; although they contained some occasional argumentation, they had little specifically juridical *ratio*. Indeed, the most important of these works, the *Mirror of Saxon Law*, contained a good many constructions of legal institutions which were not parts of the existing law at all but rather constituted fanciful attempts, inspired by the author's desire for completeness or his predilection for sacred numbers, to fill in gaps or complement other inadequacies.[38] Formally, their systematic records were private works just like those of the Hindu, Roman, and Islamic jurists. Like these, they have influenced legal practice considerably as convenient compendia and some of them even came to be recognized by the courts as authoritative source books. Their creators were representatives of a system of administration of justice by honoratiores but, unlike the English lawyers and the Italian notaries, they did not constitute a strong organized guild which, by corporate and economic interests, through a monopoly of the bench and a central position at the seat of the central courts, could have given them a measure of power which neither King nor Parliament could have easily brushed aside. Hence they could not, like the English lawyers, become the bearers of a corporate legal education and were thus unable to produce a fixed empirical tradition and a legal development that could have provided an enduring resistance against the subsequent encroachment of the jurists trained by rational university education. Formally, the law of the empirical law books of the Middle Ages was fairly well organized; systematically and casuistically, however, it was less rational, and oriented more towards concrete techniques of distinction than towards the abstract interpretation of meaning or legal logic.

The particular influence of the ancient Roman jurists[39] rested on the fact that the Roman system of administration of justice by honora-

tiores, which economized on public officials, accordingly also minimized their instructional role in the concrete conduct of a lawsuit. But this specific fact which distinguished Rome from, for instance, the Hellenic democracy also excluded the "*kadi* justice"[40] as practiced in the Attic people's courts. The official presidency over the course of the lawsuit was preserved together with the separation of power between the magistrate and the judgment finders. The combination of these factors created the specifically Roman practice of trial instruction (*Prozessinstruktion*) through a strictly formal order of the magistrate to the citizen judge (the *iudex*), giving him directions with regard to those issues of law and fact according to which he should grant or deny the plaintiff's claim.[41]

The magistrate, especially the *aedilis* and *praetor*, eventually recorded the schemata of these trial instructions in his "edict"[42] at the beginning of his year of office. It was, however, only relatively late that, in contrast with the Nordic *lag saga* he was regarded as being bound by the content of these "edicts." Naturally, in composing his edict the magistrate was advised by legal practitioners, and the edicts were thus continuously adapted to newly emerging needs. In the main, however, each magistrate simply took over the edict of his predecessor in office. Hence, the great majority of the recognized causes of action had naturally to be defined not in terms of concrete facts, but by the legal concepts of everyday language. The use of a juridically inappropriate formula by the party having to choose the appropriate action thus resulted in the loss of the case. This contrasts with our principle of fact pleading, under which a presentation of facts will support an action if the facts justify the claim from some legal point of view. Obviously under the "principle" of "fact pleading" no such sharp legal definition of concepts is required as was the case under Roman law where the practitioner was forced to define the legal terms of common usage with juristic rigor and to elaborate sharp distinctions between them.[43] Even where the instructing magistrate confined his trial instruction to purely factual matters, as he did in the *actiones in factum conceptae*,[44] the interpretation assumed a strictly formal character, as a result of the then accepted methods of legal thinking. In this state of affairs, the practical development of legal technique was at first largely left to "cautelary jurisprudence," i.e., to the activities of legal counselors who not only drafted the form of contracts for the parties but were also expert advisors to the magistrate in his *consilium*, a consultation that was typical for all Roman officials in the preparation of their edicts and formulae. Finally, they were legal advisers of the citizen judge when he had to decide the questions put to him by the magistrate and to interpret his trial instructions.

According to historical tradition, the consultative activities of the

jurisconsults seem first to have been carried out by the *pontifices*, of whom one was chosen annually for this purpose. Under this priestly influence the administration of justice, in spite of the codification of the Twelve Tables, might easily have assumed a sacrally bound and irrational character, similar to that produced in Mohammedan law by the consultative activity of the mufti. It is true that religious influences seem to have played only a secondary role in the substantive content of early Roman law, but in its purely formal aspects, which are also its most important aspects from a general historical point of view, the influence of sacred law was obviously considerable, as Demelius has made plausible for at least certain important instances.[45] For example, such important legal techniques as procedural fictions seem to have arisen under the influence of the principle of sacred law that *simulata pro veris accipiuntur*.[46] We may recall the role played in the cult of the dead of many peoples by the simulated transaction and also the role which the simulated transaction had to play in situations in which certain ritual obligations were formally fixed in an absolute fashion. It was the repugnance to an essentially bourgeois society of such obligations, which were also economically highly burdensome, which led to their replacement by a mere *pro forma* performance. The substantive secularization of Roman life, combined with the political impotence of the priesthood, turned the latter into an instrument for the purely formalistic and legalistic treatment of religious matters. Furthermore, the early development of the technique of cautelary jurisprudence in temporal matters resulted in an obvious furtherance of the use of this technique in the sphere of the cult. But we may assume with confidence that the earliest techniques of cautelary jurisprudence were at first largely concerned with sacred law.

One of the most important characteristics of early Roman law was its highly analytical nature; this at least is still valid among von Jhering's views, of which so many have become obsolete. A lawsuit would be reduced to the basic issues involved and legal transactions were cut down to the most elementary logical constituents: one lawsuit for just one issue; one legal transaction for just one object; one promise for just one performance.[47] The breaking up of the complex situations of life into specifically determined elements has been the main achievement of the early *ius civile*, the methodological effects of which have also been the most far-reaching. On the other hand, there has resulted from it a certain neglect of the constructive synthetic capacity in the perception of concrete legal institutions, as it arises in the case of a legal imagination unconfined by logical analysis. This analytical tendency, however, corresponds closely to the treatment of ritual obligations in the Roman

national religion. We may recall that the peculiarity of the genuine Roman *religio*, namely, the conceptual, abstract, and thoroughly analytical distinction of the jurisdictions of the sacred *numina* [deities], resulted in a large measure in a rational juridical treatment of religious problems. According to tradition, already the *pontifices* had invented fixed schemata of admissible actions. This pontifical legal technique seems to have remained a professionally monopolized secret knowledge. The emancipation from sacral lawfinding came only in the third century. When the *censor* Appius Claudius was trying to establish himself as a tyrant, one of his freedmen is said to have published the pontifical formulary of actions.[48] The first plebeian *Pontifex maximus*, Tiberius Coruncanius, is reported to have been the first to render *responsa* in public.[49] It was only from that stage that the edicts of the officials could develop to their later significance and that lay honoratiores came to fill the gap as legal consultants and attorneys. The opinion of counsel was communicated orally to private parties and in writing to the official who had requested it. Until the period of the Empire the opinion did not include any statement of reasons, resembling in this respect the oracle of the charismatic *lag saga* or the *fetwa* of the mufti. The expansion of professional juristic activity in step with increasing demand brought about a formal legal education as early as during the Republic, when students (*auditores*) were admitted to the consultations of the legal practitioners.

Another cause of the assumption by early Roman law of a highly formal and rational character, both regarding the substantive rules and their procedural treatment, was the growing involvement of the law in *urban* business activities as carried on through contracts. In this respect, medieval German law presents a rather different picture, for its main concern related to *rural* matters such as social rank, property in land, or family law and inheritance.

But in spite of its formalism, Roman legal life, until well into the time of the Caesars, lacked not only a synthetic-constructive but also a rational-systematic character, and it did so much more than has at times been assumed. It was the Byzantine bureaucracy which finally systematized the existing law; but as far as the formal rigor of juridical thought was concerned, it stood far behind the achievements of the jurisconsults of the Republic and the Principate. It is striking that the systematically most useful among all the literary products of the jurisconsults, namely the Institutes of Gaius, which was an introductory compendium to the study of law, was the work of an unknown person who was certainly not an authority in his own lifetime and who stood outside the circle of the legal honoratiores; one may say that Gaius' relation to them was

analogous to the relation of the modern cram book to the learned treatises of the scholars. But the difference was that the literary products of the practicing Roman jurists of that time, to whose circle Gaius did not belong, did not possess the quality of a rational system, such as university teaching tends to produce; they were mainly moderately rationally organized collections of individual opinions.[50]

The jurisconsults remained a very specific class of honoratiores. To the property-owning strata of Rome they were the universal "fathers confessor"[51] in all economic matters. It is uncertain whether a formal license to render *responsa* was necessary in earlier times, as a passage in Cicero might lead us to suppose.[52] Certainly, it was required at a later date. The *responsa*-rendering jurists emancipated themselves from the methods of the older cautelary jurisprudence, as well as the actual practice of draftsmanship, as their legal refinement increased. By the end of the Republic they formed themselves into schools. It is true that during the Republic, the orators, such as Cicero, showed the tendency, familiar from Athens, to argue emotionally and "ad hominem" rather than rationally, insofar as the specifically political assize courts (*quaestio repetundarum*) came close to assuming the character of popular justice. In this way, the orators contributed to the weakening of precise legal conceptualization; but in Rome this happened almost exclusively in political cases. Under the Empire, the administration of justice became entirely a specialized professional matter. A part of the jurisconsults were placed in an official status vis-à-vis the administration of justice by Augustus' grant of the privilege making their *responsa* binding on the judges.[53] The jurisconsults ceased to be attorneys (*causidici*); even less could they form a lawyers' guild whose interests and intellectual training would have been directed to daily practice and the needs of clients. The jurisconsults had nothing to do with the technical or business aspects of attorneyship but were concerned exclusively with the rendering of legal opinions about statements of fact which had been prepared by an attorney or a judge.[54] They were thus in the best possible position to elaborate a rigorously abstract scheme of juristic concepts. In this way the responding jurisconsults were sufficiently remote from the actual contact of legal business to allow them to reduce individual details to general principles by employing scientific techniques. This remoteness was greater in Rome than it was in England, where the lawyer was always the representative of a client. It was, however, the controversies between the schools which forced these principles into even greater abstraction.[55] Because of the binding character of their opinions, jurisconsults dominated the administration of justice; however, the *responsa* continued, at least for a time, to be rendered without a statement of

reasons, like the sage's oracle or the mufti's *fetwa*. But they began to be collected by the jurists and then to be published with comments indicating the legal reasons.[56] School discussions and disputations about legal cases among and with the *auditores* grew out of the latters' presence in the exercise of the consultative practice, but only by the end of the Republic did there develop a fixed course of training.[57] Just as the steadily increasing formal study of Hellenic philosophy took on a certain significance for juristic thought, so the Hellenic philosophical schools served, in many respects, as models for the external organization of the schools for lawyers. It was from this pedagogical and publishing activity of the law schools that the technique of Roman law developed from a stage when it was strongly empirical, despite the precision of its concepts, to increasing rationality of operation and scientific sublimation. But theoretical legal training remained secondary to legal practice and this fact explains how a slight degree of development of abstract legal concepts could go hand in hand with a high degree of abstraction in legal thinking, wherever the abstract legal concepts would have served essentially theoretical interests rather than practical requirements. The treatment of numerous, and apparently heterogeneous, fact situations under the one category of *locatio*, for instance, had important practical consequences.[58] But no direct practical consequences can arise from the elaboration of the concept of "legal transaction," which is intended to serve a mere desire for intellectual organization. Thus neither this concept nor similar ones, like "claim" or "disposition," existed in Roman law of Antiquity, and even in the time of Justinian its general systematization was not rationalized beyond a relatively modest degree. The sublimation of concepts took place almost exclusively in connection with some concrete type of contract or form of action.[59]

Two reasons are responsible for the fact that this sublimation nevertheless led to those results which we have before us now. Decisive was, first, the complete secularization of the administration of justice, including the office of jurisconsult. The binding *responsum* of the Roman jurist clearly has a parallel in the *fetwa* of the Islamic mufti. He too is an officially licensed legal consultant. But he receives his training in an Islamic school. These schools, to be sure, developed upon the pattern of the officially recognized law schools of the late Roman empire. Under the influence of the formal training through ancient philosophy, they also developed, for certain times at least, methods similar to those of Antiquity. But their instruction remained predominantly theological, and the trends just mentioned were thwarted by religious ties and traditional observance, by the vagueness and precariousness of sacred law, which can neither be eliminated nor be enforced, and by those other features

which are characteristic of all theocratic justice bound to a sacred writ. Legal education thus remained limited there to empirical and mechanical memorization and theoretical casuistry without contact with life.

The second reason for the difference between Roman and Islamic law lies in the kind of judicial organization and in the politically conditioned limits which were set to rationalization in the economic field. The theological element was completely absent from Roman legal development. The purely secular and increasingly bureaucratic late Roman state culled that unique collection of the Pandects from the products of the responding jurisconsults and their disciples, whose legal thinking was of the utmost precision, however imperfect their "system" may have been. Supplemented by autonomous Byzantine ideas, the Roman materials thus collected in the Pandects provided the stuff for the legal thought of the medieval universities for centuries to come. As early as during the imperial period, an increasingly *abstract* character trait had been added as a new element to the age-old indigenous *analytical* quality of the Roman legal concepts. To some extent this abstract character had been anticipated by the nature of the Roman forms of action. In every one of them the state of the operative facts was expressed in the form of a legal concept. Some of these concepts were so formulated, however, that they afforded the practitioners, be they cautelary jurists, attorneys, or jurisconsults, the opportunity to subsume an extraordinarily diverse range of economic situations under one single concept. The adaptation to new economic needs thus took place in large measure through the rational interpretation and extension of old concepts. It was in this way that legal-logical and constructive thinking was raised to the highest level to which it can be raised within the range of the purely analytical method. Goldschmidt[60] has properly pointed out the extraordinary elasticity of such legal concepts as *locatio-conductio, emptio-venditio, mandatum* (and especially *actio quod iussu*), *depositum*, and above all, the unlimited capacity of *stipulatio* as the one *constitutum* for most of those obligations to pay a sum certain for which we have today the bill of exchange and other formal contracts.[61]

The specific character of Roman legal logic, as it developed from the given conditions, becomes especially clear when one compares it with the modes of operation of English cautelary jurisprudence. It, too, utilized and manipulated numerous individual concepts with the greatest boldness in order to achieve actionability in the most diverse situations. But we can easily see the difference between the way in which, on the one hand, the Roman jurists used the concept of *iussum* to achieve both the drawee's authority to pay for the drawer and the latter's warranty[62] and, on the other hand, the ways in which the English lawyers derived

the actionability of numerous heterogeneous contracts from the tort concept of "trespass."[63] In the latter case, *legally* heterogeneous phenomena are thrown together in order to obtain actionability by indirection. In the Roman instance, by contrast, situations which are new and diverse *economically*, i.e., externally, are subsumed under a single and appropriate legal concept.

One must note, however, that the abstract character of many legal concepts which today are regarded as being particularly "Roman" in their origin, is not to be found originally, and in some cases did not even originate, in Antiquity. The much discussed Roman concept of *dominium*, for example, is a product of the denationalization of Roman law and its transformation into world law. Property, in national Roman law, was by no means a particularly abstractly ordered institution, and it was not even a unitary one in general.[64] It was Justinian who first abolished the fundamental differences and reduced them to the few forms which were observable in land law; and it was only after the old procedural and social conditions of the praetorian interdicts had died out that medieval analysis could concern itself with the conceptual content of the two Pandectian institutions of *dominium* and *possessio* as wholly abstract concepts. Nor was the position essentially different with many other institutions. In their earlier form, in particular, most of the genuine Roman legal institutions were not essentially more abstract than those of German law. The peculiar form of the Pandects arose out of the peculiar transformations of the Roman state. The sublimation of juristic thinking was in itself, as far as its direction was concerned, influenced by political conditions which operated in different ways in the Republican and the late Imperial period. The important technical traits of the earlier administration of justice and the jurisconsults were, as we have seen, essentially the products of rule by the Republican honoratiores. But this very rule was not entirely favorable to a professional juristic training of the political upper-class magistrates with their short terms of office. While the Twelve Tables had always been taught in the schools, knowledge of the *leges*, however, was acquired by the Roman republican magistrate mostly by practical experience. His jurisconsults looked after the rest for him. In contrast, the necessity of systematic juristic studies was greatly increased by the imperial system of legal administration through appointed officials and its rationalization and bureaucratization, especially in the provincial service. The general effect of all bureaucratization of authority will be seen later in a wider context. The systematic rationalization of the law in England, for example, was retarded because no bureaucratization occurred there. As long as the jurisconsults dominated the Roman legal administration of justice

as the legal honoratiores, the striving for systematization was feeble, and no codifying and systematizing intervention by the political authority occurred. The downfall of the Roman aristocracy under the Severi was correlated with the decline of the role of the responding jurisconsults and parallels a rapidly increasing significance of the imperial rescripts in the practice of the courts. Legal education, carried on in the later period in state-approved schools, assumed the form of textbook instruction from the works of the jurists. The courts, too, used them as authoritative sources and, in case of dissent among these books, the Emperors, by the so-called "Law of Citations," established both a certain order of priority among them and the principle that the majority of the approved authors should prevail.[85] The collections of *responsa* thus came to occupy the position held in the Common Law by the collection of precedents. This situation conditioned the peculiar form of the Pandects and the conservation of that part of classical juristic literature which had been incorporated in them.

NOTES

1. On "legal *honoratiores*"—see *supra*, sec. *i*, n. 18. In effect the present section is concerned with the legal profession, its various types, and their influence on the formal characteristics of the law.

A concise survey of the history of the legal profession in ancient and modern Western civilization will be found, with bibliography, in the article by Hazeltine, Radin, and Berle in 9 ENCYC. SOC. SCI. 324. To the bibliography should now be added F. SCHULZ, HISTORY, and R. POUND, THE LAWYER FROM ANTIQUITY TO MODERN TIMES (1953).

2. The most authoritative expositions on the development of the legal profession in the Middle Ages are those by H. Brunner: (1) *Die Zulässigkeit der Anwaltschaft im französischen, normannischen und englischen Rechte des Mittelalters* (1878) 1 Z.F. VGL. R. 321 *et seq.*, and the partial translation of it in 3 ILL. L. REV. 257; (2) *Wort und Form im altfranzösischen Process* in 57 SITZUNGSBERICHTE DER PHILOS.-HIST. CLASSE DER KAISERLICHEN AKADEMIE DER WISSENSCH. ZU WIEN (1868) 655; see also WEBER, GENERAL ECONOMIC HISTORY 340; ENGELMANN AND MILLAR, *op. cit.*

3. On the development of jury trial in general see literature cited *supra* sec. *iii*, nn. 33, 34. For the connection between *attornatio* and the "records" in the royal courts, see Brunner, *Die Zuläss. der Anwlt.*, *loc. cit.* 362: both the *attornatio* and the records were allowed only in the *curia regis*, and their relationship is clearly shown in earlier English sources—*ibid.* 373; GLANVILLE, VIII, 8, § 7; Brunner, *op. cit.* 197.

4. *Fautes volent exploits* means "errors destroy the acts" (one mistake nullifies the whole procedure); concerning this maxim and the old French procedure in general, see Brunner, *Wort und Form im altfranzösischen Process*, *loc. cit.*, esp. at p. 670.

5. Cf. *supra*, sec. *iii*:6:c.

6. See POLLOCK AND MAITLAND I, 212: "A man is allowed to put forward some one else to speak for him, not in order that he may be bound by that other person's words, but in order that he may have a chance of correcting formal blunders and supplying omissions" (Leg. Henr. 46, § 3). This was the so-called "droit d'amendement" explained by Brunner, *loc. cit.* 754–780, and also in his *Zuläss. der Anw.* 322.

7. The appointment of an attorney rested at first upon special privilege, but this was no longer so in the time of Glanville, ZUL. D. ANWL., *loc. cit.* 363; HOLDSWORTH II, 315, 316.

8. By the Lateran Council, 1215, the clergy were, however, prohibited from acting as attorneys in secular courts, except in causes concerning themselves or concerning poor persons.

9. The earliest time for which it is certain that in the royal courts of England litigants could appear by representation, is that of Henry II. Professional legal representation seems to begin with the thirteenth rather than with the twelfth century. For Bracton tells much about the "attorney" who can fully act for and indeed also fully commit his client. The attorney's job was, however, mainly procedural; and as the legal system became more and more complex, litigants required not only to be represented procedurally but also felt the need for lawyers who would *narrate* as well as argue their case in court. The lawyers were the *narrators* (and were later called the *serjeants*) but there is still too little known about their early history. As Plucknett has remarked, "In the present state of our knowledge it therefore seems safe to say that there certainly were professional *narrators* and attorneys during the reign of Edward I, and that possibly these professions already existed under Henry III" (204, 206).

In the following account of the methods of the Common Law as well as in his general ideas about it, Weber relied to an apparently large extent upon the writings of J. Hatschek, especially the third chapter of his ENGLISCHES STAATSRECHT I, 95 *et seq.* Weber's general ideas of legal thought as expressed throughout this work seem to have been influenced strongly by Hatschek, especially his article entitled *Konventionalregeln, oder über die Grenzen der naturwissenschaftlichen Begriffsbildung im öffentlichen Recht* (1909), 3 JAHRBUCH DES ÖFFENTLICHEN RECHTS 1–67.

10. For a short account of the course of this complicated development, covering several centuries, see PLUCKNETT 212–215, and literature there cited. The standard work is HERMAN COHEN, HISTORY OF THE ENGLISH BAR (1929).

11. The two universities, Oxford and Cambridge, taught only civil and canon law whereas the Inns of Court concentrated on "English" law as developed in the royal courts. Cf. PLUCKNETT 208–209.

12. On the fictions which were used by the several courts of the king to extend their jurisdiction, see PLUCKNETT 152–155; HOLDSWORTH I, 235. More generally, see Morris S. Cohen, *Fictions*, 6 ENCYC. SOC. SCI. 225; Fuller, *Legal Fictions* (1930–31), 25 ILL. L. REV. 363, 513, 877; MAINE, c. II.

13. Cf. the recent analysis of the methods of Common Law reasoning by EDWARD H. LEVI, INTRODUCTION TO LEGAL REASONING; see also LLEWELLYN, PRÄJUDIZIENRECHT UND RECHTSPRECHUNG IN AMERIKA (1933).

14. Weber is obviously thinking of the continuance in modern American real property law of such concepts as tenure, estate, and fee, and of such relics as the doctrine of destructibility of contingent remainders, the doctrine of worthier title, or the Rule in Shelley's Case. The concept of tenure has practically disappeared, the meaning and functions of the others have been radically transformed; cf. R. R. POWELL, LAW OF REAL PROPERTY (1950) I, c. iv. On seisin, see Maitland,

The Mystery of Seisin (1886), 2 L.Q. REV. 481; ordwell, *Seisin and Disseisin* (1920/21), 34 HARV. L. REV. 592; Sweet, *Seisin* (1896), 12 L.Q. REV. 239.

An Illinois case on seisin reviving most of the old features of the English law is *Fort Dearborn v. Kline* (1885), 115 Ill. 177, 3 N.E. 272.

R. POWELL, *op. cit.* 236, n. 70, characterizes Illinois decisions as "anachronistic," "re-incarnating" old English law (with the help of A. Kales's great knowledge). Powell continues (p. 237): "In general, it can be said that English law [concerning real property] is a more constantly significant factor in the thinking of the Illinois judiciary than in most of our other states. The ghosts of the past have freer exit from their closets, without much scrutiny to determine their real utility as a part of a modern scheme of life."

15. For evidence of efforts by the English bar to prevent codification and law reform, see, among others, the biography of Lord Birkenhead in DICTIONARY OF NATIONAL BIOGRAPHY (1922–1930) 782. For entham's despair at the hostility shown toward law reform and codification by the English bar, see J. DILLON, LAWS AND JURISPRUDENCE OF ENGLAND AND AMERICA (1894) 271, 316–347, 180 *et seq.* See also Sunderland, *The English Struggle for Procedural Reform* (1926), 39 HARV. L. REV. 725. The American lawyers' aversion against codification and law reform found dramatic expression in the fight of the New York bar led by J. C. Carter, against David Dudley Field's efforts to codify the law. Cf. Dillon, *op. cit.* 225; see also REPORTS OF AMERICAN BAR ASSOCIATION (1890) 217 for Carter, and 1885, 1886 for D. D. Field; on D. D. Field, cf. CENTENARY ESSAYS of the New York University School of Law, ed. by A. Reppy (1949), Llewellyn, 3 ENCYC. SOC. SCI. 243, also CLARK, CODE PLEADING (2nd ed. 1947) 17–21.

16. For illustrations of, and literature on, "the deep rooted common law tradition of judicial hostility to legislation" see J. STONE, 198.

17. The source of this statement could not be located. The English term "joint business" is used in the German text.

18. Cf. Brunner, *Die Zulässigkeit der Anwaltschaft* 324.

19. Concerning Roman-law oriented legal education, see P. KOSCHAKER, EUROPA UND DAS RÖMISCHE RECHT (1947) 45 *et. seq.*, 55–99, and literature there cited.

20. See KOSCHAKER, *loc. cit.* 94 *et seq.* and literature there cited; for the social position of lawyers in Rome, France, England, Germany, and the difference between them, see pp. 164–180, 227–234. There never was a lawyers' guild organization in Germany, *ibid.* pp. 230, 247.

21. Night schools or other law schools outside of universities and of the atmosphere of the *universitas literarum* are unknown in continental Europe and are thus not considered by Weber.

22. Legal education, as it has become established in the nineteenth century in Germany and Austria (-Hungary) and as it still exists there, consists of two parts, viz., theoretical study of three to four years at a university, and a practical in-service training of usually another three years in various courts and administrative agencies, the office of the public prosecutor and an attorney's office. Cf. Rheinstein, *Law Faculties and Law Schools*, [1938] WIS. L. REV. 5; cf. also E. SCHWEINBURG, LAW TRAINING IN CONTINENTAL EUROPE (1945) 32, 80.

23. See now Secs. 571, 581, 2 of the Civil Code; as to the rule of Roman law, under which a lease is a purely personal contract between lessor and lessee and where, consequently, the lessee has no right to remain on the land as against the purchaser from the lessor, see SOHM, INSTITUTIONEN 434; but see also BUCKLAND 499.

24. On Hindu law see S. Vesey Fitzgerald, *Hindu Law*, 9 Encyc. Soc. Sci. 261, and literature stated there; see furthermore *infra*, sec. *v*, n. 19. For an account of early "legal" education in India, see Maine, Early Law 13.

25. In his Essays on Sociology of Religion Weber has not included one on Islam; he has considered it, however, in his chapter on Sociology of Religion. As the principal sources on Islamic law he seems to have used Goldziher's Vorlesungen über den Islam (1910, 2nd ed. 1925), the pertinent chapter in Kohler and Wenger, 82 *et seq.*, and the further literature listed there on p. 152, especially the several articles of Josef Kohler's in his Zeitschrift für Vergleichende Rechtswissenschaft. For additional literature on Islamic law see the following works by J. Schacht: his articles in the Encyclopaedia of Islam (1927); his edition of G. Bergstrasser's Grundzüge des Islamischen Rechts (1935); *Islamic Law*, 8 Encyc. Soc. Sci. 344, with bibliography at p. 349; and Origin of Mohammedan Law (1951). Books and articles on Mohammedan law in the English language are listed in Stern's bibliography (1950) 43 Law Library J. 16; cf. also G. v. Grünebaum, Medieval Islam (1946).

26. *Hadiths*—traditions concerning the exemplary deeds of the Prophet and his companions, and those sayings of the former which have not been incorporated in the Koran. They make up the *sunna*, which is regarded as authoritative by the Sunnite branch of Mohammedanism, but rejected by the Shiites. When the *hadiths* were assembled in collections, only those were accepted as authoritative which could be traced through the "golden chain" of men regarded as completely reliable. On the role played in the formation and development of Islamic law by the "invention" of appropriate "traditions," see J. Schacht, Origins of Mohammedan Law (1951).

27. Georg Freiherr v. Hertling, 1843–1919, Catholic philosopher and German statesman. See his *Recht, Staat und Gesellschaft*, 1907.

28. Dharma-Sutras "are the oldest manifestation of definite schools of law, or rather they embody (in the form of mnemonic aphorisms) the law teaching given in particular Vedic schools. With one exception, which professes to emanate from a god, each of them bears the name of some great sage of the [Vedic] period."—Vesey-Fitzgerald, *op. cit.* n. 24. They probably date from the period between 600 and 300 B.C.

The statement that according to prevailing Hindu theory all law is contained in the Dharma-Sutras is tenable only when the term is used in so broad a sense as to include the *arthasastras* and those law books of the institute-type which are known under the names of *Manu* and *Yajñavalkya*. The latter occupy a prominent position in the works of those later commentators which have become important for the development of modern Hindu law.

29. Didaskalia (Greek: Teaching, Doctrine)—the unfolding of the teaching of Jesus in the pneumatic-charismatic manner of the earliest Christian communities, i.e., before its fixation in authoritative writings, such as the *Didache of the Apostles* and the channelization of Christian life in organized congregations. Cf. Sohm, Kirchenrecht 38, 41.

30. *Fetwa*—opinion of the theologian-legal scholar, the mufti.

31. *Shari'ah*—the totality of Allah's rules for the conduct of man.

32. On the Islamic schools, see *supra*, sec. *ii*:5 and sec. *iii*, n. 12.

33. In contrast to the *notary public* of the American type, whose primary function is that of authenticating signatures and thus creating official evidence of genuineness, the continental notary is also a specialist in legal drafting, especially of real estate conveyances, but also of important commercial documents. He is thus not only a lawyer but a lawyer of special training and competence. See

Deák, *Nota ies Public.* 11 ENCYC. SOC. SCI. 399, and literature cited there; also CALASSO, STORIA E SISTEMA DELLE FONTI DEL DIRITTO COMUNE (1938) I, 212, and (1934) III ARCHIVIO GIURIDICO 64. Savigny has fixed the collegium of the notaries in Bologna o the middle of the thirteenth century; cf. GESCHICHTE DES RÖMISCHEN RECHTS IM MITTELALTER 540; see also GOLDSCHMIDT 151–153.

34. On the *podestà*, Italian city magistrates brought in from other towns to allay intramural strife, see *infra*, ch. XVI:*iii*:3; cf. also ENGELMANN 59; CALISSE, *op. cit.* 143, 169, 180. On the *signoria*, the late medieval Italian city tyranny and monarchy, see *infra*, ch. XVI:*iv*:8–9.

35. Cf. Stouff (1887) 11 NOUVELLE REVUE HISTORIQUE 269; GOLDSCHMIDT, 200 and literature there cited; also p. 230 (n. 159); p. 153 (n. 32). On the notaries in France compare the diss rtation of A. COPPIN, LES ORIGINES DU NOTARIAT FRANÇAIS (1884, Académie de Douai).

36. See: for France, KOSCHAKER, EUROPA U. DAS RÖM. RECHT 221 and literature there cited; for Germany, BRUNNER I. 209, II. 296 *et seq*; see also the recent article of G. Schubart-Kikenischer, *Römisches Recht im Brünner Schöffenbuch* (1947), 65 SAV. Z. GERM. 86; see in general ENGELMANN AND MILLAR 98 *et seq.*, 114 *et seq.*, 114 *et seq.*, 199, 519.

37. EIKE VON REPGOW (c. 1180–c. 1250) is the author of SACHSENSPIEGEL (MIRROR OF SAXON LAW, 1224–1230); cf. v. Künssberg, 13 ENCYC. SOC. SCI. 308; E. WOLF, GROSSE RECHTSDENKER (1939) 1; PHILIPPE DE BEAUMANOIR (c. 1246–1296) is the author of COUTUMES DE BEAUVOISIS (1283), the most influential of the medieval law treatises of France; cf. Meynial, 2 ENCYC. SOC. SCI. 486.

38. See the introduction to the SACHSENSPIEGEL by Homeyer in his 3rd ed. (1861) 20, 305; E. Molitor, *Der Gedankengang des Sachsenspiegels* (1947), 65 SAV. Z. GERM. 15, and the most recent literature there cited.

39. On the Roman jurists see JOLOWICZ, 88, 380; H. J. WOLFF, ROMAN LAW (1951) 91; and particularly, F. SCHULZ, HISTORY, and W. KUNKEL, HERKUNFT UND SOZIALE STELLUNG DER RÖMISCHEN JURISTEN (1952).

40. *Kadi*—judge of the Mohammedan *shari'ah* court (see *supra*, n. 31), *kadi* justice (*Kadijustiz*)—used by Weber as a term of art to describe the administration of justice which is oriented not at fixed rules of a formally rational law but at the ethical, religious, political, or otherwise expediential postulates of a substantively rational law.

41. See Millar, *Procedure, Legal*, 12 ENCYC. SOC. SCI. 439, 440.

42. On the edict, see JOLOWICZ 95, 362; H. J. WOLFF, *op. cit.* 81.

43. The contrast corresponds to that between Common Law pleading and Code pleading, as it is known in American law. Cf. CLARK, *op. cit.* 5; Millar, *Procedure, Legal*, 12 ENCYC. SOC. SCI. 439, 446/447.

44. The *formula* used is one *in factum concepta*, when there is no reference to a civil law concept but the judge is simply told to condemn, if he finds certain *facts* described in the *intentio* to be true or, if not true, to absolve. Cf. JOLOWICZ 212–213; WENGER 162, 164.

45. Gustav Demelius, Professor in Bonn. (SCHIEDSEID UND BEWEISEID IM RÖMISCHEN CIVILPROZESS [1887]); see review in 8 SAV. Z. ROM. 269, by O. Gradenwitz. On the problem of the extent to which sacred law was of influence in the development of (secular) Roman law, see *infra*, sec. *v*:1–2.

46. *Simulata p o veris accipiuntur* ("the simulated transaction is regarded as the real [true] one"; SERVIUS AD AENEAM II, 116). This meant that instead of animals only their forms, modeled in bread or wax, had to be sacrificed. For other examples see JHERING I, 326.

47. Jhering III, 27ff.

48. C. 300 B.C. cf. F. Schulz, History 9.

49. Ti. Coruncanius was consul in 280 B.C. and is reported to have been the first to render *responsa* in public by Pomponius, in D. 1, 2, 2, 35: *Primus publice profiteri coepit;* cf. Schulz 10.

50. See Buckland 22. On Gaius *ibid.* 29 and Schulz, History 159; Jörs and Kunkel 33; De Zulueta, *Reflexions on Gaius* [1947], Tulane L. Rev. 173.

51. Jhering II, 440.

52. Cicero, In Verrem 4.9.20.

53. "No juristic text suggests that Augustus made responsa binding. It is clear that a change in the position of the jurists did occur under Hadrian." Buckland, Textbook 23. For recent literature on this famous controversy concerning the nature and origin of the *ius respondendi* see Koschaker, Europa u. das röm. Recht 962; Siber, *Der Ausgangspunkt des ius respondendi* (1941), 61 Sav. Z. Rom. 397; Kunkel, *Das Wesen des ius respondendi* (1948), 66 Sav. Z. Rom. 423.

54. On the distinction between the jurisconsults and the attorney, see Jhering II, 436; Buckland 22.

55. On the two "schools" of Proculians and Sabinians, their significance, and alleged controversies, see Buckland 27; Schulz, History 119; Jörs and Kunkel 32, 394.

56. On this literature, see now esp. Schulz, History 91, 173, 223.

57. See Kohler and Wenger 172; Jolowicz 469; Schulz, History 119.

58. The one concept of *locatio-conductio* ("lease"), as derived from the *actiones locati* and *conducti*, covered (1) the *locatio-conductio rei*, i.e., the lease of a piece of land or a chattel; (2) the *locatio-conductio operarum*, i.e., the contract for services, in which the worker was said to let his working power; and (3) the *locatio-conductio operis*, in which the opportunity to construct a building or to complete some other work, e.g., to make a suit of cloth, is let to an independent contractor.

59. Weber here follows Jhering II. See also now Schulz, Principles 43; Wieacker, Vom römischen Recht 7; Ehrlich 195, 312.

60. Universalgeschichte 78, 93; in general, 71–89, 331.

61. *Locatio-conductio*—lease; see *supra* n. 58; *em[p]tio-venditio*—sale; *mandatum*—mandate, i.e., contract for unpaid services; if the services are to be paid for, the contract is one of *locatio-conductio operarum.*

Actio quod iussu [*depositum*]—originally, action against one who has given to his son or slave authority to make a contract with another; *stipulatio*—promise asked for and given in certain formalized words.

Constitutum—the term is used here in an untechnical sense apparently meaning the legal basis (*causa*) of an actionable promise; technically *constitutum debiti* means the formless promise to pay an already existing debt of the promisor or a third party; it became actionable in praetorian law by the *actio de pecunia constituta*, an *actio in factum.* See Jörs and Kunkel 189.

62. Cf. Goldschmidt 78, 93. It must be remembered, however, that the *actio quod iussu* was not generally available, but only where the person by whom the contract had been made was a *filius familias*, a slave, or otherwise a dependent of the defendant. Cf. Buckland 531, according to whom the *actio quod iussu* was only of small importance. Weber's statement is based upon Goldschmidt 78, n. 93, who speaks of the "astonishingly broad category of the *mandatum* or *iussus*" (as exemplified by D. 17.1.2), of which he says that it sufficed for those modern transactions of which Weber speaks in the text. For the present state of

learning concerning *mandatum* and *iussus*, see JÖRS AND KUNKEL 213, 267, 411, 415.

63. Cf. PLUCKNETT 601, and the literature there cited.

64. The comprehensive Roman concept of ownership, *dominium*, stands in contrast with the Germanic laws, in which there has been lacking not only a common legal term covering full ownership in both land and chattels, but also a term indicating the fullness of rights to possession, utilization, and disposition of land. The various ways in which a person may derive benefits from land have been traditionally expressed in the complex set of tenures, estates, and future interests which has been characteristic of the Common Law. Only in recent times have the terms "fee" and, more recently, "title" assumed a meaning which comes near to that of the Roman *dominium*, which indicates the sum total of all rights and benefits which may be derived from a piece of land (as well as from a chattel). All rights of an objectively or temporally limited character are either, as the lease, regarded as mere personal claims against the owner or as rights in the thing of another (*iure in re aliena*), i.e., encumbrances, such as an estate for life (*usufructus*), a right of way or other easement (*servitus*), or a mortgage (*hypotheca*). As long as a particular thing is encumbered with such a right of another, the owner's *dominium* is accordingly limited, immediately to expand, however, to its fullness of unlimited freedom of possession, enjoyment, use, and disposal, as soon as the encumbrance is lifted. This concept of *dominium* must not be understood, however, in the sense that a Roman property owner would have been completely unlimited in his freedom to use or abuse his thing. At all times was he limited, especially as landowner, by police power regulations established in the public interest. The concept of *dominium* is only a mental tool to facilitate mental operations concerning property rights. Indirectly, it also tends, of course, to facilitate land transactions and thus to increase the security of land titles.

As Weber observes the highly abstract concept of *dominium* has been the product of a long process of juridical elaboration. Similar to the Germanic and other laws, older Roman law, too, operated with a variety of concepts indicating the various kinds of a person's legally recognized relationship to a thing, especially a piece of land. In the *ius civile*, *res mancipi* (citizen's land in the proper sense, slaves, cattle, and certain agricultural implements) were treated differently from the *res nec mancipi*. Ownership *ex iure Quiritium* was not the same as the *in bonis habere* of the praetorian law or the various tenures in the administratively managed public lands (see sec. *ii*:5). The elaboration of the comprehensive concept of *dominium* was the work of the jurists. According to the presently prevailing opinion, this mental process was essentially completed by the classical jurists. On the development see JÖRS and KUNKEL 120, and the extensive literature stated there and at p. 405; also BUCKLAND 188, and NOYES 131.

65. Law of Citations.—There were several; the earliest was issued by Constantine in A.D. 321; the best known is that of 426, issued by Valentinian III and Theodosius II (CODEX THEODOSIANUS 1.4.3.). The courts were ordered to consider the works of a certain number of jurists; where the jurists differed, the judge was to follow the opinion of the majority or, in the case of a tie, that of Papinian.

V

Formal and Substantive Rationalization —Theocratic and Secular Law

1. *The General Conditions of Legal Formalism*

The considerations of the last section raise the important problem, already touched upon in various places, of the influence of the form of political authority on the formal aspects of the law. A definitive analysis of this problem requires an analysis of the various types of authority which we shall not undertake until later. However, a few general remarks may be made at this point. The older forms of popular justice had originated in conciliatory proceedings between kinship-groups. The primitive formalistic irrationality of these older forms of justice was everywhere cast off under the impact of the authority of princes or magistrates (*imperium*, ban) or, in certain situations, of an organized priesthood. With this impact, the substance of the law, too, was lastingly influenced, although the character of this influence varied with the various types of authority. The more rational the administrative machinery of the princes or hierarchs became, that is, the greater the extent to which administrative "officials" were used in the exercise of the power, the greater was the likelihood that the legal procedure would also become "rational" both in form and substance. To the extent to which the rationality of the organization of authority increased, irrational forms of procedure were eliminated and the substantive law was systematized, i.e., the law as a whole was rationalized. This process occurred, for instance, in Antiquity in the *ius honorarium* and the praetorian remedies,[1] in the capitularies of the Frankish Kings, in the procedural innovations of the English Kings and Lords Chancellc ,[2] or in the inquisitorial procedure of the Catholic Church.[3] However, these rationalizing tendencies were not part of an articulate and unambiguous policy on the part of the wielders of power; they were rather driven in this direction by the needs of their own rational administration, as, for instance, in the case of the administrative machinery of the P .pacy, or by powerful interest-groups with whom they were allied and to whom rationality in substantive law and procedure constituted an advantage, as, for instance, to the bourgeois classes of Rome, of the late Middle Ages, or of modern times. Where these interests were absent the secu-

larization of the law and the growth of a strictly formal mode of juridical thought either remained in an incipient stage or was even positively counteracted. In general terms, this may be attributed to the fact that the rationality of ecclesiastical hierarchies as well as of patrimonial sovereigns is substantive in character, so that their aim is not that of achieving that highest degree of formal juridical precision which would maximize the chances for the correct prediction of legal consequences and for the rational systematization of law and procedure. The aim is rather to find a type of law which is most appropriate to the expediential and ethical goals of the authorities in question. To these carriers of legal development the self-contained and specialized "juridical" treatment of legal questions is an alien idea, and they are not at all interested in any separation of law from ethics. This is particularly true, generally speaking, of theocratically influenced legal systems, which are characterized by a combination of legal rules and ethical demands. Yet in the course of this kind of rationalization of legal thinking on the one hand and of the forms of social relationships on the other, the most diverse consequences could emerge from the nonjuridical components of a legal doctrine of priestly make. One of these possible consequences was the separation of *fas*, the religious command, from *ius*, the established law for the settlement of such human conflicts which had no religious relevance.[4] In this situation, it was possible for *ius* to pass through an independent course of development into a rational and formal legal system, in which emphasis might be either upon logical or upon empirical elements. This actually happened both in Rome and in the Middle Ages. We shall discuss later [v:2, v:8] the ways in which the relationship between the religiously fixed and the freely established components of the law were determined in these cases. As we shall see hereafter, [sec. vii] it was quite possible, as thinking became increasing secular, for the sacred law to encounter as a rival, or to be replaced by, a "natural law" which would operate beside the positive law partly as an ideal postulate and partly as a doctrine with varying actual influence upon legislation or legal practice. It was also possible, however, that the religious prescriptions were never differentiated from secular rules and that the characteristically theocratic combination of religious and ritualistic prescriptions with legal rules remained unchanged. In this case, there arose a featureless conglomeration of ethical and legal duties, moral exhortations and legal commandments without formalized explicitness, and the result was a specifically *non-formal* type of law. Just which of these two possibilities actually occurred depended upon the already mentioned characteristics of the religion in question and the principles that governed its relation to the legal system and the state; in part it de-

pended upon the power position of the priesthood vis-à-vis the state; and finally, upon the structure of the state. It was because of their special structure of authority that in almost all the Asiatic civilizations the last mentioned of these courses of development came to emerge and persist.

But although certain features in the logical structure of different legal systems may be similar, they may nevertheless be the result of diverse types of domination. Authoritarian powers resting on personal loyalty, such as theocracy and patrimonial monarchy, have usually created a nonformal type of law. But a nonformal type of law may also be produced by certain types of democracy. The explanation lies in the fact that not only such power-wielders as hierarchs and despots, and particularly enlightened despots, but also democratic demagogues may refuse to be bound by formal rules, even by those they have made themselves, excepting, however, those norms which they regard as religiously sacred and hence as absolutely binding. They all are confronted by the inevitable conflict between an abstract formalism of legal certainty and their desire to realize substantive goals. Juridical formalism enables the legal system to operate like a technically rational machine. Thus it guarantees to individuals and groups within the system a relative maximum of freedom, and greatly increases for them the possibility of predicting the legal consequences of their actions. Procedure becomes a specific type of pacified contest, bound to fixed and inviolable "rules of the game."

Primitive procedures for adjusting conflicts of interest between kinship groups are characterized by rigorously formalistic rules of evidence. The same is true of judicial procedure in *Dinggenossenschaften.* As we have seen, these rules were at first influenced by magical beliefs which required that the questions of evidence should be asked in the proper way and by the proper party. Even afterwards it took a long time for the law to develop the idea that a fact, as understood today, could be "established" by a rational procedure, particularly by the examination of witnesses, which is the most important method now, not to speak at all of circumstantial evidence. The compurgators of earlier epochs did not swear that a statement of fact was true but confirmed the rightness of their side by exposing themselves to the divine wrath. We may observe that this practice was not much less realistic than that of our days when a great many people, perhaps a majority, believe their party task as witnesses to be simply that of "swearing" as to which party is "in the right." In ancient law, proof was therefore not regarded as a "burden" but at least in large part as a "right" of the party to which it was attributed. The judge, however, was strictly bound by these rules and the traditional methods of proof. The modern theory of as late a period

as that of "common law" procedure[5] is different from ancient procedure only in that it would treat proof as burden. It, too, binds the judge to the motions of, and the evidence offered by, the parties and, indeed, the same principle applies to the entire conduct of the suit: in accordance with the principle of adversary procedure the judge has to wait for the motions of the parties. Whatever is not introduced or put into a motion does not exist as far as the judge is concerned; the same is true of facts which remain undisclosed by the recognized methods of proof, be they rational or irrational. Thus, the judge aims at establishing only that relative truth which is attainable within the limits set by the procedural acts of the parties.

This exactly was the character of adjudication in its oldest known, most clear-cut form: arbitration and composition between contending kinship groups, with oracle or ordeal constituting the trial procedure. This ancient legal procedure was rigorously formal like all activities oriented towards the invocation of magical or divine powers; but, by means of the irrational supernatural character of the decisive acts of procedure, it tried to obtain the substantively "right" decision. When, however, the authority of, and the belief in, these irrational powers came to be lost and when they were replaced by rational proof and the logical derivation of decisions, the formalistic adjudication had to become a mere contest between litigants, regulated so as to aim at the relatively optimal chance of finding the truth. The promotion of the progress of the suit is the concern of the parties rather than that of the state. They are not compelled by the judge to do anything they do not wish to do at their own initiative. It is for this very reason that the judge cannot comply with the quest for the optimal realization of substantive demands of a political, ethical or affective character by means of an adjudication which could give effect to considerations of concrete expediency or equity in individual cases. Formal justice guarantees the maximum freedom for the interested parties to represent their formal legal interests. But because of the unequal distribution of economic power, which the system of formal justice legalizes, this very freedom must time and again produce consequences which are contrary to the substantive postulates of religious ethics or of political expediency. Formal justice is thus repugnant to all authoritarian powers, theocratic as well as patriarchic, because it diminishes the dependency of the individual upon the grace and power of the authorities.[6] To democracy, however, it has been repugnant because it decreases the dependency of the legal practice and therewith of the individuals upon the decisions of their fellow citizens.[7] Furthermore, the development of the trial into a peaceful contest of conflicting interests can contribute to the further concentration of economic and

social power. In all these cases formal justice, due to its necessarily abstract character, infringes upon the ideals of substantive justice. It is precisely this abstract character which constitutes the decisive merit of formal justice to those who wield the economic power at any given time and who are therefore interested in its unhampered operation, but also to those who on ideological grounds attempt to break down authoritarian control or to restrain irrational mass emotions for the purpose of opening up individual opportunities and liberating capacities. To all these groups nonformal justice simply represents the likelihood of absolute arbitrariness and subjectivistic instability. Among those groups who favor formal justice we must include all those political and economic interest groups to whom the stability and predictability of legal procedure are of very great importance, i.e., particularly rational, economic, and political organizations intended to have a permanent character. Above all, those in possession of economic power look upon a formal rational administration of justice as a guarantee of "freedom," a value which is repudiated not only by theocratic or patriarchal-authoritarian groups but, under certain conditions, also by democratic groups. Formal justice and the "freedom" which it guarantees are indeed rejected by all groups ideologically interested in substantive justice. Such groups are better served by khadi-justice than by the formal type. The popular justice of the direct Attic democracy, for example, was decidedly a form of khadi-justice. Modern trial by jury, too, is frequently khadi-justice in actual practice although not according to formal law; even in this highly formalized type of a limited popular adjudication one can observe a tendency to be bound by formal legal rules only to the extent directly required by procedural technique. Quite generally, in all forms of popular justice decisions are reached on the basis of concrete, ethical, or political considerations or of feelings oriented toward social justice. Political justice prevailed particularly in Athens, but it can be found even today. In this respect, there are similar tendencies displayed by popular democracy on the one hand and the authoritarian power of theocracy or of patriarchal monarchs on the other. When, for example, French jurors, contrary to formal law, regularly acquit a husband who has killed his wife's paramour caught in the act, they are doing exactly what Frederick the Great did when he dispensed "royal justice" for the benefit of Arnold, the miller.[8] Even more so does the distinctive characteristic of a theocratic administration of justice consist entirely in the primacy of concrete ethical considerations; its indifference or aversion to formalism is limited only in so far as the rules of the sacred law are explicitly formulated. But in so far as norms of the latter apply, the theocratic type of law results in the exact

opposite, viz., a law which, in order to be adaptable to changing circumstances, develops an extremely formalistic casuistry. Secular, patrimonial-authoritarian administration of justice is much freer than theocratic justice, even where it has to conform with tradition, which usually allows quite a degree of flexibility.

Finally, the administration of justice by honoratiores presents two aspects depending on what legal interests there are involved, those of the honoratiores' own class or those of the class dominated by them. In England, for instance, all cases coming before the central courts were adjudicated in a strictly formalistic way. But the courts of justices of the peace, which dealt with the daily troubles and misdemeanors of the masses, were informal and representative of khadi-justice to an extent completely unknown on the Continent. Furthermore, the high cost of litigation and legal services amounted for those who could not afford to purchase them to a denial of justice, which was rather similar to that which existed, for other reasons, in the judicial system of the Roman republic.[9] This denial of justice was in close conformity with the interests of the propertied, especially the capitalistic, classes. But such a dual judicial policy of formal adjudication of disputes within the upper class, combined with arbitrariness or de facto denegation of justice for the economically weak, is not always possible. If it cannot be had, capitalistic interests will fare best under a rigorously formal system of adjudication, which applies in all cases and operates under the adversary system of procedure. In any case adjudication by honoratiores inclines to be essentially empirical, and its procedure is complicated and expensive. It may thus well stand in the way of the interests of the bourgeois classes and it may indeed be said that England achieved capitalistic supremacy among the nations not because but rather in spite of its judicial system. For these very reasons the bourgeois strata have generally tended to be intensely interested in a rational procedural system and therefore in a systematized, unambiguous, and specialized formal law which eliminates both obsolete traditions and arbitrariness and in which rights can have their source exclusively in general objective norms. Such a systematically codified law was thus demanded by the English Puritans,[10] the Roman Plebeians,[11] and the German bourgeoisie of the nineteenth century. But in all these cases such a system was still a long way off.

In the administration of justice of theocratic type, in adjudication by secular honoratiores (as judges or private or officially patented jurisconsults), as well as in that development of law and procedure which is based upon the *imperium* and the contempt powers of magistrates, princes, or officials holding in their hands the direction of the lawsuit,[12]

the view is at first strictly adhered to that fundamentally the law has always been what it is and that no more is needed than an interpretation of its ambiguities and its application to particular cases. Nonetheless, as we have seen [in sec. *iii*], the emergence of rationally compacted norms is in itself possible even under rather primitive economic conditions, once the hold of magical stereotypization has been broken. The existence of irrational techniques of revelation as the sole means of innovation has often implied a high degree of flexibility in the norms; their absence, on the other hand, has resulted in a higher degree of stereotypization, because in that event the sacred tradition as such remained the sole holy element and would thus be sublimated by the priests into a system of sacred law.

2. *The Substantive Rationalization of Sacred Law*

Sacred law and sacred lawmaking have emerged in rather different ways in different geographical areas and in different branches of the law; their persistence has likewise varied. We shall completely disregard at this point of our analysis the special attention which sacred law pays to all problems of punishment and atonement, a concern originally caused by purely magical norms; nor shall we here consider its interest in political law, or the originally magically conditioned norms which regulated the times and places at which trials were allowed to take place, or the modes of proof. In the main, we shall deal only with "private law" as commonly understood. In this branch of law, the fundamental principles regarding the permissibility and the incidents of marriage, the law of the family, and, closely related to it, that of inheritance, have constituted a major branch of sacred law in China and India as well as in the Roman *fas*, the Islamic *shariah*, and the medieval canon law. The ancient magical prohibitions of incest were early forms of religious regulation of marriage.[13] In addition there was the importance of appropriate sacrifices to the ancestors and other familial *sacra*, which caused the intrusion of sacred law into the law of the family and inheritance. In the areas of Christianity, where the latter interests lost part of their significance, the fiscal interests of the Church in the validity of wills operated to maintain its control in the field of the law of inheritance.[14]

Secular trade law was liable to come into conflict with the religious norms relating to objects and places dedicated to religious purposes or consecrated for other reasons or magically tabooed. In the sphere of contract, sacred law intervened on purely formal grounds

whenever a religious form of promise, especially an oath, had been used, a situation which occurred frequently and in the beginning, we may surmise, regularly.[15] On substantive grounds, sacred law became involved whenever important norms of a religious-ethical character, for instance, the prohibition of usury, entered the picture.

The relations between temporal and sacred law in general can vary considerably, depending upon the particular principles underlying the religious ethics in question. As long as religious ethics remains at the stage of magical or ritualistic formalism, it can, under certain circumstances, become paralyzed and completely ineffective through its own inherent means of refined rationalization of magical casuistry. In the course of the history of the Roman republic the *fas* met with just this fate. There was scarcely a single sacred norm for the circumvention of which one could not have invented some appropriate sacred device or form of evasion.[16] The College of Augurs' power of intervention in cases of defective religious form and evil *omina*, which meant, practically speaking, a power to rescind the resolutions of the popular assemblies, was never formally abolished in Rome as it had been by Pericles and Ephialtes in the case of the equally sacredly conditioned power of the Athenian Areiopagus.[17] But under the absolute domination of the priesthood by the secular magisterial nobility, this power served political purposes exclusively, and its application, like that of the substantive *fas*, was rendered practically innocuous by peculiar sacred techniques. Thus, like the Hellenic law of the late period, the thoroughly secularized *ius* was guaranteed against intrusions from this direction, despite the extraordinarily large role played in Roman life by considerations of ritual obligation. The subordination of the priesthood to the profane power in the ancient polis and certain peculiar characteristics of the Roman Olympus and of its treatment of which we have spoken, were the factors by which this line of development was determined in Rome.[18]

3. *Indian Law*

The situation was the reverse where a dominant priesthood was able to regulate the whole range of life ritualistically and thus to a considerable extent to control the entire legal system, as was the case in India.[19] According to prevailing Hindu theory, all law is contained in the Dharma-Sutras. The purely secular development of law was confined to the establishment of particular systems of law for the various vocational groups of the merchants, artisans, and so forth. No one doubted the right of the vocational groups and castes to establish their

own laws, so that the prevailing state of affairs could be summarized in the maxim: "Special law prevails over general law."[20] Almost all of the actually obtaining secular law came from these sources. This type of law, which covered almost the entire field of matters of daily life, was, however, disregarded in priestly doctrine and in the philosophical schools. Since no one thus specialized in its study and administration, it escaped not only all rationalization, but also lacked a reliable guaranty of validity in cases of divergence from the sacred law, which latter was in theory absolutely binding, even though it was widely disregarded in practice.

Lawfinding in India represented that same characteristic intermixture of magical and rational elements which corresponds to both the peculiar kind of the religion and the theocratic-patriarchal regulation of life. The formalism of procedure was on the whole rather slight. The courts were not of the type of popular justice. The rules that the king is bound by the decision of the chief justice and that lay members (viz., merchants and scribes in the older sources and guild masters and scribes in the later ones) must be among the members of the court are both expressive of rational tendencies. The great significance of private arbitration corresponded to the autonomous law creation by the consociations. However, appeals from the organized tribunals of the consociations to the public courts were permitted as a general rule. The law of evidence is today primarily rational in character; resort is primarily had to instruments in writing and to the testimony of witnesses. Ordeals were reserved for cases in which the results of the rational means of evidence were not sufficiently clear. In those situations, however, they preserved their unbroken magical significance. This was especially true of the oath, which was to be followed by a period of waiting to determine the consequences of the self-curse. Similarly the magical means of execution, especially the creditor's starving himself to death before the door of the debtor,[21] existed along with the official enforcement of judgments and legalized self-help. A practically complete parallelism of sacred and secular law existed in criminal procedure. But there was also a tendency towards the fusion of both these types of law, and on the whole sacred and secular law constituted an undifferentiated body, which obscured the remnants of the ancient Aryan law. This body of law was, in turn, largely superseded by the autonomous administration of justice of the consociations, especially the castes, which possessed the most effective of all means of compulsion, viz., expulsion.

Within the territory where *Buddhism* prevailed as the religion of the state, i.e., in Ceylon, Siam, Malaya, Indo-China, and especially Cambodia and Burma, the legislative influence of the Buddhist ethics was

far from slight.[22] The Buddhist ethics was responsible for the equal status of husband and wife as expressed, for instance, in the rule of cognatic inheritance or the system of community property, or in the duty of filial piety, established in the interest of the parents' fate in the beyond, and requiring, among other things, the heir's liability for the debts of the deceased. The whole law came to be permeated with ethical elements which found expression in the protection of slaves, the leniency of the penal law (except the often extremely cruel punishment for political crimes), and in the admissibility of giving bond for keeping the peace. Yet even the relatively worldly ethics of Buddhism was so preoccupied with conscience on the one hand and ritual formalism on the other that a system of sacred "law" could scarcely develop as the subject matter of a specialized learning. Nonetheless, a legal literature, Hindu in tone, did develop and made possible the proclamation in Burma in 1875 of the "Buddhist law" as the official law, meaning by Buddhist law a law of Hindu origin, modified in the direction of Buddhism.

4. *Chinese Law*

In *China*,[23] on the other hand, the magical and animistic duties were restricted by the power-monopoly of the bureaucracy to the purely ritual sphere. Thus, as we have seen and shall see further, it exercised profound influences on economic activity. The irrationalities of Chinese administration of justice were caused by patrimonial rather than theocratic factors. Legal prophecy, like prophecy in general, has been unknown in China, at least in historical times; there also was no stratum of responding jurisconsults and no specialized legal training. All this corresponded to the patriarchal character of the political association, which was opposed to any development of formal law. The "Wu" and the "Wei" (Taoist magicians) were the counselors in matters of magical ritual. Those of their members who had passed the examinations and had, accordingly, a literary education, were advisors to families, kinship groups, and villages in ceremonial and legal matters.

5. *Islamic Law*

In *Islam* there was, at least in theory, not a single sphere of life in which secular law could have developed independently of the claims of sacred norms. In fact, there occurred a rather far-reaching reception

of Hellenic and Roman law.[24] Officially, however, the entire corpus of private law was claimed to be an interpretation of the Koran, or its elaboration through customary law. This took place when, after the fall of the Omayyad Caliphate and the establishment of rule of the Abbassids, the caesaro-papist principles of the Zoroastrian Sassanids were transplanted into Islam in the name of a return to the sacred tradition.[25] The status of sacred law in Islam is an ideal example of the way in which sacred law operates in a genuinely prophetically created scriptural religion. The Koran itself contains quite a few rules of positive law (such as, for instance, the abolition of the prohibition of marriage between a man and his adoptive daughter-in-law, the very liberty of which Mohammed availed himself). But the bulk of the legal prescriptions are of a different origin. Formally, they usually appear as *hadith*, i.e., exemplary deeds and sayings of the prophet, the authenticity of which was attested to by a successive line of recognized transmitters extending back by oral transmission to the contemporaries of the prophet, which originally meant back to the specially qualified companions of Mohammed. Due to this unbroken chain of personal transmitters the prescriptions are, or are said to be, exclusively orally transmitted, and constitute the *Sunna*, which is not an interpretation of the Koran itself, but a tradition alongside the Koran. Its oldest component parts derive mainly from the pre-Islamic period, particularly from the customary law of Medina, the compilation and editing of which as *Sunna* has been attributed to Malik-ibn-Anas. But neither the Koran nor the *Sunna* were by themselves the sources of the law used by the judges. These sources were rather the *fikh*, i.e., the product of the speculative labors of the law schools, which are collections of *hadiths* arranged either according to authors (*musnad*) or to subject matter (*musannaf*, of which six constitute the traditional canon). The *fikh* comprises ethical as well as legal commands and has contained, ever since the law became crystallized, an increasingly large section of a completely obsolete character. The crystallization was officially achieved through the belief that the charismatic, juridical-prophetic power of legal interpretation (*ijtihad*) had been extinguished since the seventh or eighth century, that is, the thirteenth or fourteenth century of the Christian era, a belief similar to that of the Christian Church and to that of Judaism regarding their assumption that the prophetic age had come to an end. The prophets of the law, the *mujtahidûn* of the charismatic epoch, were still thought of as the agents of juridical revelation, although only the founders of the four law schools (*madhab*), acknowledged as orthodox, were given complete recognition. After the extinction of the *ijtihad* only commentators (*muqallidin*) remained and the law

became absolutely fixed. The struggle among the four orthodox law schools was primarily a conflict about the components of the orthodox *Sunna,* but it was also a conflict over methods of interpretation, and even these differences were increasingly stereotyped once the law was fixed. Only the small Hanbalite School rejects all *bida,* i.e., all new law, all new *hadith,* and all rational schemes of interpretation. Thus, as well as because of its postulate of *coge intrare,*[26] it has cut itself off from the other schools which, in principle, are tolerant of each other. The schools differ by the different roles ascribed to legal science in the creation of new law. The Malekite School was dominant for a long time in Africa and Arabia. Since it originated in the oldest political center of Islam, Medina, it was especially uninhibited, perhaps as might have been expected, in incorporating pre-Islamic law. But it was bound to a greater extent by tradition than the Hanefite School, which emerged from Iraq and was, accordingly, deeply affected by Byzantine influences.[27] Its role was particularly important in the Court of the Caliph, and it is still the official school in Turkey[28] and the dominant one in Egypt. The main contribution of the Hanefite jurisprudence, which was in close contact with the ideas of the palace, seems to have been the development of the empirical techniques of Islamic jurists, i.e., the use of analogy (*qiyâs*). It also proclaimed the *ra'y,* i.e., the idea that learned doctrine was an independent source of law, together with the received interpretation of the Koran. The Shafiite school, which originated in Baghdad and spread into Southern Arabia, Egypt, and Indonesia, is regarded as opposed not only to both these Hanefite characteristics, that is, the role ascribed to learned opinion and borrowings from foreign law, but also to the Malekites' elastic attitude toward tradition. It is thus regarded as more traditionalistic, although it has nevertheless achieved similar results through its large-scale reception of *hadiths* of questionable genuineness. The conflict between the *Ashab-al-hadith* i.e., the conservative traditionalists, and the *Ashab-al-fikh,* i.e., the rationalistic jurists, has persisted through the entire history of Islamic law.

The sacred law of Islam is throughout specifically a "jurists' law." Its validity rests on *idshmâ* (*idshmâ-al-ammah—tacitus consensus omnium*) which is defined in practice as the agreement of the prophets of the law, i.e., the great jurists (*fuqahâ*). Besides the infallible prophet, only the *idshmâ* are officially infallible. Koran and *Sunna* are merely the historical sources of the *idshmâ.* The judges do not consult the Koran or the *Sunna,* but the compilations of the *idshmâ,* and they are not allowed independently to interpret the sacred writings or traditions. The Islamic jurists were in a position similar to that of the Roman jurists, and especially the organization of their schools is reminiscent of that in Rome. The jurist's activities involved both legal consultation

and the teaching of students. He was therefore in contact with the practical requirements of his clients as well as the practical pedagogical demands, which necessitated systematic classification. But the subordination both to the fixed interpretative methods laid down by the heads of the schools and to the authoritative commentaries excluded, ever since the close of the *ijtihad* period, all freedom of interpretation. In the official universities, like *Al-Azhar* of Cairo, which includes among its faculty representatives of all four orthodox schools, teaching became the routinized recitation of fixed sentiments.[29] Certain essential characteristics of Islamic organization, viz., the absence of [Church] Councils as well as of doctrinal infallibility [like that ascribed to the papal office], influenced the development of the sacred law in the direction of a stereotyped "jurists' law." Actually, however, the direct applicability of sacred law was limited to certain fundamental institutions within a range of substantive legal domain only slightly more inclusive than that of medieval canon law. However, the universalism which was claimed by the sacred tradition resulted in the fact that inevitable innovations had to be supported either by a *fetwa*,[30] which could almost always be obtained in a particular case, sometimes in good faith and sometimes through trickery, or by the disputatious casuistry of the several competing orthodox schools. As a consequence of these factors, together with the already mentioned inadequacy of the formal rationality of juridical thought, systematic lawmaking, aiming at legal uniformity or consistency, was impossible. The sacred law could not be disregarded; nor could it, despite many adaptations, be really carried out in practice. As in the Roman system, officially licensed jurists (*muftis*, with the *Sheikh-ül-Islam* at their head) can be called on for opinions by the khadis or the parties as the occasion arises. Their opinions are authoritative, but they also vary from person to person; like the opinions of oracles, they are given without any statement of rational reasons. Thus they actually increase the irrationality of the sacred law rather than contribute, however slightly, to its rationalization.

As a status group law, the sacred law applies only to the Muslim but not to the subject population of unbelievers. As a consequence, legal particularism continued to exist not only for the several tolerated denominations, which were privileged partly positively and partly negatively, but also as local or vocational custom. The scope of the maxim that "special law prevails over the general law of the land," although it claimed an absolute validity, was of doubtful application whenever particular laws happened to conflict with sacred norms, which, themselves, were subject to thoroughly unstable interpretations. The commercial law of Islam developed from the legal techniques of late Antiquity a variety of norms, quite a few of which were directly taken over

by the West.[31] In Islam itself, however, the validity of these commercial norms did not derive from enactment or from stable principles of a rational legal system. Their guaranty consisted in nothing but the merchants' sense of honesty and economic influence. The sacred traditions rather threatened than promoted most of these particularistic institutions. They existed *praeter legem*.

This impediment to legal unification and consistency always existed as a natural consequence wherever the validity of sacred law or immutable tradition has been taken seriously, in China and India just as in the territories of Islam. Even in Islam the system of personal laws applied to the purely orthodox schools, in the same way in which it once applied as part of the folk laws in the empire of the Carlovingians.[32] It would have been quite impossible to create a *lex terrae* such as the Common Law had become since the Norman Conquest and, officially, since Henry II. We actually find in all the great Islamic empires of the present time a dualism of religious and secular administration of justice: the temporal official stands beside the khadi, and the secular law beside the *shari'ah*. Similarly to the capitularies of the Carlovingians, this secular law (*qânûn*) began to expand from the very beginning, i.e, since the times of the Omayyad Khalifs, and to assume increasing importance in relation to the sacred law, the more the latter became stereotyped. It became binding for the secular courts whose jurisdiction came to prevail in all matters except those concerning tutelage, marriage, inheritance, divorce, and, to some extent, settled lands and certain other aspects of land law. These courts are not concerned at all with the prohibitions of the sacred law but decide according to local custom, since every systematization of even the secular law was prevented by the continuous intervention of spiritual norms. Thus the Turkish Codex, which began to be promulgated in 1869, is not a Code in the true sense, but simply a compilation of Hanefite norms.[33] We shall see that this state of affairs has had important consequences as regards economic organization.

6. *Persian Law*

In *Persia*, where the Shiite form of Islam is the established religion, the irrationality of the sacred law is even greater, since there it does not even possess the relatively firm bases given by the *Sunna*. The belief in the invisible teacher (*Imâm*) who, at any rate in official theory, is regarded as infallible, is only a poor substitute.[34] The members of the judiciary are "admitted" by the Shah, who, as a religiously illegitimate

ruler, is compelled to pay the greatest regard to the wishes of the local *honoratiores*. This "admission" is no "appointment," but rather the *agrégation* of candidates graduated from the theological schools. There are judicial districts, but the jurisdictions of the individual judges do not seem to be clearly fixed, as the parties may choose from among a number of competing judges. The charismatic character of these juridical prophets is thus clearly indicated. The rigorous sectarianism of the *Shi'ah*, which is accentuated by Zoroastrian influences, would have prevented as unclean all economic intercourse with unbelievers if not through many "fictions" this seclusionism demanded by sacred law had ultimately been almost completely renunciated. There was thus brought about an extensive withdrawal of sacred legal influences from almost all spheres of activity that are of any economic and political consequence. The same retreat of sacred law took place in the political sphere when constitutionalism was justified, through *fetwas*, by quotations from the Koran. Nevertheless, the theocracy is even today far from being a negligible factor in economic life. Despite the increasing shrinkage of its range of influence, the theocratic element in adjudication was and still is—together with the peculiar features of Oriental patrimonialism which will be treated later—of great significance for economic activity. Here, as elsewhere, this fact is due less to the positive content of the norms of the sacred law than to the attitudes prevailing in judicial administration, which is aiming at "material" justice rather than at a formal regulation of conflicting interests. It arrives at decisions in accord with considerations of equity even in those cases concerning real property which belong to its jurisdiction. Such considerations are all the more likely where the law is uncodified. Predictability of decisions of kadi justice is thus at a minimum. As long as religious courts had jurisdiction over land cases, capitalistic exploitation of the land was thus impossible, as, for instance, in Tunisia.[35] However, capitalist interests succeeded in eliminating this jurisdiction. The whole situation is typical of the way in which theocratic judicial administration has interfered and must necessarily interfere with the operation of a rational economic system. It is only the precise extent of this interference which varies from place to place.

7. *Jewish Law*

Jewish sacred law has certain formal similarities with Islamic sacred law, although its context was quite the reverse of that in which Islamic sacred law existed.[36] Among the Jews, too, the Torah and the interpre-

tative and supplementary sacred tradition purported to obtain as a norm of universal validity in all areas of life; similarly, the sacred law obtained only for the coreligionists. But unlike Islam, the bearers of this legal system were not a ruling stratum but rather a pariah people. Hence commerce with outsiders was juridically foreign commerce, and it was to be governed in part by different ethical norms. To the legal norms obtaining in their environment the Jews tried to adapt themselves to the extent permitted by that environment and to the extent that it did not run counter to their own ritualistic scruples. As early as in the period of the kings, the old local oracle, the *Urim* and *Thummim*,[37] had already been supplanted by juridical prophets, who contested the king's competence to issue legal orders with much greater effectiveness than their counterparts in Germanic law.

In the post-Exilic age the Nebiim, i.e., the soothsayers and quite probably law prophets of the period of the kings,[38] were replaced, as we have seen, by the Pharisees who were originally a stratum of intellectuals of upper-class origin with marked Hellenistic traits; later they also included small middle-class people who engaged in scriptural interpretation as a pastime.[39] Thus there developed, at the latest in the last pre-Christian century, the scholastic treatment of ritual and legal questions and thereby the legal technique of the expositors of the Torah and the consulting jurists of the two Eastern centers of Judaism: Jerusalem and Babylon.[40] Like the Islamic and Hindu lawyers, they were the bearers of a tradition which in part rested on the interpretation of the Torah but was also in part independent of it. God had given that tradition to Moses during their forty-day encounter on Sinai. By means of this tradition the official institutions, for instance, levirate marriage,[41] were as markedly transformed as was the case in Islam or in India. Furthermore, like that of Islam and India, it was at first a strictly oral tradition. Its written fixation by the Tannaim[42] began with the increasing fragmentation of the diaspora and the development of a scholastic treatment in the schools of Hillel [ca. 30 B.C.—A.D. 10] and Shammai after the beginning of the Christian era. This was undoubtedly done to guarantee unity and consistency once the judge had become bound to the responses of the consulting legal scholars and therefore to precedents. As in Rome and England, the authorities for the particular legal sayings were cited, and vocational training, examinations, and licensing finally replaced the formerly free legal prophecy. The Mishnah[43] is still the product of the activities of the respondents themselves, collected by Rabbi Judah the Patriarch [ca. 135–220]. The Gemara, its official commentary, is, on the other hand, the product of the activities of the teaching lawyers, the Amoraim, who had succeeded the first interpreters and

who translated into Aramaic and interpreted for the audience the Hebraic passages recited by the reader. In Palestine they bore the title *rabbî* and a corresponding one in Babylon (*mar*). A "dialectical" treatment along the lines of occidental theology could be found in the Pumbeditha "academy" of Babylon. But this method became fundamentally suspect during the later period of orthodoxy and it is condemned today. Since then a speculative theological treatment of the Torah has been impossible. More explicitly than in India and in Islam the dogmatic-edifying and the legal elements in the tradition, the *haggadah* and the *halakhah*, were separated from one another both in literature and in division of labor. In its external aspects the center of learned activity and organization shifted increasingly toward Babylon. The Exilarch (*Resh galutha*) lived in Babylon from the time of Hadrian on and into the eleventh century. His office, which was hereditarily transmitted in the Davidic family, was officially recognized by the Parthian and Persian, and later by the Islamic, rulers; he was provided with a pontifical retinue, his jurisdiction was acknowledged for a long time, even in criminal matters, and under the Arabs he had the power of excommunication. The bearers of the legal development were the two competing academies at Sura and Pumbeditha, of which the former was the more distinguished. Their presidents, the Geonim, combined judicial activity as members of the Sanhedrin with consultative practice for the entire Diaspora and with academic teaching of law. The Geonim were partly elected by the recognized teachers and partly designated by the Exilarch. The external academic organization resembled that of the medieval and oriental schools. The regular students resided at the school; in the month of the Kalla[44] they were joined from abroad by large numbers of more mature candidates for rabbinical office, who came to participate in the academic discussions of the Talmud. The Gaon issued his responses either spontaneously or after discussion during Kalla or with the students.

The literary works of the Geonim, which began roughly with the sixth century, were, in form, no more than commentaries. Theirs was thus a more modest task than that of their predecessors, the Amoraim, who creatively expounded the Mishnah, or that of the successors of the latter, the Saboraim, who commented on it in a relatively free manner, not to speak at all of the Tannaim. But, in practice, and as a result of their elaborate and strong organization, they succeeded in having the authority of the Babylonian Talmud triumph over that of the Palestinian. It is true that this supremacy applied mainly to the Islamic countries, but up until the tenth century it was accepted also by the Jews of the Occident. It was only after that and following

the extinction of the office of the Exilarch[45] that the West freed itself from the Eastern influence. The Frankish rabbis of the Carlovingian epoch, for instance, brought about the transition to monogamy. After the learned treatises of Maimonides[46] and Asher,[47] although they were rejected by the Orthodox as rationalistic, it was ultimately possible for the Spanish Jew Joseph Karo, in his Shulchan Aruch,[48] to create a compendium which, as compared with the Islamic canonic treatises, was very manageable and brief. In practice this work then replaced the authority of the Talmudic responses, and in Algiers, for example, as well as in Continental Europe, it came in many instances to guide practice like a veritable code.

Talmudic jurisprudence originated in a highly scholastic atmosphere and, during the very period of the emergence of the commentary on the Mishnah, it had much looser relations with legal practice than in both earlier and later periods. In consequence of these two factors, its formal appearance demonstrated with great clarity the typical characteristics of sacred law, i.e., its marked predominance of purely theoretically constructed, but lifeless, casuistry, which within the narrow limits of a purely rationalistic interpretation could not be elaborated into a genuine system. The casuistic sublimation of law was by no means slight. However, living and dead law were thoroughly intermixed, and no distinction was made between legal and ethical norms.

In matters of substance innumerable receptions had occurred already in Talmudic times, from Near Eastern, especially the Babylonian, and later from the Hellenistic and Byzantine, environments. But not everything in Jewish law which corresponds to the common Near Eastern law is borrowed. On the other hand, it is intrinsically improbable that, as a modern theory holds, some of the most important legal institutions of capitalistic commerce, for instance, the instrument payable to bearer, were invented by the Jews in their own law and then imported by them into the Occident.[49] Instruments containing a bearer clause had been known already in Babylonian law of the age of Hammurabi, and the only question is whether they were instruments simply allowing the debtor to discharge his debt by making payment to the holder or whether they were genuine negotiable instruments payable to bearer.[50] The former type of instrument can also be found in Hellenistic law.[51] But the legal construction is different from what it is in the occidental negotiable instrument payable to bearer (*Inhaberurkunden*), which was influenced by the Germanic conception of the paper as the "embodiment" of rights and was therefore much more effective for purposes of commercialization.[52] The Jewish origin of the modern types of securities is rendered improbable by an additional fact, viz., the fact that the

Occidental precursors of these securities originated in the peculiar needs of the various forms of early medieval *procedure* which were clearly rational. Indeed the clauses which prepared the way for negotiability originally did not serve commercial ends at all but rather those of procedure, above all that of providing a means for substituting a representative for the true party in interest.[53] So far not a single importation of a legal institution has been clearly demonstrated as attributable to the Jews.[54]

It was not in the Occident but rather in the Orient that Jewish law played a real role as an influence in the legal systems of other peoples. Important elements of the Mosaic law were incorporated with Christianization into Armenian law as one of the components of its further development.[55] In the kingdom of the Khazars, Judaism was the official religion and thus Jewish law applied there even formally.[56] Finally, the legal history of the Russians makes it seem probable that through the Khazars certain elements of the most ancient Russian law developed under the influence of Jewish-Talmudic law.[57] There was nothing similar in the Occident. Although it is not impossible that through the mediation of the Jews certain forms of business enterprise may have been imported into the Occident, it is improbable that these forms would have been of national Jewish origin. They are much more likely to have been Syrian-Byzantine institutions or, through these, Hellenistic, or ultimately perhaps, institutions of common Oriental law deriving from Babylon. We must remember that in the importation of Eastern commercial techniques into the West the Jews were in competition with the Syrians, at least in late Antiquity.[58] As far as its formal character is concerned, genuine Jewish law as such and, particularly, the Jewish law of obligations, were no appropriate context at all for the development of such institutions as are required by modern capitalism. Its relatively unhampered development of the contractual type of transaction in no way changes this situation.

Naturally the influence of Jewish sacred law was all the more powerful in the internal life of the family and the synagogue. It was especially significant there in so far as it was ritual. The strictly economic norms were either, like the sabbatical year,[59] confined to the Holy Land—even there it has, through rabbinical dispensation, now been abolished—or rendered obsolete by changes in the economic system, or, like everywhere else, were made innocuous by formalistic practices of circumvention. Even before the emancipation of the Jews the extent to, and sense in, which the sacred law was still valid varied greatly from place to place. Formally, Jewish sacred law manifested no peculiar characteristics. As a special body of law and as one which was

only imperfectly systematized and rationalized and which, while elaborated casuistically, was still not logically consistent, Jewish sacred law possessed the general features of a product which had developed under the control of sacred norms and their elaboration by priests and theological lawyers. However interesting the theme may be in itself, we have in this place no reason to give it special attention.

8. *Canon Law*

The Canon Law of *Christendom* occupies a relatively special position with reference to all other systems of sacred law.[60] In many of its parts it was much more rational and more highly developed on the formal side than the other cases of sacred law. Furthermore, from the very beginning its relation to the secular law was one of a relatively clear dualism, with the respective jurisdictions fairly definitely marked in a manner not to be found elsewhere. This situation was, first of all, due to the fact that the early church had refused for centuries to have anything whatsoever to do with state and law. Its relatively rational character, however, was the product of several causes. When the Church saw itself compelled to seek relations with the secular authorities, it arranged them, as we saw (ch. VI:*xv*), with the aid of the Stoic conception of "natural law," that is, a rational body of ideas. Moreover, the rational traditions of the Roman law lived on in its own administration. At the beginning of the Middle Ages the Western church took for its model the most formal components of Germanic law in its attempt to create its first systematic body of law, the *penitentials*.[61] Furthermore, the structure of the occidental medieval university separated the teaching of both theology and secular law from that of canon law and thus prevented the growth of such theocratic hybrid structures as develo d elsewhere. The rigorously logical and professional legal technique which was developed through both ancient philosophy and jurisprudence was also bound to influence the treatment of Canon law. The collecting activity of the jurists of the church had to concern itself not, as almost everywhere else, with *responsa* and precedents but with conciliar resolutions, official rescripts and decretals, and ultimately it even began to "create" such sources by deliberate forgery—a phenomenon that did not occur in any other church.[62] Finally, and above all, after the end of the charismatic epoch of the early church, the character of ecclesiastical lawmaking was influenced by the fact that the church's functionaries were holders of rationally defined bureaucratic offices. This conception, which was peculiarly characteristic of the church's organization and which, too, was a conse-

quence of the connection with classical Antiquity, was temporarily interrupted by the feudal interlude of the early Middle Ages but revived and became all-powerful with the Gregorian period [i.e., the late 11th cent.]. Thus the occidental church traveled the path of legislation by rational enactment much more pronouncedly than any other religious community. The rigorously rational hierarchical organization of the church also made it possible that it could issue general decrees by which economically burdensome and hence impractical prescriptions, for instance, the prohibition of usury, could be treated as permanently or temporarily obsolete (as we saw in ch. VI:*xii*). In numerous respects, it is true, Canon law can hardly conceal the general pattern so characteristic of all theocratic law, viz., the mixture of substantive legislative and moral ends with the formally relevant elements of normation and the consequent loss of precision. But it has nonetheless been more strongly oriented towards a strictly formal legal technique than any other body of sacred law. Unlike the Islamic and Jewish legal systems, it did not grow through the activities of responding jurists. Furthermore, in consequence of the New Testament's eschatological withdrawal from the world, the basic writ of Christianity contains only such a minimum of formally binding norms of a ritual or legal character that the way was left entirely free for purely rational enactment. The *muftis, rabbis* and *geonim* found parallels only in the fathers-confessor and *directeurs de l'âme*[63] of the Counter-Reformation, and in certain divines of the old Protestant churches. Such casuistic ministry was then promptly productive of certain remote similarities to the Talmudic products, especially within the Catholic realm.[64] But everything was under the supervision of the central offices of the Holy See, and binding norms of social ethics were currently elaborated exclusively through their highly elastic decrees. In this way, there arose that unique relationship between sacred and secular law in which Canon law became indeed one of the guides for secular law on the road to rationality. The relatively decisive factor was the unique organization of the Catholic Church as a rational institution (*Anstalt*). As to the content of the law, apart from such details as the *actio spolii*[65] and the *possessorium summariissimum*,[66] the most significant contributions of Canon law were the recognition of informal contracts,[67] the promotion in the interest of pious endowments of freedom of testation,[68] and the canonist conception of the corporation. The churches were, indeed, the first "institutions" in the legal sense, and it was here that the legal construction of public organizations as corporations had its point of departure, as we have seen [sec. *ii*:6]. The direct practical significance of Canon law for secular law, as far as substantive private, and especially commercial, law was concerned, varied a great deal in the course of time;

in the main, however, it was relatively slight even in the Middle Ages. In Antiquity Canon law had not been able to bring about the legal abolition of free divorce even as late as Justinian,[69] and the submission of any cases to the spiritual courts had remained entirely a matter of discretion. The theoretical claim to an all-embracing substantive regulation of the entire conduct of life, which Canon law shared with all other systems of theocratic law, had in the Occident relatively harmless effects upon legal technique. The reason was that Canon law had found in the Roman law a secular competitor which had achieved an extraordinary formal perfection and which, in the course of history, had become the universal law of the world. The early Church had regarded the Roman Empire and its laws as definitive and eternal. And where the Canon law tried to extend its dominion it met with the vigorous and successful opposition of the economic interests of the bourgeoisie, including that of the Italian cities, with which the Papacy had to ally itself. In the municipal statutes of both Germany and Italy, and in Italian guild statutes, we find severe penalties for citizens bringing suit in an ecclesiastical court, and we can also find regulations that allow with an almost astonishing cynicism the discharge of spiritual penalties that might be incurred for "usury" by lump sum payments by the guilds.[70] Furthermore, in the rationally organized guilds of the lawyers as well as in the assemblies of the Estates the same material and ideal class interests, especially of the lawyers, turned against ecclesiastical law just as they did (in part) against Roman law. Apart from a few institutions, the main influence of the Canon law lay in the field of procedure. In contrast with the formalistic proof of a secular procedure based upon the adversary principle, the striving of all theocratic justice for substantive rather than merely formal truth produced quite early a rational but specifically substantive technique of inquisitorial procedure.[71] A theocratic administration of justice can no more leave the discovery of the truth to the arbitrary discretion of the litigants than the expiation of a wrong. It has to operate *ex officio* and to create a system of evidence which appears to offer the optimal possibilities of establishing the true facts. Canon law thus developed in the Western world the procedure by inquisition, which was subsequently taken over by secular criminal justice.[72] The conflicts about substantive Canon law became later an essentially political matter. Its still existing claims no longer lie in fields which are of practical economic relevance.

After the end of the early Byzantine period, the situation of the *Eastern* churches began to resemble that of Islam as a result of the absence of both an infallible agency for the exposition of doctrine and of conciliar legislation. The difference lay only in essentially stronger

caesaro-papistic claims of the Byzantine monarchs, as compared with those which could be voiced by the Sultans of the East after the separation of the Sultanate from the Abbassid Caliphate,[73] or even as compared with those which the Turkish Sultans could make effective after the transfer of the Caliphate from Mutawakkil to Sultan Selim,[74] to say nothing of the precarious legitimacy of the Persian Shahs *vis-à-vis* their Shiitic subjects.[75] Still, neither the late Byzantine nor the Russian and other caesaro-papistic rulers have ever claimed to be able to create new sacred law. There were, therefore, no organs at all for this purpose, not even law schools of the Islamic sort. As a result, therefore, Eastern Canon law, thus confined to its original sphere, remained entirely stable but also without any influence on economic life.

NOTES

1. *Ius honorarium*—The law created by the praetor in addition to, or in modification of, the *ius civile* as contained in the formal *leges* or in ancient tradition.

2. Cf. PLUCKNETT, 82 *et seq.*; 2 ASSOCIATION OF AMERICAN LAW SCHOOLS, SELECT ESSAYS IN ANGLO-AMERICAN LEGAL HISTORY (1908) 367.

3. Legal procedure, civil or criminal, is said to be inquisitorial when the ascertainment of the facts is regarded primarily as the task of the judge, while in the so-called adversary procedure the true facts are expected to emerge from the allegations and proof of the parties without the active coöperation of the judge. A shift from the predominantly adversary procedure of the Germanic laws was initiated in the later Middle Ages by the Church, whose model became influential for procedural development throughout Western Europe.

4. On the Roman distinction between *ius* and *fas* see JOLOWICZ, *op. cit.* 86 *et seq.*; MITTEIS 22–30 and literature there listed. For a baroque use of the terms, see BLACKSTONE III, 2.

5. Namely, of continental Europe, i.e., the procedure which was common on the Continent before the reforms introduced by the codification of the nineteenth and twentieth centuries. In this and the following senten es Weber speaks also, however, of the continental procedure of the present day, which, as will appear, is not basically different from Anglo-American procedure.

6. Weber has anticipated the procedural reforms of the modern totalitarian states whi h have shown marked tendencies to strengthen the inquisitorial at the expense of the adversary principle. Cf. Ploscowe, *Purging Italian Criminal Justice of Fascism* (1945), 45 COL. L. REV. 240; BERMAN, JUSTICE IN RUSSIA 207, EBERHARD SCHMIDT, EINFÜHRUNG IN DIE GESCHICHTE DER DEUTSCHEN STRAFRECHTSPFLEGE (1947) 406; also SCHOENKE, ZIVILPROZESSRECHT (6th ed. 1949) 25; H. Schroeder, *Die Herrschaft der Parteien im Zivilprozess* (1943), 16 ANNUARIO DI DIRITTO COMPARATO 168.

7. Apparently, Weber is thinking here of the democracy of the Athenian rather than of the modern Western type.

8. Famous case in which Frederick tried to intervene in a private lawsuit. In 1779, upon suit by his landlord, a baron, Arnold, a humble miller, was ejected because of nonpayment of rent. Arnold turned to the king who ordered

the court to vacate its judgment and restore Arnold to the possession of the mill. The judges refused to render a decision "which would be against the law." When they continued in their "obstinate" refusal to obey the king's angrily repeated command, he ordered the supreme court to sentence them to jail. When the supreme court judges declared that the law would not permit such a step, they, together with the judges of the lower court, were ordered to be arrested by the king and were sentenced by him to one year's imprisonment, loss of office, and payment of damages to Arnold. It was one of the first acts of government of Frederick's successor, Frederick William II, to comply with the demand of the public to rehabilitate the judges and to indemnify them out of the public treasury. See W. JELLINEK, VERWALTUNGSRECHT 85 and literature cited there; for an account in English, see the translation by I. Husik of R. STAMMLER, THE THEORY OF JUSTICE (1925) 243 *et seq.*

9. Cf. A. MENDELSSOHN-BARTHOLDY, IMPERIUM DES RICHTERS (1908). The allusion points to the early period when Rome was dominated by the patricians, who entirely dominated the administration of justice, until their power was broken in the long struggle of the plebeians. Cf. MOMMSEN, HISTORY OF ROME (Dickson's tr. 1900) 341–369; JOLOWICZ 7–12.

10. Cf. I. SANFORD, STUDIES AND ILLUSTRATIONS OF THE GREAT REBELLION (1858); P. A. GOOCH, ENGLISH DEMOCRATIC IDEAS IN THE SEVENTEENTH CENTURY (2nd ed. 1927) 308; HOLDSWORTH 412.

11. In their struggle against patrician domination the plebeians achieved one of their most important successes when they compelled the patricians to consent to the appointment of a commission to write down the laws and thus to make their knowledge generally accessible. The product of the commission's work was the law of the Twelve Tables, which is reported by Livy (III, 9 *et seq.*) to have been promulgated in 450/449 B.C. and which for centuries was taken as the basis of the Roman *ius civile*.

12. *Prozessinstruktion* is a term of art of German theory of procedure. It means the role and activity of those persons who keep a lawsuit, civil or criminal, going and direct the course which it has to follow. In the type of procedure mentioned in the text, the *Prozessinstruktion* is vested in a public officer or potentate who presides over the trial or at least that part of it in which the issues are formulated, but does not himself render the final judgment. The principal illustration is constituted by the role of the Roman *praetor* who presided over the proceedings *in iure*, in which there were formulated, with his active participation, those issues of law or fact or both which had to be decided, *in iudicio*, by the *iudex*, whom the *praetor* would appoint.

Another variety is represented by popular assemblies, especially of the Germanic type, which would be presided over by a prince or his representative or by some other person of authority, while the decision would be made by all, or some, of the members of the assembly (see sec. *iii*:6). Both the Roman *praetor* and the Germanic prince, etc., had the *Banngewalt*, i.e., the power to subpoena attendance upon penalty of outlawry or forfeiture of property.

13. See WESTERMARCK, HISTORY OF HUMAN MARRIAGE c. XIX; FREUD, TOTEM AND TABOO (Brill transl. 1927) c. I; Fortune, R., *Incest*, 7 ENCYC. SOC. SCI. 620 and further literature cited there.

14. On the role of the Church in maintaining or reëstablishing the principle of freedom of testation, see POLLOCK AND MAITLAND II, 349; HOLDSWORTH III, 536, 541 *et seq.*

15. Here Weber apparently follows JHERING 263. In contrast MITTEIS 23, n. 2, points to the "well-known" fact "that in Roman private life the promissory oath

was hardly used in any situations other than those in which legal coercion was lacking." Explicitly referring to Jhering, Mitteis states that "the idea of a religious component in the secular law of Rome has at one time been badly abused" (*op. cit.* 24, n. 4). More recently such ideas have been resuscitated, however, even more radically by HÄGERSTRÖM, DER RÖMISCHE OBLIGATIONSBEGRIFF (1927), and DAS MAGISTRATISCHE IUS IM ZUSAMMENHANG MIT DEM RÖM. SAKRALRECHT (1929).

16. See JHERING I, *et seq.* Recent research has thrown doubt on the correctness of applying the word *fas* to the sacred law of Rome. Cf. the following statement in JÖRS AND KUNKEL 19, n. 2: "In modern literature the distinction between *ius* and *fas* is commonly regarded as equivalent to that between temporal and sacred law. Such use of the terms does not, however, correspond to Roman usage. At first, *fas* meant that sphere which was left free by the Gods. It included quite particularly those aspects of life for which the temporal law could be effective. In an ethically deepened usage, which came to be frequent with the Ciceronian period, *fas* means that which is religiously *permitted* in contrast to *ius*, which means that which is *commanded*. Even in this sense, *fas* does not mean, however, a religiously moral order in contrast to *ius* as a man-made order. Such an idea did not arise before Christianity. Even less does *fas* mean the complex of rules concerning religious rites and similar problems. These rules belong to the *ius*, as *ius sacrum* or *ius pontificium*. The development of the meaning of *fas* is largely paralleled by that of the Greek word ὅσιον; cf. WILAMOWITZ, PLATON I. 61; LATTE, HEILIGES RECHT 55 n. 16." Cf. also *supra* n. 4.

17. On the College of Augurs and its *interventio*, see JHERING I, 329 *et seq.* On the abolition of the Areiopagos, "by a decree which was carried, about B.C. 458 and by which, as Aristotle says, the Areiopagos was 'mutilated' and many of its hereditary rights abolished" (ARIST., POL. ii 9; CIC., DE NAT. DEOR. ii 29; DE REP. i 27), see the article in W. SMITH, DICTIONARY OF GREEK AND ROMAN ANTIQUITIES (1848) 128.

18. Weber's treatment of the relations between religion and law corresponds to the prevailing opinion, as expressed especially by Mitteis. A much closer relationship and a more far-reaching influence of magico-religious ideas upon the development of Roman law has more recently been maintained by HÄGERSTRÖM, *op. cit. supra* n. 15; as to further literature on the problem see JÖRS AND KUNKEL 4, n. 3, 393.

19. On Hindu law see the article by Vesey-Fitzgerald in 9 ENCYC. SOC. SCI. 257, and literature cited there; Weber seems to have used primarily Jolly's article in BÜHLER'S GRUNDRISS DER INDOARISCHEN PHILOLOGIE (1886; Engl. transl. by Ghosh. Calcutta, 1928) and the DIGEST OF HINDU LAW by West and Bühler (Bombay, 1867/69). Cf. the footnote in WEBER'S GESAMMELTE AUFSÄTZE ZUR RELIGIONSSOZIOLOGIE (2nd ed. 1923), HINDUISMUS UND BUDDHISMUS II, 2. He also seems to have been acquainted with the pertinent passages in KOHLER AND WENGER 102–130, and with the works of SIR HENRY MAINE: ANCIENT LAW; VILLAGE COMMUNITIES; EARLY HISTORY OF INSTITUTIONS; EARLY LAW AND CUSTOM.

20. Weber uses here the old German maxim, "Willkür bricht Landrecht," which, as shown above, sec. ii: 5, meant that in the later Middle Ages and the early centuries of the modern age the customary or specially created law of some group prevailed over the general law of the land. The parallel with this German state of affairs is admissible only when one considers that Hindu law could not strictly be called the law of any particular territory in the sense of the German *Landrecht* but rather the law of the believers, which was simply regarded as *the*

law as long as it did not have to compete with any other legal system, i.e., in the period before the Mohammedan invasion.

21. See *supra*, sec. ii:2:(4b).

22. As to the law in the countries of Buddhist influence, see VESEY-FITZGERALD, *loc. cit.* in sec. iv, n. 24; also BURGE'S COMMENTARIES ON COLONIAL AND FOREIGN LAW (ed. 1908–1914), 6 vols. The following articles in 1 SCHLEGELBERGER, RECHTSVERGL. HANDWÖRTERBUCH (1929) deal with these countries' modern legal systems, in which the Buddhist traditions are still influential, although in various degrees: W. Trit I, *Siam* 470; H. Mundell, *Malaiische Staaten* 417. H. Solus, *Die französischen Besitzungen und Kolonien* 535, 553 (Cambodia); F. Grobbs, *Britisch Indien* 319–328; 324–325 (Burma). In Ceylon, Buddhist law was largely superseded in the eighteenth century by Roman-Dutch law. See LEE, INTRODUCTION TO ROMAN-DUTCH LAW (1925); PEREIRA, LAWS OF CEYLON (1913); J. KOHLER, RECHTSVERGLEICHENDE STUDIEN (1889) 211 *et seq.*, 251.

23. The principal literature on China which was used by Weber is listed in the introductory note to his essay on the ethics of Confucianism and Taoism (1 GESAMMELTE AUFSÄTZE ZUR RELIGIONSSOZIOLOGIE (3rd ed. 1934) 276; tr. by H. Gerth, s.t. THE RELIGION OF CHINA [1951]). Chinese law is discussed by him especially on pp. 391 *et seq.* and 436 *et seq.* of the work just mentioned. Weber apparently used the chapter on Chinese Law (pp. 138 *et seq.*) in KOHLER AND WENGER and the literature listed there at p. 153. For further orientation on Chinese law see Escarra, *Chinese Law*, 9 ENCYC. SOC. SCI. 249 and literature listed there at p. 266; Betz and Lautenschlager, *China*, in 1 SCHLEGELBERGER'S RECHTSVERGL. HANDWÖRTERBUCH 328, and literature listed at pp. 389–391; see also BUENGER, QUELLEN ZUR RECHTSGESCHICHTE DER T'ANG ZEIT (1949); C. H. PEAKE, RECENT STUDIES ON CHINESE LAW (1937). Weber's observations are limited, of course, to the law of the pre-revolutionary China.

24. The theory of a major reception of Roman or Hellenistic ideas or institutions in Islamic law has recently encountered well-stated opposition. See R. Vesey-Fitzgerald, *Alleged Debt of Islamic to Roman Law* (1951) in 67 L.Q. REV. 81; cf. Schacht, *Origins of Islamic Jurisprudence* (1951) and *Foreign Elements in Ancient Islamic Law* (1950), 32 COMP. LEG. 9.

25. Omayyads (661–750)—Arab dynasty following in the caliphate the immediate associates of Mohammed (abu-Bekr, Omar, Osman, and Ali), leading in the Arab-Islamic expansion into Armenia, Iran, Afghanistan, the Indus area, North Africa, and Spain; the revolutionary succession of the Abbassids (750–1258) residing in Baghdad marks the rise of the Persian element and the amalgamation of the Arab conquerors with their Oriental subjects. Cf. H. C. BECKER, in 2 CAMBRIDGE MEDIEVAL HISTORY (1913) 355–364. Sassanids (226–641)—last Persian dynasty before the Arab conquest.

26. Post. ate of *coge intrare*—claim of rightful compulsion against heretics, especially as made against the Donatists by Augustine (Epist. 185, ad Bonifacium, A.D. 417), who ascribes to the Church the right and duty to compel membership and obedience even on the part of the unwilling. As authority he refers to the parable of the great supper (Luke 14:23), in which the host bids the servant that he "compel to enter" (*coge intrare*) all those whom he will encoun r.—SCHAFF, HISTORY OF THE CHRISTIAN CHURCH (1886) 144. The argument was also used, first it seems, in 1009 by Bruno von Querfurt, in the agitation for the Crusades and the compulsory conversion to Christianity of Moslems and other infidels; cf. ERDMANN, DIE ENTSTEHUNG DES KREUZZUGSGEDANKENS (1935) 97.

27. Doubtful; see *supra*, n. 24.

28. Written before the separation of church and state by Kemal Atatürk; see now the Constitution of April 20, 1924, and the Civil Code of October 4, 1926, which is in the main a translation of the Swiss Civil Code of 1907.

29. This statement of Weber's is no longer correct. On recent reforms of Islamic legal education see A. Sékaly, *La réorganisation de l'Université d'El-Azhar* (1936), 10 Révue des Études Islamiques 1.

30. *Fetwa*—a jurist's opinion on a concrete case, similar to the *responsa* of the Roman jurists; cf. *supra*, sec. iv:3.

31. This statement of Weber's, as also that in his History 258, seems to be based upon the works of Josef Kohler, especially Kohler and Wenger 97; *Die Islamlehre vom Rechtsmissbrauch* 29 Z.f.v.R. 432–444, and Moderne Rechtsfragen bei islamitischen Juristen. Ein Beitrag zu ihrer Lösung (1885). But compare the cautious statements by Goldschmidt 98, 99, 246, 250; and *Ursprünge des Mäklerrechts, insbesondere sensal* (1882), 28 Z.f. ges. Handelsrecht 315.

Strictly denying any influence is P. Rehme, *Geschichte des Handelsrechts* in 1 Ehrenberg Handbuch des gesamten Handelsrechts (1913) 95. ("Was das Verhältnis des islamitischen Rechtes zu den romanischen anlangt, so ist festzustellen: bisher ist noch für keinen Punkt der Nachweis einer Einwirkung jenes auf dieses erbracht worden.") See also, pp. 98, 99, 102, 108. In addition to the authorities above mentioned, compare also about the *contractus mohatra* (Arabic khatar), Cohn, *Die Kreditgeschäfte* in 3 Endemann, Handbuch des deutschen Handels-, See- und Wechselrechts (1885) 846; 2 Windscheid, Lehrbuch des Pandektenrechts (1900) 73; about negotiable instruments, cf. Grasshoff, Das Wechselrecht der Araber (1899); Rehme, *loc. cit.* 95; Kohler, *Islamrecht* in 17 Z.f.v.R. 207.

32. See *supra*, sec. ii:5 and iii:2.

33. Weber's main sources seem to have been Kohler in Kohler and Wenger 130, and literature cited there at p. 153. On modern Persian law see the article by Greenfield in 1 Schlegelberger, *op. cit.*, 427.

34. The word *imâm*, which in general simply means teacher, has in the Shiite tradition assumed the special meaning of spiritual and temporal head of all Islam. The first Imâm is Ali, Mohammed's son-in-law. None but Ali's descendants can be his successors. The Omayads, who after Ali's assassination assumed the khalifate, are regarded as usurpers by the Shiites, among whom dissension also broke out, however, as to which of the several lines of Ali's descendants were to be regarded as the charismatically true. All agree that that imâm, whom they respectively regard as the last legitimate one, transcended from earth, has since been living concealed from man as the "invisible imâm," and will at the end of time reappear as *mahdi* to save the world from all evil and to establish his kingdom of peace and justice. Certain eminent sages are believed to have had personal contacts with the invisible imâm and to have received revelations from him. Cf. Goldziher, *op. cit.* 213 *et seq.*

35. Cf. Solus in 1 Schlegelberger, *op. cit.* 545.

36. In his own book on Judaism Weber does not deal with rabbinical law. The literature on Jewish law which Weber is likely to have known is listed in Kohler and Wenger 151/152; for further information see Gulak, *Jewish Law*, 9 Encyc. Soc. Sci. 219, and literature there at p. 264; also D. Daube, *The Civil Law of the Mischnah* (1944), 18 Tulane L. Rev. 351.

37. The Urim and Thummim seem to have been objects attached to the breastplates of the High Priest (Exod. 28:30) and used by him to ascertain the

will of God on questions of national importance (Num. 27:21). They disappeared in the period of the later kings (Ezra 2:63).

38. On divination and prophecy in Israel, see AJ 112 *et seq.*, 179 *et seq.*, 281 *et seq.*

39. On the sociological place and role of the Pharisees, Weber has expressed himself at AJ 401 *et seq.*

40. Both the Palestinian and the Babylonian Talmud were concluded in the later part of the fifth century B.C.

41. Deut. 25:5–10: Where a man dies without a male descendant, the widow must not marry a stranger, but the surviving brother of the deceased must take her to wife, and the first son born of them succeeds to the name and property of the deceased, cf. Cohon, *Levirate Marriage* in FERM'S ENCYC. OF RELIGION (1945) 441, and literature stated there.

49. The author referred to in the text seems to be Werner Sombart, who, in his THE JEWS AND MODERN CAPITALISM ascribes to the Jews a decisive role in giving the capitalistic organization its peculiar features, by inventing a good many details of the commercial machinery which moves the business life of today, and by coöperating in the perfecting of others (p. 11). However, in his detailed discussion of this alleged Jewish achievement, Sombart states expressly that "it would be difficult, perhaps impossible, to show what that share was by reference to documentary evidence" (p. 63). Sombart's extensive hypotheses were readily accepted in National-Socialist literature. On the problem of the influence of Jewish law, see also Kuntze, DIE LEHRE VON DEN INHABERPAPIEREN (1857) 48, who discusses some institutions of ancient and later Jewish law but leaves it expressly open whether or not they had any influence on Western developments.

56. The Khazars, one of the peoples of the North-Caucasian steppes, established an empire between the Black Sea and the Caspian. They reached the zenith of their power in the eighth and ninth centuries. Refusing to yield to pressure from Christian Byzantium and the Mohammedan khalifs, the dynasty, about A.D. 740, adopted the religion of the Jews, who had been expelled from Byzantium and found refuge with the Khazars. Jewish law did not become, however, the general law of the Khazar empire but only of those who professed the Jewish faith. With the arrival of the Viking rulers (Varangians) in Kiev in the late ninth century, the Khazar empire was steadily reduced in size and finally destroyed by Svjatoslav of Kiev (964–972). KADLEC in 4 CAMBRIDGE MEDIEVAL HISTORY 187.

57. Weber's source seems to be S. Eisenstadt, *Über altrussische Rechtsdenkmäler* (1911), 26 Z.F. VGL. R. 157, who does not state more, however, than a brief conjecture.

59. Sabbatical year: Every seventh year the Bible (Lev. 25:1–25; Deut. 15:2) ordained that loans be canceled, serfs be freed, pledged property restored, and land left fallow, with all uncultivated growth left to the poor and the stranger. To what extent these rules were ever practiced is uncertain. They became definitely meaningless with the invention of the Prosbol, which tradition has ascribed to Hillel (30 B.C.–A.D. 10). The debtor pretended to enter upon his obligation toward the court rather than the creditor himself. Upon the basis of spurious biblical authority a debt thus created was held not to be affected by the biblical command. Cf. GREENSTONE, 10 JEWISH ENCYCL. 219.

60. There is no comprehensive history of the Canon Law; for a concise survey, see Hazeltine, 3 ENCYC. SOC. SCI. 179, with bibliography at 185.

61. Cf. J. T. MCNEILL AND H. M. GAMER, MEDIEVAL HANDBOOKS OF PENANCE (1938).

62. The most famous cases were those of the Donation of Constantine and the False (or Pseudo-Isidorean) Decretals. The first-named instrument, which was fabricated, probably, in Rome between the middle and the end of the eighth century, purported to be a grant by the Emperor Constantine, in gratitude for his conversion by Pope Silvester, to that pope and his successors forever, of spiritual supremacy over all other patriarchs as well as of temporal dominion over Rome, Italy, and the entire Western region. This *Constitutum Constantini*, which was used by the medieval papacy as one of the bases for its claims of general spiritual supremacy and of temporal power of the city of Rome, was included in the ninth century in the extensive collection of spurious decretals, which purported to be the work of Isidor of Seville, the legendary author of a seventh-century Spanish collection of decretals. The principal aim of the forger was the strengthening of the power of the bishops within the church and as against the state. Both the Donation of Constantine and the False Decretals were recognized as forgeries by the humanist scholars of the sixteenth century. Cf. 7 ENCYC. BRIT. 127, 524, with extensive bibliographies.

63. Spiritual advisers, especially of French royalty and nobility of the seventeenth and eighteenth centuries.

64. The allusion is to the casuistic handbooks of confessional practice and moral theology of the seventeenth and eighteenth centuries, mostly of Jesuit or Redemptorist provenience. The most celebrated is the Homo Apostolicus of St. Alfonso dei Liguori, published 1753/5.

65. *Actio spolii*—originally, as stated in the False Decretals (see *supra* n. 62), the action by which a bishop ousted from his see can claim restoration without having to prove his right; later, on the basis of a canon of Innocent III, of 1215, action aiming at the speedy restoration to possession pertaining to the possessor who has been forcibly ejected as well as to any other person whose interest has been affected by the ejection. Cf. ENGELMANN AND MILLAR 581.

66. *Summariissimum*: summary proceeding of utmost speed and excluding defenses not susceptible of immediate proof. The judgment to be rendered in the *summariissimum* is provisional and subject to review in the *summarium* or the *ordinarium*; cf. ENGELMANN AND MILLAR. The *summariissimum* of canon law procedure influenced the development of summary procedures in the temporal courts.

73. In 1258 Musta'sim, the last kaliph of Baghdad, was defeated and deposed by Hulagu, the grandson of Jenghiz Khan.

74. After their defeat by the Mongols, the Abbassids continued a shadow sovereignty in Egypt until that country was conquered by the Turkish Sultan Selim I in 1517.

75. Following the fall of the Sassanian dynasty and the Arab conquest in 637, Persia was under alien rulers until its reconstitution as a national state under the Shiite dynasty of the Safavi in 1405. According to the official doctrine established at that time, the Shah is the representative of the "invisible *Imâm*."

VI

Imperium and Patrimonial Enactment: The Codifications

1. *Imperium*

The second authoritarian power which has intervened in the formalism and irrationalism of the old folk administration of justice is the *imperium* of the princes, magistrates, and officials. We shall not consider here that special law which a prince may create for his personal retinue, his own subordinate officials—especially his army—and of which highly significant remnants still persist today.[1] These legal creations have led in the past to very important structures of special law, e.g., the law of patron and client, master and servant, and of lord and vassal, which in Antiquity as well as in the Middle Ages escaped the control of the general or common law and the jurisdiction of the regular courts, and differed from the general law in various complicated ways. Although these phenomena are of political importance, they have in themselves no formal structure of their own. In accordance with the general character of the legal system, these structures of special law were governed, as for instance in Antiquity the law of patron and client, by a mixture of sacred norms on the one hand and conventional rules on the other; or they had, like the medieval laws of master and serf, or lord and vassal, a status group character; or they are regulated, like the present-day law of public and military service, by certain special norms of administrative and other public law, or are simply subjected to special substantive rules and procedural authorities.

What we are concerned with are rather the effects of the *imperium* on the general (common) law, its modification, and the emergence of a new law of general validity alongside, in place of, or in contrast to, the common law. Quite particularly shall we be concerned with the effects of this situation upon the formal structure of the law in general. Only one general point should be made here: the degree of development of structures of special laws of this kind is a measure of the mutual power relationship of the *imperium* to the strata with which it must reckon as supports of its power. The English kings were successful in preventing a special feudal law from emerging as a particu-

laristic system, as it did in Germany, so that it was rather absorbed into the unified *lex terrae*, the Common Law.[2] However, the entire land law, family law and inheritance law acquired a strong feudal flavor.[3] The Roman state's law took note of the *clientela* in certain isolated norms, mostly in curse formulae, but in the main it intentionally refrained from drawing this institution, important though it was for the social status of the Roman nobility, into the regulatory sphere of private law.[4] Like the English law, the Italian *statuta* of the Middle Ages created a uniform *lex terrae*.[5] In Central Europe no such achievement occurred until the advent of the absolutist princely state, which, however, was careful to preserve the substantive remnants of the various special laws until they were fully absorbed by the modern institutional state.[6]

The conditions under which the prince, magistrate, or official appeared legitimated to create or influence the common law and under which he had the actual power to do so, the scope to which this power extended in different geographic areas or legal spheres, as well as the motives which underlay this intervention, will be discussed later in our treatment of the forms of domination. In reality, that power assumed many forms and correspondingly produced many different results. Generally, one of the earliest creations of the princely power to protect the peace (*Banngewalt*) was a rational penal law.[7] Military considerations as well as general interest in "law and order" demanded regulation in this particular sphere. Next to religious lynch-law, the power of the princely office has indeed been the second main source of a separate "criminal procedure." Often priestly influences, too, were directly operative in this development, as, in Christendom, because of its interest in the extirpation of blood-vengeance and the duel. In Russia, the *knyaz* (prince), who in earlier times had presumed only to a mere arbitrator's function, was immediately after Christianization induced by the bishops to create a casuistic penal law; the very concept of "penalty" (*prodazha*) makes its appearance only at that time.[8] Similarly in the Occident, in Islam, and certainly in India, the rational tendencies of the priesthood have played a part.

It appears plausible that the establishment of those detailed tariffs of *wergilt* and fines which appear in all the old legal enactments was decisively due to the influence of the princes. Once typical conditions of composition had been developed, it seems that that system which Binding has shown to have existed in German law,[9] was a universal phenomenon: in it we find two sets of *wergilt*, viz., one of considerable magnitude for acts of manslaughter and other vengeance-requiring injuries, and a much smaller one indiscriminately applicable to all other

kinds of injury. It was probably under princely influence that there developed those almost grotesque tariffs covering every conceivable type of misdeed, which enabled everyone to reflect in advance whether the commission of a certain crime or the institution of a lawsuit would "pay."[10] The marked preponderance of a purely economic attitude toward crime and punishment has, as a matter of fact, been common to peasant strata in all ages. However, the formalism expressed in the fixed measurement of all amends is a result of the refusal to submit to the lord's arbitrariness. Not until the administration of justice had become thoroughly patriarchal did this rigorous formalism yield to a more elastic and sometimes completely arbitrary determination of punishment.

In the sphere of private law, which could never be as accessible to the peace power (*Banngewalt*) of the prince in the same way as criminal justice—regarded as a means of guaranteeing a formal order and security—the intervention of the *imperium* occurred everywhere much later and with varying results and in varying forms. In some places a princely or magisterial law arose, which, in distinction to the common law, made explicit reference to its particular source of origin, as, for instance, the Roman *ius honorarium* of the praetorian edict, the "writ" law of the English kings, or the "equity" of the English chancellors. This law was created by the special "magisterial power" (*Gerichtsbann*) of the official charged with the administration of justice; he found complacent cooperation on the part of the legal honoratiores, who, as lawyers, such as the Roman jurisconsults or the English barristers, were eager to comply with the requests of their clients. By virtue of this power the official might be entitled, as the praetor was, to issue binding instructions to the judges or, as it was finally decided in England by James I himself in the conflict between the Lord Chancellor, Francis Bacon, and the common law courts, to issue injunctions to the parties;[11] or to see to it that, by voluntary submission or through compulsion, a case be brought into the magistrate's own court, as, for instance, in England into the Royal Courts or later into the Chancery.[12]

In this way the officials created new remedies, which in the long run came to a large extent to supersede the general law (*ius civile*, common law.) The common element in these bureaucratic innovations in substantive law is that they all had their start in the desire for a more rational procedure, which emanated from groups engaging in rational economic activity, i.e., bourgeois strata. The very ancient *interdicta* trial (*Interdiktionsprozess*)[13] and the *actiones in factum* would seem to prove that the Roman praetor had acquired his predominant position in procedure, i.e., his power of instructing the jurors, quite some time before the *lex Aebutia*.[14] But as a glance at the substantive

content of the Edict shows, the formulary procedure was created by the commercial needs of the bourgeoisie as the intensity of commerce increased. The same needs resulted in the elimination of certain originally magically conditioned formalities. In England and France, the greatest attraction of the royal courts was, as it had been in Rome, the emancipation from verbal formalism. In many parts of the West, the adverse party could be compelled to testify under oath. In England, the cumbersome formalities of the summons were also dispensed with; the king would issue his summons "sub poena"; also the king's court used the jury rather than judicial combat and other irrational methods of proof which were intolerable to the bourgeoisie.

In English "Equity," innovations of substantive law did not, to any considerable extent, occur before the seventeenth century.[15] Louis IX,[16] like Henry II and his successors, especially Edward III, created above everything else a relatively rational system of evidence and eliminated the remnants of the formalism of magical or folk justice origin.[17] The "Equity" of the English Chancellor in turn eliminated from its sphere what had been the great achievement of the Royal Courts—the jury. In the dualism of "Law" and "Equity" which still obtains today in England and in the United States and frequently allows the plaintiff to choose between competing remedies, the formal distinction still consists in the fact that at Law cases are tried with, and in Equity without, a jury.

The technical instruments of magisterial law are on the whole purely empirical and formalistic in character; particularly frequent, for instance, is the use of fictions, which can be found already in the Frankish capitularies.[18] This feature is, of course, to be expected in the case of a legal system which grows directly out of legal practice. In consequence, the technical character of the law remains unchanged. Indeed, its formalism has often been intensified, although, as the term "Equity" indicates, ideological postulates could also provide the stimulus to intervention. Indeed, the case is one in which the *imperium* had to compete with a system of law the legitimacy of which it had to accept as inviolable and the general basis of which it could not eliminate. To greater lengths it could go only where, as in the case of verbal formalism and irrationality of proof, the *imperium* was accommodating urgent demands of strong pressure groups.

The power of the *imperium* is heightened where the existing law can be changed directly by means of princely decrees of equal validity with that of the common law, as we find it, for instance, in the case of the Frankish *capitula legibus addenda*, the ordinances and decrees of the signories of the Italian cities, or the decrees of the late Roman princi-

pate, which had the same validity as *leges*. In the early Empire, it will be remembered, imperial decrees were binding only upon the emperor's officials.[19] On the whole, orders of this kind were, of course, not issued without the assent of the honoratiores (Senate, assembly of imperial officials) or even of the representatives of the moot community. The attitude also persisted for a long time, at least among the Franks, that such decrees could not create real "law," and it constituted a considerable obstacle to princely legislation.[20] Between this case and the factually omnipotent manipulation of the law by Western military dictators or the manipulation of the law by Oriental patrimonial princes we can find numerous intermediate situations. Legislation by patrimonial monarchs, too, would normally respect tradition to a considerable extent. But the more it succeeded in eliminating the administration of justice by the moot community, as it generally tended to do, the more frequently it developed its own specifically formal qualities and the better it was able to impress them upon the legal system. These qualities could be of one or the other of two quite different types, corresponding to the different political conditions of existence of the power of the patrimonial monarch.

One of the forms in which princely lawmaking took place was for the prince, whose own political power was regarded as a legitimately acquired right just as any other property right, to give up some parcel of this fullness of power by granting to some one or more of his officials or subjects, or to foreign merchants, or any other person or persons some special rights (privileges), which were then to be respected by the princely administration of justice. To the extent that this was the case, law and right, "norms" and "claims," coincided in such a way that, if thought out consistently, the entire legal order would appear as a mere bundle of assorted privileges. The other form of princely lawmaking occurred in just the opposite form: the prince would not grant to anyone any claims which would be binding upon him or his judiciary. In that case, there are again two possibilities. The prince gives commands from case to case according to his entirely free discretion; to that extent there is no place for the concepts of either "law" or "right." Or the prince would issue "regulations" containing general directives for his officials. Such regulations mean that the officials are directed, until the receipt of further directives, to order the concerns of the subjects and to settle their conflicts in the manner indicated. In that situation the prospect of an individual to obtain a certain decision in his favor is not a "right" of his but rather a factual "reflex," a by-product of the regulation, which is not legally guaranteed to him. It is the same as in the case where a father complies with some wishes of his child

without thinking, however, that he thus binds himself to any formal juristic principles or fixed procedural forms. As a matter of fact, the extreme consequence of a "patriarchal" administration of justice by the *parens patriae* is but a transposition of the intrafamilial mode of settling conflicts into the political body. The whole legal system would be dissolved into "administration" if this system were ever carried to its logical consequences.[21]

We shall designate the first of these two forms as the "estate" (*ständische*) type of patrimonial princely justice and the second as the "patriarchal." In the estate type of judicial administration and lawmaking, the legal order is rigorously formal but thoroughly concrete and in this sense irrational. Only an "empirical" type of legal interpretation can develop. All "administration" is negotiation, bargaining, and contracting about "privileges," the content of which must then be fixed. It thus operates like judicial procedure and is not formally distinct from the administration of justice. This was the way of the administrative proceedings of the English Parliament and of the great old Royal Councils, which were all originally administrative and judicial bodies at the same time. The most important and the only fully developed instance of "estate" patrimonialism is the political body of the medieval Occident.

In the purely "patriarchal" administration of the law, the law is, on the contrary, thoroughly informal, as far as one may speak of "law" at all under such a system of pure "regulations." Judicial administration aims at the substantive truth and thus sweeps away formal rules of evidence. Hence it would come into conflict quite frequently with the old magical procedures, but the relation between the secular and sacred procedures could assume various forms. In Africa the plaintiff might have a chance to appeal from the prince's judgment to the ordeal or to the ecstatic judgment vision of the fetish-priests (*oghanghas*), the agents of the old sacral trial. On the other hand, the rigorously patriarchal princely justice negates the formal guaranty of rights and the principle of strict adversary procedure in favor of the attempt to settle an interest conflict objectively "right" and equitably.

Although the patriarchal system of justice can well be rational in the sense of adherence to fixed principles, it is not so in the sense of a logical rationality of its modes of thought but rather in the sense of the pursuit of substantive principles of social justice of political, welfare-utilitarian, or ethical content. Again law and administration are identical, but not in the sense that all administration would assume the form of adjudication but rather in the reverse sense that all adjudication takes the character of administration. The prince's administrative officials are at the same time judges, and the prince himself, intervening at will into

the administration of justice in the form of "cabinet justice," decides according to his free discretion in the light of considerations of equity, expediency, or politics. He treats the grant of legal remedies to a large extent as a free gift of grace or a privilege to be accorded from case to case, determines its conditions and forms, and eliminates the irrational forms and means of proof in favor of a free official search for the truth. The ideal example of this type of rational administration of justice is the "kadi-justice" of the "Solomonian" judgment as it was practiced by the hero of that legend—and by Sancho Panza when he happened to be governor.[22] All patrimonial princely justice has an inherent tendency to move in this direction. The "writs" of the English kings were obtained by applying to the king's boundless grace. The *actiones in factum* allow us to guess how far even the Roman magistrates originally were allowed to go in the free grant or denial of actions (*denegatio actionis*). English magisterial justice of the post-medieval type, too, makes its appearance as "equity." The reforms of Louis IX in France were of a thoroughly patriarchal character. Oriental, like Indian, justice, in so far as it is not theocratic, is essential patriarchal. Chinese administration of justice constitutes a type of patriarchal obliteration of the line between justice and administration. Decrees of the emperor, both educative and commanding in content, intervene generally or in concrete cases. The finding of the judgment, to the extent that it is not magically conditioned, is oriented towards substantive rather than formal standards. When measured by formal or economic "expectations," it is thus a strongly irrational and concrete type of fireside equity. This type of intervention of the *imperium* into the formation of law and the administration of justice occurs on quite different "cultural levels"; it is the result not of economic but, primarily, political conditions. Thus in Africa, wherever the power of the chief has grown strong because of either its combination with the magical priesthood or the significance of war or through a trade monopoly, the old formalistic and magical procedures and the exclusive rule of tradition have often completely disappeared. In their place has arisen a procedure with public summons in the name of the prince (often through *Anschwörung*[23] of the defendant), public enforcement of the judgment and rational proof by witnesses in place of the ordeal; there have also developed practices of law enactment either exclusively by the prince alone, as among the Ashantis or, as in South Guinea, by him with the acclamation of the community.[24] But often the prince or chief or his judge decide entirely according to their own discretion and sense of equity, without any formally binding rules whatsoever. This situation can be found in culture areas so different from each other as those

of the Basuto, the Baralong, of Dahomey, the realm of Muata Cazembe, or Morocco.[25] The only restraint consists in the apprehension of losing the throne because of an excessively flagrant breach of the law, and especially a breach of those traditional norms which are regarded as sacred and on which the rulers' own legitimacy rests. This antiformal substantive character of patriarchal administration reaches its high point when the (secular or priestly) prince places himself at the service of positive religious interests and, more particularly, when he propagates a religiosity which postulates certain ethical attitudes rather than the mere performance of rituals. All the antiformal tendencies of theocracy, which in this case are freed even from the otherwise effective restraints of ritualistic and, on that account, formal sacred norms, combine with formlessness of a patriarchal welfare policy, which aims at the nurturing of right attitudes, and the administration of which approximates the character of pastoral care of souls. The boundaries between law and ethics are then torn down just as those between legal coercion and paternal monition, and between legislative motives and legal techniques. The closest approach to this "patriarchal" type is presented by the edicts of the Buddhist King Asoka.[26] As a rule, however, a combination of estate and patriarchal elements, together with the formal procedures of folk justice, prevails in the patrimonial princely system of justice. The extent to which one or the other of these factors preponderates depends—as we shall see in our discussion of "domination"—essentially on political conditions and power relations. In the West, in addition to these, the (originally politically conditioned) tradition of moot justice, which, as a matter of principle, denied the king the position of judgment finder, was of significance for the preponderance of "estate" forms in the administration of justice.

The growth to preëminence of rational-formalistic elements at the expense of the typical features of patrimonial law, as it occurred in the modern Western world, arose from the immanent needs of patrimonial monarchical administration, especially with respect to the elimination of the supremacy of estate privileges and the "estate" character of the legal and administrative system in general. In this respect the needs of those interested in increased rationality, which means in this case, in growing predominance of formal legal equality and objective formal norms, coincide with the power interests of the prince as against the holders of privilege. Both interests are served simultaneously by the substitution of "reglementation" for "privilege."

No such coincidence existed, however, where the demand was, first, for limitations of the arbitrary patriarchal discretion by fixed rules and, second, for the recognition of definite claims of the subjects against

the administration of justice or, in other words, for guaranteed "rights." As we know, these two elements are not identical. A method of settling disputes which proceeds by means of fixed administrative regulations by no means signifies the existence of guaranteed "rights"; but the latter, i.e., the existence not only of objective and fixed norms but of "law" in the strict sense is, at least in the sphere of private law, the one sure guaranty of adherence to objective norms. This guaranty was sought after by economic interest groups which the princes wished to favor and tie to themselves because they served their fiscal and political power interests. Most prominent among these were the bourgeois interests, which had to demand an unambiguous and clear legal system, that would be free of irrational administrative arbitrariness as well as of irrational disturbance by concrete privileges, that would also offer firm guaranties of the legally binding character of contracts, and that, in consequence of all these features, would function in a calculable way. The alliance of monarchical and bourgeois interests was, therefore, one of the major factors which led towards formal legal rationalization. Alliance must not be understood, however, in the sense that a direct "cooperation" of these two powers would always have been necessary. The utilitarian rationalism characteristic of every sort of bureaucratic administration tended already by itself in the direction of the private economic rationalism of the bourgeois strata. The fiscal interests of the prince also drove him to prepare the way for capitalistic interests to a far greater extent than was actually demanded at the time by those interests themselves. On the other hand, the guaranty of rights which would be independent of the discretion of the prince and his officials was by no means a product of the tendencies genuinely immanent in bureaucracy. Moreover, it was not within the unqualified interest of the capitalist groups either. The very contrary was the case with respect to those essentially politically oriented forms of capitalism which we shall have occasion to contrast, as a special type of capitalism, with its specifically modern "bourgeois" type. Even early bourgeois capitalism itself showed this interest in guaranteed rights either not at all or to a slight extent only, and sometimes it pursued even the very opposite end. The position not only of the great colonial and commercial monopolists but also of the monopolistic large-scale entrepreneurs of the mercantilist manufacturing period regularly rested upon princely privileges which often enough infringed upon the prevailing common law, i.e., in this instance, the guild law. This latter fact called forth the violent opposition of the bourgeois middle class and thus induced the capitalists to pay for their privileged business opportunities by the precariousness of their legal position vis-à-vis the prince. The politically and monopo-

listically oriented capitalism, and even the early mercantilistic capitalism, thus came to have an interest in the creation and maintenance of the patriarchal princely power as against the estates and against the bourgeois craftsmen, as happened in the time of the Stuarts, as has been happening today, and as is likely to happen even more often in broad areas of economic life.[27] In spite of all this, the intrusion of *imperium*, especially of the monarch, into the legal system, has contributed to the unification and systematization of the law and thus to "codification." The stronger and more stable the monarch's power was, the more it tended in that direction. The prince desired "order" as well as "unity" and cohesion of his realm. These aims emerged not only from technical requirements of administration but also from the personal interests of his officials: legal uniformity renders possible employment of every official throughout the entire area of the realm, in which case career chances are, of course, better than where every official is bound to the area of his origin by his ignorance of the laws of any other part of the realm. While thus the bourgeois classes seek after "certainty" in the administration of justice, officialdom is generally interested in "clarity" and "orderliness" of the law.

2. *The Driving Forces Behind Codification*

Although the interests of officials, bourgeois business interests, and monarchical interests in fiscal and administrative ends have been the usual factors promoting codification, they have not been the only ones. Politically dominated strata other than the bourgeoisie can be interested in the unambiguous fixation of the law, and those ruling powers to whom their demands are directed and which yield to them, voluntarily or under pressure, have not always been monarchs.

Systematic codification of the law can be the product of a conscious and universal reorientation of legal life, such as becomes necessary as a result of external political innovations, or of a compromise between status groups or classes aiming at the internal social unification of the political body, or it may result from a combination of both these circumstances. The codification may thus be occasioned by the planful establishment of a community (*Verband*) in a new area, as, for instance, in the case of the *leges datae* of the colonies of Antiquity;[28] or by the formation of a new political community which in certain respects wishes to subject itself to a unified legal system, as, for instance, the Israelite confederation;[29] or by the conclusion of revolution through the compromise of status groups or classes, as the Twelve Tables are said to have

been.[80] The systematic recording of the law may also occur in the interest of legal security following a social conflict. In such situations the parties interested in the recording of the law are naturally those which had hitherto suffered most from the lack of an unambiguously fixed and generally accessible set of norms, i.e., of norms which would allow checking up on the administration of justice. In Antiquity these groups were typically the peasantry and the bourgeoisie as against a system of administration of justice carried on, or dominated by, aristocratic notables or priests. In such cases, the systematic "recording" of the law was apt to contain a large dose of new law and it was thus quite regularly imposed as *lex data* through prophets or prophet-like fiduciaries (*Aisymnetai*) on the basis of revelation or oracle.[81] The interests to be secured were likely to be understood quite clearly by the participants. The possible modes of settlement, too, were likely so to have been clarified by previous discussion and agitation that they were ripe for the prophet's or the aisymnete's fiat. For the rest, the interested parties were more concerned with a formal and clear settlement of the points actually in issue than with a systematic law. The legal normation thus used to be expressed in the epigrammatic and proverb-like brevity which is characteristic of oracles, customals, or *responsa* of jurisconsults. The very fact that we find this style in the Twelve Tables should suffice to dispel the doubts as to their origin in one single act of legislation. Of the same kind is the style of the Decalogue and the Book of the Covenant. In both complexes of commands and prohibitions, the Roman and the Jewish, this style is indicative of their truly law-prophetic and aisymnetic origin. Both also equally present the characteristic feature of combining civil and religious commandments. The Twelve Tables anathematize (*sacer esto*) the son who strikes his father and the patron who does not keep faith with his client. No legal consequences were provided in either case. Obviously the commandments had become necessary because domestic discipline and piety had fallen into decay. The Jewish and Roman codifications differ, however, in so far as in the Decalogue and the Book of the Covenant the religious content is systematized while the Roman *lex* contained but single prescriptions; the bases of religious law were fixed and there was no new religious revelation. It is a quite different and a secondary question whether the twelve "tables," on which the law of the city of Rome, as given by the legal prophets, was said to have been recorded and which are reported to have been destroyed in the conflagration of the Gallic conquest, were any more "historical" than the two tables of the Mosaic law. But the rejection of the tradition as to the age and unity of the Roman legislation is required neither by substantive nor linguistic considerations;

indeed, the latter are particularly irrelevant in view of the purely oral nature of the transmission of the tradition. The opinion that the Twelve Tables were but a collection of legal proverbs or of *responsa* of jurisconsults is contradicted by internal evidence. The norms are general ones and of a fairly abstract character; a good many of them are clearly and consciously aiming in a definite direction and a good many others clearly appear as compromises between different status groups. It is quite improbable that a mere record of the practice of jurisconsults or the literary product of a Sextus Aelius Paetus Catus[32] or some other collector of cases could have attained such an authority in a city and in an age permeated with conflicts between rationally conceived interests. Also the analogy with other aisymnetic laws is too obvious. A "systematic" codification, to be true, is produced by that situation which is typical for aisymnetic legislation and the needs to be satisfied by it only in a purely formal sense. A "systematic" codification was constituted neither for ethics by the Decalogue nor for the regulation of business activities by the Twelve Tables or the Book of the Covenant. It was only through the work of the practicing lawyers that system and legal "*ratio*" were introduced, and even then but to a limited extent. Greater in this respect were the effects of the needs of legal education, but the full extent of systematization and rationalization resulted from the work of monarchical officials. They are the true systematic codifiers, since they have a special interest in a "comprehensive" system as such. For this reason monarchical codifications commonly are so much more rational with respect to systematics than even the most comprehensive aisymnetic or prophetic promulgations.

Monarchical codification has thus been one way to systematize a law. The only other one has been didactic literary activity, especially the creation of so-called "books of law," which every now and then have acquired canonical prestige and have thus come to dominate legal practice almost with statutory force.[33] In both cases, however, the systematic recordation of the law is hardly ever more than a compilation of the existing law meant to eliminate doubts and controversies. A good many collections of laws and regulations created at the behest of patrimonial monarchs and appearing externally as codes, as, for instance, the official Chinese compilation,[34] have, in spite of a certain element of "systematic" classification, little to do with real codification; they are nothing but mechanical arrangements. Other "codifications" have sought no more than to arrange the prevailing law in an orderly and systematic fashion. The *Lex Salica* and most of the other *leges barbarorum* were such compilations for the practice of the moot communities.[35] The highly influential *Assize of Jerusalem*[36] embodied the

precedents on commercial usages: the *Siete Partidas* and similar "codifications" as far back as the *leges Romanae* collected those parts of the Roman law which had remained alive.[37] But even this kind of compilation necessarily implied a certain measure of systematization and, in this sense, rationalization of the legal data, and the groups that are interested in bringing about such a compilation are the same as those interested in a genuine codification, i.e., in a systematic revision of the substantive content of the existing law. The two cannot be sharply distinguished from one another. In that "legal security" which results from codification a strong political interest commonly exists even apart from all other considerations. Codification has thus always been near at hand in cases of creation of a new political entity. We thus find it at the establishment of the Mongolian Empire by Genghis Khan[38] where the collection of the *Yasa* constituted an incipient codification, as well as in many similar cases down to the foundation of the Napoleonic Empire. Apparently against all historical order, an epoch of codification thus occurred in the West at the very beginning of its history in the *leges* of the Germanic kingdoms newly created on Roman soil. The need to pacify these ethnically heterogeneous political structures necessarily required the determination of the law actually existing and the upheaval of the military conquest facilitated the formal radicalism with which the task was carried out.

The interest in the precise functioning of the administrative machine through the establishment of legal security, alongside the prestige-needs of the monarch, especially in the case of Justinian, were the motives for the compilations of the late Roman empire down to the Code of Justianian, as well as of the monarchical Roman-law codifications of the Middle Ages of the kind of the Spanish *Siete Partidas*. In all these cases it is unlikely that private economic interests played any direct role. On the other hand, the oldest and relatively completely known code, which is in this respect the most unique of all those which have come down to us, i.e., the Code of Hammurabi,[39] allows us to infer with some reasonable degree of certainty that there existed relatively strong commerical interests and that the king wished to strengthen the legal security of commerce for his own political and fiscal purposes. The situation is typically that of a city kingdom. The surviving remnants of earlier enactments allow us to infer that the status and class conflicts which were typical of the ancient city were at work then too, exept that, due to the difference in political structure, they led to a different result. It may be said of Hammurabi's Code that, insofar as the evidence of older records is available, it did not establish any really new law but rather codified the existing law and that it was not the first

of its kind.[40] As in most other monarchical codifications, the political interest in the unification of the legal system as such within the entire realm played a dominant role, in addition to the economic and religious interests which are so clearly apparent in the intensive regulation of familial obligations, especially, the obligation of filial piety, which there as everywhere else were lying close to the heart of the patriarchal monarch. For the same reasons which we have already come to know, most of the other monarchical codifications, too, were aimed at overcoming the old principle under which special laws were to prevail over the general law of the land. These same motives were even more influential in bringing about the increasing frequency of monarchical codifications in the era of the rise of the bureaucratic state.[41] They, too, brought innovations only to a limited extent. At least in Central and Western Europe, they presupposed the validity of the Roman and Canon law as a universal law. Roman law, as subsidiary law, recognized the prior claims of the local and special laws, and for Canon law the actual situation was not much different although it claimed for itself absolute and universal effect.

None of the monarchical codifications can match the significance of the revolution in legal thought and in the actual substantive law which was brought about by the reception of Roman law.[42] This is not the place to trace the history; all we can do is to present a few observations.

3. *The Reception of Roman Law and the Development of Modern Legal Logic*

In so far as the emperors, especially Frederick I [1152–1190], and later the territorial princes participated in it, the reception was stimulated essentially by the sovereign position of the monarch as it appears in Justinian's codification. For the rest, the question is still unresolved and perhaps not fully resolvable whether and how far economic interests were behind the reception and to what extent they were promoted by it; it is an equally open question as to what was the cause of the preeminence of the learned, i.e., university-trained, judges who were the bearers of Romanism as well as of the patrimonial-princely procedures. It is above all unsettled whether it was essentially the interested parties (*Rechtsinteressenten*) who, through arbitration agreements, resorted to the legally trained administrative officials of the princes instead of the courts, thus establishing decision "ex officio" instead of decision "ex

lege," and starving out the ancient courts (cf. Stölzel), or whether, as Rosenthal has attempted to show in detail,[48] the courts themselves were, as a result of the initiative of the princes, increasingly staffed with legally trained "assessors" rather than with lay *honoratiores*.

Whatever the answers may be to these questions, this much seems to be clear: since, as the sources indicate, even those status groups which viewed Roman law with distrust, in general did not object to the presence on the bench of some "doctors," but only opposed their preponderance and especially the appointment of foreigners, it is obvious that the advance of the trained jurists was caused by intrinsic needs of the administration of justice, especially by the need to rationalize legal procedure, and by the fact that the jurists possessed that special capacity which results from specialized professional training, viz., the capacity to state clearly and unambiguously the legal issue involved in a complicated situation. To this extent the professional interests of the legal practitioners coincided with those of the private groups interested in the law, both bourgeois and noble. Yet, in the reception of substantive Roman law the "most modern," i.e., the bourgeois groups, were not interested at all; their needs were served much better by the institutions of the medieval *law merchant* and the urban real estate law. It was only the general formal qualities of Roman law which, with the inevitable growth of the character of the practice of law as a profession, brought it to supremacy, except where there existed already, as in England, a national system of legal training protected by powerful interests. These formal qualities account also for the fact that the patrimonial monarchical justice of the West did not take the path, as it did elsewhere, of turning into a patriarchal administration of justice in accordance with standards of substantive welfare and equity. A very important factor in this respect was the formalistic training of the lawyers, on whom the princes were dependent as their officials, and which was largely responsible for the fact that in the West the administration of justice acquired that juristically formal character which is peculiar to it in contrast to most other systems of patrimonial administration of justice. The respect for Roman law and Romanist law training also dominated all the monarchical codifications of the early modern age, which were all the products of the rationalism of university-trained lawyers.

The reception of the Roman law created a new stratum of legal honoratiores, the legal scholars who, on the basis of an education in legal *literature*, had graduated from a university with a doctor's diploma. Indeed, this new stratum was the very basis of the strength of the Roman law. Its significance for the formal qualities of the law was far-reaching.

Already during the Roman Empire, Roman law had begun to be the object of a purely literary activity, which represented something quite different from the production of "law books" by the medieval legal honoratiores of Germany or France or of elementary treatises by English lawyers, however important those books may have been in their own ways. Under the influence of the philosophical training, superficial though it may have been, of the ancient lawyers, the significance of the purely logical elements in legal thinking began to increase. Indeed, it came to be especially important for the actual legal practice as there was no sacred law with any binding force and as the mind was unencumbered by any theological or substantive ethical concerns which might have pushed it in the direction of a purely speculative casuistry. As a matter of fact, incipient tendencies toward the view that what the lawyer cannot "think" or "construe" cannot be admitted as having legal reality could be already found among the Roman jurists. In this context also belong those numerous purely logical propositions as: *quod universitati debetur singulis non debetur*[44] or *quod ab initio vitiosum est, non potest tractu temporis convalescere.*[45] Only, these maxims were but unsystematic occasional productions of abstract legal logic, added to support some concretely motivated individual decisions and totally disregarded in others, even by the same jurist. The essentially inductive, empirical character of legal thought was barely affected, or not at all. The situation was quite different in the [medieval] *reception* of Roman law. First of all, it strengthened that tendency of the legal institutions themselves to become more and more abstract, which had begun already with the transformation of the Roman *ius civile* into the law of the Empire. As Ehrlich has properly emphasized,[46] in order for them to be received at all, the Roman legal institutions had to be cleansed of all remnants of national contextual association and to be elevated into the sphere of the logically abstract; and Roman law itself had to be absolutized as the very embodiment of right reason. The six centuries of Civil Law jurisprudence have produced exactly this result. At the same time, the modes of legal thought were turned more and more in the direction of formal logic. The occasional brilliant aperçus of the Roman jurists of the kind just noted were torn out of the context of the concrete cases of the Pandects and were raised to the level of ultimate legal principles from which deductive arguments were to be derived. Now there was created what the Roman jurists had so obviously lacked, viz., the purely systematic categories, such as "legal transaction" or "declaration of intention,"[47] for which ancient jurisprudence did not even have uniform names. Above all, the proposition that what the jurist cannot con-

ceive has no legal existence now acquired practical significance. Among the ancient jurists, as a result of the historically conditioned analytical nature of Roman legal thought, properly "constructive" ability, even though it was not entirely absent, was only of small significance. Now when this law was transposed into entirely strange fact situations, unknown in Antiquity, the task of "construing" the situation in a logically impeccable way became almost the exclusive task. In this way that conception of law which still prevails today and which sees in law a logically consistent and gapless complex of "norms" waiting to be "applied" became the decisive conception for legal thought.[48] Practical needs, like those of the bourgeoisie, for a "calculable" law, which were decisive in the tendency towards a formal law as such, did not play any considerable role in this particular process. As experience shows, this need may be gratified quite as well, and often better, by a formal, empirical case law. The consequences of the purely logical construction often bear very irrational or even unforeseen relations to the expectations of the commercial interests. It is this very fact which has given rise to the frequently made charge that the purely logical law is "remote from life" (*lebensfremd*). This logical systematization of the law has been the consequence of the intrinsic intellectual needs of the legal theorists and their disciples, the doctors, i.e., of a typical aristocracy of legal literati. In troublesome cases, opinions rendered by law school faculties were the ultimate authority on the Continent.[49] The university-trained judge and notary, together with the university-trained advocate, were the typical legal honoratiores.

Roman law triumphed wherever there did not exist a legal profession with a nation-wide organization. With the exception of England, northern France, and Scandinavia, it conquered all of Europe from Spain to Scotland and Russia. In Italy, at least at the beginning, the notaries were the chief agents of the movement, while in the North its main agents were the learned judges, with the monarchs standing behind them almost everywhere. No Western legal system, not even that of England, has kept itself entirely free of these influences. Their traces show up in the systematic structure of English law, in many of its institutions, and in the very definitions of the sources of the Common Law: judicial precedent and "legal principle," no matter what the difference of inner structure.[50] The true home of the Roman law remained, of course, in Italy, especially under the influence of the Genoese and other learned courts (*rotae*), whose elegant and constructive decisions were collected and printed in Germany in the sixteenth century and thus helped to bring Germany under the influence of the *Reichskammergericht*[51] and the learned courts of the territories.

4. *Types of Patrimonial Codification*

It was not until the era of fully developed "enlightened despotism" that, beginning with the eighteenth century, conscious efforts were made to transcend the specifically formal legal logic of the Civil Law and its academic legal honoratiores, which indeed constituted a unique phenomenon in the world. The decisive role was played, first of all, by the general rationalism developed by bureaucracy in line with its growing self-confidence and its naive belief of "knowing better." Political authority with its patriarchal core assumed the form of the welfare state and proceeded without regard for the concrete desires of the groups interested in the law and the formalism of the trained legal mind. It would indeed have liked nothing better than to suppress completely this kind of thought. The ideal was to deprive the law of its specialist character and to formulate it in a way that would not only instruct the officials but, above all, would enlighten the subjects about their rights and duties exhaustively and without outside aid. This desire for an administration of justice which would strive for substantive justice unaffected by juristic hairsplitting and formalism is, as we have seen, characteristic of every monarchical patriarchalism. But it has not always been able to proceed in this direction without encountering obstacles. The Justinian codifiers could not consider "laymen" as the students and interpreters of their work when they systematized the sublimated law of the jurists. They simply could not eliminate the need for specialized legal training in the face of the achievements of the classical jurists and their authority as it was officially acknowledged by the Citation Law.[53] They could do no more than put forward their work as the sole authoritative collection of citations to serve the educational needs of the students and they had thus to provide for such instruction a textbook presented in the form of a law, i.e., the *Institutes*.[53]

Patriarchalism could act more freely in that classical monument of the modern "welfare state," the Prussian *Allgemeine Landrecht*.[54] In marked contrast to the universe of "rights" of the "Estate" polity, in this Code the "law" is primarily a universe of duties. The universality of one's "darndest debt and duty" (*verdammte Pflicht und Schuldigkeit*) is the main characteristic of the legal order, and its most notable feature is a systematic rationalism, not of a formal but of that substantive kind which always is typical of such cases. Where "reason wants to reign" all law which has for its existence no reason other than the fact that it exists, such as, especially, customary law, must disappear. All modern codifications, down to the first draft of the German Civil Code,[55] have thus been at war with it. Those legal practices which do

not rest upon the explicit provisions of the legislator, just as every traditional mode of legal interpretation, are regarded by the rationalistic legislator as inferior sources of law to be tolerated only so long as the statute has not yet spoken. Codification was thus intended to be "exhaustive" and was believed able to be so. Hence, in order to prevent all creation of new law by the hated jurists, the Prussian judge was directed, in cases of doubt, to turn to a commission specially created for the purpose. The effects of these general tendencies were apparent in the formal qualities of the law so created. In view of the fixed habits of the practitioners, who had to be reckoned with even in the Prussian *Landrecht* and who were oriented towards the concepts of the Roman law, the attempt to emancipate the law from the professional lawyers by the direct enlightenment of the public through the legislator himself of necessity resulted in a highly detailed casuistry, which, due to the striving for material justice, tended to be unprecise rather than formally clear. Yet, dependency on the categories and methodology of Roman law remained inescapable, despite numerous individual divergences and the vigorous attempt, for the first time undertaken in a German legal enactment, to use a German terminology. The occurrence of numerous provisions of a merely didactic or ethically admonitory character gave rise to many doubts as to whether or not a particular provision was really meant to constitute a legally binding norm. Despite the striving for explicitness, clarity was, furthermore, obscured by the fact that the Code's system took as its point of departure not formal legal concepts but the practical relations of life and thus frequently had to take up one and the same legal institution piecemeal in different places.

The aim of eliminating the elaboration of his law by professional jurists was, indeed, achieved by the legislator to a considerable extent, although in not exactly the way intended. A real knowledge of the law by the public could scarcely be achieved by a many-volumed work with tens of thousands of sections, and if the aim was that of bringing about an emancipation from the influence of attorneys and other legal practitioners, the very nature of things prevented its realization under modern conditions. As soon as the Supreme Court (*Obertribunal*) began to publish a series of semi-official reports of its decisions, the cult of *stare decisis* developed as strongly in Prussia as anywhere outside England. On the other hand, nobody could feel stimulated to undertake a scholarly treatment of a law which created neither formally precise norms nor clearly intelligible institutions, as neither of these was intended by this utilitarian legislation.[56] As a matter of fact, patrimonial substantive rationalism has nowhere been able to provide much stimulation for formal legal thought.

The codification thus contributed to a situation in which the scholarly juristic activity was directed either even more to Roman law or, under the influence of nationalism, to the legal institutions of older German law, with the aim of present both of them, by means of the historical method, in their original "pure" form. For Roman law the result was that, under the hands of jurists trained as professional historians, it had to shed those transformations which it had undergone, since the reception, to become adapted to the needs of the times. The *Usus Modernus Pandectarum*,[57] the product of the reworking of the Justinian law through the Civil Law jurists, fell into oblivion and was condemned by scientific historical purists just as much as medieval Latin had been by the humanistic philologists. And just as the latter had resulted in the elimination of Latin as the universal language of the learned, so Roman law lost its suitability to the needs of modern life. Not until then was the way completely open for abstract legal logic. Learned rationalism was thus merely shifted from one domain to another rather than overcome, as so many of the historians seem to believe.

A purely logical re-systematization of the old law was, of course, not achieved by the historical jurists in any convincing way.[58] It is well known, and it is indeed no accident, that down to Windscheid's compendium,[59] almost all the pandectist treatises remained unfinished. The Germanist wing of the historical school of law was no more successful in producing a rigorously formal sublimation of those institutions which were not derived from Roman law. What attracted the historians in that field were indeed those irrational and antiformalistic elements which derived from the legal order of the old polity of Estates.

Systematization and codification without loss of practical adaptability could thus be achieved only for those special fields which bourgeois interests had autonomously adapted to their needs and which had been empirically rationalized in the practice of special courts, i.e., commercial law and the law of negotiable instruments.[60] This achievement was possible because compelling and clearly defined economic needs were operative. But when, after seven decades of supremacy of historians, and at the high point of a development of legal historiography never achieved in any other country, the creation of the German *Reich* dramatically demanded the unification of the private law as a national task, the German jurists were split in the two camps of Romanists and Germanists and approached the undertaking reluctantly and not fully prepared.[61]

The type of patrimonial monarchical codification is represented by other codes, too, especially the Austrian[62] and the Russian.[63] The latter, it is true, essentially constituted merely the status law of the small privileged strata and left untouched the special institutions of the other

estates, especially the peasantry, i.e., the great majority of the subjects. It even left them their own special administration of justice to a practically very far-reaching extent. The greater comprehensiveness of the Russian and Austrian codes, as contrasted with the Prussian, was purchased at the expense of precision and, in the Austrian code, by a greater dependency upon Roman law. It, too, did not attract scholarly thought for all the decades preceding Unger's work,[84] and even then its treatment was carried on almost entirely within the framework of the Romanistic categories.[85]

NOTES

1. Writing before the First World War, Weber is here alluding to certain institutions of monarchical Germany and Austria-Hungary, especially the regulations for the princely courts and the officers' corps of the army. Where, as in the United Kingdom, monarchy still exists, similar phenomena still obtain, although only in the same formal sense in which a man-of-war is referred to as "His (or Her) Majesty's" ship or an army regiment as the "Royal" Dragoons.

2. On this achievement of the English kings, see MAITLAND, CONSTITUTIONAL HISTORY OF ENGLAND (1931) 23, 151; PLUCKNETT 10. On the relation between feudal law and common law in Germany and in Medieval Europe in general, see MITTEIS, DER STAAT DES HOHEN MITTELALTERS (1944); further literature is stated by PLANITZ 101.

3. Cf. PLUCKNETT 487.

4. Cf. sec. *ii*:5. For a full discussion of the status of the *clientela* and their origin, see MITTEIS 42; MOMMSEN, RÖMISCHE FORSCHUNGEN I, 355 *et seq.*, and his STAATSRECHT III, 1, 57, 64, 76.

6. Cf. *supra*, sec. *ii*:6. For a recent concise account of the history of these special laws in France and Germany, see KOSCHAKER, EUROPA UND DAS RÖMISCHE RECHT 234–245, where also the full literature on the subject is referred to.

7. Cf. VON BAR, HISTORY OF CONTINENTAL CRIMINAL LAW (1927) 73. For a similar development of the "King's Peace" in England, see POLLOCK AND MAITLAND II, 462–464; also Pollock, *The King's Peace in the Middle Ages* (1900), 13 HARV. L. REV. 177, repr. 2 SELECTED ESSAYS IN ANGLO-AMERICAN LEGAL HISTORY 403; GOEBEL, FELONY AND MISDEMEANOR (1937). For France, see ENGELMANN AND MILLAR 661. For Germany, see BRUNNER, RECHTSGESCHICHTE II, 47.

8. *Prodazha* in modern Russian means "sale," the "giving for" money, but the original meaning was "penalty" or "fine"; cf. A. G. PREOBRAZHENSKII, ETIMOLOGICHESKII SLOVAR' RUSSKOGO IAZYKA (1910–1914; reissued 1959) II, 129. (Wi)

Opinions differ as to whether the *knyaz* ("prince," from German *kuning* ["king"] through Lithuanian *kuningas*) was merely functioning as an arbitrator, so that his award could be rejected by the parties and they would be free to proceed with duel or feud, or whether he exercised more effective judicial power. Cf. L. K. Goetz, *Das russische Recht* (1910), 24 Z.F. VOL. RW. 241, 417 *et seq.*; G. VERNADSKY, MEDIEVAL RUSSIAN LAW 10. The feud, with the possibility of its composition by the payment of *wergild* (Russian: *vira*, *vyéra*, deriving from the

same Germanic root; cf. PREOBRAZHENSKII, *op. cit.*, I, 85), was still common when Christianity was imposed upon the Kiev realm by Vladimir I (972 [980]–1015).

The opinion that a casuistic criminal law was introduced by the prince immediately after Christianization and upon the behest of the bishops finds some support in the Russian Chronicles, which are too indefinite, however, to allow a final judgment.

Public punishment by death or corporeal castigation is still exceptional in the so-called "oldest version" of the Russkaya Pravda, which was formerly ascribed to the age of Yaroslav I (1019–1054), but upon which doubt has been thrown by recent research. See sec. *iii*:6. One who has killed, injured, or otherwise offended another is ordered not only to pay *wergilt* to the person injured or his kin, but also a money fine to the prince. This combination corresponds to that of the Germanic laws where, in the period of growing royal power, an offender had to pay "peace money" (*fredus*) to the king in addition to the *Busse* (*wergilt*) payable to the injured. In Russia this fine is called *prodazha*. The word *nakazanie* as a general term for punishment seems not to occur before the time of firmly established government.

9. KARL BINDING, DIE NORMEN UNDIHRE UEBERTRETUNG (1890) 415.

10. All the *Volksrechte* (*leges barbarorum*, cf. sec. ii:2) contain extensive catalogues of misdeeds and the corresponding amounts of payment. The basis of computation is the *wergilt* payable for the killing of a freeman. The amends (*bot, Busse*) for other acts are computed as fractions of the *wergilt*. For specimens of typical catalogues of this kind, see SIMPSON AND STONE, LAW AND SOCIETY (1949) I, 97. See also POLLOCK AND MAITLAND II, 451.

11. Cf. PLUCKNETT 183; MAITLAND, EQUITY 9.

12. On the successful extension of the jurisdiction of the royal as against the ancient popular and feudal courts, see RADIN, ANGLO-AMERICAN LEGAL HISTORY (1936) 141; PLUCKNETT 337, and literature stated there.

13. *Special proceedings to protect possession.*

14. Second half of second century B.C.

15. Cf. HOLDSWORTH VI, 640.

16. Under Louis IX (the Saint, 1226–1270), trial by ordeal was abolished and the jurisdiction of the feudal lords was subjected to the supervision of the courts of the king, the *Parlements*, whose procedure dispensed with many of the formalities of the older courts. Cf. Brunner, *Wort und Form im altfranzösischen Prozes*< 57 SITZUNGSBERICHTE DER PHIL. HIST. CLASSE DER KAISERL. AKADEMIE D. WISSENSCH. IN WIEN (1868).

17. Of the measures taken by Henry II (1154–1189), the most important is the substitution of inquisition by jury for trial by battle in the assize of novel disseisin.

Under Edward III (1327–1377) the possibility of challenging a court record by battle was abolished (EDW. 3, STAT. 1, c. 4) as well as that of bringing in the ecclesiastical court a prosecution for defamation against members of a grand jury who had indicted a person who was subsequently acquitted (1 EDW. 3, STAT. 2, c. 11). Judicial independence as against the Crown was strengthened by the Statute of Northampton (2 EDW. 3, c. 8); the police and judicial functions of the "keepers," "commissioners," or "justices of the peace" were enlarged and consolidated by a number of statutes (see PLUCKNETT 159); the scope of compelling a defendant to submit to trial by means of outlawry was extended (25 EDW. 3, STAT. 5, c. 17); and use of the English language was allowed in pleadings (36 EDW. 3, c. 15).

18. *Capitularia*—legislative acts of the Frankish kings; see *supra*, sec. *v*:1. On the use of fictions in them, see BRUNNER, RECHTSGESCHICHTE I, 377, 379.

who, among others, reports the following illustration from a *capitulare* of Charles the Bald, of 864: Under the *Lex Salica*, service of summons had to be performed *ad domum*, i.e., in the house of the defendant. At that time many houses had been destroyed, however, by the Norman invaders. The king thus ordained that in such a case the process servers might undertake a sham-service on the spot where the house formerly had stood.

19. Cf. Jolowicz 372–374.

20. The legislative power of the Frankish kings was strictly limited. Laws, for example, which purported to alter the custom of the people could not be enacted without their consent. The principle was, *lex fit consensu populi ac constitutione regis* (Edict of Pistoia, 864, c. 6). Cf. Brissaud, History of French Public Law 81.

21. Compare this with Weber's discussion of "public" and "private" law *supra*, sec. *i*:1.

22. Cervantes, Don Quijote, c. 45; cf. also the story of the Ameer of Afghanistan in Max Radin's Law as Logic and as Experience (1940) 65.

23. *Anschwörung* is invocation for harm, curse, execrate, to swear at; see, e.g., the article by J. Kohler and M. Schmidt, *Zur Rechtsgeschichte Afrikas* (1913), 30 Z.f. vgl. Rw. 33. On the monopoly of trade in Africa by the chieftains see Weber, History 197.

24. For Africa see the recent literature referred to in sec. *iii*, n. 45. In general compare (1913) 30 Z.f. vgl. Rw. 12 *et seq.*, 25 *et seq.*, 32, 66–68, 75, etc.

25. *Basuto*—Bantu native of Basuto Land Protectorate; *Baralong*—Bantu group in Central Bechuanaland; *Muata Cazembe*—hereditary chief whose territory stretched from the south of Lake Mweru to north of Bangweulu, between 9° and 11° S. In the late eighteenth century the authority of the Cazembe was widely recognized; it diminished in power until, toward the end of the nineteenth century, the Cazembe sank to the rank of a petty chief. Lately the territory was divided between Northern Rhodesia and Belgian Congo. Cf. Royal Geographical Soc., The Lands of the Cazembe (1873); M. Schmidt, *Zur Rechtsgeschichte Afrikas*, 31 Z.f. vgl. Rw. (1914) 350, and 34 Z.f. vgl. Rw. 441. As to Morocco, see *Quellen zur ethnologischen Rechtsforschung* (1923) 40 Z.f. vgl. Rw. (Ergänzungsband) 125.

26. 264–c. 227 B.C.; see Vincent Smith, Asoka (rev. ed. 1920); V. A. Smith, Edicts of Asoka (1909) and especially Weber's discussion in GAzRS (2nd ed. 1923) II, 253 [*Religion of India*, 235f.].

27. Weber seems to think of the support of the Conservative party by certain groups of heavy industry and high finance, which often found itself in contrast to the demands of the Center party and other groups representing the political interests of the craftsmen and other middle-class strata in Germany.

28. Jolowicz 69.

29. The codes referred to are the Book of the Covenant (Exod. 21–23) and the Decalogues in Exod. 20:1-17 and 34:10–27; Deut. 27:15–26. See Weber's GAzRS III, 251 [*Ancient Judaism*, 235f.]. There should be added the more recent Deuteronomic Code in Deut. 4:44–26:19. On the Hebrew "codification" cf. J. M. Powis Smith, The Origin and History of Hebrew Law (1931).

30. According to tradition the Law of the Twelve Tables is the work of a Commission of Ten (*Decemviri Legibus Scribundis*) who were appointed in 451 B.C. to satisfy the Plebeian demand for a fixation of the laws. The historicity of the tradition has been doubted. Recent researchers are inclined, however, to accept it as substantially correct. Cf. Jolowicz 11, and Jörs and Kunkel 3, 392, both with literature; cf. also *supra* sec. *v*, n. 11. For a discussion of both the Hebrew and Roman Codification, see Diamond 102, 134.

31. *Aisymnetes* (Gr. "adjuster")—temporary ruler, endowed with full governmental powers, elected to adjust the relationship between contesting classes within a city state, as, for instance, Solon in Athens or Charondas in Catania.

32. Sex. Aelius Paetus Catus, who held the censorate and other magistracies at the beginning of the second century B.C., was frequently quoted b later writers (Cicero) as one of the early authorities on the civil law. He is said to have published a *Tripertita*, a three-part collation containing the XII Tables, interpretations current in his day, and a formulary of writs (*legis actiones*), which was known as the *ius Aelianum* (Pompon. Digest I, 2, 2, 38). Cf. the art. by Klebs in PAULY-WISSOWA, REALENZYKLOPÄDIE DER KLASS. ALTERTUMSWISS., I (1894), 527. (Wi)

33. The most famous examples are the SACHSENSPIEGEL and BEAUMANOIR; see *supra*, sec. *ii*:5, n. 99 and sec. *iv*:2, n. 37.

34. The Chinese compilation, which was in force in the Empire until its end, was the TA CH'ING LÜ LI of 1646, promulgated by the Manchu dynasty a few years after its seizure of power. On this and the other Chinese compilations, see WEBER, *Religion of China*, 101. Cf. also Escarra, *Law, Chinese*, 9 ENCYC. SOC. SCI. 249, 266 (bibliography).

35. For the *Lex Salica* and *Leges Barbarorum*, see sec. *ii*, n. 11; also SEAGLE 166. The most recent reliable edition of the texts is that of the series entitled *Germanenrechte*, published by the Akademie für Deutsches Recht (1935 *et seq.*).

36. The Assizes of Jerusalem were the code of laws for the kingdom of Jerusalem as established by the Crusaders in 1099; see K. RÖHRICHT, GESCHICHTE DES KÖNIGREICHS JERUSALEM (1898).

37. *Siete Partidas* (Span. Law of the Seven Parts). It was compiled between 1256 and 1265 by Alfonso X, king of León and Castile. Among its sources were both the *Fuero Juzgo*, i.e., the Spanish translation of the Germanic *Lex Visigothorum* (cf. sec. *ii*, n. 11), made in 1244, and the Roman tradition, especially as rudely compiled in the Visigothic "Code" for the Roman population, the *Lex Romana Visigothorum* or *Breviarium Alarici* of 506. Similar rudimentary compilations of the Roman law as applicable to the Roman population were made in the Ostrogothic kingdom of Theodoric, the *Edictum Theodorici* (about 500), and in the Burgundian kingdom, the *Lex Romana Burgundionum* (also known as *Papian*).

38. Cf. H. LAMB, GENGHIZ KHAN (1927) c. VII; Krause, *Cingis Han*, HEIDELBERGER AKTEN DER VON-PORTHEIM STIFTUNG (1922); G. Vernadsky, *The Scope and Content of Chingis Khan's Yasa* (1938), 3 HARV. J. OF ASIATIC STUDIES 53.

40. As to codes earlier than that of Hammurabi and related legal monuments, see Koschaker, *Forschungen und Ergebnisse in den keilschriftlichen Rechtsquellen* (1929), 49 SAV. Z. ROM. 188; P. Landsberger, *Die babylonischen Termini für Gesetz und Recht* (1935) SYMBOLA KOSCHAKER. On the Sumerian Code, which has been dated 400 years earlier than the Code of Hammurabi, see the Note. Ur-Nannu, [1954] Orientalia, fasc. 1. On a Sumerian code dated 200 years earlier than the Code of Hammurabi, see F. R. Steele, *The Code of Lipit-Ishtar*, [1948] AMERICAN JOURNAL OF ARCHAEOLOGY, No. 52; on the Accadian Code, dated 80 years before the Code of Hammurabi, see Note. Sumer [1948] 4 AMERICAN JOURNAL OF ARCHAEOLOGY IN IRAQ, No. 2.

41. Codifications of this kind were those of Denmark (King Christian V's

Danish Law, of 1683), Sweden (The Law of The Realm of Sweden, of 1736), and Bavaria (1751, 1753, 1756), the Prussian Code of 1794 (see *infra*, nn. 54–56), the preparation of which was begun in 1738, the Austrian Code of 1811 with its precursors of 1766, 1786, and 1797; also the various Ordinances successively enacted in France since 1539 and dealing with certain special topics. Cf. Continental Legal History Series I (*General Survey*), 263.

42. Among the vast literature on the resuscitation and reception of the Roman law in medieval and Renaissance law, the sources most suitable for a general orientation are: Vinogradoff, Roman Law in Medieval Europe (2nd ed. 1929); Smith; E. Jenks, Law and Politics in the Middle Ages (1905); Wieacker, Vom römischen Recht (1944) 195; and, above all, Koschaker, Europa und das römische Recht (1947); G. v. Below, Die Ursachen der Rezeption des römisch n Rechts (1905). Cf. also Maitland, English Law and the Renaissance (1901) and the articles in Continental Legal History Series, vol. I (General Survey, 1912). For an instructive case study of the reception of Roman law in a particular city, see Coing, Die Rezeption des römischen Rechtes in Frankfurt a. M. (1939).

43. The views stated are expressed in A. Stölzel, *Die Entwicklung der gelehrten R chtsprechung* (1910), in E. Rosenthal's extensive review of this book in 31 Sav. Z. Ge m. 522, esp. 538; and in Rosenthal's own Geschich e des Gerichtswesens und der Verwaltungsorganisation in Bayern (1889/1906).

44. "That which is owed to the collective is not owed to its members." Ulpian, Dig. 3.4.7.1.

45. "What is void from the beginning, cannot be cured by the passage of time." Dig. 50.17.29.

46. Ehrlich 253, 297, 348, 479.

47. These concepts are of fundamental importance in the present law of Germany and those related to it, especially Switzerland and Austria. A "legal transaction" (*R chtsgeschäft*) is every transaction of a person which is intended to produce legal consequences, such as an offer, or its acceptance, the contract itself, a will, or the abandonment of the title to a chattel; it is to be distinguished from natural events creating legal consequences, such as, for instance, the avulsion of a piece of land by a torrent, and also from *Rechtshandlungen*, i.e., human activities which create legal consequences without, or even against, the will of the actors, as, for instance, the negligent causation by one person of bodily injury to another. It is one of the peculiar features of the German Civil Code that it treats in one place those legal problems which are common to all legal transactions of any kind, be it a contract, a conveyance, a marriage, a will, or the issuance of a negotiable instrument. There are thus treated in the Third Part of the First Book of the Code (Secs. 104–185): capacity, declaration of intention, contract, condition and time term, authority, and ratification.

"Declaration of intention" (*Willenserklärung*) is that particular kind of legal transaction which requires that a person make manifest his intention. An offer or an acceptance are declarations of intention; a contract, however, is a "legal transaction" consisting of the declarations of intention of offeror and offeree. The rules applicable to declarations of intention of any kind are all treated together in Secs. 116–144, which thus deal with such problems as fraud, mistake, coercion, formalities, interpretation, or invalidity. For further explanation see Schuster, Principles of German Civil Law (1907) 78; (Brit.) Foreign Office, Manual of German Law (1950) 42.

48. In the terminology of its critics, both American and German, the method here sketched is that of "conceptual jurisprudence." As to Germany, it is described in detail, analyzed, and criticized by the various authors of the essays collected in

20th Century Legal Philosophy Series: Vol. II, THE JURISPRUDENCE OF INTERESTS (1948).

49. On this function of law school faculties as appe late courts, see ENGELMANN; STINTZING, GESCHICHTE DER DEUTSCHEN RECHTSWISSENSCHAFT (1880) I, 65; STÖLZEL, *op. cit.* I, 187; Rheinstein, *Law Faculties and Law Schools* [1938] WIS. L. REV. 5, 7.

50. For a discussion of the Roman aw influences on the Common Law, see MAITLAND, ENGLISH LAW AND THE RENAISSANCE (1901); SCRUTTON, THE INFLUENCE OF ROMAN LAW ON THE LAW OF ENGLAND (1885).

51. The *Reichskammergericht* (Imperial Chamber Court) was established in 1495, as a common supreme court for all parts of the Holy Empire, in the course of the—in the long run—futile attempts to rejuvenate its moribund central government. It was to render its decisions according to "The Em ire's Common Law," which meant, the Roman law. Cf. ENGELMANN AND MILLAR 520; R. SMEND, DAS REICHSKAMMERGERICHT (1911).

52. See *supra*, sec. iv:3, atn. 65.

53. Upon the promulgation of the completed work, the use of any juristic writings outside of the Code and especially of those which had been collected in the DIGEST, was forbidden. Prohibited also, under penalty of deportation and confiscation of roperty, was the writing of new commentaries. The Cor us Iuris was to be the exc usive source of the law. Whatever doubts would arise in its a plication were to be submitted to the Emperor for his own authoritative interpretation. The *Institutes* were to be the only treatise to be used in legal education.

54. Prussian General Code, of June 1794. Cf. *supra* n. 41.

55. The Draft provided in Sec. 2 that "rules of customary law are valid only in so far as they are referred to by the [statutory] law." This provision was not taken over into the Code.

56. A scholarly, systematic ex osition of the Code was successfully undertaken, nevertheless, by Dernburg in his PREUSSISCHES PRIVATRECHT, 3 vols. (1894). Significantly, the author was a Romanist and the treatise did not appear until short y before the Prussian Code was replaced by the new German Civil Code of 1896.

57. See EHRLICH 319–340.

58. On the historical school, see STONE 421.

vii

The Formal Qualities of Revolutionary Law —Natural Law

1. *The French Civil Code*

If we compare the products of the pre-revolutionary period with that child of the Revolution, the Civil Code,[1] and its imitations all over Western and Southern Europe,[2] we can see how considerable the formal differences between them are. The Code is completely free from the intrusion of, and intermixture with, nonjuristic elements and all didactic, as well as all merely ethical admonitions; casuistry, too, is completely absent. Numerous sentences of the Code sound as epigrammatic and as monumental as the sentences of the Twelve Tables, and many of them have become parts of common parlance in the manner of ancient legal proverbs.[3] Certainly none of the precepts of the *Allgemeine Landrecht*[4] or any other German code has achieved such fame. As a product of rational legislation, the Code Civil has become the third of the world's great systems of law, alongside Anglo-Saxon law, a product of juristic practice, and the Roman common-law, a product of theoretical-literary juristic doctrine. It has also become the foundation of the vast majority of eastern and central European codifications. The attainment of this position can be explained by its formal qualities; for the code possesses, or at least gives the impression of possessing, an extraordinary measure of lucidity as well as a precise intelligibility in its provisions. This tangible clarity of many of its precepts the Code owes to the orientation of a large number of its legal institutions to the law of the *coutumes*.[5] To this clarity and simplicity much has been sacrificed in formal juristic qualities and in the depth and thoroughness of substantive consideration.[6] However, both as a result of the abstract total structure of the legal system and the axiomatic nature of many provisions, legal thinking has not been stimulated to a truly constructive elaboration of legal institutions in their pragmatic interrelations. It has rather found itself impelled to accept as mere rules those frequent formulations of the Code which are just rules rather than articulations of broader principles, and to adapt them to the needs of practice from case to case. Quite probably, peculiar formal qualities of modern French jurisprudence are perhaps to

some extent to be ascribed to these somewhat contradictory characteristics of the Code. But these characteristics are expressions of a particular kind of rationalism, namely the sovereign conviction that here for the first time was being created a purely rational law, in accordance with Bentham's ideals, free from all historical "prejudices" and deriving its substantive content exclusively from sublimated common sense in association with the particular raison d'état of the great nation that owes its power to genius rather than to legitimacy. In certain cases the Code sacrifices juristic sublimation to vivid form. This attitude towards legal logic stems directly from the personal intervention of Napoleon, while the epigrammatically dramatized character of some of its provisions corresponds to the type of formulation of the "rights of man and citizen" in the American and French constitutions. Certain axioms concerning the substantive content of legal norms are not presented in the form of matter-of-fact rules, but as postulate-like maxims, with the claim that a legal system is legitimate only when it does not contradict those postulates. With this particular method of forming abstract legal propositions we shall now deal briefly.

2. *Natural Law as the Normative Standard of Positive Law*

Conceptions of the "rightness of the law" are sociologically relevant within a rational, positive legal order only in so far as they give rise to practical consequences for the behavior of law makers, legal practitioners, and social groups interested in the law. In other words, they become sociologically relevant only when practical legal life is materially affected by the conviction of the particular "legitimacy" of certain legal maxims, and of the directly binding force of certain principles which are not to be disrupted by any concessions to positive law imposed by mere power. Such a situation has repeatedly existed in the course of history, but quite particularly at the beginning of modern times and during the Revolutionary period, and in America it still exists. The substantive content of such maxims is usually designated as "Natural Law."[7]

We encountered the *lex naturae* earlier[8] as an essentially Stoic creation which was taken over by *Christianity* for the purpose of constructing a bridge between its own ethics and the norms of the world.[9] It was the law legitimated by God's will for all men of this world of sin and violence, and thus stood in contrast to those of God's commands which

were revealed directly to the faithful and are evident only to the elect. But here we must look at the *lex naturae* from another angle. Natural law is the sum total of all those norms which are valid independently of, and superior to, any positive law and which owe their dignity not to arbitrary enactment but, on the contrary, provide the very legitimation for the binding force of positive law. Natural law has thus been the collective term for those norms which owe their legitimacy not to their origin from a legitimate lawgiver, but to their immanent and teleological qualities. It is the specific and only consistent type of legitimacy of a legal order which can remain once religious revelation and the authoritarian sacredness of a tradition and its bearers have lost their force. Natural law has thus been the specific form of legitimacy of a revolutionarily created order. The invocation of natural law has repeatedly been the method by which classes in revolt against the existing order have legitimated their aspirations, in so far as they did not, or could not, base their claims upon positive religious norms or revelation. Not every natural law, however, has been "revolutionary" in its intentions in the sense that it would provide the justification for the realization of certain norms by violence or by passive disobedience against an existing order. Indeed, natural law has also served to legitimate authoritarian powers of the most diverse types. A "natural law of the historically real" has been quite influential in opposition to the type of natural law which is based upon or produces abstract norms. A natural law axiom of this provenience can be found, for instance, as the basis of the theory of the historical school concerning the preëminence of "customary law," a concept clearly formulated by this school for the first time.[10] It became quite explicit in the assertion that a legislator could not in any legally effective way restrict the sphere of validity of customary law by any enactment or exclude the derogation of the enacted law by custom. It was said to be impossible to forbid historical development to take its course. The same assumption by which enacted law is reduced to the rank of "mere" positive law is contained also in all those half historical and half naturalistic theories of Romanticism which regard the *Volksgeist* as the only natural, and thus the only legitimate, source from which law and culture can emanate, and according to which all "genuine" law must have grown up "organically" and must be based directly upon the sense of justice, in contrast to "artificial," i.e., purposefully enacted, law.[11] The irrationalism of such axioms stands in sharp contrast to the natural law axioms of legal rationalism which alone were able to create norms of a formal type and to which the term "natural law" has *a potiori* been reserved for that reason.

3. *The Origins of Modern Natural Law*

The elaboration of natural law in modern times was in part based on the religious motivation provided by the rationalistic sects; it was also partly derived from the concept of nature of the Renaissance, which everywhere strove to grasp the canon of the ends of "Nature's" will. To some extent, it is derived, too, from the idea, particularly indigenous to England, that every member of the community has certain inherent natural rights. This specifically English concept of "birthright" arose essentially under the influence of the popular conception that certain rights, which had been confirmed in Magna Charta as the special status rights of the barons, were national liberties of all Englishmen as such and that they were thus immune against any interference by the King or any other political authority.[12] But the transition to the conception that every human being as such has certain rights was mainly completed through the rationalistic Enlightenment of the seventeenth and eighteenth centuries with the aid, at certain periods, of powerful religious, particularly Anabaptist, influences.

4. *Transformation of Formal into Substantive Natural Law*

The axioms of natural law fall into very different groups, of which we shall consider only those which bear some especially close relation to the economic order. The natural-law legitimacy of positive law can be connected either with formal or with substantive conditions. The distinction is not a clear-cut one, because there simply cannot exist a completely formal natural law; the reason is that such a natural law would consist entirely of general legal concepts devoid of any content. Nonetheless, the distinction has great significance. The purest type of the first category is that "natural law" concept which arose in the seventeenth and eighteenth centuries as a result of the already mentioned influences, especially in the form of the "contract theory," and more particularly the individualistic aspects of that theory. All legitimate law rests upon enactment, and all enactment, in turn, rests upon rational agreement. This agreement is either, first, real, i.e., derived from an actual original contract of free individuals, which also regulates the form in which new law is to be enacted in the future; or, second, ideal, in the sense that only that law is legitimate whose content does not contradict the conception of a reasonable order enacted by free agreement.

The essential elements in such a natural law are the "freedoms," and above all, "freedom of contract." The voluntary rational contract became one of the universal formal principles of natural law construction, either as the assumed real historical basis of all rational consociations including the state, or, at least, as the regulative standard of evaluation. Like every formal natural law, this type is conceived as a system of rights legitimately acquired by purposive contract, and, as far as economic goods are concerned, it rests upon the basis of a community of economic agreement (*Einverständnisgemeinschaft*) created by the full development of property. Its essential components are property and the freedom to dispose of property, i.e., property legitimately acquired by free contractual transaction made either as "primeval contract" with the whole world, or with certain other persons. Freedom of competition is implied as a constituent element. Freedom of contract has formal limits only to the extent that contracts, and social conduct in general, must neither infringe upon the natural law by which they are legitimated nor impair inalienable freedoms. This basic principle applies to both private arrangements of individuals and the official actions of the organs of society meant to be obeyed by its members. Nobody may validly surrender himself into political or private slavery. For the rest, no enactment *can* validly limit the free disposition of the individual over his property and his working power. Thus, for example, every act of social welfare legislation prohibiting certain contents of the free labor contract, is on that account an infringement of freedom of contract. Until quite recently the Supreme Court of the United States has held that any such legislation is invalid on the purely formal ground that it is incompatible with the natural-law preambles to the constitutions.[13]

"Nature" and "Reason" are the substantive criteria of what is legitimate from the standpoint of natural law. Both are regarded as the same, and so are the rules that are derived from them, so that general propositions about regularities of factual occurrences and general norms of conduct are held to coincide. The knowledge gained by human "reason" is regarded as identical with the "nature of things" or, as one would say nowadays, the "logic of things." The "ought" is identical with the "is," i.e., that which exists in the universal average. Those norms, which are arrived at by the logical analysis of the concepts of the law and ethics, belong, just as the "laws of nature," to those generally binding rules which "not even God Himself could change," and with which a legal order must not come into conflict. Thus, for instance, the only kind of money which meets the requirements of the "nature of things" and the principle of the legitimacy of vested rights is that which has achieved the position of money through the free exchange of goods, in other

words, metallic money.[14] Some nineteenth-century fanatics therefore argued that, according to natural law, the state should rather go to pieces than that the legitimate stability of the law be sullied by the illegitimacy of "artificially" created paper money. For an infringement of the *legitimate* law, it was claimed, would in itself be a negation of the very "idea" of the State.

This formalism of natural law, however, was softened in several ways. First of all, in order to establish relations with the existing order, natural law had to accept legitimate grounds for the acquisition of rights which could not be derived from freedom of contract, especially acquisition through inheritance. There were numerous attempts to base the law of inheritance on natural law.[15] They were mainly of philosophical rather than positively juristic origin, and so we shall disregard them here. In the last analysis, of course, substantive motives almost always enter the picture, and highly artificial constructions are thus frequent. Many other institutions of the prevailing system, too, could not be legitimated except on practical utilitarian grounds. By "justifying" them, natural law "reason" easily slipped into utilitarian thinking, and this shift expresses itself in the change of meaning of the concept of "reasonableness." In purely formal natural law, the reasonable is that which is derivable from the eternal order of nature and logic, both being readily blended with one another. But from the very beginning, the English concept of "reasonable" contained by implication the meaning of "rational" in the sense of "practically appropriate." From this it could be concluded that what would lead in practice to absurd consequences cannot constitute the law desired by nature and reason. This signified the express introduction of substantive presuppositions into the concept of reason which had in fact always been implicit in it.[16] As a matter of fact, it was with the aid of this shift in the meaning of the term that the Supreme Court of the United States was able to free itself from formal natural law so as to be able to recognize the validity of certain acts of social legislation.[17]

In principle, however, the formal natural law was transformed into a substantive natural law as soon as the legitimacy of an acquired right came to be tied up with the substantive economic rather than with the formal modes of its acquisition. Lasalle, in his *System of Vested Rights* [1861], still sought to solve a particular problem in natural law fashion by formal means, in his case by those derived from Hegel's theory of evolution. The inviolability of a right formally and legitimately acquired on the basis of a positive enactment is presupposed, but the natural law limitation of this type of legal positivism becomes evident in connection with the problem of the so-called retroactivity of laws and the related

question of the state's duty to pay compensation where a privilege is abolished. The attempted solution, which is of no interest to us here, is of a thoroughly formal and natural law character.

The decisive turn towards substantive natural law is connected primarily with socialist theories of the exclusive legitimacy of the acquisition of wealth by one's own labor. For this view rejects not only all unearned income acquired through the channels of inheritance or by means of a guaranteed monopoly, but also the formal principle of freedom of contract and general recognition of the legitimacy of all rights acquired through the instrumentality of contracting. According to these theories, all appropriations of goods must be tested substantively by the extent to which they rest on labor as their ground of acquisition.

5. *Class Relations in Natural Law Ideology*

Naturally both the formal rationalistic natural law of freedom of contract and the substantive natural law of the exclusive legitimacy of the product of labor have definite class implications. Freedom of contract and all the propositions regarding as legitimate the property derived therefrom obviously belong to the natural law of the groups interested in market transactions, i.e., those interested in the ultimate appropriation of the means of production. Conversely, the doctrine that land is not produced by anybody's labor and that it is thus incapable of being appropriated at all, constitutes a protest against the closedness of the circle of landowners, and thus corresponds with the class situation of a proletarianized peasantry whose restricted opportunities for self-maintenance force them under the yoke of the land monopolists.[18] It is equally clear that such slogans must acquire a particularly dramatic power where the product of agricultural exploitation still depends primarily upon the natural condition of the soil and where the appropriation of the land is not, at least internally, completed; where, furthermore, agriculture is not carried on in rationally organized large-scale enterprises, and where the income of the landlord is either derived entirely from the tenants' rent or is produced through the use of peasant equipment and peasant labor. All these conditions exist in large measure in the area of the "Black Earth" [Ukraine and Southern Russia]. As regards its positive meaning, this natural law of the small peasantry is ambiguous. It can mean in the *first* place the right to a share in the land to the extent of one's own labor power (*trudovaya norma*); or, *secondly*, a right to the ownership of land to the extent of the traditional standard of living (*potrebityelnaya norma*). In conventional

terminology the postulate thus means either the "right to work" or the "right to a minimum standard of living"; *thirdly*, however, the two may be combined with the demand for the "right to the full product of one's labor."

The Russian revolution of the last decade [i.e., of 1905–06], in all probability the last of the world's natural-law oriented agrarian revolutions,[19] has been bled to death also by the irresolvable contradictions between its various ideologies. Those first two natural-law positions were incompatible not only with one another, but also with the various peasant programs, whether they were motivated by historical, realistically political, practically economical, or finally—and in hopeless confusion because of internal contradictions between the inherent basic dogmas—by Marxist-evolutionist considerations.

Those three "socialist" rights of the individual have also played a role in the ideologies of the industrial proletariat. The first and the second are theoretically possible under handicraft as well as under capitalistic conditions of the working class; the third, however, is possible only under handicraft conditions. Under capitalism the third right of natural law is possible either not at all or only where cost prices are strictly and universally maintained in all exchange transactions. In agriculture, it can be applied only where production is not capitalistic, since capitalism shifts the imputation of the yield of agricultural land from the place of direct agricultural production to the workshops where the agricultural implements, artificial fertilizers, etc., are produced; and the same holds true for industry. Quite generally, where the return is determined by the sale of the product in a freely competitive market, the content of the right of the individual to the full value of his product inevitably loses its meaning. There simply is no longer an individual "labor yield," and if the claim is to make any sense it can be only as the collective claim of all those who find themselves in a common class situation. In practice, this comes down to the demand for a "living wage," i.e., to a special variant of the "right to the standard of living as determined by traditional need." It thus resembles the medieval "just price" as demanded by ecclesiastical ethics which, in case of doubt, was determined by the test (and occasionally experimentally) of whether or not at the given price the craftsmen in question could maintain the standard of living appropriate to their social status.

The "just price" itself, which was the most important natural law element in canonist economic doctrine, fell prey to the same fate. In the canonistic discussions of the determinants of the "just price" one can observe how this labor value price corresponding to the "subsistence principle" is gradually replaced by the competitive price which becomes

the new "natural" price in the same measure as the market community progresses. In the writings of Antonin of Florence [1389–1459] the latter had already come to prevail. In the outlook of the Puritans it was, of course, completely dominant. The price which was to be rejected as "unnatural" was now one which did not rest on the competition of the free market, i.e., the price which was influenced by monopolies or other arbitrary human intervention. Throughout the whole puritanically influenced Anglo-Saxon world this principle has had a great influence up to the very present. Because of the fact that the principle derived its dignity from natural law, it remained a far stronger support for the ideal of "free competition" than those purely utilitarian economic theories which were produced on the Continent in the manner of Bastiat [1801–50].

6. *Practical Significance and Disintegration of Natural Law*

All natural law dogmas have influenced more or less considerably both lawmaking and lawfinding. Some of them survived the economic conditions of the time of their origin and have come to constitute an independent factor in legal development. Formally, they have strengthened the tendency towards logically abstract law, especially the power of logic in legal thinking. Substantively, their influence has varied, but it has been significant everywhere. This is not the place to trace in detail these influences and the changes and compromises of the various natural law axioms. The codifications of the pre-revolutionary rationalistic modern state, as well as the revolutionary codifications, were influenced by the dogmas of natural law, and they ultimately derived the legitimacy of the law which they created from its "reasonableness."[20] We have already seen how easily on the basis of such a concept the shift from the ethical and juristically formal to the utilitarian and technically substantive could, and did, take place. This transformation, for reasons which we have already discussed, was very favorable to the pre-revolutionary patriarchal powers, while the codifications of the Revolution, which took place under the influence of the bourgeoisie, stressed and strengthened the formal natural law, which guaranteed to the individual his rights vis-à-vis the political authorities.

The rise of Socialism at first meant the growing dominance of substantive natural law doctrines in the minds of the masses and even more in the minds of their theorists from among the intelligentsia. These sub-

stantive natural law doctrines could not, however, achieve practical influence over the administration of justice, simply because, before they had achieved a position to do so, they were already being disintegrated by the rapidly growing positivistic and relativistic-evolutionistic skepticism of the very same intellectual strata. Under the influence of this anti-metaphysical radicalism, the eschatological expectations of the masses sought support in prophecies rather than in postulates. Hence in the domain of the revolutionary theories of law, natural law doctrine was destroyed by the evolutionary dogmatism of Marxism, while from the side of "official" learning it was annihilated partly by the Comtean evolutionary scheme and partly by the historicist theories of organic growth. A final contribution in the same direction was made by *Realpolitik* which, under the impact of modern power politics, had come to affect the treatment of public law.[21]

The method of the public law theorists has been, and still is to a great extent, to point to certain apparent practical-political absurdities as the consequence of the juristic theory which they happen to oppose, and then to treat the theory as effectively disposed of forever after. This method is not only directly opposed to that of formal law, but it also contains nothing of substantive natural law. In the main, Continental jurisprudence, even up to the most recent times, proceeds on the basis of the largely unchallenged axiom of the logical "closedness" of the positive law.[22] It seems for the first time to have been expressly stated by Bentham as a protest against the case law rut and the irrationality of the common law.[23] It is indirectly supported by all those tendencies which reject all transcendental law, especially natural law, including, to this extent, the historical school. While it would hardly seem possible to eradicate completely from legal practice all the latent influence of unacknowledged axioms of natural law, for a variety of reasons the axioms of natural law have been deeply discredited. The conflict between the axioms of substantive and formal natural law is insoluble. Evolutionist theories have been at work in various forms. All metajuristic axioms in general have been subject to ever continuing disintegration and relativization. In consequence of both juridical rationalism and modern intellectual skepticism in general, the axioms of natural law have lost all capacity to provide the fundamental basis of a legal system. Compared with firm beliefs in the positive religiously revealed character of a legal norm or in the inviolable sacredness of an age-old tradition, even the most convincing norms arrived at by abstraction seem to be too subtle to serve as the bases of a legal system. Consequently, legal positivism has, at least for the time being, advanced irresistibly. The disappearance of the old natural law conceptions has destroyed all possi-

bility of providing the law with a metaphysical dignity by virtue of its immanent qualities. In the great majority of its most important provisions, it has been unmasked all too visibly, indeed, as the product or the technical means of a compromise between conflicting interests.

But this extinction of the metajuristic implications of the law is one of those ideological developments which, while they have increased skepticism towards the dignity of the particular rules of a concrete legal order, have also effectively promoted the actual obedience to the power, now viewed solely from an instrumentalist standpoint, of the authorities who claim legitimacy at the moment. Among the practitioners of the law this attitude has been particularly pronounced.[24]

7. *Legal Positivism and the Legal Profession*

The vocational responsibility of maintaining the existing legal system seems to place the practitioners of the law in general among the "conservative" forces. This is true in the twofold sense that legal practitioners are inclined to remain cool not only toward the pressure of substantive postulates put forward from "below" in the name of "social" ideals but also towards those from "above" which are put forward in the name of patriarchal power or welfare policies. Of course, this statement should not be taken as representing the whole truth without qualifications. The role of the representative of the underprivileged, and of the advocate of formal equality before the law is particularly suited to the attorney by reason of his direct relationship with his clients, as well as by reason of his character as a private person working for a living and his fluctuating social status. This is why attorneys, and lawyers in general, have played such a leading role in the movements of the *popolani* of the Italian communes and, later, in all the bourgeois revolutions of modern times as well as in the socialist parties. It also explains why in purely democratic countries, such as in France, Italy, or the United States, the lawyers, as the professionally expert technicians of the legal crafts, as honoratiores, and as the fiduciaries of their clients, are the natural aspirants to political careers.

Under certain circumstances, judges, too, have maintained strong opposition to patriarchal powers, either for ideological reasons or out of considerations of status group solidarity or, occasionally, because of economic reasons. To them, the fixed and regular determinateness of all external rights and duties is apt to appear as a worth-while value to be pursued for its own sake; this specifically "bourgeois" element in their

thought has determined their attitudes in the political conflicts which were fought for the purpose of limiting authoritarian patrimonial arbitrariness and favoritism.

Whether the legal profession would take the side either of the authoritarian or the anti-authoritarian powers, once the "rule-boundedness" of the social order had been achieved, depended upon whether the emphasis was more upon mere "order," or upon "liberty," in the sense of guaranty and security of the individual. The choice depended, in the terminology of Radbruch, on whether law was viewed more as "regulation" or as the source of "rights."[25] But quite apart from this antinomy, it was also the previously mentioned alternative between the formal and substantive legal ideals and the vigorous, economically conditioned revival of the latter, both in the upper and lower strata of the social hierarchy, that weakened the oppositionist tendencies of the lawyers as such. We shall discuss later just what technical devices authoritative powers have used to overcome resistance from within the judiciary.[26] Among the general ideological factors which account for the change in the lawyers' attitude, the disappearance of the belief in natural law has played a major role. If the legal profession of the present day manifests at all typical ideological affinities to various power groups, its members are inclined to stand on the side of "order," which in practice means that they will take the side of the "legitimate" authoritarian political power that happens to predominate at the given moment. In this respect, they differ from the lawyers of the English and French revolutionary periods and of the period of enlightenment in general. They differ also from those who had to act within the framework of patrimonial despotism or had been sitting in [German nineteenth-century] parliamentary bodies and municipal councils down to Prussia's "circuit judges' parliament" of the 1860's.[27]

NOTES

1. The French Civil Code was proclaimed on 21 March 1804, under the title of CODE CIVIL DES FRANÇAIS. In 1807 this title was changed to CODE NAPOLÉON, and in 1816 the original title was restored with the fall of the Napoleonic régime. During the reign of Napoleon III the reference to Napoleon was reinstated in the title (1852–1870). While Napoleon was the main driving force and an active participant in the making of the Code, the demand for, and the beginning of, codification in France preceded the Napoleonic era. Even before the Revolution of 1789 the diversity of local laws had come to be regarded as cumbersome and their incompleteness as a source of legal uncertainty, and the Estates General had thus petitioned for a uniform national law. Also the judges of the French *parlements* had become unpopular. The Constituent Assembly of 1790 noted that a code should be proposed, but it was left to the Convention of 1793

to create a special drafting commission, headed by Cambacérès, which was to start the actual work and indeed was charged with its completion within a month. This commission actually succeeded in completing a draft of seven hundred articles within six weeks, which, however, was rejected on the ground that it was too elaborate and detailed and might restrict the freedom of the individual! Another, much shorter, draft was presented one year later (in September 1794), but was only little debated. Of the two further drafts—one in 1796 consisting of five hundred articles and another in 1799—equally little resulted, as the Convention was engaged in waging a war with virtually the whole of Europe; yet, as Vollet has remarked (*Cambridge Modern History* VIII, 710 at 741–742), "The Convention amidst disorders at home and war abroad peacefully deliberated on questions of inheritance, alluvial lands, illegitimate children, and the whole body of civil law. . ." The Consulate, with Napoleon as First Consul, resumed the work, and much of Cambacérès' labor was embodied in the final Code.

In the Code much of the customary law of Northern France was preserved, combined with the conceptual technique of the eighteenth-century Roman law. Extensive use was made of the work of Domat (1625–1696) and, especially, Pothier (1699–1772), who had laid, in their extensive writings, the bases of a common law of France. The whole work was permeated, however, with a strong spirit of liberalism and individualism.

The Code was [in 1954] still in effect in France, although modified by a large number of amendments. A Commission had been charged with the preparation of a total revision of the Code in 1946.

On the Code, see Viollet, *loc. cit.*; Lobingier, *Code civile* and *Codification* in 3 ENCYC. SOC. SCI. 604, 606, with further literature; on the current work of revision, see J. de la Morandière, *Reform of the French Civil Code* (1948), 97 U. OF PA. L. REV. 1.

2. Through the Napoleonic conquests the CODE CIVIL was spread outside France; but permanently it was retained only in Belgium, Luxembourg, and that part of (Russian) Poland which had been constituted by Napoleon as the Grand-Duchy of Warsaw. Until the German Civil Code of 1896 took effect in 1900, the French Code remained in effect in those parts of Germany which are situated on the left bank of the Rhine, in the Grand-Duchy of Baden, and in a small sector of the Rhine Province east of the Rhine.

During the nineteenth century the CODE CIVIL, in translation and with inconsiderable modifications, became the law of the Netherlands, Italy (now replaced by a new Code of 1942), Rumania, Egypt, Quebec, Louisiana, Portugal, and Spain. The Spanish Code, with slight amendments, is still in effect in Puerto Rico, Cuba, and the Philippine Republic, and has constituted the model for most of the codes of Latin America.

New types of codification were started with the German Civil Code of 1896 and the Swiss Civil Code of 1912. The former was taken over, with slight changes, in Japan, the latter in Turkey. In the modern codes of pre-communist China, Thailand, Brazil, Mexico (federal law), and a few other Latin American countries, the models of the French, German, and Swiss codes are combined, partly also with indigenous ideas. Cf. Fisher, *The Codes*, 9 CAMBRIDGE MODERN HISTORY 148; Amos, *The Code Napoleon and the Modern World* (1928), 10 J. COMP. LEGISL. 22; A. REPPY (ed.), DAVID DUDLEY FIELD CENTENARY ESSAYS (1949).

3. Cf., for instance:

ART. 2. La loi ne dispose que pour l'avenir; elle n'a point d'effet rétroactif (The law disposes only for the future; it has no retroactive effect).

ART. 1134. Les conventions légalement formées tiennent lieu de loi à ceux qui les ont faites (A contract properly concluded holds the place of law for those who have made it).

ART. 1382. Tout fait quelconque de l'homme, qui a causé à autrui un dommage, oblige celui par la faute duquel il est arrivé, à le réparer (Every act of man which causes harm to another binds the one through whose fault it has occurred to make reparation).

ART. 2279, para. 1. En fait de meubles, la possession vaut titre ("As to chattels, possession amounts to title"—meaning: a bona fide purchaser from the possessor acquires a good title).

So great a French writer as Stendhal is said to have had such a high opinion of the Code's literary style that he made it a habit to read a chapter of it before sitting down to write. Cf. SEAGLE 286.

4. Cf. *supra*, sec. *vi*:4, at nn. 54ff.

5. *Coutumes*—customary law of Northern France. Apart from the law of property and contract, which was primarily derived from Roman law, almost everything else in the code was based on customary law. Thus it was the customary law as systematized by Pothier to which, as has been said, three-quarters of the code can be traced back: see EHRLICH 415–416.

6. An instance of this kind is provided by the two articles of the code (arts. 1382 and 1383) which purport to formulate the general principles of almost the whole French law of delicts (torts). For an analysis see Walton, *Delictual Responsibility in the Modern Civil Law* (1933), 49 L.Q. REV. 70. Compare with the two laconic articles of the French Code the 951 sections of the RESTATEMENT OF THE LAW OF TORTS by the American Law Institute (4 vols. 1939).

7. For concise surveys of, and bibliographies on, the various forms of Natural Law concepts and their role and significance, see G. Gurvitch, *Natural Law*, 11 ENCYC. SOC. SCI. 284; STONE 215; I. W. JONES, HISTORICAL INTRODUCTION TO THE THEORY OF LAW (1947); see also C. G. HAINES, REVIVAL OF NATURAL LAW CONCEPTS IN AMERICA (1930) and ROMMEN, NATURAL LAW (1947).

8. Seech. VI:xiii:3.

9. See E. TROELTSCH, THE SOCIAL TEACHINGS OF THE CHRISTIAN CHURCHES (2 vols., tr. by O. Wyon, London, 1931) and Weber's remarks on Troeltsch's paper on *The Stoic-Christian Natural Law* in VERHANDLUNGEN DES DEUTSCHEN SOZIOLOGENTAGS (1910) I, 196, 210, repr. in *GAzSS* 462.

10. Cf. *supra*, sec. *iii*:2, at n. 9.

11. This attitude is represented by the Historical School, especially the Germanists, among whom Gierke has been particularly prominent. An American representative was James C. Carter, the chief opponent of David Dudley Field's codification plans (see the article on him by Llewellyn in 3 ENCYC. SOC. SCI. 243).

12. The so-called Whig conception of English history: cf. H. BUTTERFIELD, THE ENGLISHMAN AND HIS HISTORY (1944). On the real and the imaginary Magna Carta see W. S. McKechnie, *Magna Carta 1215–1915*, MAGNA CARTA COMMEMORATION ESSAYS (1917) I, 18; M. Radin, *The Myth of Magna Carta* (1947) 60 HARV. L. REV. 1060.

13. *Sic.* What is meant is obviously the due process clause of the Fourteenth Amendment of the Constitution of the United States.

14. See WEBER, ECONOMIC HISTORY 236 and literature cited at p. 377; also *supra*, Part One, ch. II:6 and II:32–36.

15. See, for instance, Leibniz, who derives inheritance from the immortality of the soul (NOVA METHODUS DOCENDI DISCENDIQUE JURIS, Part II, Sec. 20,

17); his argumentation is also followed by Ahrens (COURS DE DROIT NATUREL [1838], Part II, Sec. 102). Grotius finds the basis of testate succession in natural freedom and that of intestate succession in its implied agreement with the will of the decedent (DE IURE PACIS AC BELLI [1625], II, c. vii; cf. on his theory MAINE 190).

The natural law theories were attacked by Pufendorf, who declared inheritance to be an institution of positive law (DE IURE NATURAE ET GENTIUM [1672], 4.10. 2–6). This opinion was followed by Blackstone (Book II, c. xiv).

16. What Weber has in mind is the shift from natural law thinking to utilitarianism, as expressed by Bentham, John Stuart Mill, and Spencer.

17. See Knoxville Iron Co. v. Harbison (1901) 183 U.S. 13; McLean v. Arkansas (1908) 211 U.S. 539; Erie R.R. v. Williams (1914) 233 U.S. 685:—statutes prescribing the character, methods, and time for payment of wages.

Holden v. Hardy (1898) 169 U.S. 366; Bunting v. Oregon (1917) 243 U.S. 426; Muller v. Oregon (1908) 208 U.S. 412; Riley v. Massachusetts (1914) 232 U.S. 671; Miller v. Wilson (1915) 236 U.S. 373; Bosley v. McLaughlin (1915) 236 U.S. 385:—statutes fixing hours of labor.

N.Y. Central R.R. Co. v. White (1917) 243 U.S. 188:—workmen's compensation laws.

Later decisions, such as Adkins v. Children's Hospital (1923) 261 U.S. 525, in which the rule of reason was temporarily nullified, or the New Deal cases, could, of course, not be considered by Weber.

For a penetrating survey and analysis, from the continental point of view, of the attitudes of the American judiciary toward social legislation, see ED. LAMBERT, LE GOUVERNEMENT DES JUGES ET LA LUTTE JUDICIARE CONTRE LA LÉGISLATION SOCIALE AUX ETATS-UNIS (1921).

18. On this and the following, see Weber's discussion of the Russian revolution of 1905 in ARCHIV F. SOZIALWISSENSCHAFT (1906), XXII, 234 and XXIII, 165; see also his article on *Russlands Übergang zur Scheindemokratie* (1917) 23 DIE HILFE 272, repr. in *GPS*, 192ff.

19. In the second of the two articles mentioned in n. 18 *supra* Weber, at p. 314, predicted the coming of a new revolution in Russia, which would be oriented toward communism rather than natural law and which would create a state of affairs different from anything that had ever existed before.

20. For a monographic inquiry into the influence of natural law ideologies upon one particular code, viz., that of Austria, see SWOBODA, DAS ALLGEMEINE BÜRGERLICHE GESETZBUCH IM LICHTE KANTS (1924).

21. The mode of a completely "positivist" treatment of public law was represented in Germany particularly by Paul Laband (1838–1918) and his disciples. On Laband, see the article by E. von Hippel in 8 ENCYC. SOC. SCI. 614.

22. See *supra*, sec. *i*:9.

23. Weber here states an opinion expressed by Hatschek (ENGLISCHES STAATSRECHT 153), but opposed by J. Lucas (*Zur Lehre von dem Willen des Gesetzgebers*, FESTGABE FÜR LABAND [1908]), who traced the dogma of the gaplessness of the legal order to the natural law tendencies of absolute monarchy and denied any possible influence in this respect of Bentham. The controversy was carried on in a series of articles by Hatschek (1909), 24 ARCHIV F. ÖFFENTLICHES RECHT 442; (1910) 26 *ibid.* 458; and Lukas (1910) 26 *ibid.* 67 and 465.

24. On positivism in Germany see G. RADBRUCH, RECHTSPHILOSOPHIE (1950) 115. This latest book of Radbruch's (as to his earlier views, see the 20th

Century Legal Philosophy Series, Vol. IV, *The Legal Philosophies of Lask, Radbruch, and Dabin* [1950]) is also typical of the revival of natural law thinking in post-World-War-II Germany; cf. in this respect also H. COING, DIE OBERSTEN GRUNDSÄTZE DES RECHTS (1947), and GRUNDZÜGE DER RECHTSPHILOSOPHIE (1950); on the transformations of Radbruch's thought, see F. v. HIPPEL, GUSTAV RADBRUCH ALS RECHTSPHILOSOPHISCHER DENKER (1951).

25. Cf. RECHTSPHILOSOPHIE (1914 ed.); the terminology is no longer used, however, in the versions of 1932 and 1950.

26. This intended investigation was not carried out by Weber.

27. *Kreisrichterparlament*—so called because a considerable number of its members were *Kreisrichter* (circuit judges), who, at the time, were predominantly Liberals and opposed to the policies of Bismarck.

VIII

The Formal Qualities of Modern Law

1. *Particularism in Modern Law*

As we have seen, the specifically modern occidental type of administration of justice has arisen on the basis of rational and systematic legislation. However, its basic formal qualities are by no means unambiguously definable. Indeed, this ambiguity is a direct result of more recent developments.

The ancient principles which were decisive for the interlocking of "right" and "law" have disappeared, especially the idea that one's right has a "valid" quality only by virtue of one's membership in a group of persons by whom this quality is monopolized. To the past now also belongs the tribal or status-group quality of the sum total of a person's rights and, with it, their "particularity" as it once existed on the basis of free association or of usurped or legalized privilege. Equally gone are the status and other special courts and procedures. Yet neither all special and personal law nor all special jurisdictions have disappeared completely. On the contrary, very recent legal developments have brought an increasing particularism within the legal system. Only the principle of demarcation of the various spheres has been characteristically changed. A typical case is that of commercial law, which is, indeed, one of the most important instances of modern particularism. Under the German Commercial Code this special law applies to certain types of contracts,[1] the most important of which is the contract for acquisition

of goods with the intention of profitable resale. This definition of commercial contract is entirely in accordance with a rationalized legal system; the definition does not refer to formal qualities, but to the intended functional meaning of the concrete transaction. On the other hand, commercial law also applies to certain categories of persons whose decisive characteristic consists in the fact that contracts are made by them in the course of their business.[2] What is thus really decisive for the demarcation of the sphere of this type of law is the concept of "enterprise." An enterprise is a commercial enterprise when transactions of such peculiar kind are its constitutive elements. Thus every contract which "belongs" substantively, i.e., in its intention, to a commercial enterprise is under the Commercial Code, even though, when regarded alone and by itself, it does not belong to that category of transactions which are generically defined as commercial and even though, in a particular case, such a contract may happen to be made by a nonmerchant. The application of this body of special law is thus determined either by substantive qualities of an individual transaction, especially its intended meaning, or by the objective association of a transaction with the rational organization of an enterprise. It is not determined, however, by a person's membership in a status group legally constituted by free agreement or privilege, which was in the past the operative factor for the application of a special law.

Commercial law, then, inasmuch as its application is personally delimited, is a class law rather than a status-group law. However, this contrast with the past is but a relative one. Indeed, so far as the law of commerce and the law of other purely economic "occupations" are concerned, the principle of jurisdictional delimitation has always had a purely substantive character, which, while often varying in externals, has essentially been the same throughout. But those particularities in the legal system which constituted a definite status law were more significant both quantitatively and qualitatively. Besides, even the vocational special jurisdictions, so far as their jurisdictions did not depend upon the litigants' membership in a certain corporate body, have usually depended upon mere formal criteria such as acquisition of a license or a privilege. For example, under the new German Commercial Code, a person is characterized as a merchant by the mere fact that he is listed in the register of commercial firms.[3] The personal scope of application of the commercial law is thus determined by a purely formal test, while in other respects its sphere is delimited by the economic purpose which a given transaction purports to achieve. The spheres of the special laws applicable to other occupational groups are also predominantly defined along substantive or functional criteria, and it is only under certain cir-

cumstances that applicability is governed by formal tests. Many of these modern special laws are also combined with special courts and procedures of their own.[4]

Mainly two causes are responsible for the emergence of these particularistic laws. In the first place, they have been a result of the occupational differentation and the increasing attention which commercial and industrial pressure groups have obtained for themselves. What they expect from these particularistic arrangements is that their legal affairs will be handled by specialized experts.[5] The second cause, which has played an increasingly important role in most recent times, has been the desire to eliminate the formalities of normal legal procedure for the sake of a settlement that would be both expeditious and better adapted to the concrete case.[6] In practice, this trend signifies a weakening of legal formalism out of considerations of substantive expediency and thus constitutes but one instance among a whole series of similar contemporary phenomena.

2. *The Anti-Formalistic Tendencies of Modern Legal Development*

From a theoretical point of view, the general development of law and procedure may be viewed as passing through the following stages: first, charismatic legal revelation through "law prophets"; second, empirical creation and finding of law by legal honoratiores, i.e., law creation through cautelary jurisprudence and adherence to precedent; third, imposition of law by secular or theocratic powers; fourth and finally, systematic elaboration of law and professionalized administration of justice by persons who have received their legal training in a learned and formally logical manner. From this perspective, the formal qualities of the law emerge as follows: arising in primitive legal procedure from a combination of magically conditioned formalism and irrationality conditioned by revelation, they proceed to increasingly specialized juridical and logical rationality and systematization, sometimes passing through the detour of theocratically or patrimonially conditioned substantive and informal expediency. Finally, they assume, at least from an external viewpoint, an increasingly logical sublimation and deductive rigor and develop an increasingly rational technique in procedure.

Since we are here only concerned with the most general lines of development, we shall ignore the fact that in historical reality the theoretically constructed stages of rationalization have not everywhere followed in the sequence which we have just outlined, even if we ignore the

world outside the Occident. We shall not be troubled either by the multiplicity of causes for the particular type and degree of rationalization that a given law has actually assumed, which even our brief sketch has shown. We shall only recall that the great differences in the line of development have been essentially influenced, first, by the diversity of political power relationships, which, for reasons to be discussed later, have resulted in very different degrees of power for the *imperium* vis-à-vis the powers of the kinship groups, the folk community, and the status group; second, by the relations between the theocratic and the secular powers; and, third, by the differences in the structure of the [strata of] "legal notables" significant for the development of a given law, differences which also were largely dependent upon political factors.

Only the Occident has witnessed the fully developed administration of justice of the folk-community (*Dinggenossenschaft*) and the status-stereotyped form of patrimonialism; and only the Occident has witnessed the rise of the national economic system, whose agents first allied themselves with the princely powers to overcome the estates and then turned against them in revolution; and only the West has known "Natural Law," and with it the complete elimination of the system of personal laws and of the ancient maxim that special law prevails over general law. Nowhere else, finally, has there occurred any phenomenon resembling Roman law and anything like its reception. All these events have to a very large extent been caused by concrete political factors, which have only the remotest analogies elsewhere in the world. For this reason, the stage of law decisively shaped by trained legal specialists has not been fully reached anywhere outside of the Occident. Economic conditions have, as we have seen, everywhere played an important role, but they have nowhere been decisive alone and by themselves. To the extent that they contributed to the formation of the specifically modern features of present-day occidental law, the direction in which they worked has been by and large the following: To those who had interests in the commodity market, the rationalization and systematization of the law in general and, with certain reservations to be stated later, the increasing calculability of the functioning of the legal process in particular, constituted one of the most important conditions for the existence of economic enterprise intended to function with stability and, especially, of capitalistic enterprise, which cannot do without legal security. Special forms of transactions and special procedures, like the bill of exchange and the special procedure for its speedy collection, serve this need for the purely formal certainty of the guaranty of legal enforcement.

On the other hand, the modern and, to a certain extent, the ancient

Roman, legal developments have contained tendencies favorable to the dilution of legal formalism. At a first glance, the displacement of the formally bound law of evidence by the "free evaluation of proof" appears to be of a merely technical character.[7] We have seen that the primitive system of magically bound proof was exploded through the rationalism of either the theocratic or the patrimonial kind, both of which postulated procedures for the disclosure of the real truth. Thus the new system clearly appears as a product of substantive rationalization. Today, however, the scope and limits of the free evaluation of proof are determined primarily by commercial interests, i.e., by economic factors. It is clear that, through the system of free evaluation of proof, a very considerable domain which was once subject to formal juristic thought is being increasingly withdrawn therefrom.[8] But we are here more concerned with the corresponding trends in the sphere of substantive law. One such trend lies in the intrinsic necessities of legal thought. Its growing logical sublimation has meant everywhere the displacement of dependence on externally tangible formal characteristics by an increasingly logical interpretation of *meaning* in relation to the legal norms themselves as well as in relation to legal transactions. In the doctrine of the continental "common law" this interpretation claimed that it would give effect to the "real" intentions of the parties; in precisely this manner it introduced an individualizing and relatively substantive factor into legal formalism. This kind of interpretation seeks to construct the relations of the parties to one another from the point of view of the "inner" kernel of their behavior, from the point of view of their mental "attitudes" (such as good faith or malice).[9] Thus it relates legal consequences to informal elements of the situation and this treatment provides a telling parallel to that systematization of religious ethics which we have already considered previously. Much of the system of commodity exchange, in primitive as well as in technically differentiated patterns of trade, is possible only on the basis of far-reaching personal confidence and trust in the loyalty of others. Moreover, as commodity exchange increases in importance, the need in legal practice to guarantee or secure such trustworthy conduct becomes proportionally greater. But in the very nature of the case, we cannot, of course, define with formal certainty the legal tests according to which the new relations of trust and confidence are to be governed. Hence, through such ethical (*gesinnungsethisch*) rationalization the courts have been helpful to powerful interests. Also, outside of the sphere of commodity exchange, the rationalization of the law has substituted attitude-evaluation as the significant element for assessment of events according to external criteria. In criminal law, legal rationalization has replaced the purely mechanistic

remedy of vengeance by rational "ends of punishment" of an either ethical or utilitarian character, and has thereby introduced increasingly nonformal elements into legal practice. In the sphere of private law the concern for a party's mental attitude has quite generally entailed evaluation by the judge. "Good faith and fair dealing" or the "good" usage of trade or, in other words, ethical categories have become the test of what the parties are entitled to mean by their "intention."[10] Yet, the reference to the "good" usage of trade implies in substance the recognition of such attitudes which are held by the average party concerned with the case, i.e., a general and purely business criterion of an essentially factual nature, such as the average expectation of the parties in a given transaction. It is this standard which the law has consequently to accept.[11]

Now we have already seen that the expectations of parties will often be disappointed by the results of a strictly professional legal logic.[12] Such disappointments are inevitable indeed where the facts of life are juridically "construed" in order to make them fit the abstract propositions of law and in accordance with the maxim that nothing can exist in the realm of law unless it can be "conceived" by the jurist in conformity with those "principles" which are revealed to him by juristic science. The expectations of the parties are oriented towards the economic or the almost utilitarian *meaning* of a legal proposition. However, from the point of view of legal logic, this *meaning* is an "irrational" one. For example, the layman will never understand why it should be impossible under the traditional definition of larceny to commit a larceny of electric power.[13] It is by no means the peculiar foolishness of modern jurisprudence which leads to such conflicts. To a large extent such conflicts rather are the inevitable consequence of the incompatibility that exists between the intrinsic necessities of logically consistent formal legal thinking and the fact that the legally relevant agreements and activities of private parties are aimed at economic results and oriented towards economically determined expectations. It is for this reason that we find the ever-recurrent protests against the professional legal method of thought as such, which are finding support even in the lawyers' own reflections on their work. But a "lawyers' law" has never been and never will be brought into conformity with lay expectation unless it totally renounce that formal character which is immanent in it. This is just as true of the English law which we glorify so much today,[14] as it has been of the ancient Roman jurists or of the methods of modern continental legal thought. Any attempt, like that of Erich Jung,[15] to replace the antiquated "law of nature" by a new "natural law" aiming at "dispute settlement" (*Streitschlichtung*) in accordance with the average expectations of average parties would thus come up against certain im-

manent limitations. But, nevertheless, this idea does have some validity in relation to the realities of legal history. The Roman law of the later Republic and the Empire developed a type of commercial ethics that was in fact oriented towards that which is to be expected on the average. Such a view means, of course, that only a small group of clearly corrupt or fraudulent practices would be outlawed, and the law would not go beyond what is regarded as the "ethical minimum."[16] In spite of the *bona fides* (which a seller had to display), the maxim of *caveat emptor* remained valid.

New demands for a "social law" to be based upon such emotionally colored ethical postulates as "justice" or "human dignity," and directed against the very dominance of a mere business morality, have arisen with the emergence of the modern class problem. They are advocated not only by labor and other interested groups but also by legal ideologists.[17] By these demands legal formalism itself has been challenged. Such a concept as economic duress,[18] or the attempt to treat as immoral, and thus as invalid, a contract because of a gross disproportion between promise and consideration,[19] are derived from norms which, from the legal standpoint, are entirely amorphous and which are neither juristic nor conventional nor traditional in character but ethical and which claim as their legitimation substantive justice rather than formal legality.

Status ideologies of the lawyers themselves have been operative in legal theory and practice along with those influences which have been engendered by both the social demands of democracy and the welfare ideology of monarchical bureaucracy. Being confined to the interpretation of statutes and contracts, like a slot machine into which one just drops the facts (plus the fee) in order to have it spew out the decision (plus opinion), appears to the modern lawyer as beneath his dignity; and the more universal the codified formal statute law has become, the more unattractive has this notion come to be. The present demand is for "judicial creativeness," at least where the statute is silent. The school of "free law" has undertaken to prove that such silence is the inevitable fate of every statute in view of the irrationality of the facts of life; that in countless instances the application of the statutes as "interpreted" is a delusion, and that the decision is, and ought to be, made in the light of concrete evaluations rather than in accordance with formal norms.[20]

For the case where the statute fails to provide a clear rule, the well-known Article 1 of the Swiss Civil Code orders the judge to decide according to that rule which he himself would promulgate if he were the legislator.[21] This provision, the practical import of which should not be overestimated, however,[22] corresponds formally with the Kantian formula. But in reality a judicial system which would practice such ideals

would, in view of the inevitability of value-compromises, very often have to forget about abstract norms and, at least in cases of conflict, would have to admit concrete evaluations, i.e., not only nonformal but irrational lawfinding. Indeed, the doctrine of the inevitability of gaps in the legal order as well as the campaign to recognize as fiction the systematic coherence of the law has been given further impetus by the assertions that the judicial process never consisted, or, at any rate never should consist, in the "application" of general norms to a concrete case, just as no utterance in language should be regarded as an application of the rules of grammar.[23] In this view, the "legal propositions" are regarded as secondary and as being derived by abstraction from the concrete decisions which, as the products of judicial practice, are said to be the real embodiment of the law. Going still farther, one has pointed out the quantitative infrequency of those cases which ever come to trial and judicial decision as against the tremendous mass of rules by which human behavior is actually determined; from this observation one has come derogatively to call "mere rules of decision" those norms which appear in the judicial process, to contrast them with those norms which are factually valid in the course of everyday life and independently of their reaffirmation or declaration in legal procedure, and, ultimately, to establish the postulate that the true foundation of the law is entirely "sociological."[24]

Use has also been made of the historical fact that for long periods, including our own, private parties have to a large extent been advised by professional lawyers and judges who have had technical legal training or that, in other words, all customary law is in reality lawyers' law. This fact has been associated with the incontrovertible observation that entirely new legal principles are being established not only *praeter legem* but also *contra legem*[25] by judicial practice, for instance, that of the German Supreme Court after the entry into force of the Civil Code. From all these facts the idea was derived that case law is superior to the rational establishment of objective norms and that the expediential balancing of concrete interests is superior to the creation and recognition of "norms" in general.[26] The modern theory of legal sources has thus disintegrated both the half-mystical concept of "customary law," as it had been created by historicism, as well as the equally historicist concept of the "will of the legislator" that could be discovered through the study of the legislative history of an enactment as revealed in committee reports and similar sources. The statute rather than the legislator has been thus proclaimed to be the jurists' main concern. Thus isolated from its background, the "law" is then turned over for elaboration and application to the jurists, among whom the predominant influence is assigned

at one time to the practitioners and at others, for instance, in the reports accompanying certain of the modern codes, to the scholars.[27] In this manner the significance of the legislative determination of a legal command is, under certain circumstances, degraded to the role of a mere "symptom" of either the validity of a legal proposition or even of the mere desire of such validity which, however, until it has been accepted in legal practice, is to remain uncertain. But the preference for a case law which remains in contact with legal reality—which means with the reality of the lawyers—to statute law is in turn subverted by the argument that no precedent should be regarded as binding beyond its concrete facts. The way is thus left open to the free balancing of values in each individual case.

In opposition to all such value-irrationalism, there have also arisen attempts to reëstablish an objective standard of values. The more the impression grows that legal orders as such are no more than "technical tools," the more violently will such degradation be rejected by the lawyers. For to place on the same level such merely "technical rules" as a customs tariff and legal norms concerning marriage, parental power, or the incidents of ownership, offends the sentiment of the legal practitioners, and there emerges the nostalgic notion of a metapositive law above that merely technical positive law which is acknowledged to be subject to change. The old natural law, it is true, looks discredited by the criticisms leveled at it from the historical and positivist points of view. As a substitute there are now advanced the religiously inspired natural law of the Catholic scholars,[28] and certain efforts to deduce objective standards from the "nature" of the law itself. The latter effort has taken two forms. In the *a-prioristic*, Neo-Kantian doctrines, the "right law," as the normative system of a "society of free men," is to be both a legislative standard for rational legislation and a source for judicial decisions where the law refers the judge to apparently nonformal criteria.[29] In the empiricist, Comtean, way those "expectations" which private parties are justified to have in view of the average conception existing with regard to the obligations of others, are to serve as the ultimate standard, which is to be superior even to the statute and which is to replace such concepts as equity, etc., which are felt to be too vague.[30]

At this place we cannot undertake a detailed discussion or a full criticism of these tendencies which, as our brief sketch has shown, have produced quite contradictory answers. All these movements are international in scope, but they have been most pronounced in Germany and France.[31] They are agreed only in their rejection of the once universally accepted and until recently prevalent *petitio principii* of the consistency

and "gaplessness" of the legal order. Moreover, they have directed themselves against very diverse opponents, for instance, in France against the school of the Code-interpreters and in Germany against the methodology of the Pandectists. Depending upon who are the leaders of a particular movement, the results favor either the prestige of "science," i.e., of the legal scholars, or that of the practitioners. As a result of the continuous growth of formal statute law and, especially, of systematic codification, the academic scholars feel themselves to be painfully threatened both in their importance and in their opportunities for unencumbered intellectual activity. The rapid growth of anti-logical as well as the anti-historical movements in Germany can be historically explained by the fear that, following codification, German legal science might have to undergo the same decline which befell French jurisprudence after the enactment of the Napoleonic Code or Prussian jurisprudence after the enactment of the *Allgemeine Landrecht*. Up to this point these fears are thus the result of an internal constellation of intellectual interests. However, all variants of the developments which have led to the rejection of that purely logical systematization of the law as it had been developed by Pandectist learning, including even the irrational variants, are in their turn products of a self-defeating scientific rationalization of legal thought as well as of its relentless self-criticism. To the extent that they do not themselves have a rationalistic character, they are a flight into the irrational and as such a consequence of the increasing rationalization of legal technique. In that respect they are a parallel to the irrationalization of religion. One must not overlook, however, that the same trends have also been inspired by the desire of the modern lawyers, through the pressure groups in which they are so effectively organized, to heighten their feeling of self-importance and to increase their sense of power. This is undoubtedly one of the reasons why in Germany such continuous reference is made to the "distinguished" position of the English judge who is said not to be bound to any rational law. Yet, the differences in the attribution of honorific status on the Continent and in England are rather rooted in circumstances which are connected with differences in the general structure of authority. We have dealt with this before, and shall do so again in a different context.

3. *Contemporary Anglo-American Law*

The differences between Continental and Common Law methods of legal thought have been produced mostly by factors which are respectively connected with the internal structure and the modes of existence

of the legal profession as well as by factors related to differences in political development. The economic elements, however, have been determinative only in connection with these elements. What we are concerned with here is the fact that, once everything is said and done about these differences in historical developments, modern capitalism prospers equally and manifests essentially identical economic traits under legal systems containing rules and institutions which considerably differ from each other at least from the juridical point of view. Even what is on the face of it so fundamental a concept of Continental law as *dominium* still does not exist in Anglo-American law.[32] Indeed, we may say that the legal systems under which modern capitalism has been prospering differ profoundly from each other even in their ultimate principles of formal structure.

Even today, and in spite of all influences by the ever more rigorous demands for academic training, English legal thought is essentially an empirical art. Precedent still fully retains its old significance, except that it is regarded as unfair to invoke a case from too remote a past, which means older than about a century. One can also still observe the charismatic character of lawfinding, especially, although not exclusively, in the new countries, and quite particularly the United States. In practice, varying significance is given to a decided case not only, as happens everywhere, in accordance with the hierarchal position of the court by which it was decided but also in accordance with the very personal authority of an individual judge. This is true for the entire common-law sphere, as illustrated, for instance, by the prestige of Lord Mansfield. But in the American view, the judgment is the very personal creation of the concrete individual judge, to whom one is accustomed to refer by name, in contrast to the impersonal "District Court" of Continental-European officialese. The English judge, too, lays claim to such a position. All these circumstances are tied up with the fact that the degree of legal rationality is essentially lower than, and of a type different from, that of continental Europe. Up to the recent past, and at any rate up to the time of Austin, there was practically no English legal science which would have merited the name of "learning" in the Continental sense. This fact alone would have sufficed to render any such codification as was desired by Bentham practically impossible. But it is also this feature which has been responsible for the "practical" adaptability of English law and its "practical" character from the standpoint of the public.

The legal thinking of the layman is, on the one hand, literalistic. He tends to be a definition-monger when he believes he is arguing "legally." Closely connected with this trait is the tendency to draw conclusions from individual case to individual case; the abstractionism of the "pro-

fessional" lawyer is far from the layman's mind. In both respects, however, the art of empirical jurisprudence is cognate to him, although he may not like it. No country, indeed, has produced more bitter complaints and satires about the legal profession than England. The formularies of the conveyancers, too, may be quite unintelligible to the layman, as again is the case in England. Yet, he can understand the basic character of the English way of legal thinking, he can identify himself with it and, above all, he can make his peace with it by retaining once and for all a solicitor as his legal father confessor for all contingencies of life, as is indeed done by practically every English businessman. He simply neither demands nor expects of the law anything which could be frustrated by "logical" legal construction.

Safety valves are also provided against legal formalism. As a matter of fact, in the sphere of private law, both Common Law and Equity are "formalistic" to a considerable extent in their practical treatment. It could hardly be otherwise under the traditionalist spirit of the legal profession. But the institution of the civil jury imposes on rationality limits which are not merely accepted as inevitable but are actually prized because of the binding force of precedent and the fear that a precedent might thus create "bad law" in a sphere which one wishes to keep open for a concrete balancing of interests. We must forego the analysis of the way in which this division of the two spheres of *stare decisis* and concrete balancing of interests is actually functioning in practice. It does in any case represent a softening of rationality in the administration of justice. Alongside all this we find the still quite patriarchal, summary and highly irrational jurisdiction of the justices of the peace. They deal with the petty causes of everyday life and, as can be readily seen in Mendelssohn's description, they represent a kind of kadi justice which is quite unknown in Germany.[33] All in all, the Common Law thus presents a picture of an administration of justice which in the most fundamental formal features of both substantive law and procedure differs from the structure of Continental law as much as is possible within a secular system of justice, that is, a system that is free from theocratic and patrimonial powers. Quite definitely, English law-finding is not, like that of the Continent, "application" of "legal propositions" logically derived from statutory texts.

These differences have had some tangible consequences both economically and socially; but these consequences have all been isolated single phenomena rather than differences touching upon the total structure of the economic system. For the development of capitalism two features of Common Law have been relevant and both have helped to support the capitalistic system. Legal training has primarily been in the

hands of the lawyers from among whom also the judges are recruited, i.e., in the hands of a group which is active in the service of propertied, and particularly capitalistic, private interests and which has to gain its livelihood from them. Furthermore and in close connection with this, the concentration of the administration of justice at the central courts in London and its extreme costliness have amounted almost to a denial of access to the courts for those with inadequate means. At any rate, the essential similarity of the capitalistic development on the Continent and in England has not been able to eliminate the sharp contrasts between the two types of legal systems. Nor is there any visible tendency towards a transformation of the English legal system in the direction of the Continental under the impetus of the capitalist economy. On the contrary, wherever the two kinds of administration of justice and of legal training have had the opportunity to compete with one another, as for instance in Canada, the Common Law way has come out on top and has overcome the Continental alternative rather quickly. We may thus conclude that capitalism has not been a decisive factor in the promotion of that form of rationalization of the law which has been peculiar to the continental West ever since the rise of Romanist studies in the medieval universities.

4. *Lay Justice and Corporative Tendencies in the Modern Legal Profession*

Modern social development, aside from the already mentioned political and internal professional motives, has given rise to certain other factors by which formal legal rationalism is being weakened. Irrational kadi justice is exercised today in criminal cases clearly and extensively in the "popular" justice of the jury.[84] It appeals to the sentiments of the layman, who feels annoyed whenever he meets with formalism in a concrete case, and it satisfies the emotional demands of those underprivileged classes which clamor for substantive justice.

Against this "popular justice" element of the jury system, attacks have been directed from two quarters. The jury has been attacked because of the strong interest orientation of the jurors as against the technical matter-of-factness of the specialist. Just as in ancient Rome the jurors' list was the object of class conflict, so today the selection of jurors is attacked, especially by the working class, as favoring class justice, upon the ground that the jurors, even though they may be "plebeians," are picked predominantly from among those who can afford the loss of time. Although such a test of selection can hardly be avoided

entirely, it also depends, in part at least, on political considerations. Where, on the other hand, the jurors' bench is occupied by working-class people, it is attacked by the propertied class. Moreover, not only "classes" as such are the interested parties. In Germany, for instance, male jurors can practically never be moved to find a fellow male guilty of rape, especially where they are not absolutely convinced of the girl's chaste character. But in this connection we must consider that in Germany female virtue is not held in great respect anyway.

From the standpoint of professional legal training lay justice has been criticized on the ground that the laymen's verdict is delivered as an irrational oracle without any statement of reasons and without the possibility of any substantive criticism. Thus one has come to demand that the lay judges be subjected to the control of the legal experts. In answer to this demand there was created the system of the mixed bench, which, however, experience has shown to be a system in which the laymen's influence is inferior to that of the experts. Thus their presence has practically no more significance than that of giving some compulsory publicity to the deliberation of professional judges in a way similar to that of Switzerland, where the judges must hold their deliberation in full view of the public. The professional judges, in turn, are threatened, in the sphere of criminal law, by the overshadowing power of the professional psychiatrist, onto whom more and more responsibility is passed, especially in the most serious cases, and on whom rationalism is thus imposing a task which can by no means be solved by means of pure science.

Obviously all of these conflicts are caused by the course of technical and economic development only indirectly, namely in so far as it has favored intellectualism. Primarily they are rather consequences of the insoluble conflict between the formal and the substantive principles of justice, which may clash with one another even where their respective protagonists belong to one and the same social class. Moreover, it is by no means certain that those classes which are negatively privileged today, especially the working class, may safely expect from an informal administration of justice those results which are claimed for it by the ideology of the jurists. A bureaucratized judiciary, which is being planfully recruited in the higher ranks from among the personnel of the career service of the prosecutor's office and which is completely dependent on the politically ruling powers for advancement, cannot be set alongside the Swiss or English judiciary, and even less the (Federal) judges in the United States. If one takes away from such judges their belief in the sacredness of the purely objective legal formalism and directs them simply to balance interests, the result will be

very different from those legal systems to which we have just referred. However, the problem does not belong to this discussion. There remains only the task of correcting a few historical errors.

Prophets are the only ones who have taken a really consciously "creative" attitude toward existing law; only through them has new law been consciously created. For the rest, as must be stressed again and again, even those jurists who, from the objective point of view, have been the most creative ones, have always and not only in modern times, regarded themselves to be but the mouthpiece of norms already existing, though, perhaps, only latently, and to be their interpreters or appliers rather than their creators. This subjective belief is held by even the most eminent jurists. It is due to the disillusionment of the intellectuals that today this belief is being confronted with objectively different facts and that one is trying to elevate this state of facts to the status of a norm for subjective judicial behavior. As the bureaucratization of formal legislation progresses, the traditional position of the English judge is also likely to be transformed permanently and profoundly. On the other hand, it may be doubted whether, in a code country, the bestowal of the "creator's" crown upon bureaucratic judges will really turn them into law prophets. In any case, the juristic precision of judicial opinions will be seriously impaired if sociological, economic, or ethical argument were to take the place of legal concepts.

All in all the movement is one of those characteristic reactions against the dominance of "specialization" and rationalism, which latter has in the last analysis been its very parent. The development of the formal qualities of the law certainly shows some peculiarly antinomial traits. Rigorously formalistic and dependent on what is tangibly perceivable as far as it is required for security to do business, the law has at the same time become informal for the sake of business good-will where this is required by the logical interpretation of the intention of the parties or by the "good usage" of business intercourse, interpreted as some "ethical minimum."

The law is drawn into antiformal directions, moreover, by all those powers which demand that it be more than a mere means of pacifying conflicts of interest. These forces include the demand for substantive justice by certain social class interests and ideologies; they also include the tendencies inherent in certain forms of political authority of either authoritarian or democratic character concerning the ends of law which are respectively appropriate to them; and also the demand of the "laity" for a system of justice which would be intelligible to them; finally, as we have seen, anti-formal tendencies are being promoted by the ideologically rooted power aspirations of the legal profession itself.

Whatever form law and legal practice may come to assume under the impact of these various influences, it will be inevitable that, as a result of technical and economic developments, the legal ignorance of the layman will increase. The use of jurors and similar lay judges will not suffice to stop the continuous growth of the technical elements in the law and hence of its character as a specialists' domain. Inevitably the notion must expand that the law is a rational technical apparatus, which is continually transformable in the light of expediential considerations and devoid of all sacredness of content. This fate may be obscured by the tendency of acquiescence in the existing law, which is growing in many ways for several reasons, but it cannot really be stayed. All of the modern sociological and philosophical analyses, many of which are of a high scholarly value, can only contribute to strengthen this impression, regardless of the content of their theories concerning the nature of law and the judicial process.

NOTES

1. These transactions, which are enumerated in Sec. 1 of the German Commercial Code of 1861/97, are the following:

(a) purchase and resale of commodities or securities such as bonds; (b) enterprise by an independent contractor to do work on materials or goods supplied by the other party; (c) underwriting of insurance; (d) banking; (e) transportation of goods or passengers, on land, at sea, and on inland waterways; (f) transactions of factors, brokers, forwarding agents, and warehousemen; (g) transactions of commercial brokers, jobbers, and agents; (h) transactions of publishers, book and art dealers; (i) transactions of printers.

2. The German Commercial Code, in Sec. 2, has the following definition: "Any enterprise which requires an established business because of its size or because of the manner in which it is carried on, is a commercial enterprise, even though it does not fall within any of the categories stated in Sec. 1." Similarly, the French Commercial Code of 1807 states in Art. 1: "Merchants are all those who carry on commercial transactions and make this activity their habit and profession."

3. *Handelsregister* (register of firms): cf. Commercial Code, Secs. 2, 5, 8, *et seq.*

4. The most important special law of this kind is the labor law with its special hierarchy of labor courts. There are, furthermore, the administrative tribunals of general administrative jurisdiction and a set of special tribunals dealing respectively with claims arising under the social security laws or the war pensions laws, with tax matters, with certain matters of agricultural administration, etc.

5. Both the commercial and the labor courts are usually organized in panels chosen from those lines of business or industry whose affairs are dealt with by the particular division of the court. Cf. ARBEITSGERICHTSGESETZ of 23 December, 1926 (R.G. BL. I., 507), Sec. 17.

6. In the labor courts representation by attorneys is, as a general rule, not

permitted at the trial stage (ARBEITSGERICHTSGESETZ of 23 December, 1926 [R.G. BL. I, 507], Sec. 11).

7. Roman-canonical procedure, as it had come to be adopted generally in the continental courts, was characterized by its system of "formal proof," which was in many respects similiar to the law of evidence of Anglo-American procedure. There were rules about exclusion of certain kinds of evidence and, quite particularly, detailed rules about corroboration and about the mechanical ways in which the judge had to evaluate conflicting evidence. The testimony of two credible witnesses constituted full proof (*probatio plena*); one credible witness made half proof (*probatio semiplena*), but one doubtful witness (*testis suspectus*) made less than half proof (*probatio semiplena minor*), etc.

This entire system of formal proof was swept away by the procedural reforms of the nineteenth century and replaced by the system of free or rational proof, which did away with most of the exclusionary rules, released the judge from his arithmetical shackles, and authorized him to evaluate the evidence in the light of experience and reason. Cf. ENGELMANN-MILLAR 39.

8. Together with the rule of stare decisis and, to some extent, the jury system, the fact that the Common Law has preserved a much more formalistic law of evidence is the principal cause why in such fields as torts, damages, interpretation and construction of legal instruments, English and American law have developed so much more numerous and detailed rules of law than the systems of the Civil Law. The comparison, for instance, of the 951 sections of the Restatement of Torts and the 31 sections dealing with torts in the German Civil Code (Secs. 823–853) or the 5 sections of the French Code (Arts. 1382–86) is revealing in this respect, just as is the comparison of the few sections of the German Code dealing with the interpretation of wills (Secs. 2087 *et seq.*) with the elaborate treatment of the topic in American law.

As to the law of evidence itself, compare the ten volumes of Wigmore's treatise (3rd ed. 1940) with the complete absence of books on evidence in Germany or the brief treatment of a few evidentiary problems in the French treatises on private law, for instance, in JOSSERAND'S COURS DE DROIT CIVIL POSITIF FRANCAIS (1939) where the chapter on "preuves" covers 43 pages.

9. Cf. HEDEMANN I, 117.

10. For illustrations of this judicial attitude see the case surveys given in connection with Sec. 242 of the German Civil Code (good faith and fair dealing) or Sec. 346 of the Commercial Code ("good" custom of trade) in the annotated editions of these Codes. The dangers of excessive judicial resort to legal provisions referring the judge to such indefinite standards have been pointed out by HEDEMANN, DIE FLUCHT IN DIE GENERALKLAUSELN, EINE GEFAHR FÜR RECHT UND STAAT (1933).

11. The German Supreme Court has consistently maintained, however, that a usage is not to be considered when it is unfair, and especially when it constitutes a gross abuse of a position of economic power; see, for instance, 114 ENTSCHEIDUNGEN DES REICHSGERICHTS IN ZIVILSACHEN 97; [1922] JURISTISCHE WOCHENSCHRIFT 488; [1932] o.c. 586.

12. The possibilities of such discrepancies have been pointed out especially in the writings of Heck and other advocates of the "jurisprudence of interests." See in this respect THE JURISPRUDENCE OF INTERESTS, vol. II of this 20th Century Legal Philosophy Series.

13. Such was the decision of the German Supreme Court in 29 ENTSCHEIDUNGEN DES REICHSGERICHTS IN STRAFSACHEN 111 and 32 o.c. 165. In Sec. 242 of the German Criminal Code larceny is defined as the unlawful taking of a

chattel. Electric power is not a chattel; hence it cannot be the subject matter of larceny. The gap in the law was filled by the enactment of a Special Law Concerning the Unlawful Taking of Electric Power, of 9 April 1900 (R.G. Bl. 1900, 228). The decisions just mentioned have become the stock "horrible" in modern German excoriations of conceptual jurisprudence.

14. In the years preceding the First World War the English administration of justice and, particularly, the creative role and prominent position of the English "judicial kings" (*Richterkönige*) were highly praised and advocated for adoption, particularly by A. Mendelssohn Bartholdy, Imperium des Richters (1908), and F. Adickes, Grundlinien einer durchgreifenden Justizreform (1906).

15. Das Problem des natürlichen Rechts (1912).

16. Expression of G. Jellinek, in Die sozial-ethische Bedeutung von Recht, Unrecht und Strafe (2nd ed. 1908).

17. On Gierke as the leading legal scholar in the movement for law as an expression of "social justice," see G. Böhmer, Grundlagen der bürgerlichen Rechtsordnung (1951) II, 155; see, especially, Gierke's lecture on The Social Task of Private Law (Die soziale Aufgabe des Privatrechts, 1899), repr. E. Wolf, Deutsches Rechtsdenken (1948).

18. On the development of the doctrine of economic duress in positive German law, see J. Dawson, *Economic Duress and the Fair Exchange in French and German Law* (1937), 12 Tulane L. Rev. 42.

19. In Sec. 138 the German Civil Code provides as follows:

"A legal transaction which violates good morals is void.

"Void, in particular, is any transaction in which one party, by exploiting the emergency situation, the imprudence, or the inexperience of another causes such other person to promise or to give to him or to a third person a pecuniary benefit which so transcends the value of his own performance that under the circumstances of the case the relationship between them appears as manifestly disproportionate."

20. The School of Free Law (*Freirecht*) constitutes the German counterpart of American and Scandinavian "realism." The basic theoretical idea of these three schools, viz., that law is not "found" by the judges but "made" by them, was anticipated in 1885 by Oskar Bülow in his Gesetz und Richteramt. The first attack upon the Pandectist "Konstruktionsjurisprudenz" (conceptual jurisprudence) or, in Weber's terminology, rational formalism, was made in 1848 by v. Kirchmann in his sensational pamphlet Über die Wertlosigkeit der Jurisprudenz als Wissenschaft. The attack was later joined by no less a scholar than Jhering, who until then had been one of the most prominent expounders of the traditional method, but who now came to emphasize the role of the law as a means to obtain utilitarian ends in a way which would now be called "social engineering" or, in Weber's terms, "substantive rationality" (Der Zweck im Recht, 1877/83; Husik's tr. s.t. Law as a Means to an End, 1913) and to ridicule legal conceptualism in his Scherz und Ernst in der Jurisprudenz (1855; on Jhering see Stone 299). At the turn of the century the attack was intensified and combined with the postulates that the courts should shake off the technique of conceptual jurisprudence (i.e., in Weber's terminology, the technique of rational formalism), should give up the fiction of the gaplessness of the legal order, should thus treat statutes and codes as ordaining nothing beyond the narrowest meaning of the words of the text, and should fill in the gaps thus created, i.e., in the great mass of problems, in a process of free, "kingly" creativeness. The leaders of this movement were E. Fuchs, a practicing attorney (principal works: Die Gemeinschädlichkeit der konstruktiven Jurisprudenz

["The Dangers of the Conceptual Jurisprudence to the Common Weal," 1909]; WAS WILL DIE FREIRECHTSSCHULE? ["What Are the Aims of the School of Free Law?" 1929]). Professor H. Kantorowicz (writing under the pen name of Gnaeus Flavius: DER KAMPF UM DIE RECHTSWISSENSCHAFT [1908]; AUS DER VORGESCHICHTE DER FREIRECHTSLEHRE [1925]; see also the article by him and E. Patterson, *Legal Science—a Summary of its Methodology* [1928], 28 COL. L. REV. 679, and *Some Rationalizations about Realism* [1934], 43 YALE L.J., 1240, where Kantorowicz recedes from some of his earlier theses), and the judge J. G. Gmelin (QUOUSQUE? BEITRAG ZUR SOZIOLOGISCHEN RECHTSFINDUNG [1910, Bruncken's transl. in Modern Legal Philosophy Series, IX, SCIENCE OF LEGAL METHOD (1917)]). These passionate radicals were joined by E. Ehrlich, who provided for the new movement a broad historical and sociological basis (FREIE RECHTSFINDUNG UND FREIE RECHTSWISSENSCHAFT [1903, Bruncken's transl. in Modern Legal Philosophy Series, IX. SCIENCE OF LEGAL METHOD (1917), 47]; *Die juristische Logik* [1918], 115 ARCHIV FÜR DIE CIVILISTISCHE PRAXIS, nos. 2 and 3, repr. as a book in 1925; and his GRUNDLEGUNG DER SOZIOLOGIE DES RECHTS [1913], Moll's transl. s.t. FUNDAMENTAL PRINCIPLES OF THE SOCIOLOGY OF LAW [1936]).

The movement stirred up violent discussion (see especially H. REICHEL, GESETZ UND RICHTERSPRUCH [1915]; G. BÖHMER, GRUNDLAGEN DER BÜRGERLICHEN RECHTSORDNUNG [1951], II, 158) and also found some attention in the United States. (See the translations listed above in this note.) Its exaggerations were generally repudiated, however, and actual developments came to be more effectively influenced by the ideas of the so-called school of jurisprudence of interests, whose principal writings are collected in vol. II of this 20th Century Legal Philosophy Series, entitled THE JURISPRUDENCE OF INTERESTS (1948). The method was elaborated primarily by M. Rümelin, P. Heck, and their companions at Tübingen, and R. Müller-Erzbach, who has been working at the elaboration of social and concrete bases for that "balancing of interests" which the method requires (see especially DAS PRIVATE RECHT DER MITGLIEDSCHAFT ALS PRÜFSTEIN EINES KAUSALEN RECHTSDENKENS [1948] and DIE RECHTSWISSENSCHAFT IM UMBAU [1950]). The Jurisprudence of Interests is close to Roscoe Pound's sociological jurisprudence. It aims at replacing the system of formally rational with one of substantively rational concepts, and it has come to establish itself firmly in German legal practice (for a concise survey and evaluation see BÖHMER, *op. cit.* 190, and, very brief, W. FRIEDMANN, LEGAL THEORY [2nd ed. 1949] 225; no complete survey is as yet available in English).

The following passages in Weber's text are concerned with the School of Free Law.

21. "The law must be applied in all cases which come within the letter or the spirit of its provisions.

"Where no provision is applicable, the judge shall decide according to the existing customary law and, in default thereof, according to the rule which he would lay down if he had himself to act as legislator.

"Herein he must be guided by tested doctrine and tradition."

22. Cf. I. WILLIAMS, THE SOURCES OF LAW IN THE SWISS CIVIL CODE (1923) 34; see also the discussion of this provision and the similarly worded Sec. 1 of the Civil Code of the Russian Federal Soviet Socialist Republic by V. E. Greaves, *Social-economic Purpose of Private Rights* (1934/5, 12 N.Y.U.L.Q. REV. 165, 439).

23. Cf. H. ISAY, RECHTSNORM UND ENTSCHEIDUNG (1929).

24. Cf. EHRLICH, esp. chapters 5 and 6.

25. *Praeter legem*—alongside the (statute) law; *contra legem*—in contradiction to the (statute) law.

26. So especially LAMBERT, *op. cit.* (1903); EHRLICH.

27. In the last two sentences of the text three different phenomena are brought together in a way which indicates the possibility that some connecting link has been omitted The postulate that in statutory interpretation the judge has to look upon the text "objectively" as a self-sufficient entity and that he should not, or that he is not even allowed to, inquire into the intentions of the legislature has not been confined to Germany. It has long been the established method of statutory interpretation in England and for a considerable time it was dominant in the United States. In Germany its principal representatives were A. Wach (HANDBUCH DES ZIVILPROZESSES [1885]) and K. Binding (HANDBUCH DES STRAFRECHTS [1885]); see also J. Kohler, *Über die Interpretation von Gesetzen* (1886), 13 GRÜNHUT'S ZEITSCHRIFT 1. The theory has had some influence on the German courts but could not prevent them in the long run from paying careful attention to parliamentary hearings and other legislative materials.

The idea that statutes ought to be interpreted narrowly so as to leave free reign to free judicial law creation in the interstices constituted one of the postulates of the School of Free Law (see *supra* n. 20).

The phrase that the solution of certain problems be left to "legal science and doctrine" recurs constantly in the report (*Motive*) accompanying the Draft of the German Civil Code. The draftsmen used it whenever they felt that too much detail would be detrimental to the purposes of the codification. It is difficult to see what it might have to do with the Free Law tenet stated in the following sentence of the text.

28. Especially VICTOR CATHREIN, RECHT, NATURRECHT UND POSITIVES RECHT (2nd ed. 1909); v. HERTLING, RECHT, STAAT UND GESELLSCHAFT (4th ed. 1917); MAUSBACH, NATURRECHT UND VÖLKERRECHT (1918); more recently H. ROMMEN, DIE EWIGE WIEDERKEHR DES NATURRECHTS (1936; Hanley's transl. s.t. THE NATURAL LAW, 1948), and the survey of the latest Catholic literature by I. Zeiger *in* (1952) 149 STIMMEN DER ZEIT 468.

29. On Neo-Kantianism, see FRIEDMANN, *op. cit.*, 91; the principal representative is R. Stammler, whose LEHRE VON DEM RICHTIGEN RECHT (1902) has been translated by Husik s.t. THE THEORY OF JUSTICE (1925). For a trenchant criticism, see E. KAUFMANN, KRITIK DER NEUKANTISCHEN RECHTSPHILOSOPHIE (1921).

30. The reference is to the continuation and elaboration of Jhering's ideas through the school of jurisprudence of interests; see *supra*, n. 20.

31. On French legal theory, see vol. VII of the Modern Legal Philosophy Series: MODERN FRENCH LEGAL PHILOSOPHY (1916) containing writings by A. Fouillée, J. Charmont, L. Duguit, and R. Demogue. A comprehensive, critical history is presented by J. BONNECASE, LA PENSÉE JURIDIQUE FRANÇAISE DE 1804 À L'HEURE PRÉSENTE (1933). Cf. also in the 20th Century Legal Philosophy Series, vol. IV, THE LEGAL PHILOSOPHIES OF LASK, RADBRUCH, AND DABIN (1950) 227; and, for latest trends, B. Horváth, *Social Value and Reality in Current French Legal Thought* (1952), 1 AM. J. OF COMPAR. LAW 243.

The principal representatives of the trends mentioned by Weber are François Gény, the founder of the French counterpart to the jurisprudence of interests (MÉTHODE D'INTERPRÉTATION [1899]; cf. his article in Modern Legal Philosophy Series, vol. IX, SCIENCE OF LEGAL METHOD [1917] 498); the sociological jurists Edouard Lambert (*op. cit.*), Léon Duguit (LE DROIT SOCIAL, LE DROIT INDIVIDUEL, ET LA TRANSFORMATION DE L'ÉTAT [1910]; L'ÉTAT, LE DROIT OBJECTIF

ET LA LOI POSITIVE [1901]; LES TRANSFORMATIONS GÉNÉRALES DU DROIT PRIVÉ [1912], transl. in Continental Legal History Series, vol. XI, s.t. THE PROGRESS OF CONTINENTAL LAW IN THE 19TH CENTURY [1918]; LES TRANSFORMATIONS DU DROIT PUBLIC [1913], transl. by Laski s.t. LAW IN THE MODERN STATE [1919]), and RAYMOND SALEILLES (MÉTHODE ET CODIFICATION [1903]; *Le code civil et la méthode historique* in LIVRE DU CENTENAIRE DU CODE CIVIL [1904]).

32. Apparently Weber was not conversant with recent common law use of the concept of title. In the classical form of the law of real property, it is true, the various ways in which one might be entitled to the use and disposition of a piece of land were defined by the various tenures, estates, and other rights in land which had come to be recognized in the royal courts of law and equity. There did not exist, however, any term which comprehensively covered, like the Roman term *dominium*, the fullness of all rights, privileges, powers, and immunities, which can possibly exist in a piece of land. But in modern usage the terms of title, fee, or fee title, are generally used in exactly this sense, especially in the United States.

33. *Das Imperium des Richters* (1908).

34. Written before the abolition of the jury in Germany by the Law of 1924; see *infra*, ch. XI:6.

CHAPTER IX

POLITICAL COMMUNITIES

1. *Nature and "Legitimacy" of Territorial Political Organizations*

The term "political community" shall apply to a community whose social action is aimed at subordinating to orderly domination by the participants a "territory" and the conduct of the persons within it, through readiness to resort to physical force, including normally force of arms. The territory must at any time be in some way determinable, but it need not be constant or definitely limited. The persons are those who are in the territory either permanently or temporarily. Also, the aim of the participants may be to acquire additional territory for themselves.[1]

"Political" community in this sense has existed neither everywhere nor always. As a separate community it does not exist wherever the task of armed defense against enemies has been assigned to the household, the neighborhood association, or some association of a different kind and essentially oriented toward economic interests. Nor has political community existed everywhere and at all times in the sense that its conceptual minimum, viz., "forcible maintenance of orderly dominion over a territory and its inhabitants," be conceived necessarily as the function of one and the same community. The tasks implied in this function have often been distributed among several communities whose actions partly complement and partly overlap each other. For example, "external" violence and defense have often been in the hands partly of kinship groups, partly of neighborhood associations, and partly of warrior consociations established *ad hoc*. "Internal" domination of the "territory" and the control of intragroup relations have likewise been distributed among various powers, including religious ones; and even in so

far as violence has been used it has not necessarily been monopolized by any one community. Under certain circumstances, "external" violence can even be rejected in principle, as it was, for a while, by the community of the Pennsylvania Quakers; at any rate, organized preparation for its use may be entirely lacking. As a rule, however, readiness to apply violence is associated with domination over a territory.

As a separate structure, a political community can be said to exist only if, and in so far as, a community constitutes more than an "economic group"; or, in other words, in so far as it possesses value systems ordering matters other than the directly economic disposition of goods and services. The particular content of social action, beyond the forcible domination of territory and inhabitants, is conceptually irrelevant. It may vary greatly according to whether we deal with a "robber state," a "welfare state," a "constitutional," or a "culture" state. Owing to the drastic nature of its means of control, the political association is particularly capable of arrogating to itself all the possible values toward which associational conduct might be oriented, there is probably nothing in the world which at one time or another has not been an object of social action on the part of some political association.

On the other hand, a political community may restrict its social action exclusively to the bare maintenance of its dominion over a territory, and it has in fact done so frequently enough. Even in the exercise of this function, the action of a political community is, in many cases, intermittent, no matter what its general level of development may be in other respects. Such action flares up in response to external threat or to an internal sudden impulse to violence, however motivated; it dies down, yielding factually to a state of "anarchy" during "normal" peaceful times, when coexistence and social action on the part of the inhabitants of the territory take the form of merely factual mutual respect for the accustomed economic spheres, without the availability of any kind of coercion either for external or for internal use.

In our terminology, a separate "political" community is constituted where we find (1) a "territory"; (2) the availability of physical force for its domination; and (3) social action which is not restricted exclusively to the satisfaction of common economic needs in the frame of a communal economy, but regulates more generally the interrelations of the inhabitants of the territory.

The opponents against whom the possibly violent social action is directed may be located outside or inside the boundaries of the territory in question. Since the political power has become the monopoly of organized, today "institutional," action, the objects of coercion are to be found primarily among the compulsory members of the organization.

For the political community, even more than other institutionally organized communities, is so constituted that it imposes obligations on the individual members which many of them fulfill only because they are aware of the probability of physical coercion backing up such obligations. The political community, furthermore, is one of those communities whose action includes, at least under normal circumstances, coercion through jeopardy and destruction of life and freedom of movement applying to outsiders as well as to the members themselves. The individual is expected ultimately to face death in the group interest. This gives to the political community its particular pathos and raises its enduring emotional foundations. The community of political destiny, i.e., above all, of common political struggle of life and death, has given rise to groups with joint memories which often have had a deeper impact than the ties of merely cultural, linguistic, or ethnic community. It is this "community of memories" which, as we shall see [see sec. 5 below], constitutes the ultimately decisive element of "national consciousness."

The political community never has been, nor is it today, the only community in which the renunciation of life is an essential part of the shared obligations. The obligations of other groups may lead to the same extreme consequences. To name but a few: blood vengeance on the part of kinship groups; martyrdom in religious communities; the "code of honor" of status groups; or the demands of a good many athletic associations; of groups like the *Camorra*[2] or, especially, of all groups created for the purpose of violent appropriation of the economic goods of others.

From such groups the political community differs, sociologically, in only one respect, viz., its particularly enduring and manifest existence as a well-established power over a considerable territory of land and possibly also sea expanse. Accordingly, the differentiation between the political community on the one hand and, on the other, the groups enumerated above, becomes less clearly perceptible the further we go back in history. In the minds of the participants the notion that the political community is just one among others turns into the recognition of its qualitatively different character in step with the change of its activities from merely intermittent reaction to active threats into a permanent and institutionalized consociation whose coercive means are both drastic and effective but which also create the possibility of a rationally casuistic order for their application.

The modern position of political associations rests on the prestige bestowed upon them by the belief, held by their members, in a specific consecration: the "legitimacy" of that social action which is ordered

and regulated by them. This prestige is particularly powerful where, and in so far as, social action comprises physical coercion, including the power to dispose over life and death. It is on this prestige that the consensus on the specific legitimacy of action is founded.

The belief in the specific legitimacy of political action can, and under modern conditions actually does, increase to a point where only certain political communities, viz., the "states," are considered to be capable of "legitimizing," by virtue of mandate or permission, the exercise of physical coercion by any other community. For the purpose of threatening and exercising such coercion, the fully matured political community has developed a system of casuistic rules to which that particular "legitimacy" is imputed. This system of rules constitutes the "legal order," and the political community is regarded as its sole normal creator, since that community has, in modern times, normally usurped the monopoly of the power to compel by physical coercion respect for those rules.

This preëminence of the "legal order" guaranteed by the political power has arisen only in the course of a very gradual development. It was due to the fact that those other groups which once had exercised their own coercive powers lost their grip on the individual. Under the pressure of economic and structural displacements they either disintegrated or subjected themselves to the political community which would then delegate to them their coercive powers, but would simultaneously also reduce them.

The rise to preëminence of the politically guaranteed legal order was also due to the simultaneous development of constantly arising new interests requiring a protection which could not be provided within the earlier autonomous communities. Consequently, a steadily widening sphere of interests, especially economic ones, could find adequate protection only in those rationally regulated guaranties which none but the political community was able to create. The process by which this "nationalization" of all "legal norms" took place, and is still taking place, has been discussed elsewhere.[3]

2. *Stages in the Formation of Political Association*

Violent social action is obviously something absolutely primordial. Every group, from the household to the political party, has always resorted to physical violence when it had to protect the interests of its members and was capable of doing so. However, the monopolization of legitimate violence by the political-territorial association and its

rational consociation into an institutional order is nothing primordial, but a product of evolution.

Where economic conditions are undifferentiated, it is hardly possible to discern a special political community. As we consider them today, the basic functions of the "state" are: the enactment of law (legislative function); the protection of personal safety and public order (police); the protection of vested rights (administration of justice); the cultivation of hygienic, educational, social-welfare, and other cultural interests (the various branches of administration); and, last but not least, the organized armed protection against outside attack (military administration). These basic functions are either totally lacking under primitive conditions, or they lack any form of rational order. They are performed, instead, by amorphous *ad hoc* groups, or they are distributed among a variety of groups such as the household, the kinship group, the neighborhood association, the rural commune, and completely voluntary associations formed for some specific purpose. Furthermore, private association enters domains of action which we are used to regard exclusively as the sphere of political associations. Police functions are thus performed in West Africa by private secret societies.[4] Hence one cannot even include the maintenance of internal peace as a necessary component of the general concept of political action.

If the idea of a specific legitimacy of violence is connected with any particular type of consensual action, it is with that of the kinship group in the fulfillment of the obligation of blood vengeance. This connection is weak, on the other hand, with regard to organizational action of a military type, directed against an external enemy, or of a police type, directed against the disturbers of internal order. It becomes more clearly perceptible where a territorial association is attacked by an external enemy in its traditional domain, and arms are taken up by the members in the manner of a home guard. Increasing rational precautions against such eventualities may engender a political organization regarded as enjoying a particular legitimacy. Such an organization can emerge as soon as there exists a certain stability of usages as well as at least a rudimentary corporate apparatus, ready to take precautions against violent attack from without. This, however, represents a fairly advanced stage.

The fact that "legitimacy" originally had little bearing upon violence—in the sense that it was not bound by norms—can be observed even more clearly in situations where the most warlike members of a group on their own initiative consociate through personal fraternization to organize marauding raids. This has been, at all stages of economic development up to the formation of the rational state, the typical

way in which aggressive wars were initiated in sedentary societies. The freely selected leader is then normally legitimated by his personal qualities (charisma), and we have discussed elsewhere the kind of structure of domination which then emerges. Violence acquires legitimacy only in those cases, however—at least initially—in which it is directed against members of the fraternity who have acted treasonably or who have harmed it by disobedience or cowardice. This state is transcended gradually, as this *ad hoc* consociation develops into a permanent structure. Through the cultivation of military prowess and war as a vocation such a structure develops into a coercive apparatus able to lay effective and comprehensive claims to obedience. These claims will be directed against the inhabitants of conquered territories as well as against the militarily unfit members of the territorial community from which the warriors' fraternity has emerged. The bearer of arms acknowledges only those capable of bearing arms as political equals. All others, those untrained in arms and those incapable of bearing arms, are regarded as women and are explicitly designated as such in many primitive languages. Within these consociations of warriors freedom is identical with the right to bear arms. The men's house, which has been studied by Schurtz with so much sympathetic care, and which, in various forms, recurs in all parts of the world, is one of those structures resulting eventually from such a consociation of warriors, or, in Schurtz's terminology, a "men's league." In the sphere of political action—assuming a highly developed profession of warriors—it is the almost exact counterpart to the consociation of monks in the monastery in the religious sphere. Only those are members who have demonstrated prowess in the use of arms and have been taken into the warriors' brotherhood after a novitiate, while he who has not passed the test remains outside as a "woman," among the women and children, who are also joined by those no longer capable of bearing arms. The man enters a family household only when he has reached a certain age, a change in status analogous to the present-day transfer to the reserves after service as a draftee. Until that moment the man belongs to the warriors' fraternity with every fiber of his existence. The members of the fraternity live, as a communistic association, apart from wives and households. They live on war booty and on the contributions they levy on non-members, especially on the women by whom the agricultural work is done. The only work, in addition to the conduct of war, regarded as worthy of them is the production and upkeep of the implements of war, which they frequently reserve for themselves as their exclusive privilege.

Depending on the social regulations in question, the warriors steal or purchase girls in common, or demand as their right the prostitution

of all the girls of the territory dominated. The numerous traces of so-called premarital promiscuity, which so often are taken for residues of primitive, undifferentiated, endogamous sexual habits, would rather seem to be connected with this political institution of the men's house. In other cases, as in Sparta, each member of the warrior fraternity had his wife and children living outside as maternal groups. In most cases, the two forms appear in combination with one another.

In order to secure their economic position, which is based on the continuous plundering of outsiders, especially women, the consociated warriors resort under certain circumstances to the use of religiously colored means of intimidation. The spirit manifestations which they stage with masked processions very often are nothing but plundering campaigns which require for their undisrupted execution that, on the first sound of the tom-tom, the women and all outsiders flee, on pain of instant death, from the villages into the woods and thus allow the "spirits" conveniently and without danger of being unmasked to take from the houses whatever may please them. The well-known procession of the Duk-Duks in Indonesia is an example in point.

Obviously, the warriors do not believe at all in the legitimacy of their conduct. The crude and simple swindle is recognized by them as such and is protected by the magical prohibition against entry into the men's house by outsiders and by the draconic obligations of silence which are imposed upon the members. The prestige of the men's league comes to an end, as far as the women are concerned, when the secret is broken by indiscretion or, as has happened occasionally, when it is intentionally unveiled by missionaries. It goes without saying that such activities, like all uses of religion for black police purposes, are linked to popular cults. But despite its own disposition towards magical superstition, the warrior society remains specifically earthly and oriented towards robbery and booty, and thus it functions as an agent of skepticism vis-à-vis popular piety. At all stages of evolution it treats the gods and spirits with that disrespect with which the Homeric warrior society treated Olympus.

Only when the warrior group, consociated freely beyond and above the everyday round of life, is, so to speak, fitted into a permanent territorial community, and when thereby a political organization is formed, do both obtain a specific legitimation for the use of violence. This process, where it takes place at all, is gradual. The larger community, among whose members are the warriors who had so far been organized as marauders or as a permanent warriors' league, may acquire the power to subject the freely consociated warriors' raids to its control. It may achieve this success through either of two processes: the warriors'

organization may disintegrate owing to a long period of pacification; or a comprehensive political consociation may be imposed either autonomously or heteronomously. The larger community will be interested in obtaining such control because all of its members may have to suffer from the reprisals against the warriors' raids. An illustration of successful acquisition of such control is presented by the suppression by the Swiss of the practice of their young men to hire out as soldiers to foreign powers.[5]

Such control over the booty campaigns was already exercised in early Germanic history by the political community of the districts (*Landsgemeinde*). If the coercive apparatus is strong enough, it will suppress private violence in any form. The effectiveness of this suppression rises with the development of the coercive apparatus into a permanent structure, and with the growing interest in solidarity against outsiders. Initially it is directed only against those forms of private violence which would injure directly the military interests of the political community itself. Thus in the thirteenth century the French monarchy suppressed the feuds of the royal vassals for the duration of a foreign war conducted by the king himself. Subsequently, it engenders, more generally, a form of permanent public peace, with the compulsory submission of all disputes to the arbitration of the judge, who transforms blood vengeance into rationally ordered punishment, and feuds and expiatory actions into rationally ordered legal procedures.

Whereas in early times even actions which were openly recognized as felonious were not proceeded against by the organized community except upon pressure on the part of religious or military interests, now the prosecution of an ever widening sphere of injuries to persons and property is being placed under the guaranty of the political coercive apparatus. Thus the political community monopolizes the legitimate application of violence for its coercive apparatus and is gradually transformed into an institution for the protection of rights. In so doing it obtains a powerful and decisive support from all those groups which have a direct or indirect economic interest in the expansion of the market community, as well as from the religious authorities. These latter are best able to control the masses under conditions of increasing pacification. Economically, however, the groups most interested in pacification are those guided by market interests, especially the burghers of the towns, as well as all those who are interested in river, road, or bridge tolls and in the tax-paying capacity of their tenants and subjects. These interest groups expand with an expanding money economy. Even before the political authority imposed public peace in its own interest, it was they who, in the Middle Ages, attempted, in coöperation with

the church, to limit feuds and to establish temporary, periodical, or permanent leagues for the maintenance of public peace (*Landfriedensbünde*). And as the expansion of the market disrupted the monopolistic organizations and led their members to the awareness of their interests in the market, it cut out from under them the basis of that community of interests on which the legitimacy of their violence had developed. The spread of pacification and the expansion of the market thus constitute a development which is accompanied, along parallel lines, by (1) that monopolization of legitimate violence by the political organization which finds its culmination in the modern concept of the *state* as the ultimate source of every kind of legitimacy of the use of physical force; and (2) that rationalization of the rules of its application which has come to culminate in the concept of the legitimate legal order.

[Excursus:] We cannot deal with the interesting, but hitherto imperfectly developed, typology of the various stages in the development of primitive political organization.[6] Even under conditions of a relatively advanced property system, a separate political organization and all its organs can be completely lacking. Such, for instance, was, according to Wellhausen,[7] the situation among the Arabs during their "pagan" age. Beyond the kinship groups with their elders (*sheiks*), they did not recognize any extra-familial permanent authority. The free community of nomads, tenting, wandering, and herding together, which arose out of the need for security, lacked any special organs and was essentially unstable, and whatever authority it accepted in the event of a conflict with outside enemies was only of an intermittent character.

Such a situation can continue for very long periods of time and under any type of economic organization. The only regular, permanent authorities are the family heads, the elders of the kinship groups, and, besides them, the magicians and diviners. Whatever disputes arise between kinship groups are arbitrated by the elders with the aid of the magicians. This situation corresponds to the form of economic life of the Bedouins. But, like the latter, it is nothing primordial. Wherever the type of settlement creates economic needs which require permanent and continuous provision beyond that which the kinship group and household can provide, the institution of village chieftain arises. The village chieftain frequently emerges from among the magicians, especially the rainmakers, or he is an especially successful leader of marauding raids. Where the appropriation of property has reached an advanced stage, the position of chieftain becomes easily accessible to any man distinguished by his wealth and the corresponding standard of living. But he cannot exercise real authority except in situations of emergency and even then exclusively upon the basis of some purely personal qualities

of some magical or similar kind. Otherwise, especially under conditions of continuous peace, he is no more than a popular arbitrator and his directions are followed as statements of good advice. The total absence of any such chieftain is by no means a rare occurrence in peaceful periods. The consensual action of neighbors is then regulated merely by the respect for tradition, the fear of blood vengeance and the wrath of magical powers. In any case, however, the functions of the peacetime chieftain are in substance largely economic, such as the regulation of tillage, and, occasionally, magico-therapeutic or arbitrational. But, in general, there is no fixed type. Violence is legitimate only when it is applied by the chieftain, and only in those manners and cases in which it is sanctioned by fixed tradition. For its application the chieftain has to rely upon the voluntary aid of the members of the group. The more magical *charisma* and economic eminence he possesses, the more he is in a position to obtain that aid.

3. *Power Prestige and the "Great Powers"*

All political structures use force, but they differ in the manner in which they use or threaten to use it against other political organizations. These differences play a specific role in determining the form and destiny of political communities. Not all political structures are equally "expansive." They do not all strive for an outward expansion of their power, or keep their force in readiness for acquiring political power over other territories and communities by incorporating them or making them dependent. Hence, as structures of power, political organizations vary in the extent to which they are turned outward.

The political structure of Switzerland is "neutralized" through a collective guarantee of the Great Powers. For various reasons, Switzerland is not very strongly desired as an object for incorporation. Mutual jealousies existing among neighboring communities of equal strength protect it from this fate. Switzerland, as well as Norway, is less threatened than is the Netherlands, which possesses colonies; and the Netherlands is less threatened than Belgium, which has precarious colonial posessions and is herself threatened in case of war between her powerful neighbors. Sweden too is quite exposed. Thus, the attitude of political structures towards the outside may be more "isolationist" or more "expansive." And such attitudes change. The power of political structures has a specific internal dynamic. On the basis of this power, the members may pretend to a special "prestige," and their pretensions may influence the external conduct of the power structures. Experience

teaches that claims to prestige have always played into the origin of wars. Their part is difficult to gauge; it cannot be determined in general, but it is very obvious. The realm of "honor," which is comparable to the "status order" within a social structure, pertains also to the interrelations of political structures.

Feudal lords, like modern officers or bureaucrats, are the natural and primary exponents of this desire for power-oriented prestige for one's own political structure. Power for their political community means power for themselves, as well as the prestige based on this power. For the bureaucrat and the officer, an expansion of power means more office positions, more sinecures, and better opportunities for promotion. (For the officer, this last may be the case even in a lost war.) For the feudal vassal, expansion of power means the acquisition of new objects for infeudation and more provisions for his progeny. In his speech promoting the crusades, Pope Urban focused attention on these opportunities and not, as has been said, on overpopulation.

Besides and beyond these direct economic interests, which naturally exist everywhere among strata living off the exercise of political power, the striving for prestige pertains to all specific power structures and hence to all political structures. This striving is not identical simply with "national pride"—of this, more later—and it is not identical with the mere pride in the excellent qualities, actual or presumed, of one's own political community or in the mere possession of such a polity. Such pride can be highly developed, as is the case among the Swiss and the Norwegians, yet it may actually be strictly isolationist and free from pretension to political prestige.

The prestige of power means in practice the glory of power over other communities; it means the expansion of power, though not always by way of incorporation or subjection. The big political communities are the natural exponents of such pretensions to prestige.

Every political structure naturally prefers to have weak rather than strong neighbors. Furthermore, as every big political community is a potential aspirant to prestige, it is also a potential threat to all its neighbors; hence, the big political community, simply because it is big and strong, is latently and constantly endangered. Finally, by virtue of an unavoidable "dynamic of power," wherever claims to prestige flame up—and this normally results from an acute political danger to peace—they challenge and call forth the competition of all other possible bearers of prestige. The history of the last decade [1900–1910], especially the relations between Germany and France, shows the prominent effect of this irrational element in all political foreign relations. The sentiment of prestige is able to strengthen the ardent belief in the actual

existence of one's own might, and this is important for positive self-assurance in case of conflict. Therefore, all those having vested interests in the political structure tend systematically to cultivate this prestige sentiment.

Nowadays one usually refers to those polities that appear to be the bearers of power prestige as the "Great Powers." Among a plurality of co-existing polities, some, the Great Powers, usually ascribe to themselves and usurp an interest in political and economic processes over a wide orbit. Today such orbits encompass the whole surface of the planet. During Hellenic Antiquity, the "King," that is, the Persian king, despite his defeat, was the most widely recognized Great Power. Sparta turned to him in order to impose, with his sanction, the King's Peace (Peace of Antalcidas) upon the Hellenic world [387 B.C.]. Later on, before the establishment of an empire, the Roman polity assumed such a role. However, for general reasons of "power dynamics," the Great Powers are very often expansive powers; that is, they are associations aiming at expanding the territories of their respective political communities, by the use or the threat of force. Yet Great Powers are not necessarily and not always oriented towards expansion. Their attitude in this respect often changes, and in these changes economic factors play a weighty part.

For a time British policy, for instance, quite deliberately renunciated further political expansion. It renounced even the retention of colonies by means of force in favor of a "little England" policy, resting upon an isolationist limitation and a reliance on an economic primacy held to be unshakable. Influential representatives of the Roman rule by notables would have liked to carry through a similar program of a "little Rome" after the Punic Wars, to restrict Roman political subjection to Italy and the neighboring islands. The Spartan aristocrats, so far as they were able, quite deliberately limited their political expansion for the sake of isolation. They restricted themselves to the smashing of all other political structures that endangered their power and prestige. They favored the particularism of city states. Usually, in such cases, and in many similar ones, the ruling groups of notables (the Roman nobility of office, the English and other liberal notables, the Spartan overlords) harbor more or less distinct fears lest a perpetual "imperialism" produce an "imperator," that is, a charismatic warlord, who might gain the ascendancy at their expense. However, like the Romans, the British, after a short time, were forced out of their policy of self-restraint and pressed into political expansion. This occurred, in part, through capitalist interests in expansion.

4. *The Economic Foundations of "Imperialism"*

One might be inclined to believe that the formation as well as the expansion of Great Power structures is always and primarily determined economically. The assumption that trade, especially if it is intensive and if it already exists in an area, is the normal prerequisite and the reason for its political unification might readily be generalized. In individual cases this assumption does actually hold. The example of the ***Zollverein***[8] lies close at hand, and there are numerous others. Closer attention, however, very often reveals that this coincidence is not a necessary one, and that the causal nexus by no means always points in a single direction.

Germany, for instance, has been made into a unified economic territory, that is one whose inhabitants seek to sell their products primarily in their own market, only through custom frontiers at her borders, which were determined in a purely political manner. Were all custom barriers eliminated, the economically determined market for the Eastern German cereal surplus, poor in gluten, would not be Western Germany but rather England. The economically determined market of the mining products and the heavy iron goods of Western Germany is by no means Eastern Germany; and Western Germany is not, in the main, the economically determined supplier of the industrial products for Eastern Germany. Above all, the interior lines of communications (railroads) of Germany would not be—and, in part, are not now—economically determined routes for transporting heavy goods between east and west. Eastern Germany, however, would be the economic location for strong industries, the economically determined market and hinterland for which would be the whole of Western Russia. Such industries are now cut off by Russian custom barriers and have been moved to Poland, directly behind the Russian custom frontier. Through this development, as is known, the political *Anschluss* of the Russian Poles to the Russian imperial idea, which seemed to be politically out of the question, has been brought into the realm of possibility. Thus, in this case, purely economically determined market relations have a politically unifying effect.

Germany, however, has been politically united *against* the economic determinants as such. It is not unusual for the frontiers of a polity to conflict with the mere geographically given conditions of economic location; the political frontiers may encompass areas that, in terms of economic factors, strive to separate. In such situations, tensions among economic interests nearly always arise. However, if the political bond is once created, it is very often, so incomparably stronger that under otherwise favorable conditions (e.g. the existence of a common language)

nobody would even think of political separation because of such economic tensions. This applies, for instance, to Germany.

[Excursus:] Empire formation does not always follow the routes of export trade, although nowadays we are inclined to see things in this imperialist way. As a rule, the "continental" imperialism—Russian, and American—just like the "overseas imperialism" of the British and of those modeled after it, follow the tracks of previously existing capitalist interests, especially in foreign areas that are politically weak. And of course, at least for the formation of great overseas dominions of the past—in the overseas empires of Athens, Carthage, and Rome—export trade played its decisive part.

Yet, even in these ancient polities other economic interests were at least of equal and often of far greater importance than were commercial profits: ground rents, farmed-out taxes, office fees, and similar gains were especially desired. In foreign trade, in turn, the interest in selling definitely receded into the background as a motive for expansion. In the age of modern capitalism the interest in exporting to foreign territories is dominant, but in the ancient states the interest was rather in the possession of territories from which goods (raw materials) could be *imported.*

Among the great states that have formed on the inland plains, the exchange of goods played no regular or decisive part. The trading of goods are most relevant for the river-border states of the Orient, especially for Egypt; that is, for states that in this respect were similar to overseas states. The "empire" of the Mongols, however, certainly did not rest on any intensive trade in goods. There, the mobility of the ruling stratum of horsemen made up for the lack of material means of communication and made centralized administration possible. Neither the empires of China, Persia, or Imperial Rome after its transformation from a coastal to a continental empire, were originated or maintained on the basis of a pre-existing and a particularly intensive inland traffic in goods or highly developed means of communication. The continental expansion of Rome was undoubtedly very strongly determined by capitalist interests; and these interests were above all the interests of tax-farmers, office hunters, and land speculators. They were not, in the first place, the interests of groups pursuing a particularly intensive trade in goods.

The expansion of Persia was not in any way served by capitalist interest groups. Such groups did not exist there as motivating forces or as pace-makers, and just as little did they serve the founders of the Chinese empire or the founders of the Carolingian monarchy.

Of course, even in these cases, the economic importance of trade was

not altogether absent; yet other motives have played their part in every political overland expansion of the past, including the Crusades. These motives have included the interest in higher royal incomes, in prebends, fiefs, offices, and social honors for the vassals, knights, officers, officials, the younger sons of hereditary officeholders, and so on. The interests of trading seaports have not, of course, been so decisive, although they were important as secondary factors: the first Crusade was mainly an overland campaign.

By no means has trade always pointed the way for political expansion. The causal nexus has very often been the reverse. Among the empires named above, those which had an administration technically able to establish at least overland means of communication did so for administrative purposes. In principle, this has often been the exclusive purpose, regardless of whether or not the means of communication were advantageous for existing or future trading needs.

Under present-day conditions, Russia may well be considered a country whose means of communication (railroads today) have been primarily determined politically. The Austrian southern railroad is another example. (Its shares are still called "lombards," a term loaded with political reminiscences.) And there is hardly a polity without "strategic railroads." Nevertheless, many projects of this kind have been undertaken with the concomitant expectation of a traffic guaranteeing long-run profitableness. It was no different in the past. On the one hand, it cannot be proved that the ancient Roman military highroads served a commercial purpose; and it certainly was not the case for the Persian and Roman mail posts, which served exclusively political purposes; on the other, the development of trade in the past has of course been the normal result of political unification. Political unification first placed trade upon an assured and guaranteed legal basis. Even this rule, however, is not without exceptions. For, besides depending on pacification and formal guarantees of law enforcement, the development of trade has been bound to certain economic conditions (especially the development of capitalism). Moreover, the evolution of capitalism may be strangled by the manner in which a unified political structure is administered. This was the case, for instance, in the late Roman Empire. Here a unified structure took the place of a league of city states; it was based upon a strong subsistence agrarian economy. This increasingly made for liturgies as the way of raising the means for the army and the administration; and these directly suffocated capitalism.[8] [End of Excursus.]

If trade in itself is by no means the decisive factor in political expansion, the economic structure in general does co-determine the extent and manner of political expansion. Besides women, cattle, and slaves,

scarce land is one of the original and foremost objects of forceful acquisition. For conquering peasant communities, the natural way is to take the land directly and to wipe out its settled population. The Teutonic Migration has, on the whole, taken this course only to a moderate degree. As a compact mass, this movement probably went somewhat beyond the present linguistic frontiers, but only in scattered zones. How far a land scarcity, caused by overpopulation, contributed, how far the political pressure of other tribes, or simply good opportunities, must be left open. In any case, for a long time some of the individual groups who went out for conquest reserved their claims to the arable land back home, in case they should return.

In other than peasant communities, too, the more or less violently taken lands are important for the way in which the victor will exploit his rights. As Franz Oppenheimer has rightly emphasized, ground rent is frequently the product of violent political subjection.[10] Given a subsistence economy and a feudal structure this subjection means, of course, that the peasantry of the incorporated area will not be wiped out but rather will be spared and made tributary to the conqueror, who becomes the landlord. This has happened wherever the army was no longer a levy composed of self-equipped freemen, or yet a mercenary or bureaucratic mass army, but rather an army of self-equipped knights, as was the case with the Persians, the Arabs, the Turks, the Normans, and the Occidental feudal vassals in general.

The interest in ground rent has also meant a great deal for plutocratic trading communities engaged in conquest. As commercial profits were preferably invested in land and indebted bondsmen, the normal aim of warfare, even in Antiquity, was to gain fertile land fit to yield ground rent. The Lelantine War [c. 590 B.C.], which marked a sort of epoch in early Hellenic history, was almost wholly carried on at sea and among trading cities. But the original object of dispute between the leading patricians of Chalcis and Eretria was the fertile Lelantine plain. Besides tributes of various sorts, one of the most important privileges that the Attic Maritime League evidently offered to the *demos* of the ruling city was to break up the land monopoly of the subject cities. The Athenians were to receive the right to acquire and mortgage land anywhere.

The establishment of *commercium* among cities allied to Rome meant in practice the same thing. Also, the overseas interests of the mass of Italics settled throughout the Roman sphere of influence certainly represented, at least in part, land interests of an essentially capitalist nature, as we know them from [Cicero's] speeches against Gaius Verres.[11]

During its expansion, the capitalist interest in land may come into

conflict with the land interest of the peasantry. Such a conflict has played its part in the status struggles in the long epoch ending with the Gracchi. The big holders of money, cattle, and men naturally wished the newly gained land to be dealt with as public land for lease (*ager publicus*). As long as the regions were not too remote, the peasants demanded that the land be partitioned in order to provide for their progeny. The compromises between these two interests are distinctly reflected in tradition, although the details are certainly not very reliable.

Rome's overseas expansion, as far as it was economically determined, shows features that have since recurred in basic outline again and again and which still recur today. These features occurred in Rome in pronounced fashion and in gigantic dimensions, for the first time in history. However fluid the transitions to other types may be, these "Roman" features are peculiar to what we wish to call *imperialist capitalism*, or rather, they provide the conditions for the existence of this specific type. These features are rooted in the capitalist interests of tax-farmers, of state creditors, of suppliers to the state, of overseas traders privileged by the state, and of colonial capitalists. The profit opportunities of all these groups rest upon the direct exploitation of political power directed towards expansion.

By forcibly enslaving the inhabitants, or at least tying them to the soil (*glebae adscriptio*) and exploiting them as plantation labor, the acquisition of overseas colonies brings tremendous opportunities for profit for capitalist interest-groups. The Carthaginians seem to have been the first to have arranged such an organization on a large scale; the Spaniards in South America, the English in the Southern States of the Union, and the Dutch in Indonesia were the last to do it in the grand manner. The acquisition of overseas colonies also facilitates the compulsory monopolization of trade with these colonies and possibly with other areas. Wherever the administrative apparatus of the polity is not suited for the collection of taxes from the newly occupied territories—of this, later—the taxes give opportunities for profit to capitalist tax-farmers.

The material implements of war may be part of the equipment provided by the army itself, as is the case in pure feudalism. But if these implements are furnished by the polity, rather than by the army, then expansion through war and the procurement of armaments to prepare for war represent by far the most profitable occasion for loan operations on the largest scale. The profit opportunities of capitalist state creditors then increase. Even during the Second Punic War capitalist state creditors prescribed their own conditions to the Roman polity.

Where the ultimate state creditors are a mass stratum of state rentiers (bondholders) such credits provide profit opportunities for bond-issuing

banks, as is characteristic of our day. The interests of those who supply the materials of war point in the same direction. In all this, economic forces interested in the emergence of military conflagrations *per se*, no matter what be the outcome for their own community, are called into life.

Aristophanes distinguished between industries interested in war and industries interested in peace, although as is evident from his enumeration, the center of gravity in his time was still the self-equipped army. The individual citizen gave orders to artisans such as the sword-maker and the armorer.[12] But even then the large private commercial storehouses, often designated as "factories," were above all stores of armaments. Today the polity as such is almost the sole agent to order war material and the engines of war. This enhances the capitalist nature of the process. Banks, which finance war loans, and today large sections of heavy industry are *quand même* economically interested in warfare; the direct suppliers of armor plates and guns are not the only ones so interested. A lost war, as well as a successful war, brings increased business to these banks and industries. Moreover, the powers-that-be in a polity are politically and economically interested in the existence of large home factories for war engines. This interest compels them to allow these factories to provide the whole world with their products, political opponents included.

The extent to which the interests of imperialist capitalism are counter-balanced depends above all on the profitableness of imperialism as compared with the capitalist interests of pacifist orientation, insofar as purely capitalist motives here play a direct part. And this in turn is closely connected with the extent to which economic needs are satisfied by a private or a public economy. The relation between the two is highly important for the nature of expansive economic tendencies backed up by political communities.

In general and at all times, imperialist capitalism, especially colonial booty capitalism based on direct force and compulsory labor, has offered by far the greatest opportunities for profit. They have been greater by far than those normally open to industrial enterprises which worked for exports and which oriented themselves to peaceful trade with members of other polities. Therefore, imperialist capitalism has always existed wherever to any relevant degree the polity *per se*, or its subdivisions (municipalities), satisfied its wants through a public economy. The stronger such an economy has been, the more important imperialist capitalism has been.

Increasing opportunities for profit abroad emerge again today, especially in territories that are opened up politically and economically, that

is, brought into the specifically modern forms of public and private enterprise. These opportunities spring from public arms contracts; from railroad and other construction tasks carried out by the polity or by builders endowed with monopoly rights; from monopolist organizations for the collection of levies for trade and industry; from monopolist concessions; and from government loans.

The preponderance of such profit opportunities increases, at the expense of profits from the usual private trade, the more that public enterprises gain in economic importance as a general form of supplying needs. This tendency is directly paralleled by politically backed economic expansion and competition among individual polities, whose members can afford to invest capital. These members aim at securing for themselves such monopolies and shares in public commissions. And the importance of the mere "open door" for the private importation of goods recedes into the background.

The safest way of monopolizing for the members of one's own polity profit opportunities which are linked to the public economy of the foreign territory is to occupy it or at least to subject the foreign political power in the form of a "protectorate" or some such arrangement. Therefore, this "imperialist" tendency increasingly displaces the "pacifist" tendency of expansion, which aims merely at freedom of trade. The latter gained the upper hand only so long as the organization of supply by private capitalism shifted the optimum of capitalist profit opportunities towards pacifist trade and not towards monopolist trade, or at least trade not monopolized by political power.

The universal revival of "imperialist" capitalism, which has always been the normal form in which capitalist interests have influenced politics, and the revival of political drives for expansion are thus not accidental. For the predictable future, the prognosis will have to be made in its favor.

This situation would hardly change fundamentally if for a moment we were to make the mental experiment of assuming the individual polities to be somehow "state-socialist" communities, that is, organizations supplying a maximum amount of their needs through a collective economy. They would seek to buy as cheaply as possible indispensable goods not produced on their own territory (cotton in Germany, for instance) from others that have natural monopolies and would seek to exploit them. It is probable that force would be used where it would lead easily to favorable conditions of exchange; the weaker party would thereby be obliged to pay tribute, if not formally then at least actually. For the rest, one cannot see why the strong state-socialist communities should disdain to squeeze tribute out of the weaker communities for their own partners

where they could do so, just as happened everywhere during early history. Even in a polity without state-socialism the mass of citizens need be as little interested in pacifism as is any single stratum. The Attic *demos*—and not it alone—lived economically off war. War brought soldiers' pay and, in case of a victory, tribute from the subjects. This tribute was actually distributed among the full citizens in the hardly veiled form of attendance-fees at popular assemblies, court hearings, and public festivities. Here, every full citizen could directly grasp the interest in imperialist policy and power. Nowadays, the yields flowing from abroad to the members of a polity, including those of imperialist origin and those actually representing "tribute," do not result in a constellation of interests so comprehensible to the masses. For under the present economic order, the tribute to "creditor nations" assumes the forms of interest payments on debts or of capital profits transferred from abroad to the propertied strata of the "creditor nation." Were one to imagine these tributes abolished, it would mean for countries like England, France, and Germany a very palpable decline of purchasing power for home products. This would influence the labor market in an unfavorable manner.

In spite of this, labor in creditor nations is of strongly pacifist mind and on the whole shows no interest whatsoever in the continuation and compulsory collection of such tributes from foreign debtor communities that are in arrears. Nor does labor show an interest in forcibly participating in the exploitation of foreign colonial territories and public commissions. This is a natural outcome of the immediate class situation, on the one hand, and, on the other, of the internal social and political situation of communities in a capitalist era. Those entitled to tribute belong to the opponent class, who dominate the community. Every successful imperialist policy of coercing the outside normally—or at least at first—also strengthens the domestic prestige and therewith the power and influence of those classes, status groups, and parties, under whose leadership the success has been attained.

In addition to the pacifist sympathies determined by the social and political constellation, there are economic sources of pacifist sympathy among the masses, especially among the proletariat. Every investment of capital in the production of war engines and war material creates job and income opportunities; every defense contract may become a factor directly contributing to prosperity by increasing demand and fostering the intensity of business enterprise. Even more so, this may indirectly become a source of enhanced confidence in the economic opportunities of the participating industries and lead to a speculative boom. Such investment, however, withdraws capital from alternate uses and makes it

more difficult to satisfy demands in other fields. Above all, the means of war are raised by way of levies, which the ruling strata, by virtue of their social and political power, usually know how to transfer to the masses, quite apart from the limits set to the regimentation of property for "mercantilist" considerations.

Countries little burdened by military expenses (the United States) and especially the small countries (Switzerland, for example) often experience a stronger economic expansion than do some of the Great Powers and sometimes are more readily admitted to the economic exploitation of foreign countries because they do not arouse the fear that political intervention might follow economic intrusion.

Experience shows that the pacifist interests of petty bourgeois and proletarian strata very often and very easily fail. This is partly because of the easier accessibility of all unorganized "masses" to emotional influences and partly because of the definite notion (which they entertain) of some unexpected opportunity somehow arising through war. Specific interests, like the hope entertained in overpopulated countries of acquiring territories for emigration, are, of course, also important in this connection. Another contributing cause is the fact that the "masses," in contrast to other interest-groups, subjectively risk a smaller stake in the game. In case of a lost war, the monarch has to fear for his throne; republican power-holders and groups having vested interests in a republican constitution have to fear their own victorious general. The majority of the propertied bourgeoisie have to fear economic loss from the brakes being placed upon business as usual. Under certain circumstances, should disorganization follow defeat, the ruling stratum of notables has to fear a violent shift in power in favor of the propertyless. The "masses" as such, at least in their subjective conception and in the extreme case, have nothing concrete to lose but their lives. The valuation and effect of this danger strongly fluctuates in their own minds. On the whole, it can easily be reduced to zero through emotional influence.

5. *The Nation*

The fervor of this emotional influence does not, in the main, have an economic origin. It is based upon sentiments of prestige, which often extend deep down to the petty-bourgeois masses of states rich in the historical attainment of power-positions. The attachment to all this political prestige may fuse with a specific belief in responsibility towards succeeding generations. The great power structures *per se* are then held to have a responsibility of their own for the way in which power

and prestige are distributed between their own and foreign polities. It goes without saying that all those groups who hold the power to steer common conduct within a polity will most strongly instill themselves with this idealist fervor of power prestige. They remain the specific and most reliable bearers of the idea of the state as an imperialist power structure demanding unqualified devotion.

In addition to the direct and material imperialist interests, discussed above, there are the indirectly material as well as the ideological interests of strata that are in various ways privileged within a polity and, indeed, privileged by its very existence. They comprise especially all those who think of themselves as being the specific "partners" of a specific "culture" diffused among the members of the polity. Under the influence of these circles, the naked prestige of "power" is unavoidably transformed into other special forms of prestige and especially into the idea of the "nation."

If the concept of "nation" can in any way be defined unambiguously, it certainly cannot be stated in terms of empirical qualities common to those who count as members of the nation. In the sense of those using the term at a given time, the concept undoubtedly means, above all, that *it is proper* to expect from certain groups a specific sentiment of solidarity in the face of other groups. Thus, the concept belongs in the sphere of values. Yet, there is no agreement on how these groups should be delimited or about what concerted action should result from such solidarity.

In ordinary language, "nation" is, first of all, not identical with the "people of a state," that is, with the membership of a given polity. Numerous polities comprise groups who emphatically assert the independence of their "nation" in the face of other groups; or they comprise merely *parts* of a group whose members declare themselves to be one homogenous "nation" (Austria is an example for both). Furthermore, a "nation" is not identical with a community speaking the same language; that this by no means always suffices is indicated by the Serbs and Croats, the North Americans, the Irish, and the English. On the contrary, a common language does not seem to be absolutely necessary to a "nation." In official documents, besides "Swiss People" one also finds the phrase "Swiss Nation." And some language groups do not think of themselves as a separate "nation," for example, at least until recently, the White Russians. As a rule, however, the pretension to be considered a special "nation" is associated with a common language as a culture value of the masses; this is predominantly the case in the classic country of language conflicts, Austria, and equally so in Russia and in eastern Prussia. But this linkage of the common language and "nation" is of

varying intensity; for instance, it is very low in the United States as well as in Canada.

"National" solidarity among men speaking the same language may be just as well rejected as accepted. Solidarity, instead, may be linked with differences in the other great culture value of the masses, namely, a religious creed, as is the case with the Serbs and Croats. National solidarity may be connected with differing social structure and mores and hence with "ethnic" elements, as is the case with the German Swiss and the Alsatians in the face of the Germans of the Reich, or with the Irish facing the British. Yet above all, national solidarity may be linked to memories of a common political destiny with other nations, among the Alsatians with the French since the Revolutionary War which represents their common heroic age, just as among the Baltic Barons with the Russians whose political destiny they helped to steer.

It goes without saying that "national" affiliation need not be based upon common blood. Indeed, especially radical "nationalists" are often of foreign descent. Furthermore, although a specific common anthropological type is not irrelevant to nationality, it is neither sufficient nor prerequisite to nation founding. Nevertheless, the idea of the "nation" is apt to include the notions of common descent and of an essential, though frequently indefinite, homogeneity. The "nation" has these notions in common with the sentiment of solidarity of ethnic communities, which is also nourished from various sources, as we have seen before [ch. V.:4]. But the sentiment of ethnic solidarity does not by itself make a "nation." Undoubtedly, even the White Russians in the face of the Great Russians have always had a sentiment of ethnic solidarity, yet even at the present time they would hardly claim to qualify as a separate "nation." The Poles of Upper Silesia, until recently, had hardly any feeling of solidarity with the "Polish Nation." They felt themselves to be a separate ethnic group in the face of the Germans, but for the rest they were Prussian subjects and nothing else.

Whether the Jews may be called a "nation" is an old problem. Most of the time, the answer will be negative. At any rate, the answers of the Russian Jews, of the assimilating West-European and American Jews, and of the Zionists would vary in nature and extent. In particular, the question would be answered very differently by the peoples of their environment, for example, by the Russians on the one side and the Americans on the other—or at least by those Americans who at the present time still maintain American and Jewish nature to be essentially similar, as an American President [T.R.] has asserted in an official document.

Those German-speaking Alsatians who refuse to belong to the German "nation" and who cultivate the memory of political union with

France do not thereby consider themselves simply as members of the French "nation." The Negroes of the United States, at least at present, consider themselves members of the American "nation," but they will hardly ever be so considered by the Southern Whites.

Only fifteen years ago, men knowing the Far East still denied that the Chinese qualified as a "nation"; they held them to be only a "race." Yet today, not only the Chinese political leaders but also the very same observers would judge differently. Thus it seems that a group of people under certain conditions may attain the quality of a nation through specific behavior, or they may claim this quality as an "attainment"—and within short spans of time at that.

There are, on the other hand, social groups that profess indifference to, and even directly relinquish, any evaluational adherence to a single nation. At the present time, certain leading strata of the class movement of the modern proletariat consider such indifference and relinquishment to be an accomplishment. Their argument meets with varying success, depending upon political and linguistic affiliations and also upon different strata of the proletariat; on the whole, their success is rather diminishing at the present time.

An unbroken scale of quite varied and highly changeable attitudes toward the idea of the "nation" is to be found among social strata within single groups to whom language usage ascribes the quality of "nations." The scale extends from emphatic affirmation to emphatic negation and finally complete indifference, as may be characteristic of the citizens of Luxembourg and of nationally "unawakened" peoples. Feudal strata, strata of officials, bourgeois strata of various occupational categories, strata of "intellectuals" do not have homogeneous or historically constant attitudes towards the idea.

The reasons for the belief that one represents a nation vary greatly, just as does the empirical conduct that actually results from affiliation or lack of it with a nation. The "national sentiments" of the German, the Englishman, the North American, the Spaniard, the Frenchman, or the Russian do not function in an identical manner—to take only the simplest illustration—in relation to the polity, with the geographical boundaries of which the "idea" of the nation may come into conflict. This antagonism may lead to quite different results. Certainly the Italians in the Austrian state would fight Italian troops only if coerced into doing so. Large portions of the German Austrians would today fight against Germany only with the greatest reluctance; they could not be relied upon. The German-Americans, however, even those valuing their [former] "nationality" most highly, would fight against Germany, not gladly, yet, given the occasion, unconditionally. The Poles in the Ger-

man State would fight readily against a Russian Polish army but hardly against an autonomous Polish army. The Austrian Serbs would fight against Serbia with very mixed feelings and only in the hope of attaining common autonomy. The Russian Poles would fight more reliably against a German than against an Austrian army.

It is a well-known historical fact that within the same nation the intensity of solidarity felt toward the outside is changeable and varies greatly in strength. On the whole, this sentiment has grown even where internal conflicts of interest have not diminished. Only sixty years ago the [Prussian conservative] *Kreuzzeitung* still appealed for the intervention of the emperor of Russia in internal German affairs; today, in spite of increased class antagonism, this would be difficult to imagine.

In any case, the differences in national sentiment are both significant and fluid and, as is the case in all other fields, fundamentally different answers are given to the question: What conclusions are a group of people willing to draw from the "national sentiment" found among them? No matter how emphatic and subjectively sincere a pathos may be formed among them, what sort of specific joint action are they ready to develop? The extent to which in the diaspora a custom, more correctly, a convention is adhered to as a "national" trait varies just as much as does the importance of common conventions for the belief in the existence of a separate "nation." In the face of this value concept of the "idea of the nation," which empirically is entirely ambiguous, a sociological typology would have to analyze all the individual kinds of sentiments of group membership and solidarity in their genetic conditions and in their consequences for the social action of the participants. This cannot be attempted here.

Instead, we shall have to look a little closer into the fact that the idea of the nation for its advocates stands in very intimate relation to "prestige" interests. The earliest and most energetic manifestations of the idea, in some form, even though it may have been veiled, have contained the legend of a providential "mission." Those to whom the representatives of the idea zealously turned were expected to shoulder this mission. Another element of the early idea was the notion that this mission was facilitated solely through the very cultivation of the peculiarity of the group set off as a nation. Therewith, in so far as its self-justification is sought in the value of its content, this mission can consistently be thought of only as a specific "culture" mission. The significance of the "nation" is usually anchored in the superiority, or at least the irreplaceability, of the culture values that are to be preserved and developed only through the cultivation of the peculiarity of the group. It therefore goes without saying that, just as those who wield

power in the polity invoke the idea of the *state*, the intellectuals, as we shall tentatively call those who usurp leadership in a *Kulturgemeinschaft* (that is, within a group of people who by virtue of their peculiarity have access to certain products that are considered "culture goods"), are specifically predestined to propagate the "*national*" idea. This happens when those culture agents. . . .

[The presentation breaks off here. Notes on the margin of the manuscript indicate that Weber intended to deal with the idea and development of the nation state throughout history. The following observations were found on the margin of the sheet: Cultural prestige and power prestige are closely associated. Every *victorious* war enhances the cultural prestige (Germany [1871], Japan [1905], etc.). Whether war *furthers* the "development of culture" is another question, one which cannot be solved in a "value neutral" way. It certainly does *not* do it in an *unambiguous* way (see Germany after 1871!). Even on the basis of purely empirical criteria it would *not* seem to do so: Pure art and literature of a specifically German character did *not* develop in the political *center* of Germany.]

6. *The Distribution of Power Within the Political Community: Class, Status, Party*[13]

A. ECONOMICALLY DETERMINED POWER AND THE STATUS ORDER. The structure of every legal order directly influences the distribution of power, economic or otherwise, within its respective community. This is true of all legal orders and not only that of the state. In general, we understand by "power" the chance of a man or a number of men to realize their own will in a social action even against the resistance of others who are participating in the action.

"Economically conditioned" power is not, of course, identical with "power" as such. On the contrary, the emergence of economic power may be the consequence of power existing on other grounds. Man does not strive for power only in order to enrich himself economically. Power, including economic power, may be valued for its own sake. Very frequently the striving for power is also conditioned by the social honor it entails. Not all power, however, entails social honor: The typical American Boss, as well as the typical big speculator, deliberately relinquishes social honor. Quite generally, "mere economic" power, and especially "naked" money power, is by no means a recognized basis of social honor. Nor is power the only basis of social honor. Indeed, social honor, or prestige, may even be the basis of economic power, and very frequently has been. Power, as well as honor, may be guaranteed by

the legal order, but, at least normally, it is not their primary source. The legal order is rather an additional factor that enhances the chance to hold power or honor; but it can not always secure them.

The way in which social honor is distributed in a community between typical groups participating in this distribution we call the "status order." The social order and the economic order are related in a similar manner to the legal order. However, the economic order merely defines the way in which economic goods and services are distributed and used. Of course, the status order is strongly influenced by it, and in turn reacts upon it.

Now: "classes," "status groups," and "parties" are phenomena of the distribution of power within a community.

B. DETERMINATION OF CLASS SITUATION BY MARKET SITUATION. In our terminology, "classes" are not communities; they merely represent possible, and frequent, bases for social action. We may speak of a "class" when (1) a number of people have in common a specific causal component of their life chances, insofar as (2) this component is represented exclusively by economic interests in the possession of goods and opportunities for income, and (3) is represented under the conditions of the commodity or labor markets. This is "class situation."

It is the most elemental economic fact that the way in which the disposition over material property is distributed among a plurality of people, meeting competitively in the market for the purpose of exchange, in itself creates specific life chances. The mode of distribution, in accord with the law of marginal utility, excludes the non-wealthy from competing for highly valued goods; it favors the owners and, in fact, gives to them a monopoly to acquire such goods. Other things being equal, the mode of distribution monopolizes the opportunities for profitable deals for all those who, provided with goods, do not necessarily have to exchange them. It increases, at least generally, their power in the price struggle with those who, being propertyless, have nothing to offer but their labor or the resulting products, and who are compelled to get rid of these products in order to subsist at all. The mode of distribution gives to the propertied a monopoly on the possibility of transferring property from the sphere of use as "wealth" to the sphere of "capital," that is, it gives them the entrepreneurial function and all chances to share directly or indirectly in returns on capital. All this holds true within the area in which pure market conditions prevail. "Property" and "lack of property" are, therefore, the basic categories of all class situations. It does not matter whether these two categories become effective in the competitive struggles of the consumers or of the producers.

Within these categories, however, class situations are further dif-

ferentiated: on the one hand, according to the kind of property that is usable for returns; and, on the other hand, according to the kind of services that can be offered in the market. Ownership of dwellings; workshops; warehouses; stores; agriculturally usable land in large or small holdings—a quantitative difference with possibly qualitative consequences; ownership of mines; cattle; men (slaves); disposition over mobile instruments of production, or capital goods of all sorts, especially money or objects that can easily be exchanged for money; disposition over products of one's own labor or of others' labor differing according to their various distances from consumability; disposition over transferable monopolies of any kind—all these distinctions differentiate the class situations of the propertied just as does the "meaning" which they can give to the use of property, especially to property which has money equivalence. Accordingly, the propertied, for instance, may belong to the class of rentiers or to the class of entrepreneurs.

Those who have no property but who offer services are differentiated just as much according to their kinds of services as according to the way in which they make use of these services, in a continuous or discontinuous relation to a recipient. But always this is the generic connotation of the concept of class: that the kind of chance in the *market* is the decisive moment which presents a common condition for the individual's fate. Class situation is, in this sense, ultimately market situation. The effect of naked possession *per se*, which among cattle breeders gives the non-owning slave or serf into the power of the cattle owner, is only a fore-runner of real "class" formation. However, in the cattle loan and in the naked severity of the law of debts in such communities for the first time mere "possession" as such emerges as decisive for the fate of the individual; this is much in contrast to crop-raising communities, which are based on labor. The creditor-debtor relation becomes the basis of "class situations" first in the cities, where a "credit market," however primitive, with rates of interest increasing according to the extent of dearth and factual monopolization of lending in the hands of a plutocracy could develop. Therewith "class struggles" begin.

Those men whose fate is not determined by the chance of using goods or services for themselves on the market, e.g., slaves, are not, however, a class in the technical sense of the term. They are, rather, a status group.

c. SOCIAL ACTION FLOWING FROM CLASS INTEREST. According to our terminology, the factor that creates "class" is unambiguously economic interest, and indeed, only those interests involved in the existence of the market. Nevertheless, the concept of class-interest is an ambiguous one: even as an empirical concept it is ambiguous as soon as one under-

stands by it something other than the factual direction of interests following with a certain probability from the class situation for a certain average of those people subjected to the class situation. The class situation and other circumstances remaining the same, the direction in which the individual worker, for instance, is likely to pursue his interests may vary widely, according to whether he is constitutionally qualified for the task at hand to a high, to an average, or to a low degree. In the same way, the direction of interests may vary according to whether or not social action of a larger or smaller portion of those commonly affected by the class situation, or even an association among them, e.g., a trade union, has grown out of the class situation, from which the individual may expect promising results for himself. The emergence of an association or even of mere social action from a common class situation is by no means a universal phenomenon.

The class situation may be restricted in its efforts to the generation of essentially *similar* reactions, that is to say, within our terminology, of "mass behavior." However, it may not even have this result. Furthermore, often merely amorphous social action emerges. For example, the "grumbling" of workers known in ancient Oriental ethics: The moral disapproval of the work-master's conduct, which in its practical significance was probably equivalent to an increasingly typical phenomenon of precisely the latest industrial development, namely, the slowdown of laborers by virtue of tacit agreement. The degree in which "social action" and possibly associations emerge from the mass behavior of the members of a class is linked to general cultural conditions, especially to those of an intellectual sort. It is also linked to the extent of the contrasts that have already evolved, and is especially linked to the transparency of the connections between the causes and the consequences of the class situation. For however different life chances may be, this fact in itself, according to all experience, by no means gives birth to "class action" (social action by the members of a class). For that, the real conditions and the results of the class situation must be distinctly recognizable. For only then the contrast of life chances can be felt not as an absolutely given fact to be accepted, but as a resultant from either (1) the given distribution of property, or (2) the structure of the concrete economic order. It is only then that people may react against the class structure not only through acts of intermittent and irrational protest, but in the form of rational association. There have been "class situations" of the first category (1), of a specifically naked and transparent sort, in the urban centers of Antiquity and during the Middle Ages; especially then when great fortunes were accumulated by factually monopolized trading in local industrial products or in foodstuffs; furthermore, under certain

conditions, in the rural economy of the most diverse periods, when agriculture was increasingly exploited in a profit-making manner. The most important historical example of the second category (2) is the class situation of the modern proletariat.

D. TYPES OF CLASS STRUGGLE. Thus every class may be the carrier of any one of the innumerable possible forms of class action, but this is not necessarily so. In any case, a class does not in itself constitute a group (*Gemeinschaft*). To treat "class" conceptually as being equivalent to "group" leads to distortion. That men in the same class situation regularly react in mass actions to such tangible situations as economic ones in the direction of those interests that are most adequate to their average number is an important and after all simple fact for the understanding of historical events. However, this fact must not lead to that kind of pseudo-scientific operation with the concepts of class and class interests which is so frequent these days and which has found its most classic expression in the statement of a talented author, that the individual may be in error concerning his interests but that the class is infallible about its interests.

If classes as such are not groups, nevertheless class situations emerge only on the basis of social action. However, social action that brings forth class situations is not basically action among members of the identical class; it is an action among members of different classes. Social actions that directly determine the class situation of the worker and the entrepreneur are: the labor market, the commodities market, and the capitalistic enterprise. But, in its turn, the existence of a capitalistic enterprise presupposes that a very specific kind of social action exists to protect the possession of goods *per se*, and especially the power of individuals to dispose, in principle freely, over the means of production: a certain kind of legal order. Each kind of class situation, and above all when it rests upon the power of property *per se*, will become most clearly efficacious when all other determinants of reciprocal relations are, as far as possible, eliminated in their significance. It is in this way that the use of the power of property in the market obtains its most sovereign importance.

Now status groups hinder the strict carrying through of the sheer market principle. In the present context they are of interest only from this one point of view. Before we briefly consider them, note that not much of a general nature can be said about the more specific kinds of antagonism between classes (in our meaning of the term). The great shift, which has been going on continuously in the past, and up to our times, may be summarized, although at a cost of some precision: the struggle in which class situations are effective has progressively shifted

from consumption credit toward, first, competitive struggles in the commodity market and then toward wage disputes on the labor market. The class struggles of Antiquity—to the extent that they were genuine class struggles and not struggles between status groups—were initially carried on by peasants and perhaps also artisans threatened by debt bondage and struggling against urban creditors. For debt bondage is the normal result of the differentiation of wealth in commercial cities, especially in seaport cities. A similar situation has existed among cattle breeders. Debt relationships as such produced class action up to the days of Catilina. Along with this, and with an increase in provision of grain for the city by transporting it from the outside, the struggle over the means of sustenance emerged. It centered in the first place around the provision of bread and determination of the price of bread. It lasted throughout Antiquity and the entire Middle Ages. The propertyless flocked together against those who actually and supposedly were interested in the dearth of bread. This fight spread until it involved all those commodities essential to the way of life and to handicraft production. There were only incipient discussions of wage disputes in Antiquity and in the Middle Ages. But they have been slowly increasing up into modern times. In the earlier periods they were completely secondary to slave rebellions as well as to conflicts in the commodity market.

The propertyless of Antiquity and of the Middle Ages protested against monopolies, pre-emption, forestalling, and the withholding of goods from the market in order to raise prices. Today the central issue is the determination of the price of labor. The transition is represented by the fight for access to the market and for the determination of the price of products. Such fights went on between merchants and workers in the putting-out system of domestic handicraft during the transition to modern times. Since it is quite a general phenomenon we must mention here that the class antagonisms that are conditioned through the market situations are usually most bitter between those who actually and directly participate as opponents in price wars. It is not the rentier, the share-holder, and the banker who suffer the ill will of the worker, but almost exclusively the manufacturer and the business executives who are the direct opponents of workers in wage conflicts. This is so in spite of the fact that it is precisely the cash boxes of the rentier, the share-holder, and the banker into which the more or less unearned gains flow, rather than into the pockets of the manufacturers or of the business executives. This simple state of affairs has very frequently been decisive for the role the class situation has played in the formation of political parties. For example, it has made possible the varieties of patriarchal socialism and the frequent attempts—formerly, at least—of threatened

status groups to form alliances with the proletariat against the bourgeoisie.

E. STATUS HONOR. In contrast to classes, *Stände* (*status groups*) are normally groups. They are, however, often of an amorphous kind. In contrast to the purely economically determined "class situation," we wish to designate as *status situation* every typical component of the life of men that is determined by a specific, positive or negative, social estimation of *honor*. This honor may be connected with any quality shared by a plurality, and, of course, it can be knit to a class situation: class distinctions are linked in the most varied ways with status distinctions. Property as such is not always recognized as a status qualification, but in the long run it is, and with extraordinary regularity. In the subsistence economy of neighborhood associations, it is often simply the richest who is the "chieftain." However, this often is only an honorific preference. For example, in the so-called pure modern democracy, that is, one devoid of any expressly ordered status privileges for individuals, it may be that only the families coming under approximately the same tax class dance with one another. This example is reported of certain smaller Swiss cities. But status honor need not necessarily be linked with a class situation. On the contrary, it normally stands in sharp opposition to the pretensions of sheer property.

Both propertied and propertyless people can belong to the same status group, and frequently they do with very tangible consequences. This equality of social esteem may, however, in the long run become quite precarious. The equality of status among American gentlemen, for instance, is expressed by the fact that outside the subordination determined by the different functions of business, it would be considered strictly repugnant—wherever the old tradition still prevails—if even the richest boss, while playing billiards or cards in his club would not treat his clerk as in every sense fully his equal in birthright, but would bestow upon him the condescending status-conscious "benevolence" which the German boss can never dissever from his attitude. This is one of the most important reasons why in America the German clubs have never been able to attain the attraction that the American clubs have.

In content, status honor is normally expressed by the fact that above all else a specific *style of life* is expected from all those who wish to belong to the circle. Linked with this expectation are restrictions on social intercourse (that is, intercourse which is not subservient to economic or any other purposes). These restrictions may confine normal marriages to within the status circle and may lead to complete endogamous closure. Whenever this is not a mere individual and socially irrelevant imitation of another style of life, but consensual action of this closing character, the status development is under way.

In its characteristic form, stratification by status groups on the basis of conventional styles of life evolves at the present time in the United States out of the traditional democracy. For example, only the resident of a certain street ("the Street") is considered as belonging to "society," is qualified for social intercourse, and is visited and invited. Above all, this differentiation evolves in such a way as to make for strict submission to the fashion that is dominant at a given time in society. This submission to fashion also exists among men in America to a degree unknown in Germany; it appears as an indication of the fact that a given man puts forward a *claim* to qualify as a gentleman. This submission decides, at least *prima facie,* that he will be treated as such. And this recognition becomes just as important for his employment chances in swank establishments, and above all, for social intercourse and marriage with "esteemed" families, as the qualification for dueling among Germans. As for the rest, status honor is usurped by certain families resident for a long time, and, of course, correspondingly wealthy (e.g. F.F.V., the First Families of Virginia), or by the actual or alleged descendants of the "Indian Princess" Pocahontas, of the Pilgrim fathers, or of the Knickerbockers, the members of almost inaccessible sects and all sorts of circles setting themselves apart by means of any other characteristics and badges. In this case stratification is purely conventional and rests largely on usurpation (as does almost all status honor in its beginning). But the road to legal privilege, positive or negative, is easily traveled as soon as a certain stratification of the social order has in fact been "lived in" and has achieved stability by virtue of a stable distribution of economic power.

F. ETHNIC SEGREGATION AND CASTE. Where the consequences have been realized to their full extent, the status group evolves into a closed caste. Status distinctions are then guaranteed not merely by conventions and laws, but also by religious sanctions. This occurs in such a way that every physical contact with a member of any caste that is considered to be lower by the members of a higher caste is considered as making for a ritualistic impurity and a stigma which must be expiated by a religious act. In addition, individual castes develop quite distinct cults and gods.

In general, however, the status structure reaches such extreme consequences only where there are underlying differences which are held to be "ethnic." The caste is, indeed, the normal form in which ethnic communities that believe in blood relationship and exclude exogamous marriage and social intercourse usually associate with one another. As mentioned before [ch. VI:*vi*:6], such a caste situation is part of the phenomenon of pariah peoples and is found all over the world. These people form communities, acquire specific occupational traditions of handicrafts or of other arts, and cultivate a belief in their ethnic community.

They live in a diaspora strictly segregated from all personal intercourse, except that of an unavoidable sort, and their situation is legally precarious. Yet, by virtue of their economic indispensability, they are tolerated, indeed frequently privileged, and they live interspersed in the political communities. The Jews are the most impressive historical example.

A status segregation grown into a caste differs in its structure from a mere ethnic segregation: the caste structure transforms the horizontal and unconnected coexistences of ethnically segregated groups into a vertical social system of super- and subordination. Correctly formulated: a comprehensive association integrates the ethnically divided communities into one political unit. They differ precisely in this way: ethnic coexistence, based on mutual repulsion and disdain, allows each ethnic community to consider its own honor as the highest one; the caste structure brings about a social subordination and an acknowledgement of "more honor" in favor of the privileged caste and status groups. This is due to the fact that in the caste structure ethnic distinctions as such have become "functional" distinctions within the political association (warriors, priests, artisans that are politically important for war and for building, and so on). But even pariah peoples who are most despised (for example, the Jews) are usually apt to continue cultivating the belief in their own specific "honor," a belief that is equally peculiar to ethnic and to status groups.

However, with the negatively privileged status groups the sense of dignity takes a specific deviation. A sense of dignity is the precipitation in individuals of social honor and of conventional demands which a positively privileged status group raises for the deportment of its members. The sense of dignity that characterizes positively privileged status groups is naturally related to their "being" which does not transcend itself, that is, it is related to their "beauty and excellence" (καλοκάγαθία). Their kingdom is "of this world." They live for the present and by exploiting their great past. The sense of dignity of the negatively privileged strata naturally refers to a future lying beyond the present, whether it is of this life or of another. In other words, it must be nurtured by the belief in a providential mission and by a belief in a specific honor before God. The chosen people's dignity is nurtured by a belief either that in the beyond "the last will be the first," or that in this life a Messiah will appear to bring forth into the light of the world which has cast them out the hidden honor of the pariah people. This simple state of affairs, and not the resentment which is so strongly emphasized in Nietzsche's much-admired construction in the *Genealogy of Morals*, is the source of the religiosity cultivated by pariah status groups (see above, ch. VI:*vi*:5);

moreover, resentment applies only to a limited extent; for one of Nietzsche's main examples, Buddhism, it is not at all applicable.

For the rest, the development of status groups from ethnic segregations is by no means the normal phenomenon. On the contrary. Since objective "racial differences" are by no means behind every subjective sentiment of an ethnic community, the question of an ultimately racial foundation of status structure is rightly a question of the concrete individual case. Very frequently a status group is instrumental in the production of a thoroughbred anthropological type. Certainly status groups are to a high degree effective in producing extreme types, for they select personally qualified individuals (e.g. the knighthood selects those who are fit for warfare, physically and psychically). But individual selection is far from being the only, or the predominant, way in which status groups are formed: political membership or class situation has at all times been at least as frequently decisive. And today the class situation is by far the predominant factor. After all, the possibility of a style of life expected for members of a status group is usually conditioned economically.

G. STATUS PRIVILEGES. For all practical purposes, stratification by status goes hand in hand with a monopolization of ideal and material goods or opportunities, in a manner we have come to know as typical. Besides the specific status honor, which always rests upon distance and exclusiveness, honorific preferences may consist of the privilege of wearing special costumes, of eating special dishes taboo to others, of carrying arms—which is most obvious in its consequences—, the right to be a dilettante, for example, to play certain musical instruments. However, material monopolies provide the most effective motives for the exclusiveness of a status group; although, in themselves, they are rarely sufficient, almost always they come into play to some extent. Within a status circle there is the question of intermarriage: the interest of the families in the monopolization of potential bridegrooms is at least of equal importance and is parallel to the interest in the monopolization of daughters. The daughters of the members must be provided for. With an increased closure of the status group, the conventional preferential opportunities for special employment grow into a legal monopoly of special offices for the members. Certain goods become objects for monopolization by status groups, typically, entailed estates, and frequently also the possession of serfs or bondsmen and, finally, special trades. This monopolization occurs positively when the status group is exclusively entitled to own and to manage them; and negatively when, in order to maintain its specific way of life, the status group must *not* own and manage them. For the decisive role of a style of life in status honor means that status groups

are the specific bearers of all conventions. In whatever way it may be manifest, all stylization of life either originates in status groups or is at least conserved by them. Even if the principles of status conventions differ greatly, they reveal certain typical traits, especially among the most privileged strata. Quite generally, among privileged status groups there is a status disqualification that operates against the performance of common physical labor. This disqualification is now "setting in" in America against the old tradition of esteem for labor. Very frequently every rational economic pursuit, and especially entrepreneurial activity, is looked upon as a disqualification of status. Artistic and literary activity is also considered degrading work as soon as it is exploited for income, or at least when it is connected with hard physical exertion. An example is the sculptor working like a mason in his dusty smock as over against the painter in his salon-like studio and those forms of musical practice that are acceptable to the status group.

H. ECONOMIC CONDITIONS AND EFFECTS OF STATUS STRATIFICATION. The frequent disqualification of the gainfully employed as such is a direct result of the principle of status stratification, and of course, of this principle's opposition to a distribution of power which is regulated exclusively through the market. These two factors operate along with various individual ones, which will be touched upon below.

We have seen above that the market and its processes knows no personal distinctions: "functional" interests dominate it. It knows nothing of honor. The status order means precisely the reverse: stratification in terms of honor and styles of life peculiar to status groups as such. The status order would be threatened at its very root if mere economic acquisition and naked economic power still bearing the stigma of its extra-status origin could bestow upon anyone who has won them the same or even greater honor as the vested interests claim for themselves. After all, given equality of status honor, property *per se* represents an addition even if it is not overtly acknowledged to be such. Therefore all groups having interest in the status order react with special sharpness precisely against the pretensions of purely economic acquisition. In most cases they react the more vigorously the more they feel themselves threatened. Calderon's respectful treatment of the peasant, for instance, as opposed to Shakespeare's simultaneous ostensible disdain of the *canaille* illustrates the different way in which a firmly structured status order reacts as compared with a status order that has become economically precarious. This is an example of a state of affairs that recurs everywhere. Precisely because of the rigorous reactions against the claims of property *per se*, the "parvenu" is never accepted, personally and without reservation, by the privileged status groups, no matter how completely

his style of life has been adjusted to theirs. They will only accept his descendants who have been educated in the conventions of their status group and who have never besmirched its honor by their own economic labor.

As to the general *effect* of the status order, only one consequence can be stated, but it is a very important one: the hindrance of the free development of the market. This occurs first for those goods that status groups directly withhold from free exchange by monopolization, which may be effected either legally or conventionally. For example, in many Hellenic cities during the "status era" and also originally in Rome, the inherited estate (as shown by the old formula for placing spendthrifts under a guardian)[14] was monopolized, as were the estates of knights, peasants, priests, and especially the clientele of the craft and merchant guilds. The market is restricted, and the power of naked property *per se*, which gives its stamp to class formation, is pushed into the background. The results of this process can be most varied. Of course, they do not necessarily weaken the contrasts in the economic situation. Frequently they strengthen these contrasts, and in any case, where stratification by status permeates a community as strongly as was the case in all political communities of Antiquity and of the Middle Ages, one can never speak of a genuinely free market competition as we understand it today. There are wider effects than this direct exclusion of special goods from the market. From the conflict between the status order and the purely economic order mentioned above, it follows that in most instances the notion of honor peculiar to status absolutely abhors that which is essential to the market: hard bargaining. Honor abhors hard bargaining among peers and occasionally it taboos it for the members of a status group in general. Therefore, everywhere some status groups, and usually the most influential, consider almost any kind of overt participation in economic acquisition as absolutely stigmatizing.

With some over-simplification, one might thus say that classes are stratified according to their relations to the production and acquisition of goods; whereas status groups are stratified according to the principles of their *consumption* of goods as represented by special styles of life.

An "occupational status group," too, is a status group proper. For normally, it successfully claims social honor only by virtue of the special style of life which may be determined by it. The differences between classes and status groups frequently overlap. It is precisely those status communities most strictly segregated in terms of honor (viz. the Indian castes) who today show, although within very rigid limits, a relatively high degree of indifference to pecuniary income. However, the Brahmins seek such income in many different ways.

As to the general economic conditions making for the predominance of stratification by status, only the following can be said. When the bases of the acquisition and distribution of goods are relatively stable, stratification by status is favored. Every technological repercussion and economic transformation threatens stratification by status and pushes the class situation into the foreground. Epochs and countries in which the naked class situation is of predominant significance are regularly the periods of technical and economic transformations. And every slowing down of the change in economic stratification leads, in due course, to the growth of status structures and makes for a resuscitation of the important role of social honor.

1. PARTIES. Whereas the genuine place of classes is within the economic order, the place of status groups is within the social order, that is, within the sphere of the distribution of honor. From within these spheres, classes and status groups influence one another and the legal order and are in turn influenced by it. "*Parties*" reside in the sphere of power. Their action is oriented toward the acquisition of social power, that is to say, toward influencing social action no matter what its content may be. In principle, parties may exist in a social club as well as in a state. As over against the actions of classes and status groups, for which this is not necessarily the case, party-oriented social action always involves association. For it is always directed toward a goal which is striven for in a planned manner. This goal may be a cause (the party may aim at realizing a program for ideal or material purposes), or the goal may be personal (sinecures, power, and from these, honor for the leader and the followers of the party). Usually the party aims at all these simultaneously. Parties are, therefore, only possible within groups that have an associational character, that is, some rational order and a staff of persons available who are ready to enforce it. For parties aim precisely at influencing this staff, and if possible, to recruit from it party members.

In any individual case, parties may represent interests determined through class situation or status situation, and they may recruit their following respectively from one or the other. But they need be neither purely class nor purely status parties; in fact, they are more likely to be mixed types, and sometimes they are neither. They may represent ephemeral or enduring structures. Their means of attaining power may be quite varied, ranging from naked violence of any sort to canvassing for votes with coarse or subtle means: money, social influence, the force of speech, suggestion, clumsy hoax, and so on to the rougher or more artful tactics of obstruction in parliamentary bodies.

The sociological structure of parties differs in a basic way according

to the kind of social action which they struggle to influence; that means, they differ according to whether or not the community is stratified by status or by classes. Above all else, they vary according to the structure of domination. For their leaders normally deal with its conquest. In our general terminology, parties are not only products of modern forms of domination. We shall also designate as parties the ancient and medieval ones, despite the fact that they differ basically from modern parties. Since a party always struggles for political control (*Herrschaft*), its organization too is frequently strict and "authoritarian." Because of these variations between the forms of domination, it is impossible to say anything about the structure of parties without discussing them first. Therefore, we shall now turn to this central phenomenon of all social organization.

Before we do this, we should add one more general observation about classes, status groups and parties: The fact that they presuppose a larger association, especially the framework of a polity, does not mean that they are confined to it. On the contrary, at all times it has been the order of the day that such association (even when it aims at the use of military force in common) reaches beyond the state boundaries. This can be seen in the [interlocal] solidarity of interests of oligarchs and democrats in Hellas, of Guelphs and Ghibellines in the Middle Ages, and within the Calvinist party during the age of religious struggles; and all the way up to the solidarity of landlords (International Congresses of Agriculture), princes (Holy Alliance, Karlsbad Decrees [of 1819]), socialist workers, conservatives (the longing of Prussian conservatives for Russian intervention in 1850). But their aim is not necessarily the establishment of a new territorial dominion. In the main they aim to influence the existing polity.

NOTES

1. This is the early formulation of territorial political organization and of the state, which Weber later summarized in sec. 17 of Part One, ch. I. (R)

2. *Camorra*—well-organized large-scale criminal gang operating in Southern Italy, especially Naples: first appearance c. 1820; achieved effective power over Naples municipal government in the 1890's, was defeated in the elections of 1901 through the effort of the Honest Government League, but flared up repeatedly in later times, especially about 1911. CHAPTER X

DOMINATION AND LEGITIMACY

1. *Domination by Economic Power and by Authority*[1]

Domination in the most general sense is one of the most important elements of social action. Of course, not every form of social action reveals a structure of dominancy. But in most of the varieties of social action domination plays a considerable role, even where it is not obvious at first sight. Thus, for example, in linguistic communities the elevation by authoritative fiat of a dialect to the status of an official language of a political entity has very often had a decisive influence on the development of a large community with a common literary language, as, for instance, Germany.[2] On the other hand, political separation has determined the final form of a corresponding linguistic differentiation, as, for instance, in the case of Holland as against Germany.[3] Furthermore, the domination exercised in the schools stereotypes the form and the predominance of the official school language most enduringly and decisively. Without exception every sphere of social action is profoundly influenced by structures of dominancy. In a great number of cases the emergence of rational association from amorphous social action has been due to domination and the way in which it has been exercised. Even where this is not the case, the structure of dominancy and its unfolding is decisive in determining the form of social action and its orientation toward a "goal." Indeed, domination has played the decisive role particularly in the economically most important social structures of the past and present, viz., the manor on the one hand, and the large-scale capitalistic enterprise on the other.

Domination constitutes a special case of power, as we shall see

presently. As in the case of other forms of power, those who exercise domination do not apply it exclusively, or even usually, to the pursuit of purely economic ends, such as, for example, a plentiful supply of economic goods. It is true, however, that the control over economic goods, i.e., economic power, is a frequent, often purposively willed, consequence of domination as well as one of its most important instruments. Not every position of economic power, however, represents domination in our sense of the word. Nor does domination utilize in every case economic power for its foundation and maintenance. But in the vast majority of cases, and indeed in the most important ones, this is just what happens in one way or another and often to such an extent that the mode of applying economic means for the purpose of maintaining domination, in turn, exercises a determining influence on the structure of domination. Furthermore, the great majority of all economic organizations, among them the most important and the most modern ones, reveal a structure of dominancy. The crucial characteristics of any form of domination may, it is true, not be correlated in any clearcut fashion with any particular form of economic organization. Yet, the structure of dominancy is in many cases both a factor of great economic importance and, at least to some extent, a result of economic conditions.

Our first aim here is that of stating merely general propositions regarding the relationship between forms of economic organization and of domination. Because of this very general character, these propositions will inevitably be abstract and sometimes also somewhat indefinite. For our purpose we need, first of all, a more exact definition of what we mean by "domination" and its relationship to the general term "power." Domination in the quite general sense of power, i.e., of the possibility of imposing one's own will upon the behavior of other persons, can emerge in the most diverse forms. If, as has occasionally been done, one looks upon the claims which the law accords to one person against one or more others as a power to issue commands to debtors or to those to whom no such claim is accorded, one may thereby conceive of the whole system of modern private law as the decentralization of domination in the hands of those to whom the legal rights are accorded. From this angle, the worker would have the power to command, i.e., "domination," over the entrepreneur to the extent of his wage claim, and the civil servant over the king to the extent of his salary claim. Such a terminology would be rather forced and, in any case, it would not be of more than provisional value since a distinction in kind must be made between "commands" directed by the judicial authority to an adjudged debtor and "commands" directed by the claimant himself to a debtor prior to judgment. However, a position ordinarily designated as "dominating"

can emerge from the social relations in a drawing room as well as in the market, from the rostrum of a lecture-hall as well as from the command post of a regiment, from an erotic or charitable relationship as well as from scholarly discussion or athletics. Such a broad definition would, however, render the term "domination" scientifically useless. A comprehensive classification of all forms, conditions, and concrete contents of "domination" in that widest sense is impossible here. We will only call to mind that, in addition to numerous other possible types, there are two diametrically contrasting types of domination, viz., domination by virtue of a constellation of interests (in particular: by virtue of a position of monopoly), and domination by virtue of authority, i.e., power to command and duty to obey.

The purest type of the former is monopolistic domination in the market; of the latter, patriarchal, magisterial, or princely power. In its purest form, the first is based upon influence derived exclusively from the possession of goods or marketable skills guaranteed in some way and acting upon the conduct of those dominated, who remain, however, formally free and are motivated simply by the pursuit of their own interests. The latter kind of domination rests upon alleged absolute duty to obey, regardless of personal motives or interests. The borderline between these two types of domination is fluid. Any large central bank or credit institution, for instance, exercises a "dominating" influence on the capital market by virtue of its monopolistic position. It can impose upon its potential debtors conditions for the granting of credit, thus influencing to a marked degree their economic behavior for the sake of the liquidity of its own resources. The potential debtors, if they really need the credit, must in their own interest submit to these conditions and must even guarantee this submission by supplying collateral security. The credit banks do not, however, pretend that they exercise "authority," i.e., that they claim "submission" on the part of the dominated without regard to the latters' own interests; they simply pursue their own interests and realize them best when the dominated persons, acting with formal freedom, rationally pursue their own interests as they are forced upon them by objective circumstances.

Even the owner of an incomplete monopoly finds himself in that same position if, despite existing competition, he is able by and large to "prescribe" prices to both exchange partners and competitors; in other words, if by his own conduct he can impose upon them a way of conduct according to his own interest, without, however, imposing on them the slightest "obligation" to submit to this domination. Any type of domination by virtue of constellation of interests may, however, be transformed gradually into domination by authority. This applies particularly to

domination originally founded on a position of monopoly. A bank, for instance, in order to control more effectively a debtor corporation, may demand as a condition for credit that some member of its board be made a member of the board of the debtor corporation. That board, in turn, can give decisive orders to the management by virtue of the latter's obligation to obey.

Or a central bank of issue causes the credit institutions to agree on uniform terms of credit and in this way tries, by virtue of its position of power, to secure to itself a continuous control and supervision of the relationships between the credit institutions and their customers. It may then utilize its control for ends of currency management or for the purpose of influencing the business cycle or for political ends such as, for instance, the preparation of financial readiness for war. The latter kind of use will be made in particular where the central bank itself is exposed to influence from the political power. Theoretically, it is conceivable that such controls can actually be established, that the ends for and the ways of its exercise become articulated in reglementations, that special agencies are created for its exercise and special appellate agencies for the resolution of questions of doubt, and that, finally, the controls are constantly made more strict. In such a case this kind of domination might become quite like the authoritative domination of a bureaucratic state agency over its subordinates, and the subordination would assume the character of a relationship of obedience to authority.

The same observation can be made with respect to the domination by the breweries over the tavern owners whom they supply with their equipment, or the domination to which book dealers would have to submit if there should some day be a German publishers' cartel with power to issue and withhold retailers' licenses, or the domination of the gasoline dealers by the Standard Oil Company, or the domination exercised through their common sales office by the German coal producers over the coal dealers. All these retailers may well be reduced to employed sales agents, little different from linemen working outside the employer's plant or other private employees but subject to the authority of a department chief. The transitions are gradual from the ancient debtor's factual dependency on his creditor to formal servitude for debt; or, in the Middle Ages and in modern times, from the craftsman's dependence on the market-wise exporter over the various forms of dependency of the home industry to the completely authoritarian labor regulation of the sweatshop worker. And from there other gradations lead to the position of the secretary, the engineer, or the worker in the office or plant, who is subject to a discipline no longer different in its nature from that of the civil service or the army, although it has been created by a

contract concluded in the labor market by formally "equal" parties through the "voluntary" acceptance of the terms offered by the employer. More important than the difference between private and public employment is certainly that between the military service and the other situations. The latter are concluded and terminated voluntarily, while the former is imposed by compulsion, at least in those countries where, as in ours, the ancient system of mercenary service has been replaced by the draft. Yet, even the relationship of political allegiance can be entered into and, to some extent, be dissolved voluntarily; the same holds true of the feudal and, under certain circumstances, even of the patrimonial dependency relationships of the past. Thus even in these cases the transitions are but gradual to those relationships of authority, for instance slavery, which are completely involuntary and, for the subject, normally nonterminable. Obviously, a certain minimum interest of the subordinate in his own obeying will normally constitute one of the indispensable motives of obedience even in the completely authoritarian duty-relationship. Throughout, transitions are thus vague and changing. And yet, if we wish at all to obtain fruitful distinctions within the continuous stream of actual phenomena, we must not overlook the clear-cut antithesis between factual power which arises completely out of possession and by way of interest compromises in the market, and, on the other hand, the authoritarian power of a patriarch or monarch with its appeal to the duty of obedience simply as such. The varieties of power are in no way exhausted by the examples just given. Even mere possession can be a basis of power in forms other than that of the market. As we pointed out before, even in socially undifferentiated situations wealth, accompanied by a corresponding way of life, creates prestige, corresponding to the position in present society of one who "keeps an open house" or the lady who has her "salon." Under certain circumstances, every one of these relationships may assume authoritarian traits. Domination in the broader sense can be produced not only by the exchange relationships of the market but also by those of "society"; such phenomena may range all the way from the "drawing room lion" to the patented *arbiter elegantiarum*[4] of imperial Rome or the courts of love of the ladies of Provence.[5] Indeed, such situations of domination can be found also outside the sphere of private markets and relationships. Even without any formal power of command an "empire state" or, more correctly, those individuals who are the decisive ones within it either through authority or through the market, can exercise a far-reaching and occasionally even a despotic hegemony. A typical illustration is afforded by Prussia's position within the German Customs Union or, later, in the German Reich. To some, although much lesser extent, New York's posi-

tion within the United States affords another illustration. In the German Customs Union the Prussian officials were dominant, because their state's territory constituted the largest and thus the decisive market; in the German Reich they are paramount because they dispose of the largest net of railroads, the greatest number of university positions, etc., and can thus cripple the corresponding administrative departments of the other, formally equal, states. New York can exercise political power because it is the seat of the great financial powers. All such forms of power are based upon constellations of interests. They thus resemble those which occur in the market, and in the course of development they can easily be transformed into formally regulated relationships of authority or, more correctly, into associations with heterocephalous power of command and coercive apparatus. Indeed, because of the very absence of rules, domination which originates in the market or other interest constellations may be felt to be much more oppressive than an authority in which the duties of obedience are set out clearly and expressly. That aspect must not affect, however, the terminology of the sociologist.

In the following discussion we shall use the term domination exclusively in that narrower sense which excludes from its scope those situations in which power has its source in a formally free interplay of interested parties such as occurs especially in the market. In other words, in our terminology *domination* shall be identical with *authoritarian power of command*.

To be more specific, *domination* will thus mean the situation in which the manifested will (*command*) of the *ruler* or rulers is meant to influence the conduct of one or more others (*the ruled*) and actually does influence it in such a way that their conduct to a socially relevant degree occurs as if the ruled had made the content of the command the maxim of their conduct for its very own sake. Looked upon from the other end, this situation will be called *obedience*.

FURTHER NOTES: 1. The definition sounds awkward, especially due to the use of the "as if" formula. This cannot be avoided, however. The merely external fact of the order being obeyed is not sufficient to signify domination in our sense; we cannot overlook the meaning of the fact that the command is accepted as a "valid" norm. On the other hand, however, the causal chain extending from the command to the actual fact of compliance can be quite varied. Psychologically, the command may have achieved its effect upon the ruled either through empathy or through inspiration or through persuasion by rational argument or through some combination of these three principal types of influence of one person over another.[6] In a concrete case the performance of the command may have been motivated by the ruled's own conviction of its propriety, or

by his sense of duty, or by fear, or by "dull" custom, or by a desire to obtain some benefit for himself. Sociologically, those differences are not necessarily relevant. On the other hand, the sociological character of domination will differ according to the basic differences in the major modes of legitimation.

2. Many transitions exist, as we have seen, between that narrower concept of domination as we have defined it now and those situations of setting the tone in the market, the drawing room, in a discussion, etc., which we have discussed earlier. We shall briefly revert to some of these latter cases so as to elucidate more clearly the former.

It is obvious that relationships of domination may exist reciprocally. In modern bureaucracy, among officials of different departments, each is subject to the others' powers of command insofar as the latter have jurisdiction. There are no conceptual difficulties involved, but where a customer places with a shoemaker an order for a pair of shoes, can it then be said that either one has control over the other? The answer will depend upon the circumstances of each individual case, but almost always will it be found that in some limited respect the will of the one has influenced that of the other even against that other's reluctance and that, consequently, to that extent one has dominated over the other. No precise concept of domination could be built up, however, upon the basis of such considerations; and this statement holds true for all relationships of exchange, including those of intangibles. Or what shall we say of the village craftsman who, as is often the case in Asia, is employed at fixed terms by the village? Is he, within his vocational jurisdiction, a ruler, or is he the ruled, and, if so, by whom? One will be inclined rather not to apply the concept of domination to such relationships, except with respect to the powers which he, the craftsman, exercises over his assistants or which are exercised over him by those persons who are to control him by virtue of their official position. As soon as we do this, we narrow the concept of domination to that technical one which we have defined above. Yet, the position of a village chief, that is, a person of official authority, may be exactly like that of the village craftsman. The distinction between private business and public office, as we know it, is the result of development and it is not at all so firmly rooted elsewhere as it is with us in Germany. In the popular American view, a judge's job is a business just as a banker's. He, the judge, simply is a man who has been granted the monopoly to give a person a decision with the help of which the latter may enforce some performance against another or, as the case may be, may shield himself against the claims of others. By virtue of this monopoly the judge enjoys directly or indirectly a number of benefits, legitimate or illegitimate, and for their enjoyment

he pays a portion of his fees to the party boss to whom he owes his job.

To all of these, the village chief, the judge, the banker, the craftsman, we shall ascribe domination, wherever they claim, and to a socially relevant degree find obedience to, commands given and received as such. No usable concept of domination can be defined in any way other than by reference to power of command; but we must never forget that here, as everywhere else in life, everything is "in transition." It should be self-evident that the sociologist is guided exclusively by the factual existence of such a power of command, in contrast to the lawyer's interest in the theoretical content of a legal norm. As far as sociology is concerned power of command does not exist unless the authority which is claimed by somebody is actually heeded to a socially relevant degree. Yet, the sociologist will normally start from the observation that "factual" powers of command usually claim to exist "by virtue of law." It is exactly for this reason that the sociologist cannot help operating with the conceptual apparatus of the law.

2. *Direct Democracy and Rule by Notables*

We are primarily interested in "domination" insofar as it is combined with "administration." Every domination both expresses itself and functions through administration. Every administration, on the other hand, needs domination, because it is always necessary that some powers of command be in the hands of somebody. Possibly the power of command may appear in a rather innocent garb; the ruler may be regarded as their "servant" by the ruled, and he may look upon himself in that way. This phenomenon occurs in its purest form in the so-called, "*immediately democratic*" *administration* ["direct democracy"].

This kind of administration is called democratic for two reasons which need not necessarily coincide. The first reason is that it is based upon the assumption that everybody is equally qualified to conduct the public affairs. The second: that in this kind of administration the scope of power of command is kept at a minimum. Administrative functions are rotated, or determined by drawing lots, or assigned for short periods by election. All important decisions are reserved to the common resolution of all; the administrative functionaries have only to prepare and carry out the resolutions and to conduct "current business" in accordance with the directives of the general assembly. This type of administration can be found in many private associations, in certain political communities such as the Swiss *Landesgemeinden* or certain townships in the United States, or in universities (insofar as the administration lies in

the hands of the rector and the deans),[a] as well as in numerous other organizations of a similar kind. However modest the administrative function may be, some functionary must have some power of command, and his position is thus always in suspense between that of a mere servant and that of master. It is against the very development of the latter that the "democratic" limits of his position are directed. However, "equality" and "minimization" of the dominant powers of functionaries are also found in many aristocratic groups as against the members of their own ruling layer. Illustrations are afforded by the aristocracy of Venice, Sparta or that of the full professors of a German university. They all have been using those same "democratic" forms of rotation of office, drawing lots, or short-term election.

Normally this kind of administration occurs in organizations which fulfill the following conditions:

1) the organization must be local or otherwise limited in the number of members; 2) the social positions of the members must not greatly differ from each other; 3) the administrative functions must be relatively simple and stable; 4) however, there must be a certain minimum development of training in objectively determining ways and means. This latter requirement exists, for instance, in the direct democratic administrations in Switzerland and the United States just as it existed in the Russian *mir* within the confines of its traditional scope of business. We do not look, however, upon this kind of administration as the historical starting point of any typical course of development but rather as a marginal type case, which lends itself well as the starting point of investigation. Neither taking turns nor drawing lots nor election are "primitive" forms of picking the functionaries of an organization.

Wherever it exists, direct democratic administration is unstable. With every development of economic differentiation arises the probability that administration will fall into the hands of the wealthy. The reason is not that they would have superior personal qualities or more comprehensive knowledge, but simply that they can afford to take the time to carry on the administrative functions cheaply or without any pay and as part-time jobs. Those, however, who are forced to work for a living would have to sacrifice time, which means income, and the more intense labor grows, the more intolerable does this sacrifice become. The bearers of that superiority are thus not simply those who enjoy high incomes but rather those who have an income without personal labor or derive it from intermittent labor. Under otherwise equal conditions a modern manufacturer can thus get away from his work less easily and is correspondingly less available for administrative functions than a landowner or a medieval merchant patrician, both of whom have not had

to work uninterruptedly. For the same reason the directors of the great university clinics and institutes are the least suited to be rectors; although they have plenty of administrative experience, their time is too much occupied with their regular work. Hence in the measure in which those who have to work are becoming unable to get away from it, direct democratic administration will tend to turn into rule by notables (*honoratiores*).

We have already met the type as that of the bearer of a special social honor connected with the mode of living.[9] Here we now encounter another indispensable requirement, viz., that capacity to take care of social administration and rule as an honorific duty which derives from economic position. Hence we shall tentatively define *honoratiores* as follows:

Persons who, *first*, are enjoying an income earned without, or with comparatively little, labor, or at least of such a kind that they can afford to assume administrative functions in addition to whatever business activities they may be carrying on; and who, *second*, by virtue of such income, have a mode of life which attributes to them the social "prestige" of a status honor and thus renders them fit for being called to rule.

Frequently such rule by *honoratiores* has developed in the form of deliberating bodies in which the affairs to be brought before the community are discussed in advance; such bodies easily come to anticipate the resolutions of the community or to eliminate them and thus to establish, by virtue of their prestige, a monopoly of the *honoratiores*. The development of the rule by *honoratiores* in this way has existed a long time in local communities and thus particularly in the neighborhood association. Those *honoratiores* of olden times had a character quite different, however, from those who emerge in the rationalized direct democracy of the present. The original qualification was old age. In all communities which orient their social conduct toward tradition, i.e., toward convention, customary law or sacred law, the elders are, so to speak, the natural *honoratiores* not only because of their prestige of wider experience, but also because they know the traditions. Their consent, advance approval (*προβούλευμα*), or ratification (*auctoritas*)[10] guarantees the properness of a resolution as against the supernatural powers just as it is the most effective decision in a case of dispute. Where all members of a community are in about the same economic position, the "elders" are simply those oldest in the household, the clan, or the neighborhood.

However, the relative prestige of age within a community is subject to much change. Wherever the food resources are scarce, he who can no longer work is just a burden. Also where war is a chronic state of affairs, the prestige of the older men is liable to sink below that of the

warriors and there often develops a democratic bias of the younger groups against the prestige of old age (*sexagenarios de ponte*).[11] The same development occurs in periods of economic or political revolution, whether violent or peaceful, and also where the practical power of religious ideas and thus the veneration of a sacred tradition is little developed or on the decline. The prestige of old age is preserved, on the other hand, wherever the objective usefulness of experience or the subjective power of tradition are estimated highly.

Where the elders are deposed, power normally accrues not to youth but to the bearers of some other kind of social prestige. In the case of economic or status differentiation the councils of elders (γερουσία, *senatus*) may retain its name, but *de facto* it will be composed of *honoratiores* in the sense discussed above, i.e., "economic" *honoratiores*, or bearers of status honor whose power ultimately is also based upon their wealth.

On the other hand, the battle cry that a "democratic" administration must be obtained or preserved may become a powerful tool of the poor in their fight against the *honoratiores*, but also of economically powerful groups which are not admitted to status honor. In that case democratic administration becomes a matter of struggle between political parties, especially since the *honoratiores*, by virtue of their status prestige and the dependency on them of certain groups, can create for themselves "security troops"[12] from among the poor. As soon as it is thus made the object of a struggle for power, direct democratic administration loses its specific feature, the undeveloped state of domination. A political party, after all, exists for the very purpose of fighting for domination in the specific sense, and it thus necessarily tends toward a strict hierarchical structure, however carefully it may be trying to hide this fact.

Something similar to this social alienation of the members, who lived in substantially the same manner in the marginal case of "pure" democracy, occurs where the group grows beyond a certain size or where the administrative function becomes too difficult to be satisfactorily taken care of by anyone whom rotation, the lot, or election may happen to designate. The conditions of administration of mass structures are radically different from those obtaining in small associations resting upon neighborly or personal relationships. As soon as mass administration is involved, the meaning of democracy changes so radically that it no longer makes sense for the sociologist to ascribe to the term the same meaning as in the case discussed so far.

The growing complexity of the administrative tasks and the sheer expansion of their scope increasingly result in the technical superiority of those who have had training and experience, and will thus inevitably

favor the continuity of at least some of the functionaries. Hence, there always exists the probability of the rise of a special, perennial structure for administrative purposes, which of necessity means for the exercise of rule. As mentioned before, this structure may be one of *honoratiores*, acting as equal "colleagues," or it may turn out to be "monocratic," so that all functionaries are integrated into a hierarchy culminating in one single head.

3. *Organizational Structure and the Bases of Legitimate Authority*

The predominance of the members of such a structure of domination rests upon the so-called "law of the small number." The ruling minority can quickly reach understanding among its members; it is thus able at any time quickly to initiate that rationally organized action which is necessary to preserve its position of power. Consequently it can easily squelch any action of the masses (*Massen- oder Gemeinschaftshandeln*) threatening its power as long as the opponents have not created the same kind of organization for the planned direction of their own struggle for domination. Another benefit of the small number is the ease of secrecy as to the intentions and resolutions of the rulers and the state of their information; the larger the circle grows, the more difficult or improbable it becomes to guard such secrets. Wherever increasing stress is placed upon "official secrecy," we take it as a symptom of either an intention of the rulers to tighten the reins of their rule or of a feeling on their part that their rule is being threatened. But every domination established as a continuing one must in some decisive point be *secret rule*.

Generally speaking, however, the specific arrangements for domination, as they are established by association, show the following characteristics:

A circle of people who are accustomed to obedience to the orders of *leaders* and who also have a personal interest in the continuance of the domination by virtue of their own participation and the resulting benefits, have divided among themselves the exercise of those functions which will serve the continuation of the domination and are holding themselves continuously ready for their exercise. (This is what is meant by "organization.")[18] Those leaders who do not derive from grant by others the powers of command claimed and exercised by them, we shall call *masters;* while the term *apparatus* shall mean the circle of those persons who are holding themselves at the disposal of the master or masters in the manner just defined.

The sociological character of the *structure* of any particular case of domination is determined by the kind of relationship between the master or masters and the apparatus, the kind of relationship of both to the ruled, and by its specific *organizational structure*, i.e., its specific way of distributing the powers of command. There can also be considered, of course, a good many other elements, which may then be used to establish a great number of varying sociological classifications. For our limited purposes, we shall emphasize those basic types of domination which result when we search for the ultimate grounds of the *validity* of a domination, in other words, when we inquire into those grounds upon which there are based the claims of obedience made by the master against the "officials" and of both against the ruled.

We have encountered the problem of *legitimacy* already in our discussion of the *legal order*. Now we shall have to indicate its broader significance. For a domination, this kind of justification of its legitimacy is much more than a matter of theoretical or philosophical speculation; it rather constitutes the basis of very real differences in the empirical structure of domination. The reason for this fact lies in the generally observable need of any power, or even of any advantage of life, to justify itself.

The fates of human beings are not equal. Men differ in their states of health or wealth or social status or what not. Simple observation shows that in every such situation he who is more favored feels the never ceasing need to look upon his position as in some way "legitimate," upon his advantage as "deserved," and the other's disadvantage as being brought about by the latter's "fault." That the purely accidental causes of the difference may be ever so obvious makes no difference.

This same need makes itself felt in the relation between positively and negatively privileged groups of human beings. Every highly privileged group develops the myth of its natural, especially its blood, superiority. Under conditions of stable distribution of power and, consequently, of status order, that myth is accepted by the negatively privileged strata. Such a situation exists as long as the masses continue in that natural state of theirs in which thought about the order of domination remains but little developed, which means, as long as no urgent needs render the state of affairs "problematical." But in times in which the class situation has become unambiguously and openly visible to everyone as the factor determining every man's individual fate, that very myth of the highly privileged about everyone having deserved his particular lot has often become one of the most passionately hated objects of attack; one ought only to think of certain struggles of late Antiquity and of the Middle Ages, and quite particularly of the class

struggle of our own time in which such myths and the claim of legitimate domination based upon it have been the target of the most powerful and most effective attacks.

Indeed, the continued exercise of every domination (in our technical sense of the word) always has the strongest need of self-justification through appealing to the principles of its legitimation. Of such ultimate principles, there are only three:

The "validity" of a power of command may be expressed, first, in a system of consciously made *rational* rules (which may be either agreed upon or imposed from above), which meet with obedience as generally binding norms whenever such obedience is claimed by him whom the rule designates. In that case every single bearer of powers of command is legitimated by that system of rational norms, and his power is legitimate insofar as it corresponds with the norm. Obedience is thus given to the norms rather than to the person.

The validity of a power of command can also rest, however, upon *personal authority*.

Such personal authority can, in turn, be founded upon the sacredness of *tradition*, i.e., of that which is customary and has always been so and prescribes obedience to some particular person.

Or, personal authority can have its source in the very opposite, viz., the surrender to the extraordinary, the belief in *charisma*, i.e., actual revelation or grace resting in such a person as a savior, a prophet, or a hero.

The "pure" types of domination correspond to these three possible types of legitimation. The forms of domination occurring in historical reality constitute combinations, mixtures, adaptations, or modifications of these "pure" types.

Rationally regulated association within a structure of domination finds its typical expression in *bureaucracy*. *Traditionally* prescribed social action is typically represented by *patriarchalism*. The *charismatic* structure of domination rests upon individual authority which is based neither upon rational rules nor upon tradition. Here too we shall proceed from the type that is the most rational and the one most familiar to us: modern bureaucratic administration.

NOTES

1. Unless otherwise indicated, all notes are by Rheinstein.

2. Among numerous German dialects and ways in which the language was used in poetry, literature, and polite parlance, acceptance as the standard was achieved by that form which was used in the late fourteenth and fifteenth cen-

turies by the imperial chancery, first in Prague and then in Vienna, especially when a style close to it was used by Luther in his translation of the Bible.

3. The low-German dialect spoken in the present Netherlands achieved, in the form in which it is used in the Province of South Holland, the status of a separate language when the United Provinces separated from Germany and the Dutch dialect became the language of officialdom and of the Bible translation (Statenbijbel, 1626–1635). Significantly no such status as a separate language was achieved by any one of the Swiss German dialects; as there was no central chancery in the loose Swiss Confederation, High German remained the official language in spite of the political separation from Germany, which took place a century earlier than that of the Netherlands.

4. *Arbiter elegantiarum*—According to Tacitus (Ann. XVI 18), Gaius Petronius, who is probably identical with the satirist Petronius Arbiter, was called by Nero the "arbiter of elegance" to whose judgment he bowed in matters of taste. Petronius and his title have been popularized through Henry Sienkiewicz' novel *Quo Vadis*.

5. On courts of love, see Part Two, ch. I, n. 10.

6. On empathy and inspiration as factors influencing the attitude of other persons, see Part Two, ch. I:2:8.

7. Cf. above, Part One, ch. III: 19f. (R)

8. At the German universities both the president (*Rektor*) and the deans are elected by the full professors for one year terms; together with the senate they administer the affairs of the university and represent it, especially as against the ministry of education, by which the universities are supervised.

9. Seech. IX: 6:8 and "Soc. of Law," ch. VIII:iv. (R)

10. *Auctoritas* [sc. *patrum*] (lat.)—the approval of the Roman Senate as required for the validity of certain resolutions of the popular assemblies (*comitia*); on the varying phrases of political significance of the requirement, see Jolowicz, *Historical Introduction to Roman Law* (1932), 30.

11. "Men of sixty, off the bridge!"—a Roman proverb of uncertain origin, which was generally associated by ancient authors with an imputed old practice of human sacrifice under which useless old men were thrown off a bridge into the Tiber. A less generally held interpretation, which Weber has in mind here, is reported in a fragment of Varro's *de vita pop. Rom. lib. IV* (II. 11); this derives the saying from the exclusion of men over military age from the voting assembly of the people in its military array on the campus Martius, access to which was over a bridge. Cf. art. "sexagenarios" in Pauly-Wissowa, RE, 2nd ser., II (1923), 205f. (Rh/Wi)

12. Weber uses the word *Schutztruppe*, a term primarily known at the time as the designation for the colonial troops in the German overseas holdings; particularly prominent was the *Schutztruppe* in Southwest Africa, which repressed the Herero uprising between 1904 and 1908. (R)

CHAPTER XI

BUREAUCRACY

1. *Characteristics of Modern Bureaucracy*

Modern officialdom functions in the following manner:

I. There is the principle of official *jurisdictional areas*, which are generally ordered by rules, that is, by laws or administrative regulations. This means:

(1) The regular activities required for the purposes of the bureaucratically governed structure are assigned as official duties.

(2) The authority to give the commands required for the discharge of these duties is distributed in a stable way and is strictly delimited by rules concerning the coercive means, physical, sacerdotal, or otherwise, which may be placed at the disposal of officials.

(3) Methodical provision is made for the regular and continuous fulfillment of these duties and for the exercise of the corresponding rights; only persons who qualify under general rules are employed.

In the sphere of the state these three elements constitute a bureaucratic *agency*, in the sphere of the private economy they constitute a bureaucratic *enterprise*. Bureaucracy, thus understood, is fully developed in political and ecclesiastical communities only in the modern state, and in the private economy only in the most advanced institutions of capitalism. Permanent agencies, with fixed jurisdiction, are not the historical rule but rather the exception. This is even true of large political structures such as those of the ancient Orient, the Germanic and Mongolian empires of conquest, and of many feudal states. In all these cases, the ruler executes the most important measures through personal trustees, table-companions, or court-servants. Their commissions and powers are not precisely delimited and are temporarily called into being for each case.

II. The principles of *office hierarchy* and of channels of appeal (*Instanzenzug*) stipulate a clearly established system of super- and subordination in which there is a supervision of the lower offices by the higher ones. Such a system offers the governed the possibility of appealing, in a precisely regulated manner, the decision of a lower office to the corresponding superior authority. With the full development of the bureaucratic type, the office hierarchy is *monocratically* organized. The principle of hierarchical office authority is found in all bureaucratic structures: in state and ecclesiastical structures as well as in large party organizations and private enterprises. It does not matter for the character of bureaucracy whether its authority is called "private" or "public."

When the principle of jurisdictional "competency" is fully carried through, hierarchical subordination—at least in public office—does not mean that the "higher" authority is authorized simply to take over the business of the "lower." Indeed, the opposite is the rule; once an office has been set up, a new incumbent will always be appointed if a vacancy occurs.

III. The management of the modern office is based upon written documents (the "files"), which are preserved in their original or draft form, and upon a staff of subaltern officials and scribes of all sorts. The body of officials working in an agency along with the respective apparatus of material implements and the files makes up a *bureau* (in private enterprises often called the "counting house," *Kontor*).

In principle, the modern organization of the civil service separates the bureau from the private domicile of the official and, in general, segregates official activity from the sphere of private life. Public monies and equipment are divorced from the private property of the official. This condition is everywhere the product of a long development. Nowadays, it is found in public as well as in private enterprises; in the latter, the principle extends even to the entrepreneur at the top. In principle, the *Kontor* (office) is separated from the household, business from private correspondence, and business assets from private wealth. The more consistently the modern type of business management has been carried through, the more are these separations the case. The beginnings of this process are to be found as early as the Middle Ages.

It is the peculiarity of the modern entrepreneur that he conducts himself as the "first official" of his enterprise, in the very same way in which the ruler of a specifically modern bureaucratic state [Frederick II of Prussia] spoke of himself as "the first servant" of the state. The idea that the bureau activities of the state are intrinsically different in character from the management of private offices is a continental Euro-

pean notion and, by way of contrast, is totally foreign to the American way.

IV. Office management, at least all specialized office management —and such management is distinctly modern—usually presupposes thorough training in a field of specialization. This, too, holds increasingly for the modern executive and employee of a private enterprise, just as it does for the state officials.

V. When the office is fully developed, official activity demands the *full working capacity* of the official, irrespective of the fact that the length of his obligatory working hours in the bureau may be limited. In the normal case, this too is only the product of a long development, in the public as well as in the private office. Formerly the normal state of affairs was the reverse: Official business was discharged as a secondary activity.

VI. The management of the office follows *general rules*, which are more or less stable, more or less exhaustive, and which can be learned. Knowledge of these rules represents a special technical expertise which the officials possess. It involves jurisprudence, administrative or business management.

The reduction of modern office management to rules is deeply embedded in its very nature. The theory of modern public administration, for instance, assumes that the authority to order certain matters by decree—which has been legally granted to an agency—does not entitle the agency to regulate the matter by individual commands given for each case, but only to regulate the matter abstractly. This stands in extreme contrast to the regulation of all relationships through individual privileges and bestowals of favor, which, as we shall see, is absolutely dominant in patrimonialism, at least in so far as such relationships are not fixed by sacred tradition.

2. *The Position of the Official Within and Outside of Bureaucracy*

All this results in the following for the internal and external position of the official:

1. OFFICE HOLDING AS A VOCATION

That the office is a "vocation" (*Beruf*) finds expression, first, in the requirement of a prescribed course of training, which demands the entire working capacity for a long period of time, and in generally

prescribed special examinations as prerequisites of employment. Furthermore, it finds expression in that the position of the official is in the nature of a "duty" (*Pflicht*). This determines the character of his relations in the following manner: Legally and actually, office holding is not considered ownership of a source of income, to be exploited for rents or emoluments in exchange for the rendering of certain services, as was normally the case during the Middle Ages and frequently up to the threshold of recent times, nor is office holding considered a common exchange of services, as in the case of free employment contracts. Rather, entrance into an office, including one in the private economy, is considered an acceptance of a specific duty of fealty to the purpose of the office (*Amtstreue*) in return for the grant of a secure existence. It is decisive for the modern loyalty to an office that, in the pure type, it does not establish a relationship to a *person*, like the vassal's or disciple's faith under feudal or patrimonial authority, but rather is devoted to *impersonal* and *functional* purposes. These purposes, of course, frequently gain an ideological halo from cultural values, such as state, church, community, party or enterprise, which appear as surrogates for a this-worldly or other-worldly personal master and which are embodied by a given group.

The political official—at least in the fully developed modern state —is not considered the personal servant of a ruler. Likewise, the bishop, the priest and the preacher are in fact no longer, as in early Christian times, carriers of a purely personal charisma, which offers other-worldly sacred values under the personal mandate of a master, and in principle responsible only to him, to everybody who appears worthy of them and asks for them. In spite of the partial survival of the old theory, they have become officials in the service of a functional purpose, a purpose which in the present-day "church" appears at once impersonalized and ideologically sanctified.

II. THE SOCIAL POSITION OF THE OFFICIAL

A. SOCIAL ESTEEM AND STATUS CONVENTION. Whether he is in a private office or a public bureau, the modern official, too, always strives for and usually attains a distinctly elevated *social esteem* vis-à-vis the governed. His social position is protected by prescription about rank order and, for the political official, by special prohibitions of the criminal code against "insults to the office" and "contempt" of state and church authorities.

The social position of the official is normally highest where, as in old civilized countries, the following conditions prevail: a strong de-

mand for administration by trained experts; a strong and stable social differentiation, where the official predominantly comes from socially and economically privileged strata because of the social distribution of power or the costliness of the required training and of status conventions. The possession of educational certificates or patents—discussed below (sec. 13 A)—is usually linked with qualification for office; naturally, this enhances the "status element" in the social position of the official. Sometimes the status factor is explicitly acknowledged; for example, in the prescription that the acceptance of an aspirant to an office career depends upon the consent ("election") by the members of the official body. This is the case in the officer corps of the German army. Similar phenomena, which promote a guild-like closure of officialdom, are typically found in the patrimonial and, particularly, in prebendal officialdom of the past. The desire to resurrect such policies in changed forms is by no means infrequent among modern bureaucrats; it played a role, for instance, in the demands of the largely proletarianized [*zemstvo*-] officials (the *tretii element*) during the Russian revolution [of 1905].

Usually the social esteem of the officials is especially low where the demand for expert administration and the hold of status conventions are weak. This is often the case in new settlements by virtue of the great economic opportunities and the great instability of their social stratification: witness the United States.

B. APPOINTMENT VERSUS ELECTION: CONSEQUENCES FOR EXPERTISE. Typically, the bureaucratic official is appointed by a superior authority. An official elected by the governed is no longer a purely bureaucratic figure. Of course, a formal election may hide an appointment—in politics especially by party bosses. This does not depend upon legal statutes, but upon the way in which the party mechanism functions. Once firmly organized, the parties can turn a formally free election into the mere acclamation of a candidate designated by the party chief, or at least into a contest, conducted according to certain rules, for the election of one of two designated candidates.

In all circumstances, the designation of officials by means of an election modifies the rigidity of hierarchical subordination. In principle, an official who is elected has an autonomous position vis-à-vis his superiors, for he does not derive his position "from above" but "from below," or at least not from a superior authority of the official hierarchy but from powerful party men ("bosses"), who also determine his further career. The career of the elected official is not primarily dependent upon his chief in the administration. The official who is not elected, but appointed by a master, normally functions, from a technical point of view, more accurately because it is more likely that

purely functional points of consideration and qualities will determine his selection and career. As laymen, the governed can evalute the expert qualifications of a candidate for office only in terms of experience, and hence only after his service. Moreover, if political parties are involved in any sort of selection of officials by election, they quite naturally tend to give decisive weight not to technical competence but to the services a follower renders to the party boss. This holds for the designation of otherwise freely elected officials by party bosses when they determine the slate of candidates as well as for the free appointment of officials by a chief who has himself been elected. The contrast, however, is relative: substantially similar conditions hold where legitimate monarchs and their subordinates appoint officials, except that partisan influences are then less controllable.

Where the demand for administration by trained experts is considerable, and the party faithful have to take into account an intellectually developed, educated, and free "public opinion," the use of unqualified officials redounds upon the party in power at the next election. Naturally, this is more likely to happen when the officials are appointed by the chief. The demand for a trained administration now exists in the United States, but wherever, as in the large cities, immigrant votes are "corralled," there is, of course, no effective public opinion. Therefore, popular election not only of the administrative chief but also of his subordinate officials usually endangers, at least in very large administrative bodies which are difficult to supervise, the expert qualification of the officials as well as the precise functioning of the bureaucratic mechanism, besides weakening the dependence of the officials upon the hierarchy. The superior qualification and integrity of Federal judges appointed by the president, as over and against elected judges, in the United States is well known, although both types of officials are selected primarily in terms of party considerations. The great changes in American metropolitan administrations demanded by reformers have been effected essentially by elected mayors working with an apparatus of officials who were appointed by them. These reforms have thus come about in a "caesarist" fashion. Viewed technically, as an organized form of domination, the efficiency of "caesarism," which often grows out of democracy, rests in general upon the position of the "caesar" as a free trustee of the masses (of the army or of the citizenry), who is unfettered by tradition. The "caesar" is thus the unrestrained master of a body of highly qualified military officers and officials whom he selects freely and personally without regard to tradition or to any other impediments. Such "rule of the per-

sonal genius," however, stands in conflict with the formally "democratic" principle of a generally elected officialdom.

C. TENURE AND THE INVERSE RELATIONSHIP BETWEEN JUDICIAL INDEPENDENCE AND SOCIAL PRESTIGE. Normally, the position of the official is held for life, at least in public bureaucracies, and this is increasingly the case for all similar structures. As a factual rule, *tenure for life* is presupposed even where notice can be given or periodic reappointment occurs. In a private enterprise, the fact of such tenure normally differentiates the official from the worker. Such legal or actual life-tenure, however, is not viewed as a proprietary right of the official to the possession of office as was the case in many structures of authority of the past. Wherever legal guarantees against discretionary dismissal or transfer are developed, as in Germany for all judicial and increasingly also for administrative officials, they merely serve the purpose of guaranteeing a strictly impersonal discharge of specific office duties.

Within the bureaucracy, therefore, the measure of "independence" legally guaranteed in this manner by tenure is not always a source of increased status for the official whose position is thus secured. Indeed, often the reverse holds, especially in communities with an old culture and a high degree of differentiation. For the subordination under the arbitrary rule of the master also guarantees the maintenance of the conventional seigneurial style of living for the official, and it does this the better, the stricter it is. Therefore the conventional esteem for the official may rise precisely because of the absence of such legal guarantees, in the same way as, during the Middle Ages, the esteem of the *ministeriales* rose at the expense of the freeman and that of the king's judge at the expense of the folk judge. In Germany, the military officer or the administrative official can be removed from office at any time, or at least far more readily than the "independent" judge, who never pays with loss of his office for even the grossest offense against the "code of honor" or against the conventions of the *salon*. For this very reason the judge is, if other things are equal, considered less socially acceptable by "high society" than are officers and administrative officials whose greater dependence on the master is a better guarantee for the conformity of their life style with status conventions. Of course, the average official strives for a civil-service law which in addition to materially securing his old age would also provide increased guarantees against his arbitrary removal from office. This striving, however, has its limits. A very strong development of the "right to the office" naturally makes it more difficult to staff offices with an eye to technical efficiency and decreases the career opportunities of ambitious candidates. This, as well as the preference of officials to be dependent upon their equals

rather than upon the socially inferior governed strata, makes for the fact that officialdom on the whole does not "suffer" much under its dependency from the "higher-up." The present conservative movement among the Baden clergy, occasioned by the anxiety of a threatening separation of church and state, was admittedly determined by the desire not to be turned "from a master into a servant of the parish."[1]

D. RANK AS THE BASIS OF REGULAR SALARY. The official as a rule receives a *monetary* compensation in the form of a *salary,* normally fixed, and the old age security provided by a pension. The salary is not measured like a wage in terms of work done, but according to "status," that is, according to the kind of function (the "rank") and, possibly, according to the length of service. The relatively great security of the official's income, as well as the rewards of social esteem, make the office a sought-after position, especially in countries which no longer provide opportunities for colonial profits. In such countries, this situation permits relatively low salaries for officials.

E. FIXED CAREER LINES AND STATUS RIGIDITY. The official is set for a "career" within the hierarchical order of the public service. He expects to move from the lower, less important and less well paid, to the higher positions. The average official naturally desires a mechanical fixing of the conditions of promotion: if not of the offices, at least of the salary levels. He wants these conditions fixed in terms of "seniority," or possibly according to grades achieved in a system of examinations. Here and there, such grades actually form a *character indelebilis* of the official and have lifelong effects on his career. To this is joined the desire to reinforce the right to office and to increase status group closure and economic security. All of this makes for a tendency to consider the offices as "prebends" of those qualified by educational certificates. The necessity of weighing general personal and intellectual qualifications without concern for the often subaltern character of such patents of specialized education, has brought it about that the highest political offices, especially the "ministerial" positions, are as a rule filled without reference to such certificates.

3. *Monetary and Financial Presuppositions of Bureaucracy*

The development of the *money economy* is a presupposition of a modern bureaucracy insofar as the compensation of officials today takes the form of money salaries. The money economy is of very great impor-

tance for the whole bearing of bureaucracy, yet by itself it is by no means decisive for the existence of bureaucracy.

Historical examples of relatively clearly developed and quantitatively large bureaucracies are: (a) Egypt, during the period of the New Kingdom, although with strong patrimonial elements; (b) the later Roman Principate, and especially the Diocletian monarchy and the Byzantine polity which developed out of it; these, too, contained strong feudal and patrimonial admixtures; (c) the Roman Catholic Church, increasingly so since the end of the thirteenth century; (d) China, from the time of Shi Hwangti until the present, but with strong patrimonial and prebendal element; (e) in ever purer forms, the modern European states and, increasingly, all public bodies since the time of princely absolutism; (f) the large modern capitalist enterprise, proportional to its size and complexity.

To a very great extent or predominantly, cases (a) to (d) rested upon compensation of the officials in kind. They nevertheless displayed many of the traits and effects characteristic of bureaucracy. The historical model of all later bureaucracies—the New Kingdom in Egypt—is at the same time one of the most grandiose examples of an organized natural economy. This coincidence of bureaucracy and natural economy is understandable only in view of the quite unique conditions that existed in Egypt, for the reservations—they are quite considerable—which one must make in classifying these structures as bureaucracies are based precisely on the prevalence of a natural economy. A certain measure of a developed money economy is the normal precondition at least for the unchanged survival, if not for the establishment, of pure bureaucratic administrations.

According to historical experience, without a money economy the bureaucratic structure can hardly avoid undergoing substantial internal changes, or indeed transformation into another structure. The allocation of fixed income in kind from the magazines of the lord or from his current intake—which has been the rule in Egypt and China for millennia and played an important part in the later Roman monarchy as well as elsewhere—easily means a first step toward appropriation of the sources of taxation by the official and their exploitation as private property. Income in kind has protected the official against the often sharp fluctuations in the purchasing power of money. But whenever the lord's power subsides, payments in kind, which are based on taxes in kind, tend to become irregular. In this case, the official will have direct recourse to the tributaries of his bailiwick, whether or not he is authorized. The idea of protecting the official against such oscillations by mortgaging or transferring the levies and therewith the power to tax,

or by transferring the use of profitable lands of the lord to the official, is close at hand, and every central authority which is not tightly organized is tempted to take this course, either voluntarily or because the officials compel it to do so. The official may satisfy himself with the use of these resources up to the level of his salary claim and then hand over the surplus. But this solution contains strong temptations and therefore usually yields results unsatisfactory to the lord. Hence the alternative process involves fixing the official's monetary obligations. This often occurred in the early history of German officialdom, and it happened on the largest scale in all Eastern satrap administrations: the official hands over a stipulated amount and retains the surplus.

A. EXCURSUS ON TAX-FARMING

In such cases the official is economically in a position rather similar to that of the entrepreneurial tax-farmer. Indeed, office-farming, including even the leasing of office to the highest bidder, is regularly found. In the private economy, the transformation of the [Carolingian] manorial or *villicatio* structure into a system of tenancy relations is one of the most important among numerous examples. By tenancy arrangements the lord can transfer the trouble of transforming his income-in-kind into money-income to the office-farmer or to the official who must render a fixed sum. This seems to have been the case with some Oriental governors in Antiquity. And above all, the farming out of public tax collection in lieu of the lord's own management of tax-gathering served this purpose. One consequence is the possibility of the advance, so very important in the history of public finances, towards regular budgeting: A firm estimate of revenues, and correspondingly of expenditures, can take the place of the hand-to-mouth living from the immediate but unpredictable inflows which is so typical of all early stages of public finances. On the other hand, however, the control and full exploitation of the fiscal resources for the lord's own use is surrendered and perhaps, depending upon the measure of freedom left to the official or the office- or tax-farmer, the long-run yield capacity even endangered by ruthless exploitation, since a capitalist will not have the same long-run interest in preservation of the subjects' ability to pay as the political lord.

The lord seeks to safeguard himself against this loss of control by regulations. The mode of tax-farming or the transfer of taxes can thus vary widely; depending upon the distribution of power between the lord and the farmer, the latter's interest in the full exploitation of the

paying capacity of the subjects or the lord's interest in the conservation of this capacity may predominate. The nature of the tax-farming system in the Ptolemaic empire, for instance, was clearly determined by the balance of the joint or the opposing influence of these motives: the elimination of oscillations in the yields, the possibility of budgeting, the safeguarding of the subjects' capacity to pay by protecting them against uneconomical exploitation, and state control of the tax-farmer's yields for the sake of appropriating the maximum possible. As in Hellas and in Rome, the tax-farmer was still a private capitalist. The collection of the taxes, however, was bureaucratically executed and controlled by the Ptolemaic state. The farmer's profit consisted only in a share of the potential surplus over and above his fee which, in fact, constituted a minimum guarantee [to the state]; his risk consisted in the possibility of yields that were lower than this sum.

B. OFFICE PURCHASE, PREBENDAL AND FEUDAL ADMINISTRATION

The purely economic conception of the office as a private source of income for the official can also lead to the direct purchase of offices. This occurs when the lord finds himself in a position in which he requires not only a current income but money capital—for instance, for warfare or for debt payments. The purchase of office as a regular institution has existed especially in modern states—in the Papal State as well as in France and England, in the cases of sinecures as well as of more important offices (for example, officers' commissions) well into the nineteenth century. In individual cases, the economic meaning of such a purchase of office can be altered so that the purchasing sum is partly or wholly in the nature of bail deposited to assure faithful service, but this has not been the rule.

Every sort of assignment of usufructs, tributes and services claimed by the lord to the official for personal exploitation always means an abandonment of typical bureaucratic organization. The official in such positions has a property right to his office. This is the case to a still higher degree when official duty and compensation are interrelated in such a way that the official does not transfer to the lord any of the yields gained from the objects left to him, but handles these objects for his private ends and in turn renders to the lord services of a personal or a military, political, or ecclesiastical character.

We shall speak of *prebends* and of a *prebendal* organization of offices in all cases of life-long assignment to officials of rent payments deriving from material goods, or of the essentially *economic* usufruct of

land or other sources of rent, in compensation for the fulfillment of real or fictitious duties of office, for the economic support of which the goods in question have been *permanently* allocated by the lord.

The transition [from such prebendal organization of office] to salaried officialdom is quite fluid. Very often the economic endowment of priesthoods has been "prebendal," as in Antiquity and the Middle Ages, and even up to the modern period. But in almost all periods the same form has been found also in other areas. In Chinese sacerdotal law, the prebendal character of all offices forced the mourning official to resign his office, for during the ritual mourning period for the father or other household authorities abstention from the enjoyment of possessions was prescribed—and the office was considered purely a source for rent. (Originally this prescription was aimed at avoiding the ill-will of the deceased master of the house, to whom the possessions had belonged.)

When not only economic but also lordly [political] rights are bestowed [upon the official] to exercise on his own, and when this is associated with the stipulation of *personal* services to the lord to be rendered in return, a further step away from salaried bureaucracy has been taken. The nature of the prerogatives conferred can vary; for instance, in the case of a political official they may tend more toward seigneurial or more toward office authority. In both instances, but most definitely in the latter case, the specific nature of bureaucratic organization is completely destroyed and we enter into the realm of feudal organization of domination.

All assignments of services and usufructs in kind as endowments for officials tend to loosen the bureaucratic mechanism, and especially to weaken hierarchic subordination, which is most strictly developed in the discipline of modern officialdom. A precision similar to that of the contractually employed official of the modern Occident can only be attained—under very energetic leadership—where the subjection of the officials to the lord is also personally absolute, i.e., where slaves or employees treated like slaves are used for administration.

C. EXCURSUS ON THE SUPERIORITY OF STATUS INCENTIVES OVER PHYSICAL COERCION

In the natural economies of the ancient world, the Egyptian officials were slaves of the Pharaoh, if not legally, then in fact. The Roman latifundia owners preferred to commission slaves with the direct management of money matters, because of the possibility of subjecting them

to torture. In China, similar results have been sought by the prodigious use of the bamboo as a disciplinary instrument. The chances, however, for such direct means of coercion to function with *steadiness* are extremely unfavorable. According to experience, the relative optimum for the success and maintenance of a rigorous mechanization of the bureaucratic apparatus is offered by an assured salary connected with the opportunity of a career that is not dependent upon mere accident and arbitrariness. Taut discipline and control which at the same time have consideration for the official's sense of honor, and the development of prestige sentiments of the status group as well as the possibility of public criticism, also work in the same direction. With all this, the bureaucratic apparatus functions more assuredly than does legal enslavement of the functionaries. A strong status sentiment among officials not only is compatible with the official's readiness to subordinate himself to his superior without any will of his own, but—as in the case with the officer—status sentiments are the compensatory consequence of such subordination, serving to maintain the official's self-respect. The purely impersonal character of the office, with its separation of the private sphere from that of the official activities, facilitates the official's integration into the given functional conditions of the disciplined mechanism.

D. SUMMARY

Even though the full development of a money economy is thus not an indispensable precondition for bureaucratization, bureaucracy as a permanent structure is knit to the one presupposition of the availability of continuous revenues to maintain it. Where such income cannot be derived from private profits, as it is in the bureaucratic organization of modern enterprises, or from land rents, as in the manor, a stable system of *taxation* is the precondition for the permanent existence of bureaucratic administration. For well-known general reasons only a fully developed money economy offers a secure basis for such a taxation system. Hence the degree of administrative bureaucratization has in urban communities with fully developed money economies not infrequently been relatively greater than in the contemporaneous and much larger territorial states. As soon, however, as these states have been able to develop orderly systems of taxation, bureaucracy has there developed far more comprehensively than in the city states where, whenever their size remained confined to moderate limits, the tendency for a plutocratic and collegial administration by notables has corresponded most adequately to the requirements. For the basis of bureaucratization has always been

a certain development of administrative tasks, both quantitative and qualitative.

4. *The Quantitative Development of Administrative Tasks*

The first such basis of bureaucratization has been the quantitative extension of administrative tasks. In politics, the big state and the mass party are the classic field of bureaucratization.

EXCURSUS ON THE DEGREE OF BUREAUCRATIZATION IN HISTORICAL EMPIRE FORMATIONS

Our statement is not meant to imply that every historically known and genuine formation of big states has brought about a bureaucratic administration. For one, the secular survival of an existing great state or the homogeneity of a culture borne by it has not always been tied to a bureaucratic structure. Both of these linkages, however, occur to a great extent in the Chinese empire, to give an example. The numerous large African kingdoms, and similar formations, have had an ephemeral existence primarily because they have lacked an apparatus of officials. The Carolingian empire disintegrated when its administrative organization fell apart, which, however, was predominantly patrimonial rather than bureaucratic. On the other hand, the empire of the Caliphs and its predecessors on Asiatic soil have lasted for considerable periods of time, and their administrative organization was essentially patrimonial and prebendal. The same is true of the [German medieval] Holy Roman Empire, in spite of the almost complete absence of bureaucracy. All these realms have represented a cultural unity of at least approximately the same strength as is usually created by bureaucratic polities. By contrast, the ancient Roman Empire disintegrated internally in spite of increasing bureaucratization, or rather precisely during its introduction, because the mode of allocation of public burdens, which was associated with it, favored a natural economy. But it should be noted that from the point of view of their purely *political* unity and its degree of intensity, the cohesiveness of the first-named formations was essentially unstable and nominal, of the nature of a conglomerate, with a steadily diminishing capacity for political action. Their relatively great *cultural* unity flowed in part from ecclesiastic structures that were strongly unified and, in the Occidental Middle

Ages, increasingly bureaucratic in character; the cultural unity also resulted from the far-going homogeneity of their social structures, which in turn was the after-effect and transformation of their former political unity. Both are phenomena of the traditional stereotyping of culture which favors survival of unstable equilibria. Both factors proved so strong a foundation that even grandiose expansionary attempts, such as the Crusades, could be undertaken in spite of the lack of political unity; they were, one might say, performed as "private undertakings." The failure of the Crusades and their often irrational political course, however, is associated with the absence of a unified state power to back them up. And there is no doubt that the nuclei of intensive, "modern" state formation in the Middle Ages developed concomitantly with bureaucratic structures, and that in the end the bureaucratically most advanced states shattered the conglomerates which rested essentially upon unstable equilibria.

The disintegration of the ancient Roman Empire was partly conditioned by the very bureaucratization of its army and official apparatus. This bureaucratization could be realized only by putting into effect at the same time a method of distribution of public burdens which was bound to lead to an increase in the relative importance of the natural economy. Individual factors of this sort always enter the picture. Furthermore, we cannot assume a direct relationship between bureaucratization and the intensity of the state's external (expansionary) and internal (cultural) influence. Certainly a direct proportionality between the degree of bureaucratization and the state's expansionary force can only be stated as the "normal," but not as the inevitable rule. For two of the most expansive political formations, the Roman empire and the British world empire, rested upon bureaucratic foundations only to the smallest extent during their most expansive periods. The Norman state in England introduced a taut organization on the basis of the feudal hierarchy. It is true that to a large extent it received its unity and its push through the bureaucratization of the royal exchequer which, in comparison to other political structures of the feudal period, was extremely advanced. The fact that later on the English state did not participate in the Continental development towards bureaucratization, but remained an administration of notables, can be attributed—just like parallels in the republican administration of Rome—to the relative absence of a continental geography, as well as to some unique preconditions which at the present time are disappearing. The dispensability of the large standing armies, which a continental state with equally expansive tendencies requires for its land frontiers, is among these special preconditions. In Rome, bureaucratization advanced with the transition from a coastal to

a continental empire. For the rest, the strictly military character of the magistrates' powers—a characteristic of the Roman polity unknown to any other people—made up for the lack of a bureaucratic apparatus with its technical efficiency, its precision and unity of administrative functions, especially outside the city limits. The continuity of administration was safeguarded by the unique position of the Senate. In Rome, as in England, one presupposition for this dispensability of bureaucracy, which should not be forgotten, was that the state authorities increasingly "minimized" the scope of their functions at home, restricting them to what was absolutely demanded for direct "reasons of state."

In the continental states, however, power at the beginning of the modern period as a rule accumulated in the hands of those princes who most relentlessly took the course of administrative bureaucratization. It is obvious that technically the large modern state is absolutely dependent upon a bureaucratic basis. The larger the state, and the more it is a great power, the more unconditionally is this the case.

The United States still bears the character of a polity which, at least in the technical sense, is not fully bureaucratized. But the greater the zones of friction with the outside and the more urgent the needs for administrative unity at home become, the more this character is inevitably and gradually giving way formally to the bureaucratic structure. Moreover, the partly unbureaucratic form of the state structure of the United States is materially balanced by the more strictly bureaucratic structures of those formations which, in truth, dominate politically, namely, the parties under the leadership of "professionals" or experts in organization and election tactics. The increasingly bureaucratic organization of all genuine mass parties offers the most striking example of the role of sheer quantity as a leverage for the bureaucratization of a social structure; in Germany, above all the Social Democratic party, and abroad both of the American parties are prime examples.

5. *Qualitative Changes of Administrative Tasks: The Impact of Cultural, Economic and Technological Developments*

Bureaucratization is stimulated more strongly, however, by intensive and qualitative expansion of the administrative tasks than by their extensive and quantitative increase. But the direction bureaucratization takes, and the reasons that occasion it, can vary widely. In Egypt, the oldest country of bureaucratic state administration, it was the technical necessity of a

public regulation of the water economy for the whole country and from the top which created the apparatus of scribes and officials; very early it found its second realm of operation in the extraordinary, militarily organized construction activities. In most cases, as mentioned before, the bureaucratic tendency has been promoted by needs arising from the creation of standing armies, determined by power politics, and from the related development of public finances. But in the modern state, the increasing demands for administration also rest on the increasing complexity of civilization.

Great power expansions, especially overseas, have, of course, been managed by states ruled by notables (Rome, England, Venice). Yet the "intensity" of the administration, that is, the assumption of as many tasks as possible by the state apparatus for continuous management and discharge in its own establishment was only slightly developed in the great states ruled by notables, especially in Rome and England, by comparison with the bureaucratic polities; this will become evident in the appropriate context. To be sure, the *structure* of state power has influenced culture very strongly both in England and in Rome. But it has done so to a very small extent in the form of management and control by the state. This holds from justice to education. The growing demands on culture, in turn, are determined, though to a varying extent, by the growing wealth of the most influential strata in the state. To this extent increasing bureaucratization is a function of the increasing possession of consumption goods, and of an increasingly sophisticated technique of fashioning external life—a technique which corresponds to the opportunities provided by such wealth. This reacts upon the standard of living and makes for an increasing subjective indispensability of public, interlocal, and thus bureaucratic, provision for the most varied wants which previously were either unknown or were satisfied locally or by the private economy.

Among purely political factors, the increasing demand of a society accustomed to absolute pacification for order and protection ("police") in all fields exerts an especially persevering influence in the direction of bureaucratization. A direct road leads from mere modifications of the blood feud, sacerdotally or by means of arbitration, to the present position of the policeman as the "representative of God on earth." The former means still placed the guarantees for the individual's rights and security squarely upon the members of his sib who were obligated to assist him with oath and vengeance. Other factors operating in the direction of bureaucratization are the manifold tasks of social welfare policies which are either saddled upon the modern state by interest groups or which the state usurps for reasons of power or for ideological

motives. Of course, these tasks are to a large extent economically determined.

Among essentially technical factors, the specifically modern means of communication enter the picture as pacemakers of bureaucratization. In part, public roads and water-ways, railroads, the telegraph, etc., can only be administered publicly; in part, such administration is technically expedient. In this respect, the contemporary means of communication frequently play a role similar to that of the canals of Mesopotamia and the regulation of the Nile in the ancient Orient. A certain degree of development of the means of communication in turn is one of the most important prerequisites for the possibility of bureaucratic administration, though it alone is not decisive. Certainly in Egypt bureaucratic centralization could, against the backdrop of an almost purely "natural" economy, never have reached the degree of perfection which it did without the natural route of the Nile. In order to promote bureaucratic centralization in modern Persia, the telegraph officials were officially commissioned with reporting to the Shah, over the heads of the local authorities, all occurrences in the provinces; in addition, everyone received the right to remonstrate directly by telegraph. The modern Occidental state can be administered the way it actually is only because the state controls the telegraph network and has the mails and railroads at its disposal. (These means of communication, in turn, are intimately connected with the development of an inter-local traffic of mass goods, which therefore is one of the causal factors in the formation of the modern state. As we have already seen, this does not hold unconditionally for the past.)

6. *The Technical Superiority of Bureaucratic Organization over Administration by Notables*

The decisive reason for the advance of bureaucratic organization has always been its purely *technical* superiority over any other form of organization. The fully developed bureaucratic apparatus compares with other organizations exactly as does the machine with the non-mechanical modes of production. Precision, speed, unambiguity, knowledge of the files, continuity, discretion, unity, strict subordination, reduction of friction and of material and personal costs—these are raised to the optimum point in the strictly bureaucratic administration, and especially in its monocratic form. As compared with all collegiate, honorific, and avocational forms of administration, trained bureaucracy is superior on all

these points. And as far as complicated tasks are concerned, paid bureaucratic work is not only more precise but, in the last analysis, it is often cheaper than even formally unremunerated honorific service.

Honorific arrangements make administrative work a subsidiary activity: an avocation and, for this reason alone, honorific service normally functions more slowly. Being less bound to schemata and more formless, it is less precise and less unified than bureaucratic administration, also because it is less dependent upon superiors. Because the establishment and exploitation of the apparatus of subordinate officials and clerical services are almost unavoidably less economical, honorific service is less continuous than bureaucratic and frequently quite expensive. This is especially the case if one thinks not only of the money costs to the public treasury—costs which bureaucratic administration, in comparison with administration by notables, usually increases—but also of the frequent economic losses of the governed caused by delays and lack of precision. Permanent administration by notables is normally feasible only where official business can be satisfactorily transacted as an avocation. With the qualitative increase of tasks the administration has to face, administration by notables reaches its limits—today even in England. Work organized by collegiate bodies, on the other hand, causes friction and delay and requires compromises between colliding interests and views. The administration, therefore, runs less precisely and is more independent of superiors; hence, it is less unified and slower. All advances of the Prussian administrative organization, for example, have been and will in the future be advances of the bureaucratic, and especially of the monocratic, principle.

Today, it is primarily the capitalist market economy which demands that the official business of public administration be discharged precisely, unambiguously, continuously, and with as much speed as possible. Normally, the very large modern capitalist enterprises are themselves unequalled models of strict bureaucratic organization. Business management throughout rests on increasing precision, steadiness, and, above all, speed of operations. This, in turn, is determined by the peculiar nature of the modern means of communication, including, among other things, the news service of the press. The extraordinary increase in the speed by which public announcements, as well as economic and political facts, are transmitted exerts a steady and sharp pressure in the direction of speeding up the tempo of administrative reaction towards various situations. The optimum of such reaction time is normally attained only by a strictly bureaucratic organization. (The fact that the bureaucratic apparatus also can, and indeed does, create

certain definite impediments for the discharge of business in a manner best adapted to the individuality of each case does not belong into the present context.)

Bureaucratization offers above all the optimum possibility for carrying through the principle of specializing administrative functions according to purely objective considerations. Individual performances are allocated to functionaries who have specialized training and who, by constant practice increase their expertise. "Objective" discharge of business primarily means a discharge of business according to *calculable rules* and "without regard for persons."

"Without regard for persons," however, is also the watchword of the market and, in general, of all pursuits of naked economic interests. Consistent bureaucratic domination means the leveling of "status honor." Hence, if the principle of the free market is not at the same time restricted, it means the universal domination of the "class situation." That this consequence of bureaucratic domination has not set in everywhere proportional to the extent of bureaucratization is due to the differences between possible principles by which polities may supply their requirements. However, the second element mentioned, calculable rules, is the most important one for modern bureaucracy. The peculiarity of modern culture, and specifically of its technical and economic basis, demands this very "calculability" of results. When fully developed, bureaucracy also stands, in a specific sense, under the principle of *sine ira ac studio*. Bureaucracy develops the more perfectly, the more it is "dehumanized," the more completely it succeeds in eliminating from official business love, hatred, and all purely personal, irrational, and emotional elements which escape calculation. This is appraised as its special virtue by capitalism.

The more complicated and specialized modern culture becomes, the more its external supporting apparatus demands the personally detached and strictly objective *expert*, in lieu of the lord of older social structures who was moved by personal sympathy and favor, by grace and gratitude. Bureaucracy offers the attitudes demanded by the external apparatus of modern culture in the most favorable combination. In particular, only bureaucracy has established the foundation for the administration of a rational law conceptually systematized on the basis of "statutes," such as the later Roman Empire first created with a high degree of technical perfection. During the Middle Ages, the reception of this [Roman] law coincided with the bureaucratization of legal administration: The advance of the rationally trained expert displaced the old trial procedure which was bound to tradition or to irrational presuppositions.

A. EXCURSUS ON KADI JUSTICE, COMMON LAW AND ROMAN LAW

The "rational" interpretation of law on the basis of strictly formal concepts can be juxtaposed to a kind of adjudication that is primarily bound to hallowed traditions. Individual cases which cannot be unambiguously decided by tradition it either settles by concrete revelation (oracle, prophetic dicta, or ordeal—that is, by charismatic justice) or—and only the following two cases interest us here—by a) informal judgments rendered in terms of concrete ethical or other practical valuations ("*Kadi*-justice," as R. Schmidt[2] has fittingly called it); or, b) formal judgments rendered, not by subsumption under rational concepts, but by drawing on "analogies" and by depending upon and interpreting concrete "precedents." This is "empirical justice."

Kadi-justice knows no rational "rules of decision" (*Urteilsgründe*) whatever, nor does empirical justice of the pure type give any reasons which in our sense could be called rational. The concrete valuational character of *Kadi*-justice can advance to a prophetic break with all tradition. Empirical justice, on the other hand, can be sublimated and rationalized into a "technique." Since non-bureaucratic forms of domination display a peculiar co-existence of strict traditionalism and of arbitrariness and lordly discretion, combinations and transitional forms between these two principles are very frequent. Even today in England, as Mendelssohn has demonstrated,[3] a broad substratum of justice is actually *Kadi*-justice to an extent that is hardly conceivable on the Continent. The justice of German juries, which excludes a statement of the reasons for their verdict, often functions in practice in the same way. In general, one has to beware of believing that "democratic" principles of justice are identical with "rational" adjudication (in the sense of formal rationality). Indeed, the contrary holds. The English and American adjudication of the highest courts is still to a great extent empirical, and specifically: an adjudication by precedents. In England, the reason for the failure of all efforts at a rational codification of law, as well as the failure to "receive" the Roman law [at the end of the Middle Ages, when this occurred elsewhere in Europe], was due to the successful resistance against such rationalization offered by the great and centrally organized lawyers' guilds, a monopolistic stratum of notables from whose midst the judges of the high courts of the realm were recruited. They retained in their hands juristic training as an apprenticeship transmitting an empirical and highly developed technology, and they successfully fought all moves toward rational law emanating especially from the ecclesiastical courts and, for a time, also from the universities, which threatened their social and material position.

The fight of the common law advocates against the Roman and

ecclesiastical law, and against the power of the church in general, was to a considerable degree economically conditioned, namely by the lawyer's interest in fees; this is distinctly evidenced by the way in which the kings intervened in this struggle. But the power position of the lawyers, who emerged victoriously from this struggle, was conditioned by political centralization. In Germany, primarily for political reasons, a socially powerful status group of notables was lacking. There was no status group which, like the English lawyers, could have been the carrier of the administration of a national law, which could have raised national law to the level of a technology based on apprenticeship, and which could have offered resistance to the intrusion of the technically superior training of the Roman-law jurists. It is not that Roman law was in its substantive provisions better adjusted to the needs of emerging capitalism; this did not decide its victory on the Continent. In fact, all legal institutions specific to modern capitalism are alien to Roman law and are medieval in origin. What was decisive was the rational form of Roman law and, above all, the technical necessity to place the trial procedure in the hands of rationally trained experts, which meant men trained in the universities in Roman law. This necessity arose from the increasing complexity of legal cases and the demands of an increasingly rationalized economy for a rational procedure of evidence rather than the ascertainment of the truth by concrete revelation or sacerdotal guarantee which everywhere was the primeval means of proof. Of course, this situation was strongly influenced by structural changes in the economy. But this factor was efficacious everywhere, including England where the royal power introduced the rational procedure of evidence primarily for the sake of the merchants. The predominant reasons for the differences in the development of substantive law in England and Germany do not rest upon this *economic* factor. As is already obvious, these differences have sprung from the autonomous development of the respective structures of *domination*: In England, centralized justice and rule by notables; in Germany, absence of political centralization in spite of bureaucratization. England, which in modern times was the first and most highly developed capitalist country, thereby retained a less rational and less bureaucratic judicature. Capitalism in England, however, could quite easily come to terms with this because the nature of the court constitution and of the trial procedure up to the modern period amounted in effect to a far-going denial of justice to the economically weak groups. This fact, in association with the high time and money expenses of the system of real estate transfers—itself a function of the economic interests of the lawyer class—exerted a profound influence upon the agrarian structure of England in favor of the accumulation and immobilization of landed wealth.

During the time of the republic, Roman law itself presented a unique mixture of rational and empirical elements, and even of elements of *Kadi*-justice. The appointment of the jury courts as such and the praetorian *actiones in factum* [*conceptae*],[4] which at first undoubtedly were formulated "from case to case," contained elements of *Kadi*-justice. The [early republican] so-called "*cautelae*-jurisprudence"[5] and all that developed from it, including even a part of the practice of *responsae* of the classical jurists [in the imperial period],[6] bore an "empirical" character. The decisive turn of legal thought toward a rational approach was first prepared by the technical nature of the trial instructions based on the *formulae* of the praetorian edict, which were geared to legal concepts. (Today, under the dominance of the principle of fact pleading, the presentation of the facts is decisive, no matter from what legal point of view they may make the complaint seem justified. The compulsion unambiguously and formally to work out the scope of concepts is now lacking; but such a compulsion was produced by the technical culture of Roman law at its very height.) Technical factors of trial procedure thus played their part in the development of rational law, factors which resulted only indirectly from the structure of the state. But the rationalization of Roman law into a closed system of concepts to be scientifically handled was brought to perfection only during the period when the polity itself underwent bureaucratization. This rational and systematic quality sets off Roman law sharply from all law produced by the Orient and by Hellenic culture.

The rabbinic responses of the *Talmud* are a typical example of empirical justice that is not rational but "rationalist," and at the same time strictly *fettered* by tradition. Pure *Kadi*-justice is represented in every prophetic dictum that follows the pattern: "It is written . . . but I say unto you." The more strongly the religious nature of the *Kadi*'s (or some similar judge's) position is emphasized, the more arbitrary—that is, the less rule-bound—will the judgment of the individual case be within that sphere where it is not fettered by sacred tradition. For a generation after the occupation of Tunisia by the French, for instance, a very tangible handicap for capitalism remained in that the ecclesiastic court (the *Chara*) decided over land holdings "at discretion," as the Europeans put it. We shall deal in another context with the sociological foundation of these older types of justice in the structure of domination.

B. BUREAUCRATIC OBJECTIVITY, RAISON D'ÉTAT AND POPULAR WILL

It is perfectly true that "matter-of-factness" and "expertness" are not necessarily identical with the rule of general and abstract norms. Indeed,

this does not even hold in the case of the modern administration of justice. The idea of a "law without gaps" is, of course, under vigorous attack. The conception of the modern judge as an automaton into which legal documents and fees are stuffed at the top in order that it may spill forth the verdict at the bottom along with the reasons, read mechanically from codified paragraphs—this conception is angrily rejected, perhaps because a certain approximation to this type would precisely be implied by a consistent bureaucratization of justice. Thus even in the field of law-finding there are areas in which the bureaucratic judge is directly held to "individualizing" procedures by the legislator.

For the field of administrative activity proper, that is, for all state activities that fall outside the field of law creation and court procedure, one has become accustomed to claims for the freedom and the paramountcy of individual circumstances. General norms are held to play primarily a negative role, as barriers to the official's positive and "creative" activity which should never be regulated. The bearing of this thesis may be disregarded here. Decisive is that this "freely" creative administration (and possibly judicature) would not constitute a realm of *free*, arbitrary action and discretion, of *personally* motivated favor and valuation, such as we shall find to be the case among pre-bureaucratic forms. The rule and the rational pursuit of "objective" purposes, as well as devotion to these, would always constitute the norm of conduct. Precisely those views which most strongly glorify the "creative" discretion of the official accept, as the ultimate and highest lodestar for his behavior in public administration, the specifically modern and strictly "objective" idea of *raison d'état*. Of course, the sure instincts of the bureaucracy for the conditions of maintaining its *own* power in the home state (and through it, in opposition to other states) are inseparably fused with this canonization of the abstract and "objective" idea of "reasons of state." Most of the time, only the power interests of the bureaucracy give a concretely exploitable content to this by no means unambiguous ideal; in dubious cases, it is always these interests which tip the balance. We cannot discuss this further here. The only decisive point for us is that in principle a system of rationally debatable "reasons" stands behind every act of bureaucratic administration, namely, either subsumption under norms, or a weighing of ends and means.

In this context, too, the attitude of all "democratic" currents, in the sense of currents that would minimize "domination," is necessarily ambiguous. "Equality before the law" and the demand for legal guarantees against arbitrariness demand a formal and rational "objectivity" of administration, as opposed to the personal discretion flowing from the

"grace" of the old patrimonial domination. If, however, an "ethos"—not to speak of other impulses—takes hold of the masses on some individual question, its postulates of *substantive* justice, oriented toward some concrete instance and person, will unavoidably collide with the formalism and the rule-bound and cool "matter-of-factness" of bureaucratic administration. Emotions must in that case reject what reason demands.

The propertyless masses especially are not served by the formal "equality before the law" and the "calculable" adjudication and administration demanded by bourgeois interests. Naturally, in their eyes justice and administration should serve to equalize their economic and social life-opportunities in the face of the propertied classes. Justice and administration can fulfill this function only if they assume a character that is informal because "ethical" with respect to substantive content (*Kadi*-justice). Not only any sort of "popular justice"—which usually does not ask for reasons and norms—but also any intensive influence on the administration by so-called "public opinion"—that is, concerted action born of irrational "sentiments" and usually staged or directed by party bosses or the press—thwarts the rational course of justice just as strongly, and under certain circumstances far more so, as the "star chamber" proceedings (*Kabinettsjustiz*) of absolute rulers used to be able to do.

7. *The Concentration of the Means of Administration*

The bureaucratic structure goes hand in hand with the concentration of the material means of management in the hands of the master. This concentration occurs, for instance, in a well-known and typical fashion in the development of big capitalist enterprises, which find their essential characteristics in this process. A corresponding process occurs in public organizations.

A. THE BUREAUCRATIZATION OF THE ARMY BY THE STATE AND BY PRIVATE CAPITALISM

The bureaucratically led army of the Pharaohs, the army of the later period of the Roman republic and of the Principate, and, above all, the army of the modern military state are characterized by the fact that their equipment and provisions are supplied from the magazines of the lord. This is in contrast to the levies of agricultural tribes, the armed

citizenry of ancient cities, the militias of early medieval cities, and all feudal armies; for these, the self-equipment and the self-provisioning of those obliged to fight was normal. War in our time is a war of machines, and this makes centralized provisioning technically necessary, just as the dominance of the machine in industry promotes the concentration of the means of production and management. In the main, however, the bureaucratic armies of the past, equipped and provisioned by the lord, came into being when social and economic development had diminished, absolutely or relatively, the stratum of citizens who were economically able to equip themselves, so that their number was no longer sufficient for putting the required armies in the field. A relative decline of these strata sufficed: relative, that is, with respect to the scope of the power claim of the polity. Only the bureaucratic army structure allows for the development of the professional standing armies which are necessary for the constant pacification of large territories as well as for warfare against distant enemies, especially enemies overseas. Further, military discipline and technical military training can normally be fully developed, at least to its modern high level, only in the bureaucratic army.

Historically, the bureaucratization of the army has everywhere occurred along with the shifting of army service from the shoulders of the propertied to those of the propertyless. Until this transfer occurs, military service is an honorific privilege of propertied men. Such a transfer was made to the native-born unpropertied, for instance, in the armies of the Roman generals of the late Republic and of the Empire, as well as in modern armies up to the nineteenth century. The burden of service has also been transferred to impecunious strangers, as in the mercenary armies of all ages. This process typically goes hand in hand with the general increase in material and intellectual culture. In addition, with increasing population density, and hence growing intensity and strain of economic work, the acquisitive strata become increasingly unavailable for purposes of war. Leaving aside periods of strong ideological fervor, the propertied strata with sophisticated and especially with urban culture as a rule are little fitted and also little inclined to do the coarse war work of the common soldier. Other circumstances being equal, the propertied strata of the countryside tend to be better qualified and more strongly inclined to become professional officers. This difference between the urban and the rural propertied is equalized only where the increasing possibility of mechanized warfare requires the leaders to qualify as "technicians."

The bureaucratization of organized warfare may be carried through in the form of private capitalist enterprises, just like any other business. Indeed, the procurement of armies and their administration by private

capitalists has been the rule in mercenary armies, especially those of the Occident up to the turn of the eighteenth century. In Brandenburg during the Thirty Years' War, the soldier was still the predominant owner of the material implements of his business. He owned his weapons, horses, and clothing, although the state, in the role, as it were, of the merchant of the putting-out system, did already purvey them. Later on, in the Prussian standing army, the chief of the company owned the material means of warfare, and only since the peace of Tilsit [in 1807] has the concentration of the means of warfare in the hands of the state definitely come about. Only with this concentration was the introduction of uniforms generally carried through. Previously, the introduction of uniforms had been left largely to the discretion of the regimental chief, with the exception of certain units upon whom the king had "bestowed" uniforms (first, in 1620, on the royal *Garde du Corps*, then repeatedly under Frederick II).

Such terms as "regiment" and "battalion" usually had quite different meanings in the eighteenth century as against today. Only the "battalion" was a tactical battle unit (as today both are), while the "regiment" was an economic management unit created by the entrepreneurial position of the colonel. Semiofficial sea-war ventures (like the Genoese *maone*) and army procurement belong to private capitalism's first giant enterprises with a largely bureaucratic character. Their "nationalization" in this respect has its modern parallel in the nationalization of the railroads, which have been controlled by the state from their beginnings.

B. THE CONCENTRATION OF RESOURCES IN OTHER SPHERES, INCLUDING THE UNIVERSITY

In this same way as with army organizations, the bureaucratization of administration in other spheres goes hand in hand with the concentration of resources. The ancient administrations through satraps and viceroys, just like those through office farmers, office buyers and, most of all, through feudal vassals, all decentralize the means of operation: Local requirements, including the cost of the army and of the lower officialdom, are as a rule paid first from the local revenues, and only the surplus reaches the central treasury. The enfeoffed official meets expenses entirely out of his own pocket. The bureaucratic state, by contrast, puts its entire administrative expense on the budget and provides the lower authorities with the current means of expenditure, the use of which the state regulates and controls. This has the same meaning for

the economy of public administration as for the large centralized capitalist enterprise.

In the field of scientific research and instruction, the bureaucratization of the inevitable research institutes of the universities is also a function of the increasing demand for material means of operation. Liebig's laboratory at Giessen University was the first example of big enterprise in this field. Through the concentration of such means in the hands of the privileged head of the institute the mass of researchers and instructors are separated from their "means of production," in the same way as the workers are separated from theirs by the capitalist enterprises.

8. *The Leveling of Social Differences*

In spite of its indubitable technical superiority, bureaucracy has everywhere been a relatively late development. A number of obstacles have contributed to this, and only under certain social and political conditions have they definitely receded into the background.

A. ADMINISTRATIVE DEMOCRATIZATION

Bureaucratic organization has usually come into power on the basis of a leveling of economic and social differences. This leveling has been at least relative, and has concerned the significance of social and economic differences for the assumption of administrative functions.

Bureaucracy inevitably accompanies modern *mass democracy*, in contrast to the democratic self-government of small homogeneous units. This results from its characteristic principle: the abstract regularity of the exercise of authority, which is a result of the demand for "equality before the law" in the personal and functional sense—hence, of the horror of "privilege," and the principled rejection of doing business "from case to case." Such regularity also follows from the social preconditions of its origin. Any non-bureaucratic administration of a large social structure rests in some way upon the fact that existing social, material, or honorific preferences and ranks are connected with administrative functions and duties. This usually means that an economic or a social exploitation of position, which every sort of administrative activity provides to its bearers, is the compensation for the assumption of administrative functions.

Bureaucratization and democratization within the administration of

the state therefore signify an increase of the cash expenditures of the public treasury, in spite of the fact that bureaucratic administration is usually more "economical" in character than other forms. Until recent times—at least from the point of view of the treasury—the cheapest way of satisfying the need for administration was to leave almost the entire local administration and lower judicature to the landlords of Eastern Prussia. The same is true of the administration by justices of the peace in England. Mass democracy which makes a clean sweep of the feudal, patrimonial, and—at least in intent—the plutocratic privileges in administration unavoidably has to put paid professional labor in place of the historically inherited "avocational" administration by notables.

2. MASS PARTIES AND THE BUREAUCRATIC CONSEQUENCES OF DEMOCRATIZATION

This applies not only to the state. For it is no accident that in their own organizations the democratic mass parties have completely broken with traditional rule by notables based upon personal relationships and personal esteem. Such personal structures still persist among many old conservative as well as old liberal parties, but democratic mass parties are bureaucratically organized under the leadership of party officials, professional party and trade union secretaries, etc. In Germany, for instance, this has happened in the Social Democratic party and in the agrarian mass-movement; in England earliest in the caucus democracy of Gladstone and Chamberlain which spread from Birmingham in the 1870's. In the United States, both parties since Jackson's administration have developed bureaucratically. In France, however, attempts to organize disciplined political parties on the basis of an election system that would compel bureaucratic organization have repeatedly failed. The resistance of local circles of notables against the otherwise unavoidable bureaucratization of the parties, which would encompass the entire country and break their influence, could not be overcome. Every advance of simple election techniques based on numbers alone as, for instance, the system of proportional representation, means a strict and inter-local bureaucratic organization of the parties and therewith an increasing domination of party bureaucracy and discipline, as well as the elimination of the local circles of notables—at least this holds for large states.

The progress of bureaucratization within the state administration itself is a phenomenon paralleling the development of democracy, as is quite obvious in France, North America, and now in England. Of course, one must always remember that the term "democratization" can

be misleading. The *demos* itself, in the sense of a shapeless mass, never "governs" larger associations, but rather is governed. What changes is only the way in which the executive leaders are selected and the measure of influence which the *demos*, or better, which social circles from its midst are able to exert upon the content and the direction of administrative activities by means of "public opinion." "Democratization," in the sense here intended, does not necessarily mean an increasingly active share of the subjects in government. This may be a result of democratization, but it is not necessarily the case.

We must expressly recall at this point that the political concept of democracy, deduced from the "equal rights" of the governed, includes these further postulates: (1) prevention of the development of a closed status group of officials in the interest of a universal accessibility of office, and (2) minimization of the authority of officialdom in the interest of expanding the sphere of influence of "public opinion" as far as practicable. Hence, wherever possible, political democracy strives to shorten the term of office through election and recall, and to be relieved from a limitation to candidates with special expert qualifications. Thereby democracy inevitably comes into conflict with the bureaucratic tendencies which have been produced by its very fight against the notables. The loose term "democratization" cannot be used here, in so far as it is understood to mean the minimization of the civil servants' power in favor of the greatest possible "direct" rule of the *demos*, which in practice means the respective party leaders of the *demos*. The decisive aspect here—indeed it is rather exclusively so—is the *leveling of the governed* in face of the governing and bureaucratically articulated group, which in its turn may occupy a quite autocratic position, both in fact and in form.

C. EXCURSUS: HISTORICAL EXAMPLES OF "PASSIVE DEMOCRATIZATION"

In Russia, the destruction of the position of the old seigneurial nobility through the regulation of the *mestnichestvo* (rank order) system and the consequent permeation of the old nobility by an office nobility [under Peter the Great] were characteristic transitional phenomena in the development of bureaucracy. In China, the estimation of rank and the qualification for office according to the number of examinations passed have similar significance, although with an—at least in theory—even more pronounced rigour. In France the Revolution and, more decisively, Bonapartism have made the bureaucracy all-powerful. In the Catholic church, first the feudal and then all independent local intermediary powers were eliminated. This was begun by Gregory VII and

continued through the Council of Trent and the Vatican Council, and it was completed by the edicts of Pius X. The transformation of these local powers into pure functionaries of the central authority was connected with the constant increase in the factual significance of the formally quite dependent *Kapläne* [auxiliary clergymen supervising lay organizations], a process which above all was based on the political party organization of Catholicism. Hence this process meant an advance of bureaucracy and at the same time of "passive" democratization, as it were, that is, the leveling of the governed. In the same way, the substitution of the bureaucratic army for the self-equipped army of notables is everywhere a process of "passive" democratization, in the sense in which this applies to every establishment of an absolute military monarchy in the place of a feudal state or of a republic of notables. The same holds, in principle, even for the development of the state in Egypt in spite of all the peculiarities involved. Under the Roman Principate the bureaucratization of the provincial administration in the field of tax collection, for instance, went hand in hand with the elimination of the plutocracy of a capitalist class, which, under the Republic, had been all-powerful; thus, ancient capitalism itself came to an end.

D. ECONOMIC AND POLITICAL MOTIVES BEHIND PASSIVE DEMOCRATIZATION

It is obvious that almost always economic conditions of some sort play their part in such "democratizing" developments. Very frequently we find at the base of the development an economically determined origin of new classes, whether plutocratic, petty-bourgeois, or proletarian in character. Such classes may call on the aid of, or they may call to life or recall to life, a political power of legitimate or of caesarist stamp in order to attain economic or social advantages through its political assistance. On the other hand, there are equally possible—and historically documented—cases in which the initiative came "from on high" and was of a purely political nature, drawing advantages from political constellations, especially in foreign affairs. Here such leadership exploited economic and social antagonisms as well as class interests merely as a means for its own purposes, throwing the antagonistic classes out of their almost always unstable equilibrium and calling their latent interest conflicts into battle. It seems hardly possible to give a general statement of this.

The extent and direction of the course along which economic influences have moved, as well as the manner in which political power relations exert influence, vary widely. In Hellenic Antiquity, the transition

to disciplined hoplite combat formations, and later in Athens the increasing importance of the navy, laid the foundation for the conquest of political power by the strata on whose shoulders the military burden rested at each given time. In Rome, however, the same development shook the rule of the office nobility only seemingly and temporarily. The modern army, finally, although it has everywhere been a means of breaking the power of the notables, has in itself in no way served as a lever of active, but rather remained an instrument of merely passive democratization. It should be noted, however, that a contributing factor in these contrasts has been the fact that the modern army rests upon bureaucratic procurement, whereas the ancient citizen army rested economically upon self-equipment.

The advance of the bureaucratic structure rests upon "technical" superiority. In consequence—as always in the area of "techniques"—we find that the advance proceeded most slowly wherever older structural forms were in their own way technically highly developed and functionally particularly well adapted to the requirements at hand. This was the case, for instance, in the administration of notables in England, and hence England was the slowest of all countries to succumb to bureaucratization or, indeed, is still only partly in the process of doing so. This is the same general phenomenon as when areas which have highly developed gas illumination works or steam railroads, with large fixed capital, offer stronger obstacles to electrification than completely new areas which are opened up for electrification.

9. *The Objective and Subjective Bases of Bureaucratic Perpetuity*

Once fully established, bureaucracy is among those social structures which are the hardest to destroy. Bureaucracy is *the* means of transforming social action into rationally organized action. Therefore, as an instrument of rationally organizing authority relations, bureaucracy was and is a power instrument of the first order for one who controls the bureaucratic apparatus. Under otherwise equal conditions, rationally organized and directed action (*Gesellschaftshandeln*) is superior to every kind of collective behavior (*Massenhandeln*) and also social action (*Gemeinschaftshandeln*) opposing it. Where administration has been completely bureaucratized, the resulting system of domination is practically indestructible.

The individual bureaucrat cannot squirm out of the apparatus into

which he has been harnessed. In contrast to the "notable" performing administrative tasks as a honorific duty or as a subsidiary occupation (avocation), the professional bureaucrat is chained to his activity in his entire economic and ideological existence. In the great majority of cases he is only a small cog in a ceaselessly moving mechanism which prescribes to him an essentially fixed route of march. The official is entrusted with specialized tasks, and normally the mechanism cannot be put into motion or arrested by him, but only from the very top. The individual bureaucrat is, above all, forged to the common interest of all the functionaries in the perpetuation of the apparatus and the persistence of its rationally organized domination.

The ruled, for their part, cannot dispense with or replace the bureaucratic apparatus once it exists, for it rests upon expert training, a functional specialization of work, and an attitude set on habitual virtuosity in the mastery of single yet methodically integrated functions. If the apparatus stops working, or if its work is interrupted by force, chaos results, which it is difficult to master by improvised replacements from among the governed. This holds for public administration as well as for private economic management. Increasingly the material fate of the masses depends upon the continuous and correct functioning of the ever more bureaucratic organizations of private capitalism, and the idea of eliminating them becomes more and more utopian.

Increasingly, all order in public and private organizations is dependent on the system of files and the discipline of officialdom, that means, its habit of painstaking obedience within its wonted sphere of action. The latter is the more decisive element, however important in practice the files are. The naive idea of Bakuninism of destroying the basis of "acquired rights" together with "domination" by destroying the public documents overlooks that the settled orientation of *man* for observing the accustomed rules and regulations will survive independently of the documents. Every reorganization of defeated or scattered army units, as well as every restoration of an administrative order destroyed by revolts, panics, or other catastrophes, is effected by an appeal to this conditioned orientation, bred both in the officials and in the subjects, of obedient adjustment to such [social and political] orders. If the appeal is successful it brings, as it were, the disturbed mechanism to "snap into gear" again.

The objective indispensability of the once-existing apparatus, in connection with its peculiarly "impersonal" character, means that the mechanism—in contrast to the feudal order based upon personal loyalty—is easily made to work for anybody who knows how to gain control over it. A rationally ordered officialdom continues to function smoothly

after the enemy has occupied the territory; he merely needs to change the top officials. It continues to operate because it is to the vital interest of everyone concerned, including above all the enemy. After Bismarck had, during the long course of his years in power, brought his ministerial colleagues into unconditional bureaucratic dependence by eliminating all independent statesmen, he saw to his surprise that upon his resignation they continued to administer their offices unconcernedly and undismayedly, as if it had not been the ingenious lord and very creator of these tools who had left, but merely some individual figure in the bureaucratic machine which had been exchanged for some other figure. In spite of all the changes of masters in France since the time of the First Empire, the power apparatus remained essentially the same.

Such an apparatus makes "revolution," in the sense of the forceful creation of entirely new formations of authority, more and more impossible—technically, because of its control over the modern means of communication (telegraph etc.), and also because of its increasingly rationalized inner structure. The place of "revolutions" is under this process taken by *coups d'état*, as again France demonstrates in the classical manner since all successful transformations there have been of this nature.

10. *The Indeterminate Economic Consequences of Bureaucratization*

It is clear that the bureaucratic organization of a social structure, and especially of a political one, can and regularly does have far-reaching economic consequences. But what sort of consequences? Of course, in any individual case it depends upon the distribution of economic and social power, and especially upon the sphere that is occupied by the emerging bureaucratic mechanism. The consequences of bureaucracy depend therefore upon the direction which the powers using the apparatus give to it. Very frequently a crypto-plutocratic distribution of power has been the result.

In England, but especially in the United States, party donors regularly stand behind the bureaucratic party organizations. They have financed these parties and have been able to influence them to a large extent. The breweries in England, and in Germany the so-called "heavy industry" and the Hansa League[1] with their election funds are well enough known in this respect. In political and especially in state formations, too, bureaucratization and social leveling with the associated

breaking up of the opposing local and feudal privileges have in modern times frequently benefitted the interests of capitalism or have been carried out in direct alliance with capitalist interests; witness the great historical alliance of the absolute princes with capitalist interests. In general, a legal leveling and destruction of firmly established local structures ruled by notables has usually benefitted the scope of capitalist activity. But, on the other hand, there is also an effect of bureaucratization that meets the petty-bourgeois interest in a safe traditional "living," or even a state-socialist effect that strangulates opportunities for private profit. This has undoubtedly been active in several cases of historically far-reaching importance, particularly during Antiquity; it is perhaps also to be expected in future developments in our world.

The very different effects of political organizations which were, at least in principle, quite similar in Egypt under the Pharaohs, in Hellenistic, and in Roman times, show the very different economic consequences of bureaucratization which are possible, depending upon the direction of other factors present. The mere fact of bureaucratic organization does not unambiguously tell us about the concrete direction of its *economic* effects, which are always in some manner present. At least it does not tell us as much as can be told about its relatively leveling *social* effect. Even in this respect one has to remember that bureaucracy as such is a precision instrument which can put itself at the disposal of quite varied interests, purely political as well as purely economic ones, or any other sort. Therefore, the measure of its parallelism with democratization must not be exaggerated, however typical it may be. Under certain conditions, strata of feudal lords have also put this instrument into their service. There is also the possibility—and often it has become a fact, as for instance in the Roman Principate and in some forms of absolutist state structures—that bureaucratization of the administration is deliberately connected with the formation of status groups, or is entangled with it by the force of the existing groupings of social power. The explicit reservation of offices for certain status groups is very frequent, and empirical reservations are even more frequent.

11. *The Power Position of the Bureaucracy*

A. THE POLITICAL IRRELEVANCE OF FUNCTIONAL INDISPENSABILITY

The democratization of society in its totality, and in the *modern* sense of the term, whether actual or perhaps merely formal, is an especially favorable basis of bureaucratization, but by no means the only

possible one. After all, bureaucracy has merely the [limited] striving to level those powers that stand in its way in those concrete areas that, in the individual case, it seeks to occupy. We must remember the fact which we have encountered several times and which we shall have to discuss repeatedly: that "democracy" as such is opposed to the "rule" of bureaucracy, in spite and perhaps because of its unavoidable yet unintended promotion of bureaucratization. Under certain conditions, democracy creates palpable breaks in the bureauratic pattern and impediments to bureaucratic organization. Hence, one must in every individual historical case analyze in which of the special directions bureaucratization has there developed.

For this reason, it must also remain an open question whether the *power* of bureaucracy is increasing in the modern states in which it is spreading. The fact that bureaucratic organization is technically the most highly developed power instrument in the hands of its controller does not determine the weight that bureaucracy as such is capable of procuring for its own opinions in a particular social structure. The ever-increasing "indispensability" of the officialdom, swollen to the millions, is no more decisive on this point than is the economic indispensability of the proletarians for the strength of the social and political power position of that class (a view which some representatives of the proletarian movement hold).[8] If "indispensability" were decisive, the equally "indispensable" slaves ought to have held this position of power in any economy where slave labor prevailed and consequently freemen, as is the rule, shunned work as degrading. Whether the power of bureaucracy as such increases cannot be decided *a priori* from such reasons. The drawing in of economic interest groups or other non-official experts, or the drawing in of lay representatives, the establishment of local, interlocal, or central parliamentary or other representative bodies, or of occupational associations—these *seem* to run directly against the bureaucratic tendency. How far this appearance is the truth must be discussed in another chapter, rather than in the framework of this purely formal and typological (*kasuistisch*) discussion. In general, only the following can be said here:

The power position of a fully developed bureaucracy is always great, under normal conditions overtowering. The political "master" always finds himself, vis-à-vis the trained official, in the position of a dilettante facing the expert. This holds whether the "master," whom the bureaucracy serves, is the "people" equipped with the weapons of legislative initiative, referendum, and the right to remove officials; or a parliament elected on a more aristocratic or more democratic basis and equipped with the right or the *de facto* power to vote a lack of confidence; or an

aristocratic collegiate body, legally or actually based on self-recruitment; or a popularly elected president or an "absolute" or "constitutional" hereditary monarch.

B. ADMINISTRATIVE SECRECY

This superiority of the professional insider every bureaucracy seeks further to increase through the means of *keeping secret* its knowledge and intentions. Bureaucratic administration always tends to exclude the public, to hide its knowledge and action from criticism as well as it can. Prussian church authorities now threaten to use disciplinary measures against pastors who make reprimands or other admonitory measures in any way accessible to third parties, charging that in doing so they become "guilty" of facilitating a possible criticism of the church authorities. The treasury officials of the Persian Shah have made a secret science of their budgetary art and even use a secret script. The official statistics of Prussia, in general, make public only what cannot do any harm to the intentions of the power-wielding bureaucracy. This tendency toward secrecy is in certain administrative fields a consequence of their objective nature: namely, wherever power interests of the given structure of domination *toward the outside* are at stake, whether this be the case of economic competitors of a private enterprise or that of potentially hostile foreign polities in the public field. If it is to be successful, the management of diplomacy can be publicly supervised only to a very limited extent. The military administration must insist on the concealment of its most important measures with the increasing significance of purely technical aspects. Political parties do not proceed differently, in spite of all the ostensible publicity of the party conventions and "Catholic Congresses" (*Katholikentage*).[9] With the increasing bureaucratization of party organizations, this secrecy will prevail even more. Foreign trade policy, in Germany for instance, brings about a concealment of production statistics. Every fighting posture of a social structure toward the outside tends in itself to have the effect of buttressing the position of the group in power.

However, the pure power interests of bureaucracy exert their effects far beyond these areas of functionally motivated secrecy. The concept of the "office secret" is the specific invention of bureaucracy, and few things it defends so fanatically as this attitude which, outside of the specific areas mentioned, cannot be justified with purely functional arguments. In facing a parliament, the bureaucracy fights, out of a sure power instinct, every one of that institution's attempts to gain through its own means (as, e.g., through the so-called "right of parlia-

mentary investigation")[10] expert knowledge from the interested parties. Bureaucracy naturally prefers a poorly informed, and hence powerless, parliament—at least insofar as this ignorance is compatible with the bureaucracy's own interests.

C. THE RULER'S DEPENDENCE ON THE BUREAUCRACY

The absolute monarch, too, is powerless in face of the superior knowledge of the bureaucratic expert—in a certain sense more so than any other political head. All the irate decrees of Frederick the Great concerning the "abolition of serfdom" were derailed in the course of their realization because the official mechanism simply ignored them as the occasional ideas of a dilettante. A constitutional king, whenever he is in agreement with a socially important part of the governed, very frequently exerts a greater influence upon the course of administration than does the absolute monarch since he can control the experts better because of the at least relatively public character of criticism, whereas the absolute monarch is dependent for information solely upon the bureaucracy. The Russian Tsar of the *ancien régime* [before the appointment of a Prime Minister in 1905] was rarely able to put across permanently anything that displeased his bureaucracy and violated its power interests. His ministries, which were subordinated directly to him as the autocrat, represented, as Leroy-Beaulieu very correctly observed, a conglomerate of satrapies which fought among each other with all the means of personal intrigue and bombarded each other with voluminous "Memoranda," in the face of which the monarch as a dilettante was quite helpless.[11]

The concentration of the power of the central bureaucracy in a single pair of hands is inevitable with every transition to constitutional government. Officialdom is placed under a monocratic head, the prime minister, through whose hands everything has to go before it gets to the monarch. This puts the latter to a large extent under the tutelage of the chief of the bureaucracy. Wilhelm II, in his well-known conflict with Bismarck, fought against this principle, but had to withdraw his attack very soon.[12] Under the rule of expert knowledge, the influence of the monarch can attain steadiness only through continuous communication with the bureaucratic chiefs which is methodically planned and directed by the central head of the bureaucracy. At the same time, constitutionalism binds the bureaucracy and the ruler into a community of interests against the power-seeking of the party chiefs in the parliamentary bodies. But *against* the bureaucracy the ruler remains powerless for this very reason, unless he finds support in parliament. The

desertion of the "Great of the Reich," here the Prussian ministers and top Reich officials, brought a monarch into approximately the same situation in November 1918 as did the parallel event under the conditions of the feudal state in 1076.[13] This, however, is an exception, for the power position of a monarch is on the whole far stronger vis-à-vis bureaucratic officials than it was in any feudal or in a "stereotyped" patrimonial state. This is because of the constant presence of aspirants for promotion with whom the monarch can easily replace inconvenient and independent officials. Other circumstances being equal, only economically independent officials, that is, officials who belong to the propertied strata, can permit themselves to risk the loss of their offices. Today as always, the recruitment of officials from among propertyless strata increases the power of the rulers. Only officials who belong to a socially influential stratum which the monarch believes to have to take into account as support of his person, like the so-called *Kanalrebellen* in Prussia, can permanently and completely paralyze the substance of his will.[14]

Only the expert knowledge of private economic interest groups in the field of "business" is superior to the expert knowledge of the bureaucracy. This is so because the exact knowledge of facts in their field is of direct significance for economic survival. Errors in official statistics do not have direct economic consequences for the responsible official, but miscalculations in a capitalist enterprise are paid for by losses, perhaps by its existence. Moreover, the "secret," as a means of power, is more safely hidden in the books of an enterprise than it is in the files of public authorities. For this reason alone authorities are held within narrow boundaries when they seek to influence economic life in the capitalist epoch, and very frequently their measures take an unforeseen and unintended course or are made illusory by the superior expert knowledge of the interested groups.

12. Excursus *on Collegiate Bodies and Interest Groups*

Since the specialized knowledge of the expert became more and more the foundation for the power of the officeholder, an early concern of the ruler was how to exploit the special knowledge of experts without having to abdicate in their favor. With the qualitative extension of administrative tasks and therewith the indispensability of expert knowledge, it typically happens that the lord no longer is satisfied by occasional consultation with proven confidants or even with an assembly of such men called together intermittently and in difficult situations.

He begins to surround himself with *collegiate* bodies which deliberate and resolve in continuous session (*Conseil d'État*, Privy Council, *Generaldirektorium*, Cabinet, *Divan*, *Tsungli Yamen*, *Wai-wu pu*, etc.). The *Räte von Haus aus* are a characteristic transitional phenomenon in this development.

The position of such collegiate bodies naturally varies according to whether they themselves become the highest administrative authority, or whether a central and monocratic authority, or several such authorities, stand at their side. In addition, a great deal depends upon their procedure. When the type is fully developed, such bodies meet—either actually or as a fiction—with the lord in the chair, and all important matters are resolved, after elucidation by the formal position papers of the responsible experts and the reasoned *vota* of other members, by a decision which the lord will sanction or reject by an edict. This kind of collegiate body thus is the typical form in which the ruler, who increasingly turns into a "dilettante," at the same time exploits expert knowledge and—what frequently remains unnoticed—seeks to fend off the threatening dominance of the experts. He keeps one expert in check by others, and by such cumbersome procedures seeks personally to gain a comprehensive picture as well as the certainty that nobody prompts him into arbitrary decisions. Often the ruler expects to assure himself a maximum of personal influence less from personally presiding over the collegiate bodies than from having written memoranda submitted to him. Frederick William I of Prussia, whose actual influence on the administration was very significant, almost never attended the collegiately organized sessions of the cabinet ministers. He rendered his decisions on written presentations by means of marginal comments or edicts which were sent to the ministers from the "cabinet," via the *Feldjäger*, after consultation with the "cabinet"-servants personally attached to the king. The Cabinet, in Russia as well as in Prussia and in other states, thus developed into a personal fortress in which the ruler sought refuge, so to speak, from expert knowledge and the impersonal and functional routinization of administration. The hatred of the bureaucratic departments turned against the Cabinet, just as did the distrust of the subjects in case of failure.

By the collegiate principle the ruler furthermore tries to fashion a sort of synthesis of *specialized experts* into a collective unit. His success in doing this cannot be ascertained in general. The phenomenon itself, however, is common to very different forms of state, from the patrimonial and feudal to the early bureaucratic, and it is especially typical for early princely absolutism. The collegiate principle has proved itself to be one of the strongest educative means for "matter-of-factness"

in administration. It also made it possible to counsel with socially influential private persons and thus to combine in some measure the authority of notables and the practical knowledge of private enterprisers with the specialized expertness of professional bureaucrats. The collegiate bodies were one of the first institutions to allow the development of the modern concept of "public authorities," in the sense of enduring structures independent of the person.

As long as an expert knowledge of administrative affairs was the exclusive product of a long *empirical* practice, and administrative norms were not regulations but elements of tradition, the council of *elders*—often with priests, "elder statesmen," and notables participating—was the adequate form for collegiate authorities, which in the beginning merely gave counsel to the ruler. But since such bodies, in contrast to the changing rulers, were perennial formations, they often usurped actual power. The Roman Senate and the Venetian Council, as well as the Athenian Areopagus until its downfall and replacement by the rule of the *demagogos*, acted in this manner. We must, of course, sharply distinguish such authorities from the corporate bodies under discussion here.

In spite of manifold transitions, collegiate bodies, as a type, emerge on the basis of the rational specialization of functions and the rule of expert knowledge. On the other hand, they must be distinguished from advisory bodies selected from among private and *interested* circles, which are frequently found in the modern state and whose nucleus is not formed of officials or of former officials. These collegiate bodies must also be distinguished sociologically from the collegiate supervisory "board of directors" (*Aufsichtsrat*) found in the bureaucratic structures of the modern private economy (joint stock corporation). This distinction must be made in spite of the fact that such corporate bodies not infrequently complete themselves by drawing in notables from among disinterested circles for the sake of their expert knowledge or in order to exploit them for representation and advertising. Normally [in Germany] such bodies do not consociate experts for their special knowledge, but rather the representatives of the paramount economic interests, especially of the banks financing the enterprise—and such men by no means hold merely advisory positions. They have at least a controlling voice, and very often they occupy an actually dominant position. Such bodies are to be compared (not without some distortion) to the assemblies of the great independent holders of feudal fiefs and offices and other socially powerful interest groups of patrimonial or feudal polities. Occasionally, however, these have been the precursors of the "councils" which emerged in consequence of an increased intensity of adminis-

tration, and even more frequently they have been precursors of corporations of such privileged status groups.

With great regularity the bureaucratic collegiate principle was transferred from the central authority to the most varied lower authorities. Within locally closed, and especially within urban units, collegiate administration is the original form of the rule of notables, as we indicated before [XI:3:D]. Originally it worked through elected, later on, usually, or at least in part, through co-opted councilors, colleges of magistrates, *decuriones* and *scabini*. Such bodies are a normal element of organized "self-government," that is, the management of administrative affairs by local interest groups under the control of the bureaucratic authorities of the state. The above-mentioned examples of the Venetian Council and even more so of the Roman Senate represent transfers of the rule of notables, normally rooted in local political associations, to great overseas empires. In the bureaucratic state, collegiate administration disappears again once progress in the means of communication and the increasing technical demands upon the administration necessitate quick and unambiguous decisions and the other motives for full bureaucratization and monocracy, which we discussed above, push themselves dominantly to the fore. Collegiate administration disappears when, from the point of view of the ruler's interests, a strictly unified administrative leadership appears to be more important than thoroughness in the preparation of administrative decisions. This is the case as soon as parliamentary institutions develop and—usually at the same time—as criticism from the outside and publicity increase.

Under these modern conditions the thoroughly rationalized system of specialized ministers and [territorial] prefects, as in France, offers significant opportunities for pushing the old forms everywhere into the background, probably supplemented by the interest groups, normally in the form of advisory bodies recruited from among the economically and socially most influential strata. This practice, which we have mentioned above, is becoming increasingly frequent and gradually may well be ordered more formally.

This latter development, which seeks to put the concrete experience of the interest groups into the service of a rational administration by trained specialized officials, will certainly be important in the future and further increase the power of bureaucracy. It is well known how Bismarck sought to make use of the plan for a "National Economic Council" as a weapon against the Reichstag, accusing the opposing majority—to whom he would have never granted the right to parliamentary investigation as practiced in England—of trying to prevent officialdom, in the interests of parliamentary power, from becoming

"too knowing." What position the organized interest groups may in this manner obtain within the administration in the future cannot be discussed in the present context.

Only with the bureaucratization of the state and of law in general can one see a definite possibility of a sharp conceptual separation of an "objective" legal order from the "subjective" rights of the individual which it guarantees, as well as that of the further distinction between "public" law, which regulates the relationships of the public agencies among each other and with the subjects, and "private" law which regulates the relationships of the governed individuals among themselves. These distinctions presuppose the conceptual separation of the "state," as an abstract bearer of sovereign prerogatives and the creator of legal norms, from all personal authority of individuals. These conceptual distinctions are necessarily remote from the nature of pre-bureaucratic, especially from patrimonial and feudal, structures of authority. They were first conceived and realized in urban communities; for as soon as their officeholders were appointed by periodic *elections*, the individual power-holder, even if he was in the highest position, was obviously no longer identical with the man who possessed authority "in his own right." Yet it was left to the complete depersonalization of administrative management by bureaucracy and the rational systematization of law to realize the separation of the public and the private sphere fully and in principle.

13. *Bureaucracy and Education*

A. EDUCATIONAL SPECIALIZATION, DEGREE HUNTING AND STATUS SEEKING

We cannot here analyze the far-reaching and general cultural effects that the advance of the rational bureaucratic structure of domination develops quite independently of the areas in which it takes hold. Naturally, bureaucracy promotes a "rationalist" way of life, but the concept of rationalism allows for widely differing contents. Quite generally, one can only say that the bureaucratization of all domination very strongly furthers the development of "rational matter-of-factness" and the personality type of the professional expert. This has far-reaching ramifications, but only one important element of the process can be briefly indicated here: its effect upon the nature of education and personal culture (*Erziehung und Bildung*).

Educational institutions on the European continent, especially the institutions of higher learning—the universities, as well as technical academies, business colleges, gymnasia, and other secondary schools—, are dominated and influenced by the need for the kind of "education" which is bred by the system of specialized examinations or tests of expertise (*Fachprüfungswesen*) increasingly indispensable for modern bureaucracies.

The "examination for expertise" in the modern sense was and is found also outside the strictly bureaucratic structures: today, for instance, in the so-called "free" professions of medicine and law, and in the guild-organized trades. Nor is it an indispensable accompaniment of bureaucratization: the French, English and American bureaucracies have for a long time done without such examinations either entirely or to a large extent, using in-service training and performance in the party organizations as a substitute.

"Democracy" takes an ambivalent attitude also towards the system of examinations for expertise, as it does towards all the phenomena of the bureaucratization which, nevertheless, it promotes. On the one hand, the system of examinations means, or at least appears to mean, selection of the qualified from all social strata in place of the rule by notables. But on the other, democracy fears that examinations and patents of education will create a privileged "caste," and for that reason opposes such a system.

Finally, the examination for expertise is found already in prebureaucratic or semibureaucratic epochs. Indeed, its earliest regular historical locus is in *prebendally* organized structures of domination. The expectation of prebends, first of church prebends—as in the Islamic Orient and in the Occidental Middle Ages—and then, as was especially the case in China, also of secular prebends, is the typical prize for which people study and are examined. These examinations, however, have only in part the character of tests for specialized "expertise."

Only the modern development of full bureaucratization brings the system of rational examinations for expertise irresistibly to the fore. The American Civil-Service Reform movement gradually imports expert training and specialized examinations into the United States; the examination system also advances into all other countries from its main (European) breeding ground, Germany. The increasing bureaucratization of administration enhances the importance of the specialized examination in England. In China, the attempt to replace the old semipatrimonial bureaucracy by a modern bureaucracy brought the expert examination; it took the place of the former and quite differently structured system of examinations. The bureaucratization of capitalism, with

its demand for expertly trained technicians, clerks, etc., carries such examinations all over the world.

This development is, above all, greatly furthered by the social prestige of the "patent of education" acquired through such specialized examinations, the more so since this prestige can again be turned to economic advantage. The role played in former days by the "proof of ancestry," as prerequisite for equality of birth, access to noble prebends and endowments and, wherever the nobility retained social power, for the qualification to state offices, is nowadays taken by the patent of education. The elaboration of the diplomas from universities, business and engineering colleges, and the universal clamor for the creation of further educational certificates in all fields serve the formation of a privileged stratum in bureaus and in offices. Such certificates support their holders' claims for connubium with the notables (in business offices, too, they raise hope for preferment with the boss's daughter), claims to be admitted into the circles that adhere to "codes of honor," claims for a "status-appropriate" salary instead of a wage according to performance, claims for assured advancement and old-age insurance, and, above all, claims to the monopolization of socially and economically advantageous positions. If we hear from all sides demands for the introduction of regulated curricula culminating in specialized examinations, the reason behind this is, of course, not a suddenly awakened "thirst for education," but rather the desire to limit the supply of candidates for these positions and to monopolize them for the holders of educational patents. For such monopolization, the "examination" is today the universal instrument—hence its irresistible advance. As the curriculum required for the acquisition of the patent of education requires considerable expenses and a long period of gestation, this striving implies a repression of talent (of the "charisma") in favor of property, for the intellectual costs of the educational patent are always low and decrease, rather than increase, with increasing volume. The old requirement of a knightly style of life, the prerequisite for capacity to hold a fief, is nowadays in Germany replaced by the necessity of participating in its surviving remnants, the duelling fraternities of the universities which grant the patents of education; in the Anglo-Saxon countries, the athletic and social clubs fulfill the same function.

On the other hand, bureaucracy strives everywhere for the creation of a "right to the office" by the establishment of regular disciplinary procedures and by the elimination of the completely arbitrary disposition of the superior over the subordinate official. The bureaucracy seeks to secure the official's position, his orderly advancement, and his provision for old age. In this, it is supported by the "democratic" sentiment

of the governed which demands that domination be minimized; those who hold this attitude believe themselves able to discern a weakening of authority itself in every weakening of the lord's arbitrary disposition over the officials. To this extent bureaucracy, both in business offices and in public service, promotes the rise of a specific status group, just as did the quite different officeholders of the past. We have already pointed out that these status characteristics are usually also exploited for, and by their nature contribute to, the technical usefulness of bureaucracy in fulfilling its specific tasks.

It is precisely against this unavoidable status character of bureaucracy that "democracy" reacts in its striving to put the election of officials for short terms in place of the appointment of officials and to substitute the recall of officials by referendum for a regulated disciplinary procedure, thus seeking to replace the arbitrary disposition of the hierarchically superordinate "master" by the equally arbitrary disposition of the governed or rather, of the party bosses dominating them.

B. EXCURSUS ON THE "CULTIVATED MAN"

Social prestige based upon the advantage of schooling and education as such is by no means specific to bureaucracy. On the contrary. But educational prestige in other structures of domination rests upon substantially different foundations with respect to content. Expressed in slogans, the "cultivated man," rather than the "specialist," was the end sought by education and the basis of social esteem in the feudal, theocratic, and patrimonial structures of domination, in the English administration by notables, in the old Chinese patrimonial bureaucracy, as well as under the rule of demagogues in the Greek states during the so-called Democracy. The term "cultivated man" is used here in a completely value-neutral sense; it is understood to mean solely that a quality of life conduct which *was held to be* "cultivated" was the goal of education, rather than a specialized training in some expertise. Such education may have been aimed at a knightly or at an ascetic type, at a literary type (as in China) or at a gymnastic-humanist type (as in Hellas), or at a conventional "gentleman" type of the Anglo-Saxon variety. A personality "cultivated" in this sense formed the educational ideal stamped by the structure of domination and the conditions of membership in the ruling stratum of the society in question. The qualification of this ruling stratum rested upon the possession of a "plus" of such *cultural quality* (in the quite variable and value-neutral sense of the term as used here), rather than upon a "plus" of expert knowledge. Military, theological and legal expertise was, of course,

intensely cultivated at the same time. But the point of gravity in the Hellenic, in the medieval, as well as in the Chinese educational curriculum was formed by elements entirely different from those which were "useful" in a technical sense.

Behind all the present discussions about the basic questions of the educational system there lurks decisively the struggle of the "specialist" type of man against the older type of the "cultivated man," a struggle conditioned by the irresistibly expanding bureaucratization of all public and private relations of authority and by the ever-increasing importance of experts and specialised knowledge. This struggle affects the most intimate aspects of personal culture.

14. *Conclusion*

During its advance, bureaucratic organization has had to overcome not only those essentially negative obstacles, several times previously mentioned, that stood in the way of the required leveling process. In addition, administrative structures based on different principles did and still do cross paths with bureaucratic organization. Some of these have already been mentioned in passing. Not all of the types existing in the real world can be discussed here—this would lead us much too far afield; we can analyze only some of the most important *structural principles* in much simplified schematic exposition. We shall proceed in the main, although not exclusively, by asking the following questions:

1. How far are these administrative structures in their developmental chances subject to economic, political or any other external determinants, or to an "autonomous" logic inherent in their technical structure? 2. What, if any, are the economic effects which these administrative structures exert? In doing this, one must keep one's eye on the fluidity and the overlapping of all these organizational principles. Their "pure" types, after all, are to be considered merely border cases which are of special and indispensable analytical value, and bracket historical reality which almost always appears in mixed forms.

The bureaucratic structure is everywhere a late product of historical development. The further back we trace our steps, the more typical is the absence of bureaucracy and of officialdom in general. Since bureaucracy has a "rational" character, with rules, means-ends calculus, and matter-of-factness predominating, its rise and expansion has everywhere had "revolutionary" results, in a special sense still to be discussed, as had the advance of *rationalism* in general. The march of bureaucracy accordingly destroyed structures of domination which were not rational

in this sense of the term. Hence we may ask: What were these structures?

NOTES

Unless otherwise indicated, all notes and emendations are by Roth and Wittich.

1. The Grand Duchy of Baden was one of the mainstays of liberalism in Imperial Germany. After 1900 liberals and Social Democrats began to cooperate. The "Great Coalition" of National Liberals, Progressives and Social Democrats was directed against the powerful Catholic Center party and conservative Protestant groups, which tried to gain control over the legislature. Since both Catholic priests and Protestant ministers were civil servants, they were opposed to anything which might alter their status.

2. Richard Schmidt, a contemporary (born 1862) and one-time colleague of Weber at Freiburg University, who extensively investigated the development of trial procedures and was interested in the problem of the "calculability" of judicial decisions. The term is used in his "Die deutsche Zivilprozessreform und ihr Verhältnis zu den ausländischen Gesetzgebungen," *Zeitschrift für Politik*, I (1908), 266; see also his *Allgemeine Staatslehre* (3 vols.; Leipzig 1901–1903).

3. Albrecht Mendelssohn-Bartholdy, *Das Imperium des Richters*, Strassburg 1908. (W)

4. Trial instruction issued by the praetor to the (lay) judge permitting a suit based not on a provision of the civil law (*ius*), but on the facts of the case as stated in the *actio*. Such cases obtained justiciable standing only by virtue of the praetor's acceptance of the *formula;* he thus played an innovatory role somewhat similar to that of the English equity courts. The stereotyped *formulae* were published in the magistrate's edict. Cf. Gerhard Dulckeit, *Römische Rechtsgeschichte* (2d. ed., Munich 1957), 144.

5. *Kautelar-Jurisprudenz.* This term is in German generally used to designate the early stage of Roman secular jurisprudence, which was exercised primarily in the drafting of contracts (*cautiones*) and in the formulation of contractual provisions (*cautelae*). Cf. ch. VIII:*iv*:3 and elsewhere in the "Sociology of Law"; Dulckeit, *op. cit.*, 146ff.

6. I.e., the law interpretations of the great jurisconsults, which were binding on the judges and in fact created a large part of the classical Roman law.

7. After the breakup of Chancellor Bülow's Liberal-Conservative coalition in 1909 (cf. Part Two, ch. II, n. 7), the *Hansabund* was established in the following year as a rallying center for all forces of industrial society—from big business to labor—against the East Elbian aristocracy, whose conservative Reichstag representatives had refused the introduction of inheritance taxes for armament purposes. Indicative of the rigidity of Imperial Germany's political alignments was the fact that labor organizations refused to join the association and the greater part of big business deserted it within a year, preferring its old alliance with the big agrarian interests. A leading figure of the association was Gustav Stresemann, later for six years foreign minister of the Weimar Republic. Cf. J. Riesser, *Der Hansabund* (Jena: Diederichs, 1912).

8. This is directed, among others, at Robert Michels, to whom Weber wrote in November 1906:

> "Indispensability in the economic process means nothing, absolutely nothing for the power position and power chances of a class. At a time when no "cit-

izen" worked, the slaves were ten times, nay a thousand times as necessary as is the proletariat today. What does that matter? The medieval peasant, the Negro of the American South, they were all absolutely "indispensable." . . . The phrase contains a dangerous illusion. . . . Political democratization is the only thing which can perhaps be achieved in the foreseeable future, and that would be no mean achievement. . . . I cannot prevent you from believing in more, but I cannot force myself to do so."

Quoted in Wolfgang Mommsen, *Max Weber und die deutsche Politik, 1890–1920* (Tübingen: Mohr, 1959), 97 and 121.

9. *Katholikentag*: An annual conference established in 1858, under the direction of a central committee, to discuss ecclesiastical, political and social welfare issues and to represent German Catholicism before the public which was then largely Protestant. Discontinued during the Nazi period, the Congress has been meeting biannually since 1950.

10. *Enquêterecht*. Weber assigned great significance to this right of parliamentary investigation, which the Reichstag was substantially lacking. Cf. below, Appendix II:*iii*.

11. See Anatole Leroy-Beaulieu, *The Empire of the Tsars and the Russians* (New York: Putnam, 1894), vol. II, pp. 69–86. Weber seems to have used the German translation by L. Pezold (3 vols., 1884–1890).

12. Weber refers here to *monarchic* constitutionalism, the form of government that Bismarck gave to Imperial Germany: the prime minister remained responsible to the king, not to parliament, and the army also remained under the king's control. In practice, this arrangement gave extraordinary power first to Bismarck, then to the Prussian and Imperial bureaucracy, both vis-à-vis the monarch and the parliament. Weber attacked this system in a sensational series of articles in the midst of the First World War; see Appendix II, "Parliament and Government in a Reconstructed Germany." A brilliant comparative analysis of monarchic constitutionalism was written by the historian who came closest to Weber's sociological (but not his political) approach: Otto Hintze, "Das monarchische Prinzip und die konstitutionelle Verfassung," *Preussische Jahrbücher*, vol. 144, 1911, 381–412; reprinted in Hintze's collected writings, ed. by Gerhard Oestreich: *Staat und Verfassung* (Göttingen: Vandenhoeck and Ruprecht, 1962), 359–89.

13. This passage is an addition to the older manuscript; however, it is not clear how many changes Weber actually made. Weber wrote the passage not only after the downfall of William II and the monarchic bureaucracy, but after he had attacked them in the *Frankfurter Zeitung* in 1917 (see Appendix II). Hence, whereas Weber draws in "Parliament and Government in a Reconstructed Germany" on the earlier part of the chapter, he also seems to draw on that essay in the present section.

In referring to 1076, Weber compares the downfall of William II with the desertion of Henry IV by most of his great nobles in the face of the emperor's spectacular excommunication by Gregory VII; Henry's dramatic submission at Canossa helped him to recoup his political fortunes and began Gregory's decline. The incident was one of the high points in the conflict between papacy and empire, which determined much of the course of European history with all its eventual consequences for rationalism, capitalism and democracy. (See Weber's analysis of caesaropapism and hierocracy in ch. XV). Weber's comparison can also be seen in the context of Bismarck's famous dictum at the height of his conflict with the Catholic church that "we will not go to Canossa" (1872). A few years later, Bismarck did go, and in 1919 Weber went with the German peace delegation to another Canossa: Versailles.

14. When in 1899 the German Reichstag discussed a bill for the construction of the Mittelland Kanal the conservative Junker party fought the project. Among the conservative members of the parliamentary party were a number of Junker officials who stood up to the Kaiser when he ordered them to vote for the bill. The disobedient officials were dubbed *Kanalrebellen* and temporarily suspended from office. Cf. Chancellor Bülow's *Denkwürdigkeiten* (Berlin 1930), vol. I, pp. 293ff.; H. Horn, "Der Kampf um die Mittelland-Kanal Vorlage aus dem Jahre 1899," in K. E. Born (ed.), *Moderne deutsche Wirtschaftsgeschichte* (Cologne 1966). (G/M)

CHAPTER XII

PATRIARCHALISM AND PATRIMONIALISM[1]

1. *The Nature and Origin of Patriarchal Domination*

Among the prebureaucratic types of domination the most important one by far is patriarchal domination. Essentially it is based not on the official's commitment to an impersonal purpose and not on obedience to abstract norms, but on a strictly personal loyalty. The roots of patriarchal domination grow out of the master's authority over his household. Such personal authority has in common with *impersonally* oriented bureaucratic domination stability and an "everyday character." Moreover, both ultimately find their inner support in the subjects' compliance with norms. But under bureaucratic domination these norms are established rationally, appeal to the sense of abstract legality, and presuppose technical training; under patriarchal domination the norms derive from tradition: the belief in the inviolability of that which has existed from time out of mind.

The meaning of the norms is fundamentally different under the two forms of domination. Under bureaucratic domination the enacted norm establishes that the person in power has legitimate authority to issue a specific ruling. Under patriarchal domination the legitimacy of the master's orders is guaranteed by personal subjection, and only the fact and the limits of his power of control are derived from "norms," yet these norms are not enacted but sanctified by tradition. The fact that this concrete master is indeed their ruler is always uppermost in the minds of his subjects. The master wields his power without restraint, at his own discretion and, above all, unencumbered by rules,

insofar as it is not limited by tradition or by competing powers. By contrast, the order of a bureaucratic official goes in principle only as far as his special "competence" permits, and this in turn is established by a rule. The objective basis of bureaucratic power is its technical indispensability founded on specialized professional knowledge. In the case of domestic authority the belief in authority is based on personal relations that are perceived as natural. This belief is rooted in filial piety, in the close and permanent living together of all dependents of the household which results in an external and spiritual "community of fate." The woman is dependent because of the normal superiority of the physical and intellectual energies of the male, and the child because of his objective helplessness, the grown-up because of habituation, the persistent influence of education and the effect of firmly rooted memories from childhood and adolescence, and the servant because from childhood on the facts of life have taught him that he lacks protection outside the master's power sphere and that he must submit to him to gain that protection. Paternal power and filial piety are not primarily based on an actual blood relationship, no matter how normal this relationship may be for them. Rather, primitive patriarchalism continues to view household authority as the power of disposition over property even after the (by no means primitive) recognition that procreation and birth are connected. The children of all women subject to the authority of a master are considered "his" children if he so wishes, just as the offspring of his animals are his property. This holds whether the woman is a wife or a slave, and regardless of the facts of paternity. The purchase and selling of children is still a common phenomenon in developed cultures, in addition to the renting (into the *mancipium*) and mortgaging of children and of women. Indeed, such transactions are the original form of adjusting manpower and labor demand among different households. As late as in Babylonian times freemen entered into a "work contract" by selling themselves into slavery for a limited time. However, the purchase of children also serves other, especially religious purposes, such as securing the continuity of sacrifices offered to the dead; it is a precursor of "adoption."

The household became more differentiated as soon as slavery developed into a regular institution and the blood relationship became more factual: now the children as free subjects (*liberi*) were distinguished from the slaves. Of course, this distinction did not significantly limit the master's discretion, for he alone chose his children. Under Roman law even in historical times the master could designate by testament a slave as his heir (*liber et heres esto*) and sell his own child

into slavery. But apart from this possibility the slave differed from the master's child because he could not become head of a household. Most of the time, however, this power of disposition was denied to the master or at least curtailed. Moreover, wherever sacred and politically inspired limitations were imposed—the latter at first for military reasons—they primarily or exclusively concerned the children; however, it took a long time before these limitations were firmly established.

Everywhere the objective basis of solidarity is the permanent sharing of lodging, food, drink and everyday utensils—in pre-Mohammedan Arabia as well as according to the terminology of some Hellenic laws of historic times, and generally according to most persistently patriarchal systems of law. It depended upon very different arrangements and was determined by diverse economic, political and religious conditions whether household authority was vested in a woman, or in the eldest son or in the economically most competent one (a possibility in the Russian extended family). In the same way it depended upon diverse factors whether patriarchal power was limited through heteronomous enactment, and if so in what fashion, or whether there were no limitations in principle, as in Rome and China. If there were such heteronomous barriers, they could have the sanction of criminal and civil law, as is nowadays the rule, or merely of sacred law, as in Rome, or merely the sanction of custom, as was originally the case in all places. The arbitrary violation of custom evoked the subjects' dissatisfaction and disapprobation. This too was an effective protection, for everything within this structure of domination is ultimately determined by the power of tradition, that is, the belief in the inviolability of what has always been (*des "ewig Gestrigen"*). The Talmudic maxim, "Man should never change a custom" derives its practical significance not only from the inherent power of custom which is rooted in fixed attitudes, but originally also from the fear of undefined magical evils which might befall an innovator or an approving group who violate the interests of the spirits. As the idea of god develops, this belief is replaced by one which holds that the gods have posited the traditional as norm, to be protected as something sacred.

The two basic elements of patriarchal authority then are piety toward tradition and toward the master. The power of the former also constrained the master and hence benefited the subjects who had no formal rights; for example, the slaves were more protected under the tradition-bound Oriental patriarchalism than they were on the Carthaginian-Roman plantations where they were the object of an unhampered rational exploitation.

2. *Domination by Honoratiores and Pure Patriarchalism*

Patriarchal domination is not the only authority that relies on the sanctity of tradition. Another, the *domination by honoratiores,* is an important form of normally traditional authority; we have dealt with it occasionally and we will deal with it again. It exists wherever social honor ("prestige") within a group has become the basis of domination —and by no means does this happen in every case of social honor. Domination by *honoratiores* differs from patriarchal domination because it lacks the specific personal loyalty—filial and servants' piety—that is motivated by membership in a household or a manorial, "servile" (*leibherrlich*) or patrimonial group. The specific authority of the notable—especially of one distinguished among his neighbors through property, education or style of life—derives from "honor." This typological distinction should be made even though the boundaries are not rigid. In itself the authority of *honoratiores* differs greatly in basis, quality and impact. We will pursue this at more suitable occasions [sec. 16 and 17 below]. At present we are concerned with patriarchal domination as the formally most consistent authority structure that is sanctified by tradition.

In its pure form patriarchal domination has no legal limits. It is transferred without qualification to the new master at the time of the old master's death or downfall. The new master also acquires the sexual disposition of his predecessor's women—possibly of his own father's. Simultaneous holders of patriarchal power have at times existed, but this is naturally rare. Sometimes patriarchal power has been split; for example, the independent authority of a matron may be found next to the normally superordinated authority—a condition that has always been connected with the oldest typical division of labor, the division between the sexes. The female chiefs among the *sachems* of American Indians, and occasional subchiefs, such as the *lukokesha* in the realm of *Mwata Yamvo,* who wielded independent authority in their own area, usually owed their existence to woman's function as the oldest agent of the basic economy, that is, the continuous provision of food through land cultivation and food processing; or they owe it to the complete separation from the household of all men capable of bearing arms, a separation which occurs in certain kinds of military organization.

When we dealt previously with the household we observed the following: Its original sexual and economic communism was increasingly curtailed; its internal closure increased steadily, the rational "enterprise" emerged from the capitalist market-oriented household, the principle of accounting and of fixed shares gained more and more im-

portance, and women, children and slaves acquired personal and financial rights of their own. By definition these developments amounted to as many limitations of unrestrained patriarchal power. As the polar opposite of the capitalist enterprise we found the communal form of household differentiation: the *oikos*. Our present purpose is to examine that form of domination which developed on the basis of the oikos and therefore of differentiated patriarchal power: ***patrimonial domination.***

3. *Patrimonial Domination*

At first it is only a decentralization of the household when the lord settles dependents (including young men regarded as family members) on plots within his extended land-holdings, with a house and family of their own, and provides them with animals (therefore: ***peculium***) and equipment. But this simple development of an *oikos* leads inevitably to an attenuation of full patriarchal power. Since there are originally no consociations in the form of binding contracts between masters and dependents—in all civilized countries it is even today legally impossible to contractually modify the legal content of paternal authority—, the psychological and formal relations between master and subject are here too regulated merely in accordance with the master's interest and the distribution of power.

The dependency relationship itself continues to be based on loyalty and fidelity. However, such a relationship, even if it constitutes at first a purely one-sided domination, always evolves the subjects' claim to reciprocity, and this claim "naturally" acquires social recognition as custom. Whereas the physical whip assures the exertion of the slaves lodged in barracks and the wage whip and threat of joblessness guarantees the effort of the "free" worker, whereas the marketable slave must be readily replaceable in order to be profitable and the replacement of the "free" worker costs nothing as long as there are others willing to work, the master who decentralizes his household is largely dependent upon his subjects' compliance and always upon their capacity to deliver rent in kind. Hence, the master too "owes" something to the subject, not legally but according to custom and in his own self-interest: first of all external protection and help in case of need, then "humane" treatment and particularly a "customary" limitation of economic exploitation. Under a form of domination which is not directed toward monetary acquisition but toward the satisfaction of the master's wants out of his own resources, exploitation may be reduced without violating

his interests; this is possible because his demand is only quantitatively different from that of his subjects, given the absence of a qualitative expansion of needs which is in principle limitless. Indeed, such a restraint is positively advantageous to the master, because not only his security but also his maintenance is strongly dependent upon the basic attitudes and the morale of his subjects.

Custom prescribes that the subject support the master with all available means. In extraordinary cases this obligation is economically unlimited, for example in the case of freeing the master from debt, providing a dowry for his daughters or ransoming him from captivity. Personally unlimited is the subject's obligation to render service in a feud or in war. He serves as page, coachman, carrier of arms, camp-follower—as in the knightly armies of the Middle Ages—or as private fully equipped warrior of his master. The last kind of service was apparently also rendered by the Roman clients who held a *precarium*, which was revokable at any time and in its function probably similar to a service fief. It was rendered by the *coloni* as early as the Civil Wars, and of course by the retainers of manorial lords and of cloisters in the Middle Ages. In the same fashion the armies of the Pharaoh and the Oriental kings and great landlords were to a significant extent recruited patrimonially from their *coloni* and equipped and maintained by the master's household. Occasionally, especially in the navy, we find levies of slaves; in the ancient Orient they carried the lord's tag of ownership. For the rest, the retainer renders compulsory labor (*Fronden*) and services, honorary gifts, regularly and irregularly levied taxes, formally according to the master's need and discretion, in fact according to established custom. The master remains, of course, free to expropriate him at will, and custom too takes it originally for granted that the master can freely dispose of persons and possessions left behind at the retainer's death. Patrimonial domination is thus a special case of patriarchal domination—domestic authority decentralized through assignment of land and sometimes of equipment to sons of the house or other dependents.

Mere habituation is the first factor that stereotypes the patrimonial relationship and in fact limits the master's discretion. From there the sanctifying power of tradition evolves. Everywhere the purely factual resistance against everything unwonted is powerful; in addition, the master is restrained from introducing innovations by the possible disapproval of his environment and by his own fear of religious powers which everywhere protect tradition and dependency relationships. Furthermore, the master is considerably influenced by the well-founded apprehension that his own, especially his economic, interests would be

badly hurt by any shock to traditional loyalty produced by groundless and "unjust" interference with the traditional distribution of duties and rights. Here, too, the master's omnipotence toward the individual dependent is paralleled by his powerlessness in face of the group. Thus arose almost everywhere a legally unstable, but in fact very stable order which diminished the area of the master's discretion in favor of traditional prescription. The master may want to formalize this traditional order as a manorial and service *reglement* in the manner of the modern factory regulations, with the difference that the latter are rational constructs for rational purposes, whereas the former derives its obligatory power from its very recourse to tradition rather than to future purpose. It is obvious that the regulations decreed by the master do not commit him legally. But if he is very much dependent upon the good will of those from whom he derives revenues, either because of the extensive size of his property that is assigned to dependents or because of its fragmented location or because of continuous political and military preoccupations, a law of sodalities may emerge and tie the master in fact very strongly to his own decrees. For every such order turns a mere interest group into a privileged group (*Rechtsgenossen*)—whether or not in the strictly legal sense—, increases the members' knowledge of the common nature of their interests and thus the inclination and ability to look after them; eventually the subjects confront the master, at first only occasionally, then regularly, as a closed unit. This was just as much the consequence of the *leges*—ordinances, not laws—which were issued for the Imperial domains, especially in Hadrian's times, as of the medieval manorial ordinances (*Hofrechte*). If there is a consistent development, the customal of the manorial court, in which the manorial dependents participate, becomes the source of authoritative interpretation of the legal order. From here dates a kind of "constitution"—only that a modern constitution exists for the sake of continuous legislation and of the power distribution between bureaucracy [and legislative bodies] in connection with the rational regulation of social relations, whereas the customals serve the interpretation of tradition. Not only this development, which rarely reached its logical conclusion, but already the earlier stages of the process in which tradition stereotyped patrimonial relations resulted in a considerable disintegration of pure patriarchalism. A strongly tradition-bound structure of domination arises, the *manor* (*seigneurie*), joining lord and manorial dependent with ties that cannot be dissolved unilaterally. At this point we cannot pursue the vicissitudes of this institution, which has fundamental importance and which is found all over the world.

4. *The Patrimonial State*

Patrimonial conditions have had an extraordinary impact as the basis of *political* structures. As we shall see, Egypt almost appears as a single tremendous *oikos* ruled patrimonially by the pharaoh. The Egyptian administration always retained characteristics of the *oikos* economy, and the Romans treated the country essentially like a huge Imperial domain. The Inca state and in particular the Jesuit state in Paraguay were based on forced labor (*fronhofartige Gebilde*). It is true that the political realm of a prince comprises not only his manors but also political dependencies; however, the actual political power of the Oriental sultans, the medieval princes and the Far Eastern rulers centered in these great patrimonial domains. In these latter cases the political realm as a whole is approximately identical with a huge princely manor.

A vivid picture of the administration of these domains is provided by the *reglements* of the Carolingian period and also by the extant ordinances of the Roman Imperial domains. On a vast scale the Near Eastern and Hellenistic states contained areas the inhabitants of which were manorial and personal dependents of the monarch and which were administered in manorial fashion from his household.

We shall speak of a *patrimonial state* when the prince organizes his political power over extrapatrimonial areas and political subjects—which is not discretionary and not enforced by physical coercion—just like the exercise of his patriarchal power. The majority of all great continental empires had a fairly strong patrimonial character until and even after the beginning of modern times.

Originally patrimonial administration was adapted to the satisfaction of purely personal, primarily private household needs of the master. The establishment of a "political" domination, that is, of *one* master's domination over *other masters* who are not subject to his patriarchal power implies an affiliation of authority relations which differ only in degree and content, not in structure. The substance of the political power depends upon the most diverse conditions. The two powers which we consider specifically political: military and judicial authority, are exercised without any restraint by the master as components of his patrimonial power. By contrast, the judicial "power" of the chief over those who are not members of his household has conferred only the position of an arbitrator in all periods of peasant communities. The lack of autocratic authority which can employ physical force constitutes the most distinct difference between "merely" political domination and domestic authority. But as his power increases, the holder of judiciary

authority tends to consolidate his position through the usurpation of contempt powers (*Banngewalten*), until it is practically identical with the basically unlimited judicial power of the patriarch. A special military authority over those who are not household dependents or—in the case of clan feuds—clan members is known in early history only in the form of occasional consociations for staging or repelling a raid, and then normally in the form of subordination under a leader who arises or is elected *ad hoc*; we will deal later with the structure of his authority. However, if the military authority of a political patrimonial ruler persists it turns into a levying power toward his political subjects which differs only in degree from the patrimonial subjects' duty to render military service.

In the patrimonial state the most fundamental obligation of the subjects is the material maintenance of the ruler, just as is the case in a patrimonial household; again the difference is only one of degree. At first, this provisioning takes the form of honorary gifts and of support in special cases, in accordance with the spirit of intermittent political action. However, with the increasing continuity and rationalization of political authority these obligations become more and more comprehensive and ever more similar to patrimonial ones, so that in the Middle Ages it is often very difficult to tell apart obligations originating in political and patrimonial power. In all ancient, Asian and medieval large-scale states which were dependent upon a natural economy the ruler is typically maintained in such a manner that the demands for food, clothing, armor and other wants are apportioned in kind among the various parts of his realm; the court is provisioned by the subjects wherever it resides at any given time. A communal economy (*Gemeinwirtschaft*) which relies on payment and delivery in kind is the primary form of satisfying the needs of patrimonial political structures. However, there were economic variations: the Persian royal household was a heavy burden for the city in which the king resided, but the Hellenistic royal household which was based on money economy was a source of income for the city. With the development of trade and of money economy the patrimonial ruler may satisfy his economic needs no longer through his *oikos* but through profit-oriented monopolism. This happened on a vast scale in Egypt, where even the pharaoh of the early period of natural economy carried on trade for his own account; in the Ptolemaic period and even more so under Roman rule a great many diverse monopolies and countless taxes replaced the old liturgical methods. Fc in the course of financial rationalization patrimonialism moves imperceptibly toward a rational bureaucratic administration, which resorts to systematic taxation. Whereas the old mark of "liberty"

is the voluntary material support of the ruler and the absence of any patrimonial obligation to surrender fixed tributes, a very powerful lord will tend to force even the "free" subjects to meet the costs of his feuds and of his appropriate upkeep through means of liturgy or taxation. The only difference between the two categories of subjects consists then regularly in the more narrow definition of these tributes and in certain legal guarantees for the "free," that means, the merely political subject.

5. *Power Resources: Patrimonial and Non-Patrimonial Armies*

The tributes which the prince can extract from political subjects depend upon his power over them and thus upon his prestige and the effectiveness of his apparatus; however, the tributes remain largely circumscribed by tradition. The prince may dare to demand unwonted and new tributes only under favorable conditions---especially when he is supported by troops who are at his disposal independently of the subjects' good will.

These troops may consist, 1) of patrimonial slaves, retainers living on allowances, or *coloni*. Pharaohs and Mesopotamian kings, as well as powerful private lords in Antiquity (for example, the Roman nobility) and in the Middle Ages (the *seniores*), employed their *coloni* as personal troops; in the Orient serfs branded with the lord's property mark were also used. However, at least the agrarian *coloni* were ill-suited as a continuously available force, since they had to maintain themselves and the lord and hence were normally indispensable; furthermore, excessive demands—transcending tradition—could shake their loyalty, which had a merely traditional basis. Therefore, the patrimonial prince regularly sought to base his power over political subjects on troops specifically raised for this purpose, whose interests were completely solidary with his own.

This military force may be made up, 2) of *slaves* who are completely separated from agricultural production. Indeed, after the final dissolution in 833 of the Arabian, tribally organized theocratic levy, whose "booty-happy" religious zeal had been the bearer of the great conquests, the Caliphate and most Oriental products of its disintegration relied for centuries on armies of purchased slaves. The Abbasids bought and militarily trained Turkish slaves who, as tribal aliens, appeared wholly tied to the ruler's domination; thus the dynasty became independent of the national levy and its loose peacetime discipline and created a

disciplined army. It is uncertain when the purchased Negro slave troops of the great families in the Hejaz came into being, especially those of the various families fighting one another for control over Mecca. However, it seems certain that in Mecca these Negro soldiers, in contrast to mercenaries as well as military freedmen, really served their intended purpose as the private armies of their master and his family; those other military groups occasionally played the role of the praetorian guard, changed their master and opted among various pretenders. The number of Negro troops depended upon the competing families' incomes, which in turn depended directly upon the size of their landed property and indirectly upon their share in the exploitation of the pilgrims, a source of revenue which was monopolized by and apportioned among the families residing in Mecca. The use of Turkish slaves by the Abbasids and of purchased slave soldiers in Egypt, the Mamelukes, turned out very differently. Their officers succeeded in gaining control over the nominal rulers; even though the troops, especially in Egypt, officially remained slave troops and were replenished hereditarily and through purchase, they were in fact and eventually in law beneficeholders; they finally received the whole land in lieu of their pay, first as mortgagees and then as owners; their *emirs* controlled the whole administration until the Mamelukes were annihilated in Muhammed Ali's blood bath [in 1811]. The slave army presupposed considerable liquid capital on the part of the ruler for the initial purchase; furthermore, its good will was dependent on pay and therefore upon the ruler's money revenues. However, the feudalization of the economy was facilitated when the Seljuk troops and the Mamelukes were assigned the tax yield of land and subjects; eventually land was transferred to them as service holdings, and they became landowners. The extraordinary legal insecurity of the taxpaying population vis-à-vis the arbitrariness of the troops to whom their tax capacity was mortgaged could paralyze commerce and hence the money economy; indeed, since the period of the Seljuks [ca. 1050–1150] the Oriental market economy declined or stagnated.

3) The Ottoman rulers, who until the 14th century were supported in essence only by the Anatolian levies, resorted for the first time in 1330 to the famous *conscription of boys* (*devshirme*), since the discipline of the levies and also of the rulers' Turkmenian mercenaries was insufficient for the great European conquests; from conquered peoples who were tribal or religious aliens (Bulgarians, Bedouins, Albanians, Greeks) boys were recruited for the newly formed professional army of Janissaries (*yenicheri* means "new troops"). Boys aged ten to fifteen were conscripted every five years; at first 1,000 were recruited, later in-

creasingly more; finally their establishment numbered 135,000. The boys were drilled for about five years, received religious instruction (without directly being forced to embrace the Islamic religion), and were then incorporated into the army. According to the original regulation, they were supposed to remain celibate, to live an ascetic life in barracks under the patronate of the *bektashi* order, the founder of which was their patron saint, and to refrain from commercial activities; they were subject only to the jurisdiction of their own officers and had other significant privileges, officers were promoted according to seniority, there was an old-age pension and a daily allowance during a campaign, for which they were obliged to furnish their own weapons. During peacetime they were dependent upon certain jointly administered revenues. The extensive privileges made the positions desirable, and Turks, too, attempted to have their children accepted. The Janissaries, on the other hand, attempted to monopolize the positions for their own families. As a result, admission was first limited to relatives and then to children of Janissaries, and the *devshirme* was practically stopped at the end of the 17th century; the last conscription order, which was not executed, was issued in 1703. The Janissaries were the most important force for the great European expansion from the conquest of Constantinople to the siege of Vienna, but they were a corps so prone to reckless violence and often so dangerous to the sultan himself that in 1825 a Moslem army was conscripted, based on a *fetwa* of the *Sheikh-ül-Islam* according to which the faithful were to undergo military training, and the revolting Janissaries were annihilated in a tremendous blood bath [in 1826].

4) The use of *mercenaries*. The use of such troops was not necessarily dependent upon monetary compensation. In early Antiquity we find mercenaries who are primarily paid in kind. But the real incentive was always that part of the pay rendered in precious metals. The prince therefore had to have monetary revenues for the mercenaries, just as he had to have a treasure for the slave armies in order to afford their acquisition. He raised revenues either by trading or by producing for the market, or by levying monetary tributes upon the subjects, supported as he was by the mercenaries whom he paid with these tributes. In both cases, but especially in the latter, a money economy had to exist. In fact, in the Oriental states, and since the beginning of modern times also in the Occident, we observe a characteristic phenomenon: the opportunities for the military monarchy of a despot backed by mercenaries increase significantly with the advance of money economy. In the Orient the military monarchy has since remained the typical national form of domination, and in the Occident the *signori* of the Italian cities, just as formerly the ancient tyrants and largely also the "legitimate" monarchs

based their power upon mercenary troops. Naturally, the hired soldiers were most closely tied through solidary interests to the prince's domination whenever they were completely alien (*stammfremd*) to the subjects and thus could neither seek nor find close ties with them. Indeed, the patrimonial rulers quite regularly preferred to recruit aliens for their bodyguards, from the Cretans and Philistines of David to the Swiss guards of the Bourbons. Almost every radical "despotism" had such a base.

5) The patrimonial ruler may also rely on persons who have been *granted landlots*, just like manorial peasants, but instead of economic services they need render only military ones, and for the rest they enjoy privileges of an economic or other kind. The monarch's troops in the ancient Orient were partly recruited in this fashion, especially the so-called "warrior caste" of Egypt, the Mesopotamian fief-warriors, the Hellenistic cleruchs and more recently the Cossacks. This means of creating a personal military force was, of course, also used by other patrimonial rulers who were not princes, as we will see when we will deal with the "plebeian" variants of feudalism [ch. XIII:1]. These troops too, were particularly reliable if they came from alien tribes and thus were completely tied to the ruler's domination. Therefore land was often granted especially to persons alien to the country. However, different tribal membership is by no means an indispensable prerequisite.

For 6) the solidarity of interests that developed between the ruler and his professional warriors—his "soldiers" [literally, "hired men"] was at any rate sufficiently strong without tribal heterogeneity, and could be significantly increased through the mode of selecting the troops—as in the case of Janissaries—or through a privileged legal position vis-à-vis the subjects. Wherever the patrimonial ruler did not recruit his army from tribal aliens or pariah castes but from subjects—and hence through *conscription*—he adhered to fairly generally determined social criteria. Nearly always the strata which hold the social and economic power in their hands were exempted from recruitment for the "standing army" or they were given the welcome opportunity of buying themselves off. To this extent the patrimonial ruler regularly based his military power upon the propertyless or at least nonprivileged masses, and especially the rural masses. Thus he disarmed his potential competitors for domination. By contrast, any army of *honoratiores*, whether it be the citizens army of an urban commonwealth or the army of a tribal association of freemen, regularly turns the duty and the honor of carrying arms into a privilege of a dominant stratum. The selection from the ranks of the negatively privileged, especially from the economically underprivileged, strata was facilitated by an economic circumstance and a related military-technical development: On the one hand, economic indispensability became more

prominent with the increasing intensity and rationalization of economic acquisition and on the other military activities became a permanent "profession" with the growing importance of military training. Under certain economic and social preconditions both phenomena could promote the development of a status group of *honoratiores* who were trained warriors. The feudal army of the Middle Ages just as the Spartan army of *hoplites* are examples. Both armies were founded on the economic indispensability of the peasants and a military technology which suited the military training of a dominant stratum. But the army of the patrimonial prince is based upon the fact that the propertied strata, too, were or became economically indispensable, as for example the trading and craft bourgeoisie of ancient and medieval cities; this fact, together with military technology and the political needs of the ruler for a standing army, required the conscription of "soldiers" for permanent service, not just for occasional campaigns. Hence the development of patrimonialism and of the military monarchy is not only a consequence of purely political circumstances: of territorial expansion and of the resulting need for the permanent protection of the frontiers—as in the Roman empire —but also very often a consequence of economic changes: of the increasing rationalization of the economy, in connection therefore with an occupational specialization and a differentiation between "military" and "civilian" subjects, as it occurred equally in late Antiquity and in the modern patrimonial state. The patrimonial ruler customarily draws the economically and socially privileged strata over to his side by exclusively reserving for them the leading positions in the standing army, which is organized into a body of disciplined and trained permanent units; these positions now offer also a specific "profession" with social and economic opportunities in the manner of bureaucratic officialdom. Instead of being honoratiores who are also warriors they are now drawn into a professional officers career and provided with status privileges.

Finally, there is a decisive economic condition for the degree to which the royal army is "patrimonial," that means, a purely personal army of the prince and hence at his disposal also *against* his own political subjects (*Stammesgenossen*): the army is equipped and maintained out of supplies and revenues belonging to the ruler. The more this condition prevails, the more unconditionally is the army in the ruler's hands, since it is in this case incapable of any action without the ruler and completely dependent upon him and his non-military officials; of course, manifold intermediate forms between such a pure patrimonial army and military organizations based upon self-equipment and self-provisioning have existed. For example, the granting of land constitutes, as we shall see, a form of devolving the burdens of equipment and maintenance

from the lord upon the soldiers themselves, but it also leads, under certain circumstances, to a significant weakening of his power of disposition.

However, scarcely anywhere does the political authority of the patrimonial prince rest exclusively upon the fear of his patrimonial military power. Wherever this fear was very real, it meant in effect that the ruler himself became so dependent on his army that, in the event of his death, of ill-fated wars and similar cases, the soldiers simply dispersed, went on strike, deposed and installed dynasties, or they had to be newly won through donations and promises of higher pay; of course, they also could be made to desert the ruler through the same means. In the Roman empire this phenomenon was the consequence of the militarism of the Severans, and under Oriental sultanism it was a regular feature. The result was the sudden collapse of a patrimonial regime and the equally sudden rise of a new one, and therefore, great political instability. To an extreme extent, this was the fate of the rulers in the classic locale of patrimonial armies, the Near East, which was also the classic location of "sultanism."

6. *Patrimonial Domination and Traditional Legitimacy*

As a rule, however, the political patrimonial ruler is linked with the ruled through a consensual community which also exists apart from his independent military force and which is rooted in the belief that the ruler's powers are legitimate insofar as they are *traditional*. Hence we will call "political subjects" those who are in this sense legitimately ruled by a patrimonial prince. They differ from the freemen of the judicial and military folk community (*Ding- und Heergenossen*) by being subject to taxes and service for political purposes; they differ from the personal retainers of the patrimonial lord by virtue of the right of mobility, which exists at least in principle and which they share with the free retainers who are only manorial, not personal dependents. Furthermore, the political subject differs from the personal retainer by owing traditional and therefore fixed services and taxes, just as the manorial retainers do. However, he differs from both in that he can freely dispose of his property and, in contrast to the free manorial retainer, also of his land, insofar as the prevailing order limits this at all; the political subject can bequeath his property according to custom and can marry without the lord's consent; in legal matters he does not address the manorial or house officials, but one of the various courts, if he does not resort to selfhelp by feuding. This he is entitled to do as long

as the feud is not outlawed by a general public peace edict (*Landfrieden*). For in principle he has the right and hence also the duty to bear arms.

However, the bearing of arms also obliges the political subject to follow the prince's call to arms. Despite the predominance first of feudal and later of mercenary armies, the English kings stressed to their political subjects the duty of owning their own arms and of equipping themselves, gradated according to their property. And in the case of the rebellious German peasants of the 16th century the traditional possession of arms was still important. However, this "militia" of merely political subjects was by right only available for traditional purposes, for the defense of the country (*Landwehr*) that is, but not for the various feuds of the patrimonial prince. Although the professional or patrimonial army of the prince was formally a hired army, it too could resemble in substance a levy of the militia, if it was indeed recruited from the subjects; the militia, on the other hand, could occasionally approximate the professional army. The battles in the Hundred Years' War were fought not only by knights but very prominently also by the English yeomanry, and a great many patrimonial forces were intermediate between a patrimonial army proper and a levy. The more such forces were levies and the less they were specifically patrimonial troops, the more limited was the prince in their use and the more tied by tradition was he with regard to his political power vis-à-vis the subjects; a levy would not have unconditionally supported his violation of tradition. Therefore it was historically important that the English militia was not a patrimonial army of the king, that it was based on the freemen's right to bear arms. To a large extent the militia was the military agent of the great revolution against the tax claims of the Stuarts, which violated tradition, and the negotiations of Charles I with the victorious parliament, which were hopeless on this score, ultimately concerned the control over the militia.

The subjects' tax and service obligations deriving from political domination were as a rule not only quantitatively more clearly circumscribed by tradition than those stemming from manorial and personal dependency, but were also legally distinguished from the latter. In England, for example, the property of the freemen rather than the retainer was charged with the *trinoda necessitas*: the responsibility for 1) the construction of fortifications, 2) road and bridge construction, and 3) the military burdens. In southern and western Germany as late as the 18th century the services owed to the judiciary lord were separated from duties deriving from personal dependence (*Leibherrschaft*); the former were the only remaining personal obligations after personal dependence proper had been transformed into a rent claim. Thus, the

obligations of freemen are everywhere bound by tradition. Taxes levied in violation of tradition and by virtue of special decrees, to which the subjects yielded with or without a particular agreement with the ruler, often continued to denote by their names (*Ungeld* or *malatolta*) their irregular origin. However, patrimonial domination inherently tends to force the extrapatrimonial political subjects just as unconditionally under the ruler's authority as the patrimonial subjects and to regard all powers as personal property, corresponding to the master's patriarchal power and property. On the whole, the extent of the ruler's success depended upon the power constellation and, apart from his own military power, especially upon the mode and the impact of certain religious influences, as we will show later. Marginal cases in this respect were the New Kingdom in Egypt and the Ptolemaic empire, where the distinction between royal *coloni* and free landowners, royal domains and other lands practically disappeared.

7. *The Patrimonial Satisfaction of Public Wants. Liturgy and Collective Responsibility. Compulsory Associations.*

The patrimonial satisfaction of public wants has its distinctive features as well as features which also occur in other forms of domination. The *liturgical* meeting of the ruler's political and economic needs is most highly developed in the patrimonial state. This mode of meeting demands has different forms and effects. We are here interested in those consociations of the subjects which derive from liturgical methods. For the ruler liturgical methods mean that he secures the fulfillment of obligations through the creation of heteronomous and often heterocephalous associations held accountable for them. Just as the kinship group is answerable for crimes of its members, so these associations are liable for the obligations of all members. Among the Anglo-Saxons, for example, kinship groups were in fact the oldest units which the ruler held accountable. They guaranteed to him the obedience of their members. Similarly the villagers became collectively liable for the individual inhabitant's political and economic obligations. We saw earlier that this could result in the hereditary attachment of the peasants to the village; the individual's right to a share of the land could in this way turn into a duty to participate in the production of a yield, in the interest of the contributions owed to the ruler.

The most radical liturgical arrangement is the transfer to other vo-

cational groups of this hereditary attachment: thus corporations, guilds and other vocational groups established, legalized or made compulsory by the ruler become liable for specific services or contributions of their members. In compensation and especially because of his own interest in preserving the subjects' economic capacity, the ruler customarily grants a monopoly on the respective economic pursuits and ties the individual and his heirs to the association, both with respect to their persons and their property. The obligations may consist of contributions specific to the respective trade, for example, the production and maintenance of war materials, but they may also comprise other duties, for example, ordinary military contributions or tax payments. Sometimes it has been assumed that even the Indian castes were at least in part of liturgical origin, but at present there is no sufficient basis for this opinion. It is also very doubtful to what extent the use of the early medieval guilds for military, political and other contributions and their official establishment (*Offizial*) was a really important factor in the very wide spreading of the guild system. In the Indian case the primary influence must definitely be ascribed to magic-religious and status differences as well as to racial ones; in that of the guilds voluntary association played the major role. But elsewhere the compulsory liturgical association has been common, and by no means only in patrimonial regime, although there it was often installed with the most radical thoroughness. For such regimes it is natural to view the subject as existing for the ruler and the satisfaction of his needs, and therefore also to consider the significance of his economic activities for corresponding liturgical capacities as his *raison d'être*. Accordingly, liturgical methods of meeting public needs prevailed especially in the Orient: in Egypt and in parts of the Hellenistic world, and again in the late Roman and the Byzantine empire. With less consistency these methods were also applied in the Occident and played a considerable role, for example, in English administrative history. Here liturgical bonds usually do not significantly fetter the person, but essentially affect his property, especially his landed property. However, they share with the Oriental liturgies the existence of a compulsory association guaranteeing collective liability for the obligations of the individuals, on the one hand, and a link, at least *de facto*, with a monopoly position on the other.

One example is the guarantee of public peace and order called in England the frankpledge: the compulsory collective liability of a group of neighbors for the law-abiding behavior and political compliance of every member. This institution is found in East Asia (China and Japan) as well as in England. For the sake of public order neighbors were organized and registered in groups of five in Japan and of ten in China

and made collectively liable. The beginnings of such an organization existed in England already before the Norman period, which greatly relied on such arrangements. Compulsory associations whose members were collectively liable to criminal persecution were made responsible for the appearance of an accused in court, for giving information about guilt or innocence in criminal cases involving a neighbor—a function from which the institution of the jury developed—, for the appearance in court of "jurors," for providing the militia, for the military *trinoda necessitas* and later for the most diverse public burdens; these associations were at least in part established specifically for these purposes, and landed property in particular was made liable [for the obligations imposed]. The associations were penalized by the king *pro falso iudicio* as well as for other violations of the public duties for which they were collectively liable. In turn, they held their members accountable personally and with their property, and the political burdens were therefore quite regularly conceived to be linked to the most "real" kind of property, the individual's land. For these reasons the liturgical compulsory organizations later became the source of the English municipal associations and therefore of self-government, mainly in a twofold fashion: 1) The internal apportionment of the obligations demanded by the ruler became their autonomous affair; 2) certain of their public duties which could be fulfilled only by propertied members were delegated to the latter and, by virtue of the resulting influence, became status rights of the propertied who proceeded to monopolize them. An example is the office of the justice of the peace.

For the rest, every political obligation within patrimonial administration had an inherent tendency to turn into an impersonal fixed obligation to render contributions resting on concrete objects of wealth, especially on land and also on production shops and sales points. This was bound to happen when the liturgical collective duties did not hereditarily bind the individual at the same time that the "chargeable" objects remained or became alienable. For in this case the ruler had generally no choice but to depend for the fulfillment of his demands upon that which remained always visible and within his reach: "visible profitable property," as it was called in England, and that was primarily real estate. The ruler would have required a very extensive coercive apparatus in order to get hold, in each instance, of the persons who were under liability, and this difficulty exactly was the reason for the system of compulsory associations upon which this task devolved. However, these associations, too, faced the same difficulty if they were not aided by the coercive apparatus of the ruler.

Thus a liturgical meeting of public needs could develop into two

very different structures: In one marginal case it could lead to local administration by largely independent *honoratiores;* this administration was connected with a system of specific obligations whose extent and manner were traditionally determined and which rested on specific property objects. On the other extreme a personal patrimonial dependence of all subjects could develop which tied the individual hereditarily to the land, the vocation, the guild and the compulsory association and which exposed the subjects to very arbitrary demands; these demands were advanced within highly unstable limits merely set by the ruler's concern for the subjects' permanent capacity to fulfill their obligations. The more technically developed the ruler's own patrimonial position was, and especially his patrimonial military power on which he could rely also against his political subjects, the more easily the second type, total dependency, could prevail. The majority of these cases was naturally intermediate. We have already dealt with the significance of the ruler's military power, his patrimonial army. However, besides the army the coercive administrative apparatus available to the ruler was important for determining the size and quality of the enforceable demands. It was never possible or useful for the ruler, if he strove for an optimal personal power position, to turn all desired services into liturgies based on collective liability: he was always in need of a *body of officials.*

8. *Patrimonial Offices*

In the simplest case the prince's [illegible]mains comprise his own household, together with a complex of [illegible]orial dependencies to which the households of manorial peasants are attached. This already requires an organized administration and hence a suitable division of functions developing in proportion to its size; the latter is even more true of the attached political administration. In this fashion the *patrimonial offices* come into being. The crown offices which originated in the household administration are similar all over the world. Besides the house priest and sometimes the ruler's personal physician we find the supervisors of the various branches of the administration: the lord high steward for the food supplies and the kitchen; the butler or cupbearer for the wine cellar; the marshal (*connétable: comes stabuli*) for the stables; the *Fronvogt* for the peasants' compulsory services; the *intendant* for clothing and armor; the chamberlain for treasury and revenues; the seneschal for general administration. There were other supervisors for whatever branches resulted from the household's administrative needs. In a grotesque degree this differentiation was maintained at the Turkish court

up to this century. Any task transcending the immediate household operations was at first subsumed under that part of the household administration to which it was most closely related. For example, the command over the cavalry was given to the supervisor of the stables, the marshal. All officials are charged, in addition to their administrative tasks proper, with attendance on the person of the ruler and with representational duties; in contrast to a bureaucratic administration, there is no professional specialization, but just like bureaucratic officials, the patrimonial officials usually develop into a status group set off from the ruled. The *sordida munera* and *opera servilia* of the manorial or personal dependents are everywhere differentiated, in late Antiquity as well as during the Middle Ages, from those higher, courtly, administrative services and liturgies which devolve upon the *ministeriales* and which, at least in the service of great lords, later come to be considered worthy also of a free man.

The ruler recruits his officials in the beginning and foremost from those who are his subjects by virtue of personal dependence (slaves and serfs), for of their obedience he can be absolutely sure. A political administration, however, can rarely rely on them alone. The political rulers were nearly always compelled to recruit their officials also in an extrapatrimonial fashion, not only because of the subjects' resentment when they saw unfree men rise above everybody else in power and status, but also because of the direct administrative needs and the continuation of prepatrimonial forms of administration. On the other hand, free men derived such great advantages from serving a lord that they accepted the at first inevitable submission to the ruler's personal power. For wherever possible, the ruler insisted that officials of extrapatrimonial origin accept the same personal dependency as the officials recruited from unfree men. Throughout the Middle Ages the official had to become *familiaris* [a household dependent] of the prince in patrimonial states proper (for example, also in the patrimonial state of the Angevins in Southern Italy, as the most knowledgeable person of this matter confirmed to me).[2] The free men who became *ministeriales* in Germany surrendered their land to the lord and received it back from him as service land suitably enlarged. After the extensive debates on the origin of the *ministeriales* it no longer seems doubtful today that they came at first from unfree strata, but it also seems certain that their rise as a status group was due to the massive influx of free men adhering to a knightly style of life. Everywhere in the Occident, and especially in England, the *ministeriales* were absorbed as equals by the knightly stratum. In practice this meant that their position was largely stereotyped and that therefore the lord's claims were firmly limited; once this had

happened it stood to reason that the ruler could demand of them only services conventionally befitting a knightly status group and that in general he had to adhere to the proper status conventions in his relations with them.

The position of the *ministeriales* was further stereotyped when the ruler issued reglements and thus created a *Dienstrecht* (service law) which turned them into members of a legally autonomous group (*Rechtsgenossen*), as was the consequence of the medieval service laws. Subsequently the group members monopolized the offices, established fixed rules and especially the requirement of their consent for the inclusion of new members into the corporate group, delimited services and fees and formed in every respect a closed status group, with which the ruler had to come to terms. Thereafter the ruler could no longer deprive such an official of his service fief, unless a judicial verdict directed its forfeiture, and that means in the Occident a verdict of a court composed of *ministeriales*. Finally, the officials' power reaches its apex when they or some of them, for example the highest-ranking court officials, demand that the ruler select his policy-making officials only according to their proposals or mandatory recommendation. Such attempts were occasionally made. However, in nearly all cases in which the ruler's advisors successfully imposed their recommendation for the selection of his top officials, these advisors were not officials and especially not *ministeriales*, but the congregated council of his great vassals or of the country's *honoratiores;* in particular, they were representatives of the Estates. According to the classic Chinese tradition, the ideal emperor appoints as his prime minister the person recommended as the most competent one by the great nobles at court, but it is unclear whether these are autonomous *honoratiores* and vassals or officials; it is certain that of the English barons who raised the same demand repeatedly in the Middle Ages only a few were officials, and these did not raise it in their capacity as officials.

Wherever possible the ruler attempts to avoid such monopolization of offices by status groups and such stereotyping of the administrative services by appointing hereditary personal dependents or aliens who are completely dependent upon him. The more offices and official duties are stereotyped, the more natural is the lord's attempt to free himself from such monopolies when new administrative tasks arise and new offices have to be created; in fact, this attempt was made especially at such occasions, sometimes successfully. However, the ruler is always confronted with the indignant opposition of the native aspirants to office and sometimes also of the subjects. Insofar as this is a struggle of the local *honoratiores* for the monopoly of local offices, it will be treated

later. But wherever the ruler creates typical and lucrative offices, he must face attempts at monopolization by certain strata, and it is a question of power to what extent he can resist these powerful interests.

The monopolistic, legally autonomous sodality (*Rechtsgenossenschaft*) of the *ministeriales* and therefore also their sodalian association with the ruler was mainly a phenomenon of Occidental law. But traces of it can also be found elsewhere. In Japan, according to Rathgen, the *han* (i.e., "fence"), the community of the *daimyo* and his free *antrustiones* or *ministeriales* (samurai), was considered the holder of the seigneurial rights of which the lord could avail himself. However, the articulation of the sodality law was nowhere as consistent as in the Occident.

The typification and monopolistic appropriation of the powers of office by the incumbents as members of such a legally autonomous sodality created the *estate-type* of patrimonialism.

The monopoly of the *ministeriales* on the court offices is an example of court prebends; an example in the political field is the monopoly of the members of the English bar on the offices of the bench. Examples in the history of church administration are the monopolies of the *ulemas* on the positions of the *kadi*, *mufti* and *imâm* and the numerous monopolies of similar Occidental graduates in the ecclesiastical prebends. But whereas in the Occident the typification of the positions of the *ministeriales* gave to the individual a relatively secure sodality right to the office specifically granted to him, this was by and large far less true of the Orient. There the offices were indeed highly stereotyped, but the incumbent himself remained freely replaceable; as we shall see, this resulted from the absence of certain Occidental Estate features and from the military power position of the Oriental ruler which had a different political and economic basis.

9. *Patrimonial versus Bureaucratic Officialdom*

Patrimonial officialdom may develop bureaucratic features with increasing functional division and rationalization, especially with the expansion of clerical tasks and of authority levels through which official business must pass. But the genuinely patrimonial office differs sociologically from the bureaucratic one the more distinctly, the more purely each type has been articulated.

The patrimonial office lacks above all the bureaucratic separation of the "private" and the "official" sphere. For the political administration,

too, is treated as a purely personal affair of the ruler, and political power is considered part of his personal property, which can be exploited by means of contributions and fees. His exercise of power is therefore entirely discretionary, at least insofar as it is not more or less limited by the ubiquitous intervention of sacred traditions. With the exception of traditionally stereotyped functions, hence in all political matters proper, the ruler's personal discretion delimits the jurisdiction of his officials. Jurisdiction is at first completely fluid—if we want to use this specifically bureaucratic concept here at all. Of course, each office has some substantive purpose and task, but its boundaries are frequently indeterminate. Originally, however, other officials do not differ on this score from patrimonial officials. At first, only competing powers create stereotyped boundaries and something akin to "established jurisdictions." However, in the case of the patrimonial officials this derives from the treatment of the office as a *personal* right and not, as in the bureaucratic state, from *impersonal* interests—occupational specialization and the endeavor to provide legal guarantees for the ruled. Therefore this quasi-jurisdictional limitation of the powers of office results primarily from the competing economic interests of the various patrimonial officials. Insofar as sacred tradition does not prescribe certain official acts, they are discretionary, and hence the lord and his officials demand a compensation in each case, either arbitrarily or according to established rates. Thus the distribution of these sources of income provides a strong incentive for the gradual delimitation of administrative jurisdictions, which was at first almost non-existent in the *political* sphere of the patrimonial state. To protect their fees the English lawyers, for example, insisted upon the appointment of judges exclusively from their midst and upon admission to their own ranks exclusively of apprentices trained in law offices. In contrast to other countries, the university graduates trained in Roman law were thus excluded. This also prevented the reception of Roman law. For the sake of fees the secular courts fought with the ecclesiastic ones, the common-law courts with the chancellery courts, and the three great courts—Exchequer, Common Pleas, King's Bench —with one another and all other courts. Jurisdiction was determined most of the time by compromises among those interested in taking fees, not primarily and never solely by rational considerations. Since jurisdictions often overlapped the courts competed with one another for the favor of the clients by resorting to various incentives, in particular convenient procedural fictions, lower fees, etc.

However, this example refers to offices that were already perpetuated and typified, a condition which even in large and permanent political structures developed only gradually. In the beginning we find as a rule

the *ad hoc* official whose powers are defined by a concrete purpose and whose selection is based on personal trust, not on technical qualification. Wherever the administration of a large political realm is patrimonial, every attempt at identifying "jurisdictions" is lost in a maze of official titles whose meaning seems to change quite arbitrarily; witness Assyria even during the period of its greatest expansion. When the ruler's political operations are appended to his purely economic concerns, they appear as auxiliary resources which are used merely according to need and opportunity: The political administration is at first intermittent, entrusted to that person—most of the time a court official or table companion—who in the concrete case appears to be the most qualified and, above all, nearest to the ruler. For the personal discretion and the favor or disfavor of the ruler are decisive as a matter of principle and not just as a matter of fact, as of course it does happen everywhere. This also applies to the relation between the ruled and the officials. The latter are permitted to do whatever is compatible with the power of tradition and the ruler's interest in the preservation of the subjects' compliance and economic capacity to support him. Absent are the binding norms and regulations of the bureaucratic administration. Decisions are made *ad hoc* not only in areas of novel or significant problems, but throughout the realm of the ruler's powers, insofar as these are not curbed by well-established rights of individuals. Hence the exercise of the ruler's powers by the officials proceeds in two often unrelated areas: one in which it is limited by obligatory and sacred tradition or definite individual rights, and one in which the ruler's personal discretion prevails. This may create conflicts for the officials. A violation of the old customs may be an offense to perhaps dangerous forces, whereas disobedience to the ruler's orders is a criminal disregard of his powers of injunction (*Banngewalt*) and subjects the violator, in the terminology of English law, to the ruler's *misericordia:* his right to impose arbitrary sanctions. The conflict between tradition and the ruler's judicial rights (*Herrenbann*) is everywhere irreconcilable wherever they overlap. Long after the powers of political offices have been standardized within fixed territorial jurisdictions, as for the English sheriff of the Norman period, the ruler suspends, exempts and redresses in principle according to his own discretions.

In contrast to bureaucracy, therefore, the position of the patrimonial official derives from his purely personal submission to the ruler, and his position vis-à-vis the subjects is merely the external aspect of this relation. Even when the political official is not a personal household dependent, the ruler demands unconditional administrative compliance. For the patrimonial official's loyalty to his office (*Amtstreue*) is not an im-

personal commitment (*Dienstireue*) to impersonal tasks which define its extent and its content, it is rather a servant's loyalty based on a strictly personal relationship to the ruler and on an obligation of fealty which in principle permits no limitation. In the Germanic kingdoms the king threatens even free officials with disfavor, with blinding and death in the case of disobedience. However, in relation to other persons the official partakes in the ruler's dignity because and insofar as he is personally subject to the ruler's authority (*Herrengewalt*). In the Germanic kingdoms only the royal official has increased *Wergild*, irrespective of status, but not the free judge of the folk community (*Volksrichter*), and everywhere the servile official, although he is not a free man, easily rises above the free subjects. All patrimonial service regulations, which would be *reglements* according to our [bureaucratic] notions, are ultimately nothing but purely subjective rights and privileges of individuals deriving from the ruler's grant or favor; in fact, this can be said for the entire system of public norms of the patrimonial state in general. It lacks the objective norms of the bureaucratic state and its "matter-of-factness," which is oriented toward impersonal purposes. The office and the exercise of public authority serve the ruler and the official on which the office was bestowed, they do not serve impersonal purposes.

10. *The Maintenance of Patrimonial Officials. Benefices in Kind and Fees*

Originally the patrimonial officials are typically *maintained* at the ruler's table and from his supplies, as is every other household member. As a basic component of the household, commensality gained far-reaching symbolic significance and extended far beyond its boundaries, a development in which we are here not interested. At any rate, patrimonial officials, especially their highest ranks, retained for a long time the right to be fed at the lord's table when they were present at court, even if the ruler's table had long ceased to be important for their maintenance.

When the patrimonial official leaves this intimate community, the result is naturally a diminution of the ruler's direct control. The ruler could indeed make the official's economic compensation completely dependent upon his discretion and thus put the official in a precarious position, but this was not feasible in a relatively large apparatus and it was dangerous for the ruler to violate regulations once they had been established. The maintenance in the ruler's household was therefore succeeded very early by the granting of benefices or fiefs to patrimonial

officials who had their own household. We will deal first with the *benefice*. This important institution, which as a rule also implies a definite "right to the office" and thus its appropriation, has had the most diverse fates. At first, the benefice was, as in Egypt, Assyria and China, an allowance in kind from the depots and granaries of the ruler (king or god), as a rule *for life*. For example, when the commensality of the temple priests was dissolved in the ancient Orient an allowance in kind provided by the temple granary was introduced. Later these allowances became alienable and were negotiable even in fractions (for example, for single days of each month); thus they were something like forerunners, at the stage of natural economy, of modern government bonds. We shall call this type *benefices in kind* (*Deputatpfründe*).

The second type is the *fee benefice* (*Sportelpfründe*): the assignment of certain fees which the ruler or his representative can expect for official acts. This type of benefice removes the official even further from the ruler's household, because it is based on revenues of a relatively extrapatrimonial origin. Already in Antiquity this kind of benefice was subject to purely commercial transactions. A large part of those priestly positions, for example, which had the character of an "office" (and not of a free profession or, conversely, of a family's hereditary possession) were publicly sold in the ancient polis. It is not known to what extent the trading of benefices was practiced in Egypt and the ancient Orient. But in view of the prevailing interpretation of the office as a "living," such a development would have been natural in those areas.

Finally, the benefice could also take the form of a *landed benefice* assigning office or service land (*Amts- oder Dienstland*) for the incumbent's own use. This approximates the fief and gives the beneficeholder greater autonomy from the lord. The lord's officials and thegns by no means always welcomed the separation from his table community since this imposed upon them economic risks and the burden of a household. But their desire to found a family and to be independent predominated. On the lord's part it became necessary to unburden his own household, since with the growing number of table companions expenditures increased tremendously and beyond the point of control; at the same time the household remained exposed to the vicissitudes of income fluctuation. It was clear, however, that in the case of a secular official who had a family the separation immediately resulted in a drive for hereditary instead of merely lifelong appropriation of the benefice. Insofar as the fief is concerned, we will be treating this process in another context.

The appropriation of benefices took place especially in the early period of the modern patrimonial-bureaucratic state. This process oc-

curred everywhere, most strongly in the papal Curia, in France, to a lesser extent in England, because there a smaller number of officials was involved. At stake were primarily *fee benefices*, which were either bestowed upon intimates or favorites with the permission to hire a more or less proletarian deputy who did the real work, or they were given to interested persons on a fixed lease or for a lump sum. In this way the benefice became a patrimonial possession of the leaseholder or purchaser, and we can observe the most diverse arrangements, including hereditability and alienability. To begin with, the official may give up his benefice for a compensation paid by the interested person, while claiming the right vis-à-vis the ruler to propose the successor for the position which is his by virtue of purchase or rental. Alternatively, a body of officials, for example, the collegiate body of a court, may claim the right of making such proposals and then proceed in the common interest of the colleagues to set the conditions for transferring the benefice to an outsider. The lord, of course, wanted to participate in one way or another in the profits of such a transfer since he had granted the benefice, and originally never for life. Accordingly he, too, sought to establish guidelines for such transfers. The results greatly differed from case to case. For the Curia and the princes the trading of offices—that means, the capitalization of fee incomes through the massive creation of fee benefices in the form of sinecures—became a financial operation which was most important for the coverage of their extraordinary needs. In the Papal States the wealth of the *nepotes* derives to a significant extent from the exploitation of fee benefices.

In France the *de facto* hereditability and the trade of benefices began with the *parlements*—the highest court authorities—and subsequently encompassed all ranks of financial and administrative officialdom, including the *prévôts* and *baillis*. When an official resigned, he sold his benefice to a successor. The heirs of a deceased official claimed the same right (*survivance*), since the office had become a property object. After several abortive attempts at abolishing this practice, the royal treasury began to share in the deal, from 1567 on, by receiving a fixed fee from the successor (*droit de resignation*). In 1604 the whole practice was systematized in the form of the *paulette*, so called after its inventor Charles Paulet. The *survivance* was affirmed, but the Crown's *droit de resignation* was sharply reduced; in its stead the office-holder was obliged to pay to the Crown annually one and two thirds percent of the purchase price, and the revenues were in turn annually leased by the Crown (first to Paulet). The purchase price of the benefices went up as income opportunities improved, and this again meant higher gains for the leaseholder and the Crown. However, this office appropriation

made it virtually impossible to dismiss officials (especially the members of the *parlements*). For an official could be dismissed only if the Crown refunded the purchase price of the benefice, a step which it was hesitant to take. It was only on August 4, 1789 that the Revolution eradicated office appropriation, and even then it had to pay a compensation of more than one-third of a billion livres. If the king tried to impose his will upon the *parlements*, he could be thwarted in case of need by a general strike—mass resignation which would have forced him to pay back the total purchase value of all benefices; this happened repeatedly before the Revolution.

Appropriated benefices were one of the mainstays of the *noblesse de robe*, that important status group in France which formed the leadership of the *tiers état* against the king and the landowning or court aristocracy.—

By and large the Christian clergy in the Middle Ages was maintained through endowment with land or fee benefices. Originally the church had been supported by the offerings of the community—ever since it had become necessary to make economic provisions for the maintenance of the religious services by forming a "profession"; and this in turn had made the professional clergy completely dependent on the bishops, who disposed of the offerings. This was the normal state of affairs in the old church of the cities, which were then the bearers of Christianity. If we disregard some other peculiarities, the church was a patriarchally modified bureaucracy. But in the Occident the urban character of religion eventually disappeared and Christianity spread into the countryside, which was still deep in the natural economy. Some of the bishops gave up their urban residence, especially in the North. Many of the churches were secularly owned (*Eigenkirchen*), either by the peasant community or the manorial lord, and the clergymen frequently became the latter's dependents. Even if the secular builders and patrons used the more considerate form of endowing the church with fixed rents or with glebe, they would claim the right of appointing and even of removing the priest; this naturally resulted in a fundamental weakening of the bishop's authority and also in a significant decrease of the clergy's religious interests. As early as during the Frankish kingdom the bishops attempted, most of the time unsuccessfully, to prevent the predominance of benefices by establishing communal living at least for the clergy of the chapter. Time and again the monastic reform movement had to fight against the displacement of monastic communism by a phenomenon typical of the Eastern church: The transformation of the monks into benefice-holders, who often lived outside the monastery, and of the monasteries themselves into "social security" agencies for the nobility.

The bishops could not prevent the prebendalization of clerical positions. The bishoprics of the North, especially those in which the bishop maintained his urban residence, were very large and required subdivision; this contrasts with the South where each of the numerous cities had its own bishop. Since many churches and their revenue sources were privately controlled, the bishop could not treat them as his free office property, even if otherwise the canonical conditions were gradually introduced. The benefice was created simultaneously with the parish; only sometimes was it conferred by the bishop. In the European mission territories the benefices and the corresponding property were provided by powerful secular founders who wanted to retain control over most landed property. The same can be said of the position of the bishops, even in face of the claim to supremacy of the papal power; they were at first appointed almost at will by the secular rulers who were both accepting and regulating the church, and as trusted advisers they were endowed with political rights. Thus the development of the church hierarchy veered toward decentralization, and at the same time also toward appropriation of patronage by the secular rulers, whose prebendal house priests or feudal vassals the church officials tended to become.

By no means only feudal princes were eager to have the learned and literate clergy, cut off from family ties, as cheap and qualified manpower in whose hands the hereditary appropriation of offices need not be feared. The Venetian overseas administration, for instance, lay in the hands of churches and monasteries up to the conflict about lay investiture. This conflict marked an important phase in the establishment of the urban bureaucracy, since the subsequent separation of church and state abolished the clerics' oath of allegiance to the doge as well as the electoral initiative, supervision, affirmation and investiture on his part. Up to that time the churches and monasteries directly leased and administered the colonies or were the *de facto* center of a settlement in their role as domestic arbitrators and diplomatic representatives of Venetian interests.

The German imperial administration of the Salic emperors and their political power were rooted primarily in the disposition over church property and especially in the obedience of the bishops. The familiar reaction of the Gregorian epoch was directed against the utilization of the clerical benefice for secular ends. The success of this reaction was considerable, but within very narrow limits. The popes increasingly seized control over the disposition of vacant benefices, a development which reached its peak at the beginning of the 14th century.

The benefice became one of the issues in the cultural conflict *Kulturkampf)* between church and secular power of the 14th and 15th

century. For throughout the Middle Ages the clerical benefice was the basic resource serving the purpose of "high culture" (*Geisteskultur*). Especially in the later Middle Ages, up to the Reformation and Counter-Reformation, the benefice developed into the material foundation of that class which was then the bearer of "high culture." By endowing the universities with the disposal over benefices the popes made possible the rise of that medieval stratum of intellectuals which, apart from the monks, had the most significant share in the preservation and development of scientific work; the same end was served by the multitude of benefices which they bestowed upon personal favorites, among whom were many scholars, relieving them of official duties. At the same time, however, by flatly ignoring national differences in their bestowal of benefices, the popes provoked that violent nationalist resistance of the intellectuals, especially of the Northern countries against Rome, which became such an important feature of the conciliar movement.

Moreover, kings and barons continued in spite of the canonical injunctions to seize control over the clerical benefices. On a very large scale this was done by the English kings since the 13th century, primarily for the purpose of securing cheap and reliable manpower. The employment of clerics also freed them from dependence upon the *ministeriales* whose services were linked to hereditarily appropriated service land and had become stereotyped and useless for a rational central administration. A celibate cleric was cheaper than an official who had to support a family, and he would not be tempted to strive for the hereditary appropriation of his benefice. By virtue of his power over the church, which had a very concrete meaning in this instance, the king provided the clerics with pensions (*collatio*) from church property. Clerics came to replace the older type of official on such a large scale that even today we are reminded of it by the name for office personnel: clerks. The great barons were powerful enough to secure control over a large number of benefices or to force the king into disposing of them according to their wishes. The trading in benefices (*brocage*) became very extensive. Hence the ever-changing coalitions of the participants, Curia, king and barons, in the struggle over benefices during the period of the conciliar movement. At one time king and parliament opposed the pope in order to monopolize the benefices for domestic owners and candidates, at another king and pope joined forces to their mutual advantage at the expense of the native interests. The prebendal nature of the clerical offices as such was not changed by the pope. Not even the Tridentine reform could change the prebendal character of the mass of clerical positions, especially of the regular parochial clergy who maintained a limited, but effective "right to the office." The secularizations of modern

times fixed this prebendal character even more when the economic maintenance of the church and its officials was transferred to the state budget. Only the modern struggles between secular states and the church, and especially the separation of church and state, provided the [Catholic] hierarchy with the opportunity to abolish the "right to the office" all over the world after supplanting the prebendal system with one in which the clerical officials are *ad nutum* [at will] removable; this most important shift in the church constitution has occurred almost unnoticed.

The trading in benefices is essentially limited to the fee benefice and thus a product of the advancing money economy. An increase in the importance of cash fees and a growing tendency to invest wealth in the sources of fee incomes presuppose the formation of monetary wealth. Other epochs did not experience an expansion in the trading in benefices of the kind and volume observable in late medieval and especially early modern history, from the 16th to the 18th century. But similar developments were widespread. We have already mentioned quite significant beginnings in Antiquity. In China the office benefice was not appropriated because of the peculiar organization of offices, which we will discuss later, and therefore it never became legally marketable. However, in China too an office could most of the time be obtained only with the aid of money—in the form of a bribe. Although we cannot say this of legalized trading in benefices, the benefice itself is a universal phenomenon. The obtainment of a benefice is the goal of education and the purpose of the academic or other degrees in China and in the Orient, just as in the Occident. This is very clearly brought out by the fact that the characteristic punishment for political deviation in China is the suspension of examinations in a province and thus the temporary exclusion of its intellectuals from office benefices. The tendency toward the appropriation of benefices is also universal, although results vary. Especially the self-interest of the qualified aspirants is often an effective counterweight to appropriation. The benefice of the Islamic *ulemas*, that means, of the status group of examined aspirants for the offices of the *kadi* (judge), *mufti* (ecclesiastic jurists responding through *fetwa*) and *imâm* (priest), was often granted for only a short time (one to one and a half years), in order to facilitate its circulation among the aspirants and in order not to impair the *esprit de corps* in favor of desires for appropriation on the part of the individual.

In addition to his continuous normal income: allowances in kind, sometimes landrent and fees, the patrimonial official receives irregular gifts from his lord in the case of special merit or the latter's good mood. Their source is the lord's thesaurus, hoard, treasure: stocks of precious

metals, jewelry and arms, and sometimes his stud. Precious metals are particularly important. Since the good will of the officials depended on the possibility that their merits would be rewarded, the possession of a treasure was everywhere the indispensable basis of patrimonial domination. In the argot of scaldic poetry the king is called the "breaker of rings" (*Ringebrecher*). The seizure or loss of the hoard often decided wars between pretenders, for in a predominantly natural economy a treasure of precious metals has paramount importance. We will deal later with the economic relations which are determined by this fact.

11. *Decentralized and Typified Administration As a Consequence of Appropriation and Monopolization*

In a patrimonial state every prebendal decentralization of the administration, every jurisdictional delimitation caused by the distribution of sources of fee incomes among competitors, and even more so every appropriation of benefices signifies not rationalization but *typification*. In particular the appropriation of the benefice, which made the officials —as we have seen—often practically irremovable, can have the same effect as the modern legal guarantee of judicial "independence," although its meaning is completely different; its aim is the protection of the official's right to his office, while modern civil service law endeavors to insure the official's impartiality in the interest of the ruled through "independence," that means, through his irremovability unless he has been properly tried and convicted.

The officials who had legally or factually appropriated the benefices could very effectively curtail the ruler's governmental power; above all they could vitiate any attempt at rationalizing the administration through the introduction of a well-disciplined bureaucracy and preserve the traditionalist stereotyped separation of political powers. The French *parlements*, collegiate bodies of benefice-holders, in whose hands were the formal legalization and partly also the execution of royal orders, checked the king's power for centuries and blocked all innovations which would have been detrimental to their traditional rights. It is true that here, too, the patrimonial norm was accepted in principle: An official must not contradict his ruler. When the king personally appeared in the midst of these assemblies of office beneficiaries (*lit de justice*), he could formally insist on the legalization of any order, for in his presence every opposition had to cease, and he tried to achieve the same effect through direct written directives (*lettre de justice*). But by virtue of their property rights to the office, the *parlements*, through *remon-*

trance, often questioned immediately afterwards the validity of the decree which ran counter to tradition, and frequently vindicated their claim to be independent bearers of authority. The effectiveness of the appropriation of benefices which was at the roots of this situation was of course variable and depended upon the power distribution between benefice-holder and ruler, especially upon the availability to the latter of financial means for redeeming the appropriated rights of the benefice holders and for replacing them with a completely dependent bureaucracy. As late as 1771 Louis XV attempted through a *coup d'état* to destroy the preferred weapon of the benefice-holders in the *parlements*, the "general strike" in the form of a mass resignation, which was designed to enforce the king's retreat since he could not afford to remit the purchase price of the offices. In this case the officials' resignation was accepted, but the purchase price was not paid back, the officials were detained for disobedience, the parliaments were dissolved, new agencies were created in their place, and the appropriation of offices was abolished. But this attempt at establishing discretionary patrimonialism, under which the ruler could freely remove officials, failed. In 1774 Louis XVI retracted the decrees in view of the stormy opposition of the vested interests, the old conflicts between king and parliament were revived, and only the summoning of the Estates General in 1789 created a completely new situation which very soon obliterated the issue of the privileges of the two antagonistic forces: monarchy and administrative benefice-holders.

A special situation, which we will later casuistically analyze in greater detail, obtained for those officials through which the ruler directed the local districts, which were originally formed out of the ancient folk court districts (*Dingverbände*) and sometimes also out of individual great domains. Here, too, the frequent appropriation of benefices through purchase led to typification and the splitting off of autonomous powers from the ruler's authority; this happened especially in France. In addition, however, a decentralizing and stereotyping influence was exerted here by the necessity to pay heed to the general conditions under which an official could hold such an exposed position, far removed from the ruler's personal authority. A mere official who was completely—economically and socially—dependent upon the ruler's favor could gain personal authority only under very conducive conditions. In general at least, this was permanently possible only on the basis of a precisely functioning rational apparatus such as modern bureaucracy with its economic and technical preconditions, because in such a system specialized knowledge does itself create the necessary power. Under the general conditions of patrimonialism, however, and thus of

an administration which requires "experience" and at most concrete skills (such as writing), but not rational specialized knowledge, the position of the local official was determined by the weight of his own social prestige (*Autorität*) within his local district; everywhere this prestige was mainly based on a capacity to maintain the style of life appropriate to a status group of notables. Therefore, the property-owning, especially the land-owning stratum of the subjects can easily monopolize the local offices. We will soon deal with this in detail. Only a ruler with the specific gifts necessary to maintain a strongly autocratic government can impose the opposite principle: rule through property-less persons who are economically and socially completely dependent upon him. This can be done only in a continuous struggle with the local *honoratiores*, which pervades the history of the patrimonial state. The office-holding honoratiores, who form a cohesive interest group, usually gain the upper hand in the long run. Not only in the Merovingian kingdom, but all over the world officials time and again extracted from a lord who urgently needed their support the promise that he will keep them in office for life and their children after them.—

As the appropriation of offices progresses the ruler's power, especially his political power, disintegrates into a bundle of powers separately appropriated by various individuals by virtue of special privileges —rights which are most variously defined but which, once the definition has become established, cannot be altered by the ruler without arousing dangerous resistance from the vested interests. This structure is rigid, not adaptable to new tasks, not amenable to abstract regulation, and thus a characteristic contrast to bureaucracy with its spheres of jurisdiction, which have a purposively abstract organization and can be reorganized at any time if need be. In juxtaposition to this stands the completely discretionary power of the lord in areas in which this appropriation of offices has not occurred, permitting him to appoint his personal favorites especially to administrative tasks and power positions which are not pre-empted by appropriated powers. The patrimonial state as a whole may tend more toward the stereotyped or more toward the arbitrary pattern. The former can be more frequently found in the Occident, the latter to a large extent in the Orient, where the theocratic and patrimonial-military foundations of power, often usurped by new conquerors, counteracted quite effectively the otherwise natural process of decentralization and appropriation.

In the course of this typification the old court officials became purely representative dignitaries and benefice-holding sinecurists; this was especially true of the officials of the most powerful lords, who

chose no longer unfree men as court officials but nobles who naturally declined to handle routine tasks.

The more appropriation takes place, the less does the patrimonial state operate either according to the concept of jurisdiction or to that of the "agency" in the contemporary sense. The separation of official and private matters, of official and private property and powers was carried through more or less only in the arbitrary type of patrimonialism; the separation disappeared with increasing prebendalization and appropriation. It is true that the medieval church tried to prevent the free disposition over benefice revenues at least for the case of the prebendary's death, and that the secular power at times extended its *ius spolii* also to the private estate of a deceased clergyman, but in the case of full appropriation official and private property practically coincide.

In general the notion of an *objectively defined* official duty is unknown to the office that is based upon purely personal relations of subordination. Whatever traces of it there are disappear altogether with the treatment of the office as benefice or property. The exercise of power is primarily a personal right of the official: outside of the sacred boundaries of tradition he makes *ad hoc* decisions, just like the lord, according to his personal discretion. Hence a typical feature of the patrimonial state in the sphere of law-making is the juxtaposition of inviolable traditional prescription and completely arbitrary decision-making (*Kabinettsjustiz*), the latter serving as a substitute for a regime of rational rules. Instead of bureaucratic impartiality and of the ideal—based on the abstract validity of one objective law for all—of administrating without respect of persons, the opposite principle prevails. Practically everything depends explicitly upon the personal considerations: upon the attitude toward the concrete applicant and his concrete request and upon purely personal connections, favors, promises and privileges. Even the privileges and appropriations granted by the lord —including especially land grants, however "definitive" the grant— are very often revocable in the case of very vaguely defined "ingratitude"; their validity beyond the grantor's death is also uncertain because of the personal quality of all relationships. These grants are therefore submitted to the successor for confirmation. Depending upon the always unstable distribution of power between lord and officials, confirmation may be considered the ruler's obligation and thus pave the way from revocability to permanent appropriation as a well-deserved privilege, but it may also be an occasion for the successor to enlarge his own realm of discretion by cashiering such special rights; this last means has been repeatedly applied in modern times during the rise of the Occidental patrimonial-bureaucratic state.

Even where the rights of the officials in their relationship to the ruler and also the ruler's powers over them have been stereotyped by means of sodality rights (*Genossenrechte*) and office appropriation, their *de facto* exercise remains decisive for their relative strength; therefore every accidental weakness of the central authority lasting any length of time and perhaps due solely to personal factors will lead to a diminution of its power through the rise of new conventions detrimental to it. Hence, in such an administrative structure the ruler's purely *personal ability* to assert his will is to a very high degree decisive for the always unstable content of his nominal power. The Middle Ages have to this extent rightly been called the "age of individualities."—

12. *Defenses of the Patrimonial State Against Disintegration*

The ruler endeavors to safeguard the integrity of his domination in various ways and to protect it against the appropriation of offices by the officials and their heirs as well as against other means by which officials can gain independent powers. To begin with, he may regularly travel through his realm. In particular the German monarchs of the Middle Ages moved about almost constantly, and not merely because inadequate transportation compelled them to consume on the spot the supplies provided by the various domains. This motive was not necessarily dominant: The English and the French kings as well as their central agencies—and the latter is the important point—had a fixed residence quite early, even though, as the phrase *ubicumque fuerimus in Anglis* ["wherever we shall be in England"] indicates, *de iure* it became fixed only gradually; the same was true of the Persian kings. The decisive fact was that only their continually renewed personal presence maintained their authority over the subjects. As a rule, the ruler's personal traveling was supplemented or supplanted by the "missatic" system: the systematic circling through the land of officials with special powers—the Carolingian *missi dominici*, the English circuit-court judges—, who periodically held popular assemblies for purposes of adjudication and for handling complaints.

Furthermore, the ruler insisted upon various personal guarantees from officials appointed to outside positions where they were not under permanent observation. In the crudest form this amounted to a demand for hostages. More subtle means were the following: a) duty of regular attendance at court; for example, the Japanese daimyos had to reside

every other year at the court of the Shogun and to leave their families permanently there; b) compulsory court service for the sons of officials —the corps of pages; c) appointment of relatives or in-laws to important positions—a very dubious means, as we have pointed out; d) brief tenures in office; this was true originally of the Frankish courts and also of many Islamic benefices; e) exclusion of officials from districts in which they had landed property and relatives, as in China; f) the greatest possible use of celibates for certain important positions—this does not only explain the great importance of celibacy for the bureaucratization of the church, but above all also the use of clerics in the royal administration, especially in England; g) systematic surveillance of the officials through spies or official controllers, such as the Chinese "censors," who were usually recruited from personal dependents of the ruler or from impecunious benefice-holders; h) creation of a competing office in the same district, as for example that of the coroner which was set up against the sheriff. A universal means of assuring loyalty was the use of officials who did not come from socially privileged strata, or even were foreigners, and who therefore did not possess any social power and honor of their own but were entirely dependent for these on the lord. The interests of the ruler were the same: when Claudius intimidated the senatorial nobility with the threat to rule the empire, in disregard of the Augustean status regulations, solely with the assistance of his clientele of freedmen, when Septimius Severus and his successors appointed as officers common soldiers of their armies instead of Roman nobles, or when Oriental Grand Viziers as well as the numerous court favorites of modern history, especially the technically most successful agents and hence those most hated by the aristocracy, were so very frequently raised to their posts from complete obscurity.

Among the devices used to maintain the control of the ruler's central administration over the local officials the splitting up of spheres of jurisdiction became very important to the development of administrative law. This subdivision occurred either in the form that the finance administration alone was entrusted to special officials or that civilian and military officials were juxtaposed to one another in every administrative district, a solution also suggested by technical considerations. The military official then had to rely for procurement upon the civilian administration which was independent from him, and the latter in turn needed the military official's co-operation for maintaining its power. It seems that already the Pharaonic administration of the New Kingdom separated the magazine administration from the military command, and this too was probably a technical necessity. In the Hellenistic period, especially under the Ptolemies, the introduction and bureaucratization

of tax-farming made it possible for the ruler to retain financial control separate from the military command. During the Principate the Roman administration—excepting certain areas such as Egypt and some frontier provinces, where this was not done for political reasons—appointed an autonomous imperial *procurator* of finance who served as the second-highest provincial official next to the imperial commander or the senatorial governor, and it created separate career channels for the two administrations. The reorganization under Diocletian divided the whole imperial administration into civilian and military branches, from the *praefecti praetorio*—as imperial chancellors and the *magistri militum* as imperial commanders down to the *praesides*, on the one hand, and the *duces* on the other. In later periods of Oriental history, especially under the Islam, the separation of the office of the military commander (*emir*) from that of the tax collector and tax farmer (*'amil*) became a firm principle of all strong governments. It has been pointed out correctly that nearly every case of a permanent merger of these two jurisdictions, that means, the fusion of the military and economic power of an administrative district in the hands of one person, soon tended to encourage the administrator's disengagement from the central authority. The increasing militarization of the Islamic realm during the period of slave armies with its mounting demands upon the subjects' tax capacities; the recurrent financial collapse and the mortgaging or seizure of the tax administration by the troops, ended naturally either in the disintegration of the empire or in the rise of the benefice system.

Some historically important examples may illustrate the functioning of patrimonial administrations and especially the means with which the ruler attempts to preserve his power vis-à-vis the tendencies toward appropriation on the part of the officials.

13. *Ancient Egypt*

The first consistent patrimonial-bureaucratic administration known to us existed in ancient Egypt. It seems that originally it was solely staffed with royal clients—servants attached to the pharaoh's court. Later, however, officials also had to be recruited from the outside, from the ranks of the only class technically suited, the scribes, who thereby entered into patrimonial dependency. As early as the Old Kingdom the entire people was pressed into a hierarchy of clientage, within which a man without a master was considered a good prize and, if apprehended, simply assigned to the pharaoh's draft labor gangs; this development

was propelled by the overriding importance of systematic centralized river-regulation and of the construction projects during the long season in which the absence of agricultural work permitted drafting on an unprecedented scale. The state was based on compulsory labor: the pharaoh carried the scourge as one of his attributes, and the privileges of immunity from the third millenium, which Sethe[3] was the first to translate correctly, concern the exemption of temple retainers or officials from compulsory services. The pharaoh maintained his oikos through his own enterprises and trade monopolies, the home production of unfree craft labor, the agricultural output of the *coloni*, and contributions. There was a rudimentary market economy, market exchange in particular, with quasi-monetary means of exchange (*Uten*, metal staffs). In the main, however, the economic needs of the pharaoh were met, as the extant accounts show, from magazines and deliveries in kind, and for extraordinary construction and transportation services the pharaoh mobilized the subjects by the thousands, as the sources reveal.

The large private landed estates and nomarchies, the origin and significance of which are documented by the sources of the Old Kingdom, created an intermediate period of feudalism in the Middle Kingdom, but they disappeared after the period of foreign domination, as they had in Russia after the era of the Tatars. However, the temples acquired immunities as early as the Old Kingdom and were granted immense properties by the Ramessides. Thus, the priests and the [royal] officials became the only major privileged strata confronting the masses. The bulk of the population was made up of political and patrimonial subjects, who were not clearly distinguished from one another. Among those doubtlessly under patrimonial rule we find numerous designations for the servile and the unfree who apparently differed in their economic condition and social rank; we cannot yet tell them apart, and perhaps they were in fact not strictly differentiated. Insofar as the subjects were not drafted for compulsory services, their taxes seem to have been farmed out to the officials for a lump sum. The officials enforced the declaration of taxable property through whipping and similar methods; thus tax collection typically took the form of a sudden raid, flight and chase. There was apparently a difference between the patrimonial *coloni* of the pharaoh and the free political subjects, between the pharaoh's own land and the private property of the peasants, but this difference seems to have been mainly technical and perhaps had no stable meaning. For it appears that the royal household satisfied its economic needs increasingly in a liturgical fashion. The individual became permanently tied to his fiscal function and through it to the local administrative district to which he had been assigned or

belonged by birth, landed property or occupation; the details are not known. Occupational choice was *de facto* largely free, but we cannot say for sure that a hereditary vocational attachment was not enforced if the economic needs of the royal household seemed to warrant it. There were no castes in the specific sense of the word. The political as well as the patrimonial subject could have a *de facto* freedom of mobility, but this became legally precarious as soon as the demands of the royal household required the subject to discharge his duties at the locality to which he belonged. The later Greek terminology denoted this location as the *idia*, the Roman terminology as the *origo* of the individual, and this legal conception played an important role toward the end of Antiquity. All landed property and every craft enterprise was considered to be subject to certain duties, in the form of services or deliveries; at the same time the possession of land and of an enterprise was viewed as the reward for fulfilling a function and thus tended to approximate the characteristics of a benefice. Benefices in kind or landed benefices were the compensation for specific office functions as well as for fulfilling military duties.

The army too was patrimonial, and this was decisive for the pharaoh's power position. At least during wartime the army was equipped and provisioned out of the royal magazines. The warriors, whose descendants were the *machimoi* of the Ptolemaic period, received landlots; apparently they were also used for police duties. In addition, there were mercenaries paid from the royal hoard, which the pharaoh's trade enterprises kept filled. The completely disarmed masses were easily held in check; resistance erupted only in the form of recalcitrance and strikes if food supplies were insufficient during compulsory labor projects. The geographic conditions, especially the comfortable river road and the objective necessity of uniform river regulation, preserved territorial unity up to the Cataracts with only a few interruptions. Career opportunities and the dependence upon the royal magazines were apparently sufficient to preclude an extensive appropriation of benefices, which is technically easier in any case where the benefices involve fees or land rather than allowances in kind, as they did predominantly in the present case. The numerous grants of immunity show by their wording—the repeated promises of inviolability and the threats of punishment against officials who will violate them—that on the basis of his patrimonial power the ruler could indeed treat these privileges as precarious, so that the beginnings of a polity of estates (*Ständestaat*) are here entirely lacking and patriarchalism remained fully intact. The fact that the benefices in kind were largely retained and that the private landed estates became rather insignificant in the New Kingdom contributed to the preserva-

tion of the patrimonial bureaucracy. The fully developed money economy of the Ptolemaic period did not weaken it, but rather acted as a strengthening factor by providing the means for rationalizing the administration. The liturgical methods, especially compulsory labor, yielded to a very comprehensive system of taxation, although the ruler never abandoned his right to draw on the labor services of his subjects and to tie them to their *idia;* indeed the older arrangements immediately regained practical importance when the money economy disintegrated in the third century A.D. The whole country appeared almost as one single domain of the royal oikos; only the temple households approximated it in significance. The Romans took this setup as the legal basis for their treatment of the country.

14. *The Chinese Empire*

The Chinese empire constituted an essentially different type. Here too the power of patrimonial officialdom was based on river regulation, especially canal construction—but primarily for transportation, at least in northern and central China—, and on tremendous military fortifications; again these projects were only possible through intensive use of compulsory labor and through the use of magazines for storing payments in kind, from which the officials drew their benefices and the army its equipment and provisions. In addition, the patrimonial bureaucracy benefitted from the even more complete absence of a landed nobility than was the case in Egypt. In historical times there were no liturgical ties which perhaps had existed in the past or whose introduction may once have been attempted, as might be inferred from certain traces in the tradition and some rudiments. At any rate, *de facto* freedom of mobility and of vocational choice—both were officially not really recognized—does not seem to have been permanently restricted in the historical past. In practice some impure vocations were hereditary. Otherwise there is not a trace of a caste system or of other status or hereditary privileges, apart from an unimportant titular ennoblement which was granted for several generations. In the main, patrimonial officialdom was confronted only by the sibs as autochthonous power, aside from merchant and craft guilds as they are found everywhere; the sibs, whose elders retained a very effective power position in the villages, were bound together within the narrower range of the family by ancestor worship and within the range of common surnames by exogamy.

Because of the tremendous expansion of the empire and the small number of officials relative to the size of the population, the Chinese

administration was neither intensive nor was it centralized under the average ruler. The directives of the central agencies were treated by the subordinate ones as discretionary rather than binding. Here as everywhere under such circumstances officialdom was obliged to take into account the resistance of traditionalism, whose bearers were the sib elders and the occupational guilds, and somehow to arrive at an accommodation with these powers so that it could function at all. But on the other hand, despite the tremendously tenacious power of these forces, the government apparently succeeded not only in creating a rather uniform officialdom, as far as its general character was concerned, but also prevented its transformation into a stratum of territorial lords or feudal barons whose power rests on local notability and who are therefore independent of the imperial administration. This was accomplished even though here too officials liked to use legally and illegally acquired wealth for investment in land and even though the Chinese ethic prescribed close bonds of loyalty between the candidate for office and his teachers and office-holders and their superiors. Especially the institution of patronage and the officials' close relation to their sib were bound to create a tendency toward hereditary office baronies with a permanent clientele. It seems that such incipient baronies emerged time and again; above all, tradition glorified feudalism as the historically original institution and the classic writings consider the *de facto* hereditability of offices as the normal state of affairs, as they do the right of the highest-ranking officials to be consulted before the appointment of colleagues. To vitiate the recurrent tendencies toward office appropriation and to arrest the formation of a fixed clientage and the rise of office monopolies on the part of local *honoratiores* the imperial patrimonial regime employed the usual measures: brief office tenures, exclusion from appointment in areas in which the official's sib is entrenched, and surveillance by spies (the so-called censors).

In addition, the imperial regime introduced something new: for the first time in history there appear official qualifying examinations and official certificates of conduct. Qualification for rank and office came to depend in theory exclusively, and largely in practice, upon the number of examinations successfully passed; confirmation in office and promotion or demotion were based upon the official's conduct reports, a resumé of which was periodically published until recently together with the enumeration of reasons, roughly in the manner of the quarterly grade reports of a German *Gymnasiast*. From a formal viewpoint this constitutes the most radical application of bureaucratic objectivity possible and therefore an equally radical break with typical patrimonial office-holding which rests on the ruler's personal discretion and favor.

It is true, of course, that benefices still could be bought and that personal patronage remained important, but feudalization, appropriation and the clientele attached to an office (*Amtsklientel*) were contained, negatively by the intensive competition and distrust which isolated the officials, and positively by the increasingly universal acceptance of the social prestige which the educational patents imparted. As a result, the status conventions of the officials took on those features of an educational aristocracy which have since characterized Chinese life so distinctly; these conventions were specifically bureaucratic, had a utilitarian orientation, were formed by classical education, and considered as highest virtues the dignity of gesture and the maintenance of "face."

Nevertheless, Chinese officialdom did not develop into a modern bureaucracy, for the functional differentiation of spheres of jurisdiction was carried through only to a very limited extent in view of the country's huge size. Technically, this low degree of differentiation was feasible because the whole administration of the pacified empire was a civilian administration; moreover, the relatively small army constituted a separate body and, as we shall see presently, measures other than the division of jurisdiction guaranteed the officials' compliance. But the positive reasons for refraining from jurisdictional differentiation were matters of principle. The specifically modern concept of the functional association (*Zweckverband*) and of specialized officialdom, a concept which was so important in the course of the gradual modernization of the English administration, would have run counter to everything characteristically Chinese and to all the status trends of Chinese officialdom. For the educational achievements, controlled by the examinations, did not impart professional qualifications but rather their exact opposite. The mastering of the calligraphic art, stylistic perfection, and convictions properly oriented to the classics were of paramount importance in passing the essay tests whose themes were sometimes reminiscent of the traditional patriotic and moral essay topics in our secondary schools. The examination really was a test of a person's cultural level and established whether he was a gentleman, not whether he was professionally trained. The Confucian maxim that a refined man was not a tool—the ethical ideal of universal personal self-perfection, so radically opposed to the Occidental notion of a specific vocation—stood in the way of professional schooling and specialized competencies, and time and again prevented their general application. This accounts for the specifically anti-bureaucratic and patrimonialist tendency of this administration, which in turn explains its "extensive" character and its technical backwardness.

But China was also that country which had oriented status privileges

most exclusively toward a conventional and officially patented literary education; to this extent it was formally t e most perfect representative of the modern, pacified and bureaucratized society whose monopolies of benefices, on the one hand, and specific status structure on the other rest everywhere on the prestige of patented education. It is true that the beginnings of a bureaucratic ethos and philosophy can be found in some Egyptian documents, but only in China was a bureaucratic philosophy, Confucianism, systematically elaborated and brought to t eoretical consistency. We have already dealt with its effect upon religion and economy. The unity of Chinese culture is essentially the unity of that status group which is the bearer of the bureaucratic classic-literary education and of Confucian ethic wit its ideal of gentility that we have previously discussed. T e utilitarian rationalism of this status ethic is firmly restricted by the acceptance of a traditional magical religiosity and of its ritual code as a component of the status convention, and in particular by the acceptance of the duty of filial piety toward ancestors and parents. Just as patrimonialism has its genesis in the piety of the children of the house toward the patriarch's authority, so Confucianism bases the subordination of the officials to the ruler, of the lower to the higher-ranking officials, and particularly of the subjects to the officials and the ruler, on the cardinal virtue of filial piety. The typically Central and East European patrimonial notion of the "father of the country" (*Landesvater*) is similar, as is the role which filial piety plays as the foundation of all political virtues in strictly patriarchal Lut eranism, but Confucianism elaborated this complex of ideas much more consistently. This development in Chinese patrimonialism was of course aided by t e lack of a landowning seigneurial stratum and thus of a group of local notables capable of exercising political authority. But beyond this, it was made possible by the far-reaching pacification of the empire since the completion of the Great Wall, which for many centuries diverted the invasion of the Huns to Europe, and ever since expansive drives had been aimed only at territories which could be held in subjection with a relatively small professional army. Toward the subjects the Confucian ethic developed a t eory of t e welfare state which was very similar to, but much more consistent than that of the patrimonialist theoreticians of the Occident in the age of enlightened absolutism and also that of t e theocratically and spiritually accentuated edicts of the Budd ist king Asoka. Yet the practice was different: despite some traces of mercantilism, t e patrimonial regime interfered only for compelling reasons with the numerous local feuds of the sibs and villages. Economic intervention was nearly always fiscally motivated; wherever this was not t e case, the attempt usually foundered on the

recalcitrance of the interested groups in view of the inevitable extensiveness of the administration. In normal times this seems to have led to a far-reaching restraint of the political authorities toward the economy, a restraint which very early found support in theoretical laissez-faire principles. Within the sibs the educational prestige of the examined candidate for office, to whom all sib members turned for advice and, if he held office, for patronage, overlapped with the traditional authority of the elders, whose decisions remained usually decisive in local matters.

15. *Decentralized Patrimonial Domination: Satrapies and Divisional Principalities*

Even under purely bureaucratic patrimonialism no administrative technique could prevent that, as a rule, the individual arts of the realm evaded the ruler's influence the more, the farther away they were from his residence. The nearest territories are directly administered by the ruler's patrimonial court officials and form his dynastic landholdings (*Hausmacht*). Adjacent to these are the outlying provinces, whose governors in turn administer them in patrimonial fashion. Because of the inadequate means of transportation, if for no other reason, the governors do not render all of the contributions to the ruler, but only the surplus remaining after the local demands have been met; as a rule, they pay only fixed tributes and with increasing distance they become more and more independent in their disposition over the military and tax capacities of their provinces. This is also a consequence of the need, in view of the lack of modern means of communications, for rapid decision-making by the officials in the case of enemy attacks on these marches; their governors were everywhere endowed with strong powers. It is for this reason that in Germany the strongest development toward a unified territorial state occurred in [the two former marches:] Brandenburg [-Prussia] and Austria. Finally, there are the very remote areas whose merely nominally dependent rulers could be forced to pay tributes only through continually renewed campaigns of extortion. The Assyrian kings undertook such campaigns just as did until very recently the rulers of many African kingdoms, who every year turned to another remote area of their presumed, generally unstable, and partly outright fictitious, realm. The dependency of the "governors" of most Oriental and Asian empires was in practice always unstable; their position is usually in between two types represented on the one hand by the Persian satraps, who could be arbitrarily removed, but who were re-

sponsible for fixed tributes and fixed military contingents, and on the other the Japanese daimyos, who were almost independent territorial rulers, although they could be transferred if they violated their obligations. In the great continental empires this kind of political conglomeration always constituted the most widespread type; its crucial features remained rather constant but its individual variations could naturally be quite considerable. Until modern times, the Chinese empire, too, despite the homogeneity of its officialdom, showed these features of a conglomeration of satrapies, in part merely nominally dependent, which were grouped around the directly administered central provinces. Just as did the Persian satrapies, the local authorities retained the revenues from their provinces and used them first of all to cover the costs of local administration; the central government received only its fixed tribute, which could legally be increased, but in fact only with great difficulties and against the passionate resistance of the provincial interests. The most important issue of contemporary administrative reform in China is probably the question of the extent to which the very palpable remnants of this condition should and can be abolished in favor of a rational organization of central and local powers, including the creation of a reliable central government capable of attracting [foreign] loans; this problem is of course closely linked with those connections between central and provincial finances and thus with those same conflicts of economic interest.

The mere obligation to pay tributes and to provide contingents is one marginal case of decentralization; another is the sub-kingdom. Since all powers, economic as well as political, are considered the ruler's personal property, hereditary division is a normal phenomenon. As a rule such a division is not understood as constituting completely independent powers: it is not a definitive division (*Totteilung*) in the sense of Germanic law, but at first mostly a mere apportionment of revenues and seigneurial rights for independent use within a realm the unity of which is at least fictitiously preserved. This purely patrimonial interpretation of the princely position resulted in the Merovingian Kingdom, for example, in a geographically most irrational manner of division: prosperous domains or other good revenue sources had to be divided in such a fashion as to equalize the incomes of the various divisional rulers. The manner and the degree of the unity which actually remains can vary considerably. Sometimes only an honorific precedence of one ruler over others is maintained. Kiev, to which the title of the Grand Prince was attached and which was the seat of the metropolitan, played the same role in the period of Russian divisional principalities as did Aix-la-Chapelle and Rome with regard to the imperial title after the

division of the Carolingian empire. Genghis Khan's empire was considered the joint property of his family and the title of the Great Khan was supposed to devolve upon the youngest son, even though in actuality it was bestowed by designation or election. In practice the divisional rulers free themselves everywhere from the subordination expected of them. Instead of preserving the unity of the realm, the very apportionment of important offices to members of the ruling family may precipitate disintegration or—as in the Wars of the Roses—clashes between pretenders. It depends upon various circumstances to what extent hereditary division will apply to appropriated office powers also, once the patrimonial offices have become heritable property. One important factor will certainly be the degree of disintegration or, conversely, of preservation of the office character of this property. If patrimonial officialdom is very powerful, one central official may represent the actual unity of the empire vis-à-vis the divisional rulers—as did the Carolingians when they held the office of the *maior domus;* the removal of such an official would facilitate the definite division. But it is natural that these highest patrimonial offices, once fully appropriated, in turn easily became subject to division, as again happened with the Carolingian "mayoralty of the palace" under the Merovingian kings. This principle of hereditary division was very dangerous for the stability of patrimonial structures; its elimination was accomplished in different degrees and for different motives.

Very generally speaking, political considerations were bound to oppose hereditary division in countries exposed to political pressures from the outside; moreover, in the interest of family preservation every monarch had an obvious interest in preventing hereditary division. But this motive of power politics did not always suffice. Motives of a partly ideological and partly technical-political nature were necessary to strengthen this trend. After the introduction of the bureaucratic order the Chinese monarch was vested with a dignity so supernatural as to make it conceptually indivisible. Furthermore, the status solidarity and the career interests of the bureaucracy militated against the technical divisibility of the political structure. In Japan the shogun and the daimyo remained formally "officials," and the peculiar vassalic character of the civilian and military administration (the *han* concept which we dealt with earlier) favored the preservation of the unity of political authority (*Herrenstellung*). The religious unity of the caliphate did not prevent the disintegration of the purely secular sultanate, a creation of the slave generals, into sub-empires. But the unity of the well-disciplined slave armies in turn favored the indivisibility of these sub-empires once they were established; partly for that reason hereditary division never

became customary in the Islamic Orient. It also did not exist in the ancient Orient; the imperative unity of a state-controlled irrigation economy was probably the major technical reason for preserving the principle of indivisibility, which, however, most likely had its historical origin in the initial character of kingship as the rulership of a town. For in contrast to rural territorial domination, the rulership of a town is technically not at all divisible, or only under great difficulties. At any rate, the absence of hereditary division in the Oriental patrimonial monarchies had religious and administrative and, in particular, technical and military reasons. A division like that effected by the successors of Alexander the Great occurred because several standing armies under separate commanders existed side by side, but not because of the division of inheritance in a ruling house.

Wherever the ruler's powers had an office character in the Occident, they tended to impede hereditary division, as in the case of the Roman emperorship. Only with the final disappearance of the office-character of the Roman *princeps*, replaced by the *dominus* of Diocletian's new order, did a tendency toward division emerge, but its basis was politico-military, not patrimonial, and soon found its limits in the unity of each of the two halves which long ago had become separated militarily with regard to recruitment. Thus the origin of the magistracy and the monarchy in the supreme command over the citizens' army remained effective until very late in Antiquity. Later, too, everything that was considered wholly an "office" remained indivisible; especially the emperorship, beside offices which had not become appropriated. Moreover, in the Occident as everywhere else all long-range power interests of the monarchs favored the limitation or the elimination of hereditary division. This was especially true of new kingdoms based on conquest. The Norman kingdoms in England and Southern Italy and the kingdoms of the Spanish *reconquista* remained indivisible, just as had been the first kingdoms of the Teutonic migrations. Elsewhere indivisibility was aided by two strongly contrasting developments. In the kingdoms of Germany and France this was the fact that they—the latter at least formally—became electoral monarchies. In the other patrimonial countries, however, it was the emergence of a specifically Occidental phenomenon: the bodies of territorial Estates (*ständische Territorialkörperschaften*). Because and insofar as each body of Estates—the predecessor of the modern state—was considered a unit, the power of the territorial ruler (*Landesherr*) was also viewed as indivisible. However, here we have already the beginnings of the modern "state." Within the patrimonial structures the independence of the local powers may vary widely, ranging from officials attached to the patrimonial household to

tributary princes and to divisional rulers who are dependent merely in name.

16. *Patrimonial Ruler versus Local Lords*

The continuous struggle of the central power with the various centrifugal local powers creates a specific problem for patrimonialism when the patrimonial ruler, with his personal power resources—his landed property, other sources of revenue and personally loyal officials and soldiers—, confronts not a mere mass of subjects differentiated only according to sibs and vocations, but when he stands as one landlord (*Grundherr*) above other ***landlords***, who as local *honoratiores* wield an autonomous authority of their own. In contrast to China and to Egypt since the New Kingdom, this happened in the ancient and medieval patrimonial "states" of the Near East and most prominently in the Occident since the Roman Empire. The patrimonial ruler cannot always dare to destroy these autonomous local patrimonial powers. Some Roman emperors, Nero, for example, went far in wiping out private large landowners, especially in Africa. However, if the ruler intends to eliminate the autonomous *honoratiores*, he must have an administrative organization of his own which can replace them with approximately the same authority over the local population. Otherwise a new stratum of *honoratiores* comes into being with similar pretensions—the new leaseholders or landowners who take the place of their native predecessors.

To some extent for the Near Eastern state, and as a rule for the Hellenistic and the Imperial Roman state, the specific means of creating a local administrative apparatus was the founding of a city. We also find a similar phenomenon in China, where as late as the last century the subjection of the Miaotse was identical with their urbanization. We shall later deal with the meanings which the foundation of cities had in these various cases; there were indeed great differences. At any rate, from this fact can be explained that, generally speaking, the economic limits in time and space of city foundation in the Roman empire also became the boundary lines for the traditional structure of ancient culture. Landed estates naturally gained the more political influence, the more the empire became an inland state.

In the late Roman state since Constantine, the power of the bishops became the safeguard of the empire's unity; the ecumenical councils became the imperial assemblies proper. We will show later why the church, universalized and politicized by the state, could not in the long run keep up this role sufficiently—exactly because its accentuated po-

litical character very soon "regionalized" it. In the patrimonial state of the early Middle Ages the church was chosen for a similar role, albeit in a different form, for example, in the kingdom of the Franks and, again differently, in the feudal states. In Germany, in particular, the king attempted, at first with the greatest success, to establish a countervailing power to the local and regional powers; in the bishops he created a clerical estate of political *honoratiores* to compete with the corresponding secular stratum. Since bishoprics were not hereditary and the bishops not locally recruited and interested, they appeared solidary with the king by virtue of their universalist interests. Furthermore, the seigneurial and political powers granted to them by the king remained even legally in his hands. Therefore, the pope challenged in particular the German king's basic power resources vis-à-vis the local authorities when he attempted to organize the church directly in a bureaucratic manner and thus to gain complete control over the church offices or at least to have these appointments made by the local clergy and parish according to the canonical rule. The latter alternative meant in essence control of the church offices by a local stratum of clerical *honoratiores*—the capitulars of the cathedral chapters—who were linked with the local secular *honoratiores* through familial and personal ties. For this reason the church easily secured the support of the secular notables in its struggle with the king.

As far as we know the matter, the unstable unity of the Persian empire for two centuries was made possible through disarmament and theocratic rule—as also in the cases of the Jews and of Egypt; moreover, strong national differences and the collisions of interest of local notables were exploited. At any rate, already in the Babylonian and Persian empire we find at least traces of those typical clashes between local notables and central powers which later became one of the most important determinants of western medieval development.

The local landlords demand first and foremost that the patrimonial ruler do not interfere with their own patrimonial power over their retainers or that he directly guarantee it. They demand especially immunity: exemption from interference on the part of the ruler's administrative officials on their own land. The following claims are advanced: only through the mediation of the landlord should the ruler contact retainers; the landlord should be held responsible for their criminal and fiscal liabilities, to him should be delegated the drafting of the army recruits and he should be the one to pay the ruler's tax claim on the retainers as well as to sub-allocate it among them. In addition, since the local lord desires to exploit for himself the retainers' economic capacity to render services and contributions, he will attempt to diminish as far

as possible, or at least to fix, their obligations toward the patrimonial ruler. Privileges of immunity which satisfy such claims in varying degrees can be found in Egypt as early as the third millennium where they were granted to temples and officials; in the Babylonian empire they were granted also to private landowners. If asserted with consistency, these pretensions lead to the exemption of the *latifundia* from the communal associations—villages communes and sometimes also cities—set up by the patrimonial ruler as the bearers of rights and duties. We find this condition as early as the Hellenistic empire and in Imperial Rome. At first the royal domains themselves were exempted from all communal associations. It could therefore happen that not only the monarchic officials but also the lease-holder of the royal domain exercised political in addition to patrimonial rights. The same was also true of the private *latifundia*, which became increasingly important in the Roman empire; besides the cities, their territories came to occupy a position similar to that of the East Elbian estate districts (*Gutsbezirke*), which date back to feudal times.[4] However, in the Occidental monarchies of the Middle Ages the claims of the local seigneurial powers proved much more effective than in Antiquity, since their rulers were not supported by the standing army, and the bureaucracy was not trained according to established traditions. Even in early modern history the monarchy could not avoid making compromises with the seigneurial lords, as long as it was not in a position to establish its own army and bureaucracy and to pay both from its own treasury. The monarchy of late Antiquity, especially of Byzantium, likewise had to make concessions to regional interests. Even military recruitment became increasingly regional from the fourth century on. The urban administration by *decuriones* and the manorial administration in the countryside put all purely local affairs into the hands of the local notables. But these strata were after all controlled by the late Roman and the Byzantine central power. This was completely lacking in the Occident. In contrast to the official principles of Chinese administration and also those which Occidental rulers repeatedly attempted to impose, the seigneurial lords succeeded very soon in their insistence that the ruler's local official be an owner of landed property in the district and thus that he be taken from the stratum of local land-owning notables. This was true of the English sheriffs and justices of the peace as well as of the Prussian *Landräte*. In Prussia their right of nomination for local state offices was preserved for the post of the *Landrat* into the 19th century. The nominating committees were controlled by the large landowners of a county. On a far greater scale the greatest of the medieval barons succeeded in usurping *de facto* the office patronage of large areas. Historical development tended every-

where to "mediatize" all subjects of the patrimonial ruler, to interpose the local honoratiores as the sole occupants of all political offices, to cut off the direct relationship between ruler and common subjects and to direct both exclusively to the local office incumbent for their respective claims—for taxes and military service, on the one hand, and for legal protection on the other. This was a trend toward the elimination of any control on the part of the ruler and toward the hereditary appropriation of the political office by a family, legally or in fact, or at least by a monopolistic group of local *honoratiores*.

The struggle between the patrimonial prince and the natural tendencies of the local patrimonial interests had the most diverse results. The prince had primarily a fiscal and military interest in the "mediatized" subjects: an interest in maintaining their number, that is, the number of small holdings sufficient to support one peasant family; in preventing their exploitation by the local patrimonial authorities beyond a point at which their capacity to satisfy his own demands would suffer; in retaining the power to tax them and call them up for military service directly without any mediation. On their part, the local patrimonial lords wanted to represent the peasants in all dealings with the prince. Apart from its implications for feudal law, which we will discuss later, the principle of *nulle terre sans seigneur* also had this practical significance in the sphere of administrative law: that for the princely administration a village community of peasants, as an association with powers of its own, was not to exist and that each peasant was to belong to a patrimonial association and to be represented by a patrimonial lord, so that the ruler would only be entitled to deal with the lords but not with their retainers. This latter policy was fully carried through only in exceptional cases, and then only temporarily. Whenever the prince could strengthen his position, his connections with all his subjects became more direct in one way or another. However, as a rule the prince found himself compelled to compromise with the local patrimonial authorities or other *honoratiores;* he was restrained by the possibility of an often dangerous resistance, by the lack of a military and bureaucratic apparatus capable of taking over the administration and, above all, by the power position of the local *honoratiores*. Purely financial reasons alone would have made it impossible for the prince to run the local administration without the help of the nobility in late medieval England and even more so in the East Elbian Prussia of the 18th century. For Prussia this situation probably explains the monopolization by the nobility of officers' posts and its preferential treatment in the civil service—especially the complete exemption from qualifications otherwise required, or at least a fairly extensive dispensation; another

result was the predominance, still existing today, of the estate owners (*Rittergutsbesitz*) in all rural local administrative bodies.

17. *The English Administration by Notables, the Gentry's Justices of the Peace, and the Evolution of the "Gentleman"*

If the prince wanted to prevent such an appropriation of the whole local state administration by the local patrimonial lords, he had no choice, as long as he did not have very considerable resources of his own, but to put the administration into the hands of some other group of *honoratiores*, whose number and power were significant enough to check the great patrimonial lords. In England this situation resulted in the emergence of the *justices of the peace*, an institution whose characteristic features were shaped during the great wars with France.[5] The patrimonial administration of the manorial lords and their judicial powers, but also the local offices—the sheriff—dominated by the feudal nobility could not cope with purely administrative tasks because economic developments dissolved the servility relationship. Furthermore, the Crown was interested in pushing aside the patrimonial and feudal authorities, a policy that was vigorously supported by the Commons. Here as elsewhere the novel administrative tasks primarily concerned the maintenance of public peace; economic change created a growing need for pacification. The usual explanation that war-time insecurity brought about these administrative changes is unconvincing, since the position of the justice of the peace became permanent. The public insecurity was felt more strongly because of the increasing market ties of the individual households. Characteristically enough, we also encounter unemployment and rising food prices, which resulted from the expansion of the money economy. Therefore, the first of the manifold tasks devolving upon the justices of the peace were public security and the policing of the trades and of consumption. The justices were recruited from private groups economically interested in their functions. The Crown attempted to win the gentry over to its side and to pit it against the greatest patrimonial lords, the barons, by appointing from each county local notables as *conservatores pacis* and by equipping these with increasingly complex police and criminal court powers. Appointments were made *de facto* and soon also *de iure* from among the landowners of the district who qualified by virtue of their groundrent and who maintained a knightly style of life; formally these appointments were revokable but in practice they were for life; the Crown retained the right to effect the appoint-

ments, and reserved to the royal courts the supervision of the incumbents' conduct. One of the justices of the peace, the Lord Lieutenant, became commander of the militia. Regular bureaucratic channels for appeal against the decisions of the justices of the peace did not exist, or at least only at the peak of the royal power claims, in the form of the Star Chamber, which for this very reason was destroyed by the gentry in the 17th century revolution. The only way to bring a concrete issue before the central agencies—a way which in practice was increasingly used—was a special order (the writ of *certiorari*), issuance of which was at first completely discretionary. The Crown managed to defeat many attempts at making the appointment of justices of the peace directly dependent upon election by the local *honoratiores;* it modified its control over appointments only by granting a right of nomination to certain advisors of the king. Thus, these high-ranking officials, especially the chancellor, were given a patronage power which was often used for pecuniary gain. However, in opposing this patronage as well as the legal claims of the crown, the solidarity of the gentry was strong enough to perpetuate its monopoly on the office of the justice of the peace, and during the reign of Elizabeth complaints were heard that the recommendation by incumbents was indeed decisive for new appointments.

Like all royal officials, the justice of the peace took fees and received daily allowances. But in view of the low income involved it became the status convention of the landowners to decline fees. As late as the 18th century, the property qualification of the justices of the peace was considerably raised. As a normal prerequisite a certain land value was required. The increasing leasing of property typical of England freed the time of the rural gentry for these official tasks. As far as the urban bourgeoisie was concerned, the participation of active businessmen was handicapped because of the very economic indispensability which everywhere excludes them from the circle of *honoratiores*. However, older persons who had retired from business frequently became justices of the peace; this was even more often true of that growing group of guild members who turned from entrepreneurs into rentiers after having amassed sufficient wealth. The characteristic fusion of the rural and urban rentier strata in the type of the *gentleman* was greatly facilitated by their common ties to the office of the justice of the peace. In these circles it became a status custom to have the sons appointed justices of the peace at an early age, after they had finished their humanist education. Henceforth the office was an unpaid position whose obligatory assumption was formally a liturgy for qualified aspirants, often to be discharged for only a short period. Many justices of the peace were inactive, but this trend was reversed in modern times. For them the office was

merely titular and a source of social honor. Social status and social power also explain why this position, requiring considerable work if actively held, remained at all times sufficiently sought after even for its active occupation. Eventually the professional jurists, who competed sharply for centuries, lost out. They were gradually driven from the office by its low income and the gentry's eventual renunciation of all fees. The individual lay justice of the peace took the advice of his personal lawyer, but on the whole he made his decisions with the help of the clerks according to tradition and largely also to considerations of substantive justice; this made the administration of the justices of the peace popular and accounts for its distinctive features. Here we have one of the very few cases in which professional officialdom was entirely displaced, in peaceful competition, by the honorary office in spite of the increase of administrative tasks. The decisive incentive for the gentry's interest in the office of the justice of the peace was not some specific "idealism," but the real and practically unrestrained influence which the office provided; formally it was limited solely by the rule that all important issues should be settled only collegiately, by at least two judges together, but substantively it was constrained by a strong sense of duty that derived from the status convention.

Administration by justices of the peace reduced all local administrative bodies outside the cities almost to insignificance. At the peak of this system of self-government, which was praised as a national palladium, the justices of the peace were practically the only officials who did effective administrative work in the counties, next to whom the old compulsory liturgical associations, the patrimonial manorial administration and every kind of royal patrimonial-bureaucratic regime had shrunk to insignificance. This was one of the most radical types of an administration solely by notables ever carried through in a big country, and the conduct of office corresponded to it. The administration of the justices of the peace was up to our own days very much in the nature of "*kadi* justice"—and the only administration significant for the masses since the royal courts in London were geographically and, because of the immense fees, economically just as far out of their reach as the *praetor* was for the Roman and the Tsar for the Russian peasants. Like all administration by *honoratiores*, its inevitable characteristics were administrative minimization and *ad hoc* activities, which thus did not amount to a continuous and systematic operation (*Betrieb*). To the extent that this administration was not limited to the keeping of rolls (as at first in the case of the *custos rotulorum*), it was mainly repressive and unsystematic, and as a rule reacted only to evidently gross violations or to the complaint of an injured party. This administration was technically

unsuited to deal continuously and intensively with positive administrative tasks or to pursue a consistent unified "welfare policy," because it was essentially a part-time occupation for gentlemen. It is true that at the quarter sessions of the justices of the peace at least one of them had to be legally trained. The quorum clause required that this person or these persons be listed by name in the commission; in this fashion the central administration retained influence on the composition of the active justices of the peace. But even this stipulation lost validity since the 18th century: everyone actively participating came to be included in the quorum.

The subject had to reckon with the possibility that the police and penal power of the justices might affect all spheres of his life: from visits to the pub, cardplaying or the choice of clothes proper to his station in life to the level of the corn prices and the adequacy of wages, and from indolence to heresy. An infinite number of statutes and ordinances, whose stipulations often had an accidental origin, depended for their enforcement solely upon the justices of the peace. But it was largely within their discretion whether and when, with what means and how thoroughly they intervened. The notion of systematic administrative activity in the service of definite goals was exceptional in these circles, and an attempt to impose a coherent system of "Christian welfare policies" was made only during the brief period of the Stuarts, especially under Laud's administration. As might be expected, this attempt eventually failed because of the very circles from whom the justices of the peace were recruited.

The "extensive" and intensive administration by the justices of the peace seems to be reminiscent of the Chinese administration which had some of the same external characteristics; the same appears true of the way in which the central authorities intervened: either concretely for individual cases and then often successfully, or in an abstract manner through very general directives which often had little more than suggestive value. But the difference is tremendous. It is true that here as there the decisive state of affairs is the same: The patrimonial-bureaucratic administration is confronted by local authorities with whom it must somehow reach an accommodation in order to carry on its operations. However, in China the educated administrative officials face the elders of the sibs and the guild associations, whereas in England the professionally trained judges face the educated *honoratiores* of the landowning gentry. The Chinese *honoratiores* are the educated who have been prepared for an administrative career through a classic-literary training; they are benefice-holders and aspirants to benefices, and therefore on the side of the patrimonial-bureaucratic power; by contrast, in England the core of the gentry was a free status group of large landowners, who

were merely empirically trained on the job to rule over retainers and workers and who came to be humanistically educated. Such a stratum did not exist in China, which represents the purest type of patrimonial bureaucracy that is unencumbered (as far as this is possible) by any counterweight and that has not yet been refined into modern specialized officialdom.

At its peak the English administration by the justices of the peace was a combination of patrimonialism of the estate type with a pure type of autonomous administration by *honoratiores*, and it tended much more toward the latter than toward the former. Originally this administrative system was formally based on liturgical obligation—for this is what the duty to take on the office involves. But in reality, due to the actual distribution of power, it was the voluntary co-operation not of subjects, but of free members of a political association—of "citizens," that is—on which the prince depended for the exercise of his authority. Primarily on that account this administration is quite different from the typical political hierarchy of a princely patrimonial household and of subordinate private patrimonial rulers with their own subjects; in fact, it developed exactly parallel to the disintegration of private dependency. Substantively the English squirearchy, which had created this system, was of course a stratum of notables of decidedly manorial character. Without specific feudal and manorial antecedents the peculiar "spirit" of the English gentry would never have come into being. The particular ideal of manliness of the Anglo-Saxon gentleman shows indelible traces of this origin. This trait comes to the fore mainly in the formal strictness of the conventions, in the vigorously developed pride and sense of dignity, and in the social importance of sports which in itself is conducive to the formation of a status group. However, already before the penetration of Puritanism this "spirit" was quite effectively transformed and rationalized by the increasing fusion of the squirearchy with specifically bourgeois, urban rentier and active business strata; as we will discuss later, it was influenced in a direction similar to the one which resulted from the fusion of nobility and *popolo grasso* in Italy. But the modern type of gentleman developed out of the older one only under the influence of Puritanism, which transcended the realm of its strict adherents; the squirearchic semifeudal features were gradually assimilated to the ascetic, moralistic and utilitarian ones, but as late as the 18th century they were opposed to one another.

In the face of the assault of capitalist forces the office of the justice of the peace was one of the most important means for preserving the influence of this peculiar type of gentility not only on the administrative practices and the high integrity of the officials, but also on the general social notions of honor and morality. Administration by unrecompensed

justices of the peace who were educated laymen was technically no longer feasible under the conditions of the modern city life. Slowly the number of paid urban justices of the peace increased; in the middle of the last century they numbered 1,300 out of 13,000, among whom 10,000 were merely titulars. The lack of any systematic administrative organization and the mixture of patriarchal and purely rational organization resulted from the fact that rational bureaucracy was introduced only in piecemeal fashion into the old administrative framework, as concrete individual needs arose. The old administration was politically important because of the intensive schooling of the propertied classes in the conduct of administrative affairs and the strong conventional dedication to and identification with the state. Economically relevant was especially the inevitable minimization of administrative activity which gave almost completely free reign to economic initiative despite its fairly strong conventional restraints on business ethics. Viewed as an instance of patrimonialism, administration through justices of the peace constituted an extreme marginal case.

In all other historically significant cases of a coexistence of patrimonial prince and landowning *honoratiores* the latter were patrimonial lords too. When at the beginning of modern history the patrimonial bureaucracy emerged, the two powers agreed explicitly or tacitly on this compromise: that the local patrimonial lords are guaranteed authority and economic control over their retainers insofar as this is compatible with the ruler's interest in taxation and military recruitment; that they completely control the local administration and the lower courts which have jurisdiction over their retainers; that they represent the latter vis-à-vis the prince and his officials; that all state offices or at least a large percentage of them, especially all or almost all officers' posts, are reserved for them; that they do not pay personal or real estate taxes, and that as "nobility" they enjoy extensive status privileges with regard to the courts competent to judge them, the type of punishment and of evidence. Their privileges stipulate most of the time that only they qualify for patrimonial lordship and hence can own estates with personally or patrimonially dependent peasants. In the England of the gentry administration only remnants of such status privileges of an independent nobility survived.

18. *Tsarist Patrimonialism*

The power position of the English gentry within the local administration resulted from the acceptance of a quasi-liturgical obligation entailing a very time-consuming and costly duty of holding an unpaid office.

Such obligations did no longer exist on the Continent in modern history. However, the Russian nobility was subjected to a kind of service liturgy from the period of Peter the Great to Catherine II. Peter the Great abolished the customary social ranks and legal rights of the Russian nobility in favor of two simple principles: 1) Social rank (*chin*) is obtained only through service in a patrimonial-bureaucratic (civilian or military) position, and depends upon a person's relative standing in an office-hierarchy of fourteen ranks. Since the existing nobility had no office monopoly and since no landed property qualification but—at least theoretially—an educational qualification was required, this seemed to approximate the Chinese conditions. 2) The aristocratic privileges lapsed after two generations if their holders did not take over an office. This, too, seems to be similar to the Chinese practice. However, the Russian aristocratic title entailed among other privileges the exclusive right of owning land settled with serfs. Hence "nobility" was tied to the prerogatives of seigneurial patrimonialism in a manner quite unknown in China. The forfeiture of aristocratic patents because of failure to take an office was abolished in the reign of Peter III and Catherine II. But the *chin* and the official table of ranks (*tabel' o rangakh*) continued to be the official basis of social prestige, and at least a temporary service in a state office remained a status convention for young noblemen. The patrimonial domination of the aristocratic landowner was almost universal in the realm of private landed property, in the sense of the principle "*nulle terre sans seigneur*," since apart from the "noble" landed property there were only the manors of the princely domains and appanages and of the clergy and monasteries; allodial property in other hands existed not at all or only in a few survivals (the *odnodvortsy*) or in the form of military fiefs (held by Cossacks). Thus the rural local administration, insofar as it was not a domain administration, was completely in the hands of the landowning nobility. However, political power proper and social prestige were—wholly in accordance with the Chinese pattern—dependent solely upon office holding or directly upon court connections; this was especially true of all opportunities for economic advancement deriving here as everywhere from the exercise of political power. Of course, it was an exaggeration when Paul I enlightened a foreign visitor that a nobleman was only he with whom he deigned to talk and only as long as he talked to him. However, the Crown could indeed risk a behavior toward the nobility, even toward the bearers of the most famous names and owners of the largest properties, which no Occidental ruler, no matter how great a potentate, could have permitted himself toward the lowliest of his legally unfree *ministeriales*.

The Tsar's power was rooted in the firm solidarity of interest with him on the part of the individual *chin*-holders who ran the administra-

tion and the army, which was based on compulsory recruitment. Equally important was the complete lack of a status-based solidarity of interest among the nobility. Just like the Chinese benefice-holders, the Russian nobles viewed one another as competitors for the *chin* and all the opportunities available through the ruler's favor. Therefore, the nobility was deeply split into coteries and entirely powerless in relation to the ruler; the modern reorganization of local administration created a partly new situation, yet the nobility attempted common resistance only rarely and then always unsuccessfully, even though Catherine II had expressly endowed it with the right of assembly and of collective petition. This complete lack of aristocractic status solidarity, which resulted from the competition for court favors, was not merely a consequence of the reorganization undertaken by Peter the Great, but had its origin in the older system of the *mestnichestvo*, which had determined the social ranking of the *honoratiores* since the Muscovite patrimonial state had been established. From the beginning social rank depended upon the dignity of the office granted by the Tsar, the universal landowner; its material compensation was the service fief—*pomest'e* (from *mesto*: position). The difference between the old *mestnichestvo* and the new order of Peter the Great was in the last analysis merely that [in the former] the service fief and the rank assigned to the first acquirer, or a later possessor by virtue of his administrative position, became hereditary for all his descendants, and hence that the rank order of the individual noble families had a relative stability. The young nobleman received his first office according to 1) the highest official rank in the office hierarchy achieved by any ancestor and 2) the number of generations elapsed between the highest position held by one of these ancestors and the beginning of his own services. Well-established status convention prescribed that no member of a higher-ranking family could accept an office which would make him subordinate to an official from a family of lower office rank; just as little could he ever accept a seat at table —even if he endangered his life when it was the Tsar's table—below an official who, according to the *mestnichestvo*, had a lower family rank, no matter how high the latter's personal official position was. The system limited the Tsar considerably in the selection of his highest-ranking administrative officials and army leaders; only under great difficulties could he ignore it and then at the risk of continuous protests and insubordination even on the battlefield. But the system also forced the nobility, the more so the higher the hereditary rank of a person was, to enter the court service and the patrimonial bureaucracy for the sake of preserving social status and career chances. Thus the nobility became almost completely a "court nobility" (*dvorianstvo*, from *dvōr*: court).

The importance of private landownership as a basis of social rank declined. The *votchinniki*, the holders of a *votchina*, an estate which had not originally been granted for services rendered but inherited from the ancestors as allodial property, were displaced by the *pomeshchiki*, whose name has today become the exclusive term for the "lord of the manor." Social rank was determined not by the ownership of a "noble" estate but by administrative rank, whether personally acquired or inherited. Tsarist patrimonialism shrewdly used this system which linked all social power with services for the ruler. The origins of this linkage are to be found in a combination of 1) the institution of the royal following, which will be analyzed later, and 2) sib solidarity which endeavored to appropriate for the whole sib the service rank, once it was acquired, and the opportunities connected with it. Peter the Great, when faced with this condition, tried to simplify matters by burning the lists of family rank (*razriadnaia perepis'*), which contained the claims of the noble families, and by putting in their place the *chin* scheme, which was almost completely based on the actual holding of office. This was an attempt to eliminate the sib honor without creating a status solidarity directed against the Tsar; up to that time the sib honor had hindered the development of status solidarity just as much as the Tsar's interests in the free selection of his officials. The policy was successful. The nobility remained deeply split, through ruthless competition insofar as it strove for the social rank of the *chin*, and through animosity and hatred toward the *chinovnik*—the general name for officials—insofar as it remained a purely landed aristocracy. The monopoly of serf ownership did not create a solidary status group, since the competition for *chin* interfered and since only the employ in the Tsar's service provided the great incidental opportunities for enrichment.

In this respect the situation was the same as in the late Roman and Byzantine empire, in their Babylonian, Persian and Hellenistic predecessors and Islamic successors: There manorial patrimonialism—which did not exist at all in China—resulted neither in a definite nexus between landowners and state offices nor in the rise of a homogeneous manorial aristocracy, no matter how many incipient phenomena existed. In the late Roman empire the increasingly important land-owning class of the *possessores* confronted a socially quite distinct stratum of officials, divided into ranks according to the level of benefice-revenues. The same disconnected juxtaposition of landed nobility and patrimonial officialdom can be observed in the early Oriental and the Hellenistic empires. In the Islamic empires, corresponding to their theocratic character, social rank was conferred first of all by the profession of the Islamic creed, and office opportunities depended upon religiously controlled education and

upon the personal favor of the ruler; this did not give rise to permanent and enduringly effective aristocratic monopolies.

19. *Patrimonialism and Status Honor*

On this basis one fundamental feature of medieval Western aristocracy could not develop at all: a central guide to social conduct in the form of a distinctive traditional ethic re-enforced by education; this ethic made personal relations central to the style of life and impressed every individual with the obligations of a status honor that was jointly held and thus a unifying bond for the status group as a whole. Numerous status conventions developed in Russia as well among the strata of *honoratiores* in those empires. But it cannot be ascribed to the above-mentioned ambiguous basis of social rank alone that these conventions could not serve as a uniform ethical guide for "honorable" conduct. They merely provided a framework for the defense of economic interests or the undisguised striving for social prestige and failed to offer to the notables an elementary internalized standard of self-assertion and of proving one's own honor. The individual's social honor and his relation to the lord were either without any inner connection, as in the case of the autonomous *honoratiores*, or simply amounted to career opportunities which merely appealed to the desire to count for something, as in the cases of the court aristocracy, the *chin*, the mandarins and all kinds of positions depending exclusively upon the ruler's favor. On the other hand, appropriated benefices of all types were indeed a suitable basis for a sense of office and status dignity in the manner of the *noblesse de robe*, but not for a personal "honorable" relationship to the lord and a corresponding ethos.

The Occidental *ministerales*, whose social honor depended on the lord's favor, and the English gentleman of the squirearchy, whose social honor was determined by autonomous notability, were both, although in different ways, bearers of a peculiar, personal sense of dignity whose root was personal honor, not only the prestige of office. In the case of the *ministeriales* it is obvious and in that of the English gentleman it can easily be seen that their basic attitudes were influenced by Occidental *knighthood*. The former group merged completely with the knightly stratum; the English gentleman, on the other hand, increasingly absorbed bourgeois traits into his ideal of manliness and his style of life, thus modifying his medieval knightly features as the demilitarization of the notability progressed. Eventually there emerged in the Puritan gentleman a type equal in rank to the old squire but of very hetero-

geneous provenience; this resulted in the most diverse mutual adjustments. But it remains true that for both strata feudal knighthood was the original, specifically medieval center of orientation.

The knight's conduct was molded by the feudal concept of honor and this in turn by the notion of vassalic fealty; this was the only type of status honor conditioned on the one hand by a common and internalized ethos and on the other by an external relationship to the lord. Since the specific feudatory relationship is always extrapatrimonial, it transcends in this respect the boundaries of patrimonial structures of domination. But it can easily be seen that, systematically, the feudatory relationship is best treated as an extreme marginal case of patrimonialism, since it is so much shaped by the purely personal loyalty bond with the lord and since it appears as a "solution" to a specific practical problem, namely that of political domination by a patrimonial prince over, and with the help of, local patrimonial lords.

NOTES

1. The following four chapters have not been available in previous translations, with the exception of sections of the chapter on charisma. The editors' major effort has been the translation of the text and the verification of ambiguous historical references, which required considerable background research. However, the notes have been held to a minimum, since many of Weber's sources for the following chapters can be found in the notes to the *Sociology of Law* (ch. VIII) and *The City* (ch. XVI). All notes, unless otherwise marked, are by Roth.

On the controversies about the origin of the notion of patrimonialism and the actual existence of a patrimonial state in German history see Otto Brunner, *Land und Herrschaft* (Vienna: Rohrer, 1959), 4th ed., 146–64. For Brunner's treatment of the relationship between sociology and history see his *Neue Wege der Sozialgeschichte* (Göttingen: Vandenhoeck, 1956). Brunner deals with Weber in both works.

2. Weber probably refers to Eberhard Gothein, who lived in Heidelberg since 1904; he was the author of *Die Kulturentwicklung Süditaliens in Einzeldarstellungen* (1886) and of *Die Renaissance in Süditalien* (sec. ed., 1924). (W)

3. See Kurt Sethe, *Die altägyptischen Pyramidentexte* (Leipzig 1908–22), 4 vols. This is still a standard work. (W)

4. On the Prussian *Gutsbezirk*, a rural district exempted from the ordinary village association and administered by the *Junker* owners, see *infra*, ch. XVI:v, n.9.

5. One of Weber's major sources about English constitutional history were the writings of Julius Hatschek; see his *Englisches Staatsrecht* (Tübingen 1905/6), 2 vols. and *Englische Verfassungsgeschichte* (Munich 1913). Weber also knew the first comprehensive history of the English constitution by the liberal scholar and parliamentarian Rudolf von Gneist, *The English Constitution* (1891).

CHAPTER XIII

FEUDALISM, STÄNDESTAAT AND PATRIMONIALISM

1. *The Nature of Fiefs and Types of Feudal Relationships*

The structure of *feudal relationships* can be contrasted with the wide realm of discretion and the related instability of power positions under pure patrimonialism. [Occidental] feudalism (*Lehensfeudalität*) is a marginal case of patrimonialism that tends toward stereotyped and fixed relationships between lord and vassal. As the household with its patriarchal domestic communism evolves, in the age of the capitalist bourgeoisie, into the associated enterprise based on contract and specified individual rights, so the large patrimonial estate leads to the equally contractual allegiance of the feudatory relationship in the age of knightly militarism. The personal duty of fealty has here been isolated from household loyalties, and on its basis a cosmos of rights and duties has come into being, just as the purely material relationships were isolated when the enterprise developed. We shall see later that the feudal allegiance between lord and vassal must also be interpreted as a routinization of a charismatic relationship and that from this viewpoint certain specific features of feudal allegiance find their proper systematical location. Here, however, we will attempt to comprehend the internally most consistent form of the feudal relationship. For "feudalism" and also the "fief" can be defined in different ways.

If we define feudalism as the rule of a landed military aristocracy, then Poland, for example, was "feudal" in the most extreme sense. But Poland was unlike a "feudal" realm in the technical sense, for she lacked the decisive element: the feudatory relationship. For the structural development—or lack of it—of the Polish Kingdom it was most

important that the Polish aristocrats were allodial landed notables. The resulting "republic of aristocrats" represents the extreme opposite of Norman centralized feudalism.

The Greek *polis* of the pre-classic period and even the early stages of democracy at the times of Cleisthenes can be called "feudal," because citizenship was always identical with the right and the duty to bear arms, the citizens were generally landowners, and the power of the dominant stratum of *honoratiores* rested on manifold loyalty relationships to clients. This was also true of the Roman Republic up to its last period. In nearly all of Antiquity the connection between land grants and military obligations toward a personal master, a patrimonial prince, or an association of citizens has been of basic importance.

If the "fief" is defined as any grant of rights, especially of land use or of political territorial rights, in exchange for military or administrative service, then the term can be applied to the service fief of the *ministeriales* [in the German Middle Ages], perhaps to the early Roman *precarium*, certainly to the land given to the *laeti*, who were settled in the Roman Empire after the Marcomannic Wars, and later to land which was directly granted to alien tribes upon the condition of military service; the term will apply all the more to the land of the Cossacks, and also to the soldiers' land that is found all over the ancient Orient and in Ptolemaic Egypt, and to similar world-wide phenomena in all epochs.

Most of these cases involve the creation of hereditary livings which establish either a direct patrimonial dependence or at least a liturgical attachment to obligations and thence to the land. Moreover, social positions may be established by an autocratic ruler which, in relation to other "free" strata, are privileged through freedom from taxation and special land rights (*Bodenrecht*). In return, the incumbents are obliged to undergo military training and to be at the lord's arbitrary or limited disposal for military or administrative purposes. The settling of warriors, in particular, is the typical form of securing economically dispensable and readily available military forces under a natural economy, which cannot maintain a mercenary army; these military forces come into being as soon as the standard of living, the intensity of agricultural and non-agricultural work and the development of war technology make the mass of the population indispensable as well as inferior in their military capabilities. Many kinds of political associations resort to such arrangements. One type is the originally inalienable plot of land (κλῆρος) in the Hellenic polis of *hoplites;* their holders were obligated to an association of citizens. A second type is the Egyptian "warrior caste" (μάχιμοι), which was obligated to the patrimonial prince; and a third type is the land grant to "clients," who are obligated to a personal master. All despotic regimes of the ancient Orient and also the cleruchies of the

Hellenistic period have used this type of military manpower in one way or another. We will see later that occasionally it was still used by the Roman nobility.

The last-mentioned cases are functionally and also legally similar to the fief proper without being the same, because even privileged peasants remain, socially speaking, peasants or, at any rate, "common people"; this then is a kind of feudal relationship on the level of plebeian law. By contrast, the relationship of the *ministeriales* to the lord has originally a patrimonial basis and hence is different from that of the fief-holder.

Genuine feudatory relationships in the full technical sense always exist a) between members of a stratum which is hierarchically gradated, but stands above the mass of freemen, forming a unit against them; and b) by virtue of the feudatory relationship individuals are related to one another through a free contract, not through patrimonial dependence. Vassalage does not diminish honor and status of the vassal; on the contrary, it can augment his honor, and commendation is not submission to patriarchal authority, although its forms are borrowed from it.

We can now classify "feudal" relationships in the broad sense of the word as follows: (1) "Liturgic" feudalism: soldiers provided with land, frontier guards, peasants with specific military duties (cleruchs, *laeti, limitanei*, Cossacks); (2) "Patrimonial" feudalism, a) "manorial": levies of *coloni* (for example, of the Roman nobility as late as the Civil War, and of the ancient Egyptian pharaoh); b) "servile": slaves (ancient Babylonian and Egyptian armies, Arabian private troops in the Middle Ages, Mamelukes); c) gentile: hereditary clients as private soldiers (Roman nobility); (3) "free" feudalism, a) "vassalic": only by virtue of personal fealty without the grant of manorial rights (most Japanese Samurai, the Merovingian *trustis*); b) "prebendal": without personal fealty, only by virtue of granted manorial rights and tax revenues (Middle East, including the Turkish fiefs); c) "feudatory" (*lehensmässig*): personal fealty and fief combined (Occident); d) "urban" (*stadtherrschaftlich*): by virtue of the communal association of warriors, based on manorial land allotted to the individual (the typical Hellenic polis of the Spartan type). At this point we will deal primarily with the types of "free" feudalism and, among these, primarily with the most consequential: Occidental feudalism (*Lehensfeudalismus*); we will draw on the other types only for comparative purposes.

The full fief is always a *rent-producing* complex of rights whose ownership can and should maintain a lord in a manner appropriate to his style of life. Primarily seigneurial rights and income-yielding political powers, that is, rent-producing rights, are conferred upon the warrior. In the feudal Middle Ages the *gewere* of a piece of land belonged to the

recipient of the rent. Wherever the hierarchy of fiefs was strictly organized, these feudal sources of rent were registered according to their yield. The Turkish "fiefs," which were classified after the model of the Sassanids and Seljuks, were registered according to their yield in *asper*, and the provisioning of the Japanese vassals (Samurai) according to the *kokudaka* (rice rent). Inclusion in the English "Doomsday Book," as it was later called, did not amount to a feudal matriculation of fiefs, but this register owed its origin to the especially tight centralization of the English feudal administration.

Since manors are the normal object of a fief, every genuine feudal structure has a patrimonial foundation. Moreover, where offices themselves are not treated as fiefs, the patrimonial order normally continues to exist—at least wherever the feudal system, as it happens frequently, is incorporated into a patrimonial or prebendal state as part of its administration. The Turkish cavalry which held fief-like prebends existed next to the patrimonial Janissaries and the partly prebendal organization of offices, and therefore remained itself semi-prebendal.

Excepting Chinese law, the granting of seigneurial rights from the estate of the king can be found in the most diverse legal areas. In the realm of the Rajputs in India, especially in Udaipur, the ruler until recently bestowed territorial and judicial rights upon members of the dominant clan in return for military services; they in turn paid homage to him and renewal fees in case of his death, and they risked the loss of their rights if they violated their duties. The same approach to land and political rights—an approach originating in the joint control of the ruling warriors over conquered land—occurred very often, and probably was once the basis of Japan's political constitution. On the other hand, we can find numerous phenomena typified by the Merovingian royal land grants and by the various forms of *beneficium*. Almost always they presuppose the rendering of military aid and possible revocability in case of default, the extent of which is often ill-defined. Substantively, the numerous Oriental land-grant types that were similar to hereditary leases also had a political purpose. However, neither fits the concept of the "fief," as long as they are not related to the very specific fealty of the vassal.

2. *Fiefs and Benefices*

The fief can also be distinguished legally from the benefice, although we will see soon that the transitions are fluid. The benefice is a lifelong, not a hereditary, remuneration for its holder in exchange for his real or presumed services; the remuneration is an attribute of the

office, not of the incumbent. Therefore, in the Occident during the early Middle Ages the benefice was not, like the fief, forfeited in case of the ruler's death—as U. Stutz has emphasized[2]—, but it reverted to the ruler upon the death of the benefice-holder; at the zenith of the Occidental Middle Ages a non-hereditary fief came to be considered inferior. The income of the benefice, accruing to the office, not to the person, is only used and not personally owned—the Church, for example, drew certain conclusions from this in medieval times—, whereas the fief is the vassal's personal property for the duration of the feudatory relationship; however, it remains inalienable since it is tied to a highly personal relationship, and indivisible since it is intended to preserve the vassal's service capacities. The benefice-holder was often, and sometimes generally, relieved from paying his administrative costs, or portions of the income from the benefice were set aside for this purpose. But the vassal had always to pay from his own resources for the costs of the fice granted to him.

However, such differences were not really pervasive. For example, they did not exist under Turkish nor under Japanese law; however, we will note soon that these two cases are not genuine examples of feudatory law. On the other hand, we have observed that the nonhereditary character of benefices was very often fictitious; the appropriation of benefices—especially of many French benefices—reached a point where even the heirs received a compensation for the loss of revenue drawn from the benefice. The decisive difference must be located elsewhere: Wherever the benefice had lost all traces of patrimonial origin, the benefice-holder was a simple usufructuary or rentier who had certain official duties and was to that extent akin to the bureaucratic officials.

In contrast, the free vassal, who stands outside any patrimonial subordination, is subject to a very demanding code of duties and honor. In a peculiar fashion, the feudatory relationship merged seemingly most contradictory elements in its most developed form: on the one hand, strictly personal fealty, on the other contractual stipulation of rights and duties, their depersonalization by virtue of the rent nexus, and finally hereditary control of the possession. Wherever the original meaning of the relationship had been preserved, "hereditariness" was not a common "inheritance." To begin with, the pretender had to be personally qualified for vassalage before he could claim the fief. Furthermore, he had to enter personally into the fealty relationship. Just as the son of a Turkish vassal had to request a new *bérat* in due time from the *beglerbeg* and, if necessary, through him from the Sublime Porte, so the Occidental aspirant had to void the fief and to ask the lord for being invested with it after performing commendation and the oath of homage.

To be sure, the lord was obliged to accept the vassalage if the aspirant's qualification had been established, but vassalage had a contractual character and could be terminated by the vassal at any time upon yielding the fief. Furthermore, the lord could not arbitrarily impose obligations upon the vassal; rather their typical extent depended upon contractual obligations of fealty and loyalty which were shaped by a code of honor binding upon both parties. Thus the typification of the obligations and the substantial safeguards of the vassal's interest were linked with a highly personal relationship to an individual ruler. This developed to the highest degree in Occidental feudalism, whereas the Turkish feudal system remained much more prebendal with regard to claims of inheritance, since the power of the Sultan and the *beglerbeg* continued to be largely arbitrary despite all of the rules and regulations.

Japanese feudalism, too, does not represent a complete feudatory system.[3] The Japanese *daimyo* was not a feudatory vassal, but a vassal committed to supply definite war contingents, to provide guard units and to pay a fixed tribute; within his own district he exercised administrative, judicial and military authority practically in his own name, in the manner of a territorial ruler. He could be transferred to another district for disciplinary reasons. That he was not a vassal as such is demonstrated by the fact that the Shogun's real vassals (*fudai*), if daimyos-districts had been granted to them, could suffer transfer (*kunigaye*), because of their personal dependence, for reasons of political expediency without any default on their own part. This very fact also proves that the district granted to them was an office, not a fief. These *daimyos* were forbidden to establish alliances, to enter into relations of vassalage with one another, to conclude treaties with foreign powers, to carry on feuds and to build fortresses; their allegiance was assured through the institution of the *sankinkotai*—the requirement of periodic residence in the capital.

The *samurai*, on the other hand, were personally free private soldiers of the individual daimyos (or of the Shogun himself); they were maintained with rice allowances, rarely with land grants; they originated partly in the voluntary following of warriors, partly in office-holders entitled to court service, who developed a practically free contractual relationship, just as the *ministeriales* of the German Middle Ages; they differed greatly in their social status, from the small rentier who gained his rice allowance by serving in the lord's manor, sleeping with up to four others in one room, to the practically hereditary incumbent of a court office. The *samurai* were a class of free retainers, partly plebeians and partly courtiers, not vassals but benefice-holders, whose position was more similar to that of the Frankish *antrustiones* than to that of a

medieval feudal benefice-holder. The relationship to the lord was endowed with a sense of knightly loyalty, which was analogous to, but more intense than, Occidental fealty; this intense attachment grew out of the transformation of the followers' loyalty into a glorified free vassalage, and out of the warrior's concept of status honor.

Finally, the special features of the Islamic warrior's fief can be explained, as C. H. Becker has recently shown, on the basis of their origin in a mercenary army and in tax-farming.[4] Unable to pay his mercenaries, the patrimonial ruler had to give them direct access to the tax payments of his subjects. He also had to transfer to the military official (*emir*) the position of the tax official (*'amil*), who drew a fixed remuneration; this office was originally independent of the military office in accordance with the typical patrimonial division of powers familiar to us. Three different elements merged into the concept of the *iktâh* (*beneficium*): 1) *Takbil*, the farming of revenues of a village or a district to a *muktah* (tax-farmer); 2) *Kata'i'*, the fiefs—called *sawafi* in Mesopotamia—, grants of land to deserving or indispensable supporters, and finally 3) the possession of the subjects' taxes, which were seized as security by, or assigned to, *emirs* and soldiers, especially Mamelukes, in order to cover their arrears of pay. The incumbent of an *iktâh* had to serve as a soldier and was supposed to surrender the surplus of taxes over his pay—which he rarely did. The arbitrary exploitation inherent in this type of control in an early case motivated the vizier Nizam al-Mulk—under the Seljuks in Mesopotamia toward the end of the 11th century—to assign land definitely to the soldiers and emirs as benefices and to give up all claim to tax surpluses, in return for their military service. The Mamelukes adopted the same system in Egypt in the 14th century. The soldiers, who turned from tax-farmers or mortgagees into landowners, now developed a personal interest in the improvement of their subjects' land; this also did away with the friction between the military and the fiscal authorities. The Ottoman *sipahi*-benefices are a modification of this system of military benefices. Its origin in the decaying tax system and the mercenary army of a state based on a money economy, organized on the ancient pattern, distinguishes these military benefices radically from Occidental feudalism developed on the basis of a natural economy and the leader's following. Oriental feudalism was bound to lack all those features that derive from the loyalty of followers, in particular, the norms of the specific as well as personal fealty of the vassal; conversely, Japanese feudalism with its exclusively personal allegiance lacked the manorial component of the *beneficium*. Hence both types differ, in exactly opposite direction, from that combination of

personal fealty, derived from the follower's loyalty, and benefice which accounts for the distinctiveness of Occidental feudalism.

3. *The Military Origin of Feudalism*

The widespread phenomenon of the fief was primarily of military origin. The Turkish fief-benefice committed its holder to live on the land and, during the Empire's great expansion, was considered forfeited if the holder had not served in the army within the last seven years; the claims of the heirs were also partly dependent on the proof of active military service. In the Orient as well as the Occident, the fief-benefice normally served the establishment of a *cavalry*, whose members had identical equipment and were continuously trained. The military effectiveness of these warriors, who were personally devoted to their lord, was enhanced by their notion of *honor*. This cavalry was a substitute for the levy of freemen and sometimes also for the king's charismatic following (*trustis*). The Frankish fiefs originated on secularized church land in defense against the Arabian cavalry. The Turkish fief-benefices, too, were not concentrated in the Ottomans' old peasant settlements (in Anatolia); they were mostly landed estates, managed by Rayas, in areas conquered at a later time (especially in Rumelia). Wherever it substituted for the levy of freemen, the feudal army was a function of intensified economic activities and of expanding boundaries in an inland state with a natural economy. The same was true of the mercenary army in maritime states or inland states with a money economy. For the mass of the landowners increasing pacification and intensified agriculture diminished both their familiarity with military tasks and their opportunities for military training; this reduced the economic dispensability of smallholders. The growing preoccupation of men with work originally done by women tied them to the land, and the increasing differentiation of property through division or accumulation of land destroyed the possibility of identical military equipment; the growing masses of smallholders could no longer equip themselves—the precondition of every army of freemen. In particular, campaigns at the far-away peripheries of a great empire could not be conducted with a peasant levy, just as an urban militia could not control large overseas areas of expansion. And just as the mercenary army replacing the citizens' army substituted professional soldiers for militia men, so the transition to the feudal army resulted initially in identical equipment of high quality. In its Occidental beginnings, horse and arms were part of the fief; self-equipment came later when this institution became widespread.

The specific element that determines the vassal's behavior under fully developed feudalism is the appeal not only to his obligations of fealty, but to his sense of high status which derives from an exalted conception of honor. The warrior's sense of honor and the servant's faithfulness are both inseparably connected with the dignity and conventions of a ruling stratum and buttressed by them. Thus, the peculiarity of Occidental, fully developed feudalism was largely determined by the fact that it constituted the basis of a cavalry—in contrast to the plebeian infantry-fiefs of the clients, cleruchs, μάχιμοι, and ancient Oriental fief-holding soldiers. We will frequently encounter the ramifications of this factor.

4. *Feudal Legitimation*

The feudal system produces men who can equip themselves and handle weapons professionally, who in war identify their own honor with that of the lord, who see in the expansion of his power the chance to secure fiefs for their heirs and, above all, who find the only *basis for the legitimacy of their own fief* in the preservation of *his* personal authority. Everywhere this last element has been eminently important for the transition to feudalism, and especially for the extension of feudalism from its original domain, military service, to public offices. In Japan the ruler attempted in this fashion to emancipate himself from the dominance of lineage groups which had familial charisma. In the Frankish empire the attempts of the patrimonial state to preserve the sovereign's power through limiting tenure in office and through the system of emissaries were again and again subverted; the violent ups and downs in the power struggle of the aristocratic cliques in the Merovingian empire were eventually terminated by the strong arm of a central official, but this resulted in the overthrow of the legitimate dynasty in his favor. The bestowing of offices as fiefs under the Carolingians provided relative stability; from the 9th century on this policy was definitely carried through, after the Carolingians had at first used the vassals as countervailing power against the Merovingian *trustis* and after the strictly personal fealty of all office-holders had emerged as the only support of the royal thrones during the struggles of the kings in the divided empire. Conversely, the destruction of Chinese feudalism—for a long time lamented as the really sacred order of the fathers—by the prebendal-bureaucratic order, which since has consistently followed its own momentum, was propelled by the equally typical motive for eliminating the feudal office: the motive of restoring full power to the sovereign.

For the quite considerable guarantee of the ruler's position through the vassal's knightly honor is acquired at the price of a great decline of his power over the vassals. Fully developed feudalism is the most extreme type of systematically decentralized domination.

To begin with, the lord has only limited "discipline" over the vassal. The only reason for taking back the fief is "felony": the violation of fealty toward the lord through failure to fulfil the feudatory obligations. However, the concept of "felony" is very vague, and normally this does not benefit the lord's arbitrariness but the vassal's position. For even where feudal courts composed of vassals did not exist and hence vassals were not organized as members of an autonomous corporate group (as in the Occident), the generalization is fully valid that the lord is powerful vis-à-vis the individual vassal, but powerless with regard to the interests of all vassals; he must be sure of the support or at least the toleration of the other vassals before he can safely proceed against any one of them. Since the feudatory relationship is founded on mutual loyalty, an arbitrary act of the lord has, as a "breach of faith," an inherently destructive effect upon his relations with all vassals. This fairly rigid limitation of the ruler's disciplinary powers over his own vassals is made more palpable by the fact that he often has no direct control over the subvassals of his own vassals.

Under fully developed feudalism there was a "hierarchy" in two respects: First, only those seigneurial rights, especially only those landed estates, the possession of which could be derived from the supreme ruler as the source of all power, were transferable as full fiefs; second, there was a social rank-order (such as the *Heerschild* of the *Sachsenspiegel*) according to the level of sub-infeudation which the respective fief-holder occupied relative to the supreme ruler. But the extent of the ruler's direct control over subvassals of his own vassals remained very problematic because, as in every feudatory relationship, the one between vassal and subvassal was also strictly personal and hence could not easily be canceled by any felony of the first vassal against his lord. In its classic period the Turkish feudal system achieved a relatively strong centralization through the quasi-prebendal definition of the fief and of the *beglerbeg*'s position in relation to the Sublime Porte. But the Occidental reservation: *salva fide debita domino regi* [with the exception of the fealty owed to the overlord] in the oath of homage did not preclude at the least a conflict of conscience for a subvassal even in cases in which his lord's felony was clear, since he was faced with a dual obligation of loyalty. In any case, he always considered himself entitled to examine for himself whether the overlord of his own lord discharged his obligations.

For the centralistic development of England an arrangement taken over from Normandy by William the Conqueror became crucial: All subvassals were directly oath-bound to the king and considered his men; furthermore, subvassals who did not obtain legal satisfaction from their lord were not forced (as in France) to go through various stages of appeal of the feudal hierarchy but could go directly to the king's courts; thus, the feudal hierarchy in England was not identical, as in most other countries, with a jurisdictional hierarchy in matters of feudal law. In Normandy and England, just as under Turkish feudalism, this tight organization and the firm bonds between lord and vassal were due to the fact that the feudal polity was constituted on conquered territories—similar to the church which established its strictest hierarchical organization in mission territories. However, even then conflicts of conscience on the part of subvassals were not completely absent. For this reason too attempts were frequently made to limit subinfeudation or at least its frequency on lower levels; by contrast, in Germany the limitation of the *Heerschilde* derived from general principles of the office hierarchy.

On the other hand, fully developed feudal law stipulated that all objects which had once been included in a fief would have to be granted again in case of escheat, and it also established the principle: *nulle terre sans seigneur*. Superficially, there is a correspondence between the bureaucratic principle and the feudal rule that all traditional feudatory units must be bestowed upon vassals by the king, but the intent is fundamentally different. Under the bureaucratic system the mandatory filling of offices is intended as a legal protection for the ruled, but the compulsory granting of fiefs cut off most of the vassals' subjects from any direct relation to the supreme ruler; furthermore, this feudal practice establishes as a collective right of the vassals that the lord cannot ignore the feudal distribution of power for the sake of his own interests by taking power back into his hands; rather he must utilize again all existing fiefs for the purpose of equipping the vassals' descendants. According to the familiar scheme, the vassals could press their demands with particular strength whenever they were organized into a legally autonomous groups and especially when legal proceedings in which they participated as members of a feudal court (*Lehenskurie*) dealt with disputes and legal business concerning the obligatory granting of an inheritance, escheat and renewal of fiefs. In this case the demand for fiefs was monopolized in addition to the means for protecting the supply of fiefs.

Monopolization proceeded by virtue of the continuous increase of

demands upon the personal feudal qualifications of the aspirant, just as it does in the bureaucratized community by virtue of the aspirants' demand for more and more specialized examinations and ever more diplomas as a condition of employment. The feudal qualification, however, was the polar opposite of the qualification for bureaucratic office, which is based on specialized knowledge. Bureaucracy and patrimonial officialdom are based on social levelling in the sense that as pure types they are only concerned with personal qualifications, the one with substantive expertise, the other with purely personal characteristics; both types disregard status differences and in fact constitute the specific instrument of their negation—irrespective of the circumstance discussed earlier that the bureaucratic and the patrimonial strata, too, easily become carriers of a distinct status honor with all its consequences. This social honor was here a result of the power position of these strata. But the essence of feudalism is status consciousness, and it increasingly perfects this very characteristic. Everywhere the vassal (in the specific meaning of the word) had to be a free man, not subordinate to the patrimonial power of a lord. The Japanese samurai too changed his lord at will. At first, of course, the vassal's characteristic qualification was most of the time merely his professional capability, his military proficiency; this it remained, for example, under Turkish feudalism; even Rayas could receive fiefs if they had rendered the requisite military services. However, in its fullest elaboration the feudatory relationship can only be an attribute of a ruling stratum, since it rests on emphatic notions of status honor as the basis of fealty and also of military fitness. Therefore, the requirement of seigneurial ("knightly") conduct is added everywhere, especially the injunction against any kind of remunerative labor which would detract from military training and be degrading.

When the opportunities for the support of the descendants begin to decrease, the monopolization of fiefs and offices—and later particularly of the prebends (*Stiftspfründen*) for the maintenance of relatives without proper means—sets in with full force. The increasing influence of status conventionalism comes on top of it, and the claim is advanced that the aspirant for a fief or a prebend must not only live like a knight, but also be of knightly descent. That means, he has to be the offspring of a minimum number of knightly ancestors—at first, knightly parents, then knightly grandparents: the "four ancestors." Finally, in the regulations of the tournaments and convents of the late Middle Ages monopolization reached a point where sixteen ancestors were required and the urban patriciate was excluded because it shared authority with the guilds and sat with them in the same councils.

5. *The Feudal Division of Powers and Its Typification*

The strict legal autonomy (*Eigenrecht*) of the individual vassal paralleled the claim of all qualified aspirants on the possession of all fiefs, a claim which was not everywhere recognized but everywhere advanced in one fashion or another. The fact that in the classic areas of feudalism the vassal's right was contractual and subject to renewal, but at the same time inheritable according to established norms, stereotyped the division of powers far beyond the degree attained under the prebendal structure and made it highly inelastic. This very permeation of the whole system with the guarantee of the fief-holder's position through a bilateral contract was very important for the development of feudalism; this guarantee transcended the mere granting of privileges by the lord and, in contrast to the appropriation of benefices, it was not just a purely economic matter. It turned feudalism into an approximation of the *Rechtsstaat* [constitutional government], at least in comparison to pure patrimonialism with its juxtaposition of traditional prescription and appropriated rights, on the one hand, and arbitrariness and discretion on the other. Feudalism is a "separation of powers," but unlike Montesquieu's scheme, which constitutes a qualitative division of labor, it is simply a quantitative division of authority. The idea of the social contract (*Staatsvertrag*) as the basis of the distribution of political power, an idea which led to constitutionalism, is anticipated in a primitive fashion. Of course, not in the form of a pact between the ruler and the ruled or their representatives—under which the subjection of the ruled is conceived as the source of the ruler's right—, but in the essentially different form of a contract between the ruler and those whose authority derives from him. Type and distribution of powers are fixed through this contract, but there is no general *règlement* and no rational differentiation of individual jurisdiction. For the powers of the office are personal rights, contrary to the bureaucratic case; their extent is determined positively by the official's personal grant *and* negatively by the subjects' exemptions, immunities and privileges, whether they be granted or sanctified by tradition. Only this juxtaposition and the mutual limitation of the subjective right of *one* power-holder by the opposed rights of another produces—very similar to the stereotyped and appropriated patrimonial offices—that power distribution which would correspond to some extent to the bureaucratic notion of official jurisdiction. For in its genuine sense this notion does not exist under feudalism, and therefore the concept of the "agency" (*Behörde*) is also absent.

At first only a section of the vassals was granted political powers, and that means most of all: judicial powers. In France these were the

so-called *seigneurs justiciers*. The ruler could divide his own judicial powers by granting one part of them to one vassal and other parts to another vassal. Typical was the division into higher jurisdiction—including capital judicature (*Blutbann*)—and lower jurisdiction, and their distribution among different vassals. This does not mean that the vassal who has been granted seigneurial powers which were higher in the original hierarchy of offices also has a higher rank in the hierarchy of fiefs, which is established according to the distance from the supreme lord. In principle, at least, the hierarchy of fiefs is not at all concerned with the hierarchy of powers granted, but only with the distance or nearness from the first lord. In fact, however, the possession of the highest judicial powers, especially of capital judicature, everywhere tends to establish its holders as a special group of princely rank (*Fürstenstand*). This tendency had to compete everywhere with the overlapping tendency to consider the immediate feudatory relationship to the king as the mark of belonging to the highest status group. This happened particularly in Germany in characteristic ups and downs, with which we cannot deal here. The result was everywhere a most intricate complex of seigneurial powers which had been fragmented through grants to the most diverse holders. In principle, the territorial jurisdiction of the Occidental lord, which was based on the grant of political rights, was separated from his feudatory jurisdiction over his own vassals, on the one hand, and from his patrimonial (*hofrechtliche*) jurisdiction on the other. All of this resulted in the fragmentation of powers into numerous individual rights, appropriated on different legal grounds, which traditionally limited one another. Absent was the separation, so typical of every bureaucracy and still recognizable in the prebend, of person and vocation, personal property and official means of administration. Since the income from the fief was not an office revenue, the differentiation between allodial and feudal possesions in the case of escheat and inheritance was, unlike the externally similar differentiation in the case of the prebend, only a stratification of inheritance.

Furthermore, not only were all official powers and revenues of a vassal part of his personal rights and of his own household, but above all the *costs* of administration were personal expenditures indistinguishable from those of his own household. Just as every individual, be it lord or fief-holding official, pursued his essentially personal interests on the basis of his own right, so all administrative expenditures were covered by his own personal services and resources or—and especially—by the services of the patrimonial retainers or of the "subjects" who were subordinate by virtue of the political rights granted to him; thus the expenditures were not met out of a rational system of taxation,

as under a bureaucracy, or out of the ruler's household or special prebendal revenues as under patrimonialism. Since the tributes and services of the "subjects" were ordinarily regulated by tradition, the apparatus was financially inelastic, and this was aggravated by the typical practice, or at least universal tendency, of using the feudal association as the vehicle (*Träger*) of political administration; this limited very much the personal as well as the substantive means of power of the ruler and all other lords.

To begin with, the vassals attempted everywhere to regulate through fixed norms the maximal annual duration of their most elementary obligation, for the sake of which the feudal association had been created: the obligation to render military service. Most of the time they were successful. Moreover, the right to carry on feuds existed also between the vassals of the same lord. The lord's power only guaranteed his vassals' fiefs, but nothing else. The private wars of the vassals against one another could of course be very detrimental to the power interests of the feudal lord, but beyond the stipulation that private feuds could at least not take place during one of the lord's own military actions no curb was successful on the European continent up to the time when church and cities, together with the king, enforced the edicts of peace (*"Landfrieden"*).

The limitations on the financial rights of the ruler were particularly severe. Apart from the tutelary utilization of a fief by a lord, these rights consisted mostly in the vassal's obligation to subsidize the lord in certain cases of need; the lord would have liked to turn these obligations into a comprehensive right of taxation, but the vassals set out to turn them into definitely fixed occasional tributes. In compensation for increasingly fictitious military duties, the tax exemption of knightly fiefs eventually became the normal pattern until long after the Middle Ages. In general, the vassals were no less successful, at least as long as the lord was dependent on the feudal army, in freeing their retainers from the lord's taxation, which they permitted only in exceptional cases. As a rule, the lord could directly raise *tallagia* only from his manorial and personal retainers. The right of escheat became increasingly impractical. Everywhere the extension of the right of inheritance to collateral relatives prevailed. The alienation of the fief, which of course required the lord's willingness to accept the new vassal, became more and more the rule and the purchase of his consent one of the most important feudal sources of revenue. However, the purchase was equivalent to the full appropriation of the fief, since the transfer fee came to be fixed by tradition or law. Thus, while the fealty relationship became progressively stereotyped and commercialized, it also lost its unequivocal character

and practical utility as a means of power. As a free man, the vassal could later even take a fief from several lords; this made his support precarious for any one of them in case of a conflict. French feudal law distinguished the *homagium simplex*, the feudal oath with mental reservations as to other obligations, from the *homagium ligium*, the unconditional oath, which was, so to speak, the first mortgage upon fealty; it preceded all other obligations and hence could only be rendered to one ruler. For the rising power of the French monarchy it was important that the great feudal lords were forced to render the latter oath. In general, however, the possibility of multilateral obligations resulted in their far-reaching devaluation. Eventually it became almost impossible to run a continuously functioning administration with the help of vassals. In the abstract, the vassal had the duty to help his lord not only with deeds but also with advice. The great vassals liked to derive from this duty a "right" to be heard before important decisions were made, and usually they succeeded since the feudal lord was dependent upon the morale of the feudal army. As an obligation, however, the vassal's advisory activity was gradually reduced, just like his military duty; it was quite discontinuous and therefore could not be used for the organization of a concrete agency (*Behörde*).

Thus, the feudal association provided to the local office-holders a hereditary appropriation and guarantee of their seigneurial rights; however, for the central administration it did not offer the lord continuously available personnel and easily forced him to adapt his actions to the "advice" of the strongest among his vassals, rather than helping him to control them. Under these circumstances all powerful vassals were so strongly tempted to dissolve the feudal bond altogether, that the only fact to be explained is why this did not happen more often than it actually occurred. The reason was the guarantee of *legitimacy*, which we mentioned earlier and which the vassals found in the feudal association with regard to their land and seigneurial rights; the feudal lord too was interested in this guarantee because of the advantages—no matter how precarious—which his rights entailed, even if they were fictitious.

6. *The* Ständestaat *and the Transition from Feudalism to Bureaucracy*

In contrast to the system of "agencies," which are generally subject to enacted rules and which have equally regulated spheres of jurisdiction, the prebendal and feudal variants of patrimonialism are a cosmos

and, according to the circumstances, also a chaos of concrete subjective rights and duties of the lord, the office-holders and the ruled; these rights and duties overlap and limit one another, and their interaction produces modes of action that cannot be reconstructed with currently prevalent political categories and for which the name "state" in the modern sense of the word is even less applicable than for the purely patrimonial polity. Feudalism is estate-type patrimonialism, a marginal case that contrasts with patriarchal patrimonialism.

Feudalism is oriented not only to characteristic patrimonial features such as tradition, privilege, customal and precedent, but also to *temporary alliances* between the various power-holders, as it was typical of and, in fact, the essence of the *polity of Estates* (*Ständestaat*) in the Occident. Just as the individual holders of fiefs and benefices and the other possessors of appropriated powers exercise their authority by virtue of privileges guaranteed by the prince, so his own power is considered a personal privilege, his "prerogative," which should be recognized and safeguarded by the fief-holders and other power-holders. These holders of privileges consociate with one another for the purpose of a concrete action which would not be possible without this collaboration. The existence of a *Ständestaat* merely indicates that this system of alliances, which was unavoidable because of the contractual guarantee of all rights and duties and because of the resulting inelasticity, has developed into a chronic condition, which under certain circumstances was legally perpetuated through an explicit association. Once the fiefholders constituted an autonomous legal group, the *Ständestaat* came into being for very diverse reasons, mainly however because the stereotyped and therefore inflexible fiefs and privileges had to be adapted to extraordinary or new administrative requirements. These needs were to a large extent economically determined, even though externally this was not true in the majority of cases. Most of the time the economic influence was indirect: The extraordinary needs centered on the political, especially the military administration. The changing economic structure, in particular the advancing money economy, exerted its influence by making it possible, and hence mandatory in view of the struggle and competition with other polities, to satisfy these needs in a manner superior to the normal means of stereotyped feudal-patrimonial administration; this involved especially the raising of considerable amounts of money all at once. These normal means were most of the time inadequate because of the very principle pertaining to this structure of domination: that everybody, the ruler as well as all other power-holders, had to pay the costs of his, and only his, administration out of his own pocket. There

were no provisions for raising these special revenues; hence the frequent conclusion of new agreements was unavoidable, eventually requiring a consociation of the individual power-holders in the form of a corporative assembly. This very association either included the prince or turned privileged persons into "Estates," and thus changed the mere agreed-upon action of the various power-holders and the temporary associations into a permanent political structure.

Within this structure, however, ever new and impelling administrative tasks created the princely bureaucracy, which was destined, in turn, to dissolve the *Ständestaat*. This process must not be understood too mechanically as if the ruler endeavored everywhere, for the sake of expanding his own sphere of power, to destroy the competing power of the Estates by developing the bureaucracy. Unquestionably and quite naturally, this was very often one major determinant, but not always the really crucial one. Quite frequently the Estates demanded from the ruler that he satisfy the requests of interested persons for new administrative services and that he render these through the establishment of a suitable agency; these continuously emerging demands were the result of the general economic and cultural development and thus due to objective developmental factors. The ruler's compliance was tantamount to a spread of officialdom and hence normally to an increase of his power; at first this led to a renaissance of patrimonialism, which remained dominant in Continental Europe up to the French Revolution, but the longer patrimonialism lasted, the more it approached pure bureaucratism. For everywhere the nature of the new administrative tasks exerted a pressure toward creating permanent agencies, fixed jurisdictions and procedural as well as professional qualification.

The feudal association and the *Ständestaat* are by no means indispensable intermediate links in the development from patrimonialism to bureaucracy; on the contrary, under certain circumstances, they present considerable obstacles to bureaucracy. The beginnings of a genuine bureaucracy can be found everywhere in relatively uncomplicated forms of patrimonial administration; the transition from the patrimonial to the bureaucratic office is fluid and the typological attribution dependent not so much upon the nature of the individual office, but upon the manner in which offices in general are set up and administered. However, the fully developed *Ständestaat* as well as the fully developed bureaucracy grew only on European soil, for reasons to which we will turn later. In the meantime we will deal with certain intermediate and transitional forms, which preceded pure bureaucracy within feudal and patrimonial structures.

7. *Patrimonial Officialdom*

For simplicity's sake we have hitherto assumed that the political ruler's affairs in the central administration are managed in purely patrimonial fashion through household and court officials, whom we discussed earlier, or through fief-holders, who in turn have their own patrimonial administration. In reality, the structure of patrimonial and of feudal rulership has not been so simple. As soon as the household administration has passed the stage of "discontinuous" administration through companions and intimates, the addition of purely political tasks regularly leads to the establishment of special central offices and most of the time to the rise of a single political official, who may have various characteristics. Because of its very nature patrimonialism was the specific locus for the rise of favoritism—of men close to the ruler who had tremendous power, but always were in danger of sudden, dramatic downfall for purely personal reasons. If specific structures develop, the most typical patrimonial case is one in which a court official, whose function involves the closest, purely personal position of confidence, also directs the central political administration, formally or in fact; this may be the keeper of the harem or a similarly employed person who deals intimately with the ruler's personal affairs. It also happens that a specifically political position of trust is added. In some African kingdoms the visible representative of capital jurisdiction, the executioner, is the continuous and most influential companion of the ruler. Similarly, the judicial functions of the ruler gain importance with the development of contempt powers (*Banngewalt*), and then an official corresponding to the Frankish Count Palatine often rises to prominence. In militarily active states the same is true of the royal commander-in-chief, and in feudal states of the official who is often identical with him, but also controls the fief patronage (Shogun, *major domus*). In the Orient we find regularly the figure of the Grand Vizier; we will see later for which reasons he became a "constitutional" necessity, just as did the responsible prime minister in modern states.

In general we can only say that, on the one hand, the existence of such a monocratically unified position can become especially dangerous to the prince's authority, if the official concerned controls the economic accoutrements of the vassals and subordinate officials so that he can bind them to his own person vis-à-vis the ruler—consider the well-known examples of Japan and of the Merovingian Kingdom; on the other hand, the complete absence of such a central figure tends to lead regularly to the disintegration of the realm—see the telling example of the Carolingians whose own experience made them wary of

the creation of a centralized office. We will soon come back to the manner in which the resulting problems were solved.

We are here first interested in the following phenomenon: Because of the increasing continuity and complexity of administrative work, especially because of the development of the grants and privileges characteristic of patrimonial and feudal structures, and finally because of the growing rationalization of finance, the *clerical and accounting officials* begin to play an increasingly important role. Without them a ruler's household is condemned to instability and powerlessness. The more developed the clerical and accounting system is, the stronger is the central power, even in the pure feudal state (for example, in Norman England and the Ottoman Empire in the period of its greatest power). In ancient Egypt the scribes controlled the administration. In the modern Persian empire the accounting officials usurped a very considerable role by virtue of their "secret" art—a secrecy sanctified by tradition. In the Occident the chancellor, the chief of the secretariat, was most of the time the central figure of the political administration. The central administration may also originate in the accounting office, the Exchequer in Normandy and later in England. At the same time, such offices are regularly the beginning of bureaucratization, because the working officials, who were mostly clerics in medieval times, gain actual control from the high-ranking courtiers who officially occupy them.

We have dealt earlier [XI:12] with the rise of the great *collegiate* central agencies as a concomitant of the qualitative extension of administrative tasks; we discussed them as antecedents of bureaucracy and in the context of the increasing importance of specialized knowledge, which propels bureaucratization. Of course, not all of the ruler's advisory bodies in prebureaucratic states have been early stages of modern bureaucracy. Advisory assemblies of central officials can be found in the most diverse patrimonial and feudal structures all over the world. They serve the ruler often as a counterbalance, not to the power of specialized knowledge—as do those early bureaucratic structures—but simply to the power of the highest-ranking officials; furthermore, they are a means of establishing administrative continuity. To that extent they are everywhere products of a certain stage in the qualitative development of administrative tasks; however, as this development progresses ever further, these advisory assemblies approximate those phenomena of early bureaucratism by taking on the character of a collegiate "agency," which operates according to definitive procedures; they assume this form the more the office organization and administrative procedures approach the bureaucratic pattern; the boundary is here very fluid, as

the examples of China and Egypt demonstrate. Typologically these agencies should be distinguished, again despite the natural continuity of the transitions, from those collegiate bodies which share authority not by virtue of the ruler's fiat, but by virtue of their own right (after the fashion of the "Council of Elders" or of a body of *honoratiores*); we will briefly deal with the latter below, for they do not partake in the transition from patrimonialism to bureaucratism, but are a stage of the division of powers between the ruler and other holders of power, whether they have charismatic or estate-type characteristics.

We cannot treat here the influence of the patrimonial or feudal polities on the general *cultural* development. Patrimonialism, especially the non-stereotyped, arbitrary type, and feudalism are *distinguished* from one another very definitely in that area which everywhere provides the most important opening for the impact of domination upon culture: the field of *education*. Only a few general remarks will be added here to the brief earlier statements about the connection between education and domination. Wherever feudalism develops a status-oriented "knightly" stratum, systematic preparation for a corresponding way of life emerges with all its consequences. Typically, certain *artistic* creations (in literature, music and the visual arts), which cannot be treated here, become a means of self-glorification and establish and preserve the nimbus of the dominant stratum vis-à-vis the ruled. Thus "refinement" is added to the at first purely military-gymnastic training; the result is that very complex type of "cultivation" which is the polar opposite of specialized education in a bureaucratic regime. Wherever domination is prebendally organized, education tends to be intellectualist-literary, and thus to be intrinsically related to the bureaucratic ideal of transmitting specialized knowledge. In a particularly typical form this is true of China and in cases—to be discussed later [ch. XV:4]—in which theocracy takes over education. The last development tends to reach its culmination in the secular state of the arbitrary patrimonial type, which does not develop an educational system of its own.

8. *The Indeterminate Economic Preconditions of Patrimonialism and Feudalism*

Little that is definitive can be said about purely economic preconditions for the rise of patrimonial and feudal structures. The existence and the predominance of royal and aristocratic manors is indeed the general basis of all forms of feudal organization, whether fully developed or not. And the Chinese state of officials, which in its own

way is the most consistent political form of patrimonialism, is not based on landed estates, but, as we have seen, is so uniformly patrimonial because of their very absence. Patrimonialism is compatible with household and market economy, petty-bourgeois and manorial agriculture, absence and presence of capitalist economy. The well-known Marxist statement that the hand-mill requires feudalism just as the steam-mill necessitates capitalism is at most correct in its second part, and then only partially.[5] The steam-mill fits without any difficulty into a state-socialist economy. The first part of the statement, however, is entirely incorrect: The hand-mill has lived through all conceivable economic structures and political "superstructures." In general we can say about capitalism only that, since its opportunities for expansion are limited under feudalism and patrimonialism, its champions usually attempt to substitute bureaucratization or a plutocratic domination by *honoratiores*. This too, however, is only true of production-oriented modern capitalism, based on the rational enterprise, the division of labor and fixed capital, whereas politically oriented capitalism, just as capitalist whole-sale trade, is very much compatible with patrimonialism. Indeed we have seen that a strong development toward a market economy, which provides sufficient tax revenues for buying slave soldiers or for recruiting mercenaries, was the very precondition for the rise of Oriental Sultanism and thus for the strictly patriarchal variant of patrimonialism, which—compared to our Occidental *Rechtsstaat*—is farthest removed from modern forms of the state.

The relationship between market economy and feudalism is very different. However, there is no general economic formula which would determine whether a patrimonial *or* a feudal structure will prevail—with the exception, of course, that the manorial system strongly facilitates the development of feudalism in its various forms. As we have seen, the rationalization of the irrigation economy in the ancient Orient—the fact that the area of cultivation had to be won systematically from the desert through organized draft labor—worked in favor of semi-bureaucratic political patrimonialism, just as did large-scale construction in China. In both cases, however, patrimonialism had to exist before these edifices became possible. By contrast, the acquisition of new land through the clearing of forests in Northern Europe favored the manorial system and therefore feudalism. However, feudalism also existed in the Orient, although in much less consistent forms. For the rest, we can only make the generalization that the weak development of the technical means of communication and therefore of political control, together with the prevailing natural economy, promoted decentralized patrimonialism—a system of tributary satraps, because of the

difficulties of creating a rational system of taxation and hence the precondition for a centralized administration of patrimonial officials; these weaknesses provided a strong impetus for the use of personal fealty and the feudal code of honor as means of political cohesion, wherever this was possible, that is, wherever the manorial system determined social stratification.

9. *The Impact of Trade on the Development of Patrimonialism*

Scholars have often overlooked one constant that has been historically important in the development of strong, centralized patrimonial bureaucracies—*trade*. We saw previously that the power positions of all rulers transcending the level of the primitive village headman were based on their possession of precious metals in raw or finished form. They needed this treasure above all for the maintenance of their following, the body-guards, patrimonial armies, mercenaries and especially officials. This treasure was supplied through the exchange of gifts with other rulers—this was in fact often an instance of barter—, through the ruler's own regular trade (in particular, the coastal intermediate trade), which can lead to a direct monopolization of foreign trade, or finally through other uses of foreign trade. This was done either directly in the form of taxation through tariffs, tolls and other tributes, or indirectly through market-privileges and the founding of cities, which were princely prerogatives that yielded high ground-rents and subjects capable of paying high taxes. Throughout history, this last type of utilizing trade was systematically undertaken; as late as the beginning of modern times, Polish seigneurs founded countless towns and settled them with Jews emigrating from the West. Typically, patrimonial political structures persist and expand territorially, although their trade is relatively moderate or outright weak in comparison to their size or their population—see the case of China and of the Carolingian empire—, but the genesis of patrimonial political rulership is infrequent without trade playing a considerable role; it has happened—witness the Mongolian empire and the kingdoms of the Teutonic Migration—, but nearly always according to the pattern that tribes who live adjacent to territories with a highly developed money economy invade these, take possession of their precious metals and found new polities on these territories. The royal trade monopoly can be found all over the world, in Polynesia just as much as in Africa and in the ancient Orient. Only recently, for example, all larger political entities on the West African

coast collapsed because the Europeans destroyed the intermediate trade monopoly of the respective chiefs. The location of most of the oldest large patrimonial polities is closely related to this function of trade.

Very often the ruler's special power position as a seigneurial landowner is only secondary. Of course, royal and aristocratic power originate most of the time in landholdings; with regard to areas in which there is still a surplus of land—as between the Congo and Zambesi rivers—it is more precise to say that this pre-eminence depends upon the possession of men and cattle, which advances rent-producing cultivation. Income from rent property is naturally necessary for that mode of life which socially establishes prince and aristocrat. But the subsequent development toward the monopolization of "ground-rent" is very often codetermined by trade gains. When a ruler is considered the landlord (not just the feudal overlord) of a whole country—as often happens at the most diverse stages of cultural development—, this is usually not the starting point, but the consequence of his political position, of the resulting advantages in the acquisition of chattel—in Caffraria the possession of humans (women) and of cattle—and, generaly, of the economic ability, based in particular on the possession of precious metals, to maintain patrimonial soldiers or mercenaries. The situation is usually not different with regard to the monopolistic land control of the aristocracy in maritime states: debt-serfs are an important part of agricultural labor in Hellenic Antiquity and probably also in the ancient Orient. They till the soil for the urban patriciate for a share in the crops. Direct and indirect trade gains provide the urban patriciate with the means for accumulating land and people. In a natural economy even the moderate possession of precious metals was extraordinarily important for the rise and the power position of a state. Of course, this did not change the fact that the bulk of the needs could be, and most of the time was, satisfied by the natural economy. Both things must not be confused with one another, as it happens all too often, when somebody talks about the impact of trade in primitive times.

The causal influence of trade upon the formation of political associations is certainly not unequivocal. As we pointed out, neither are all origins of patrimonial authority necessarily rooted in trade, nor did a patrimonial state arise wherever there was trade. Domination by *honoratiores*, too, was often a primary product of trade. However, very often there was a connection between trade and the rise of a simple chief to the rank of a prince. By contrast, trade is on the whole very antagonistic to the strictly feudatory system and the tightly-knit structure of the feudal hierarchy. It is true that trade typically created the "municipal feudalism" of a seigneurial patriciate, especially in the Medi-

terranean area. However, in Japan and India as well as in the Occident and in the Islamic Orient, feudalization was closely related to the slow progress, and often to the decline, of the market economy, but one factor was as often the cause as the consequence of the other. In the Occident, feudalism was a consequence of natural economy and provided the only possible means of establishing an army; in Japan and in the Near East during the Middle Ages the opposite situation prevailed. What was the origin of the latter development?

10. *The Stabilizing Influence of Patrimonialism and Feudalism on the Economy*

Both forms of domination, but feudalism much more so than patrimonialism, may have a strongly stabilizing effect upon the economy. Patrimonialism may have such an effect because under its rule only the leading officials, whose activities cannot be controlled continuously by the ruler, have in general the chance of getting rich quickly: witness the mandarins in China. The source of the accumulation of wealth is not acquisition by exchange, but the exploitation of the tax capacities of the subjects and the latter's need to buy all official actions of the ruler and the officials, given the wide latitude for granting favors and for arbitrariness. On the other hand, the power of the patrimonial officials is, in essence, limited only by tradition; its violation is dangerous even for the most powerful official. Therefore, material and personal innovations, new classes that are not sanctified by tradition, new kinds of acquisition and enterprise that run counter to tradition, are in a very precarious situation and at the least exposed to the arbitrariness of the ruler and of his officials. Both traditionalism and arbitrariness affect very deeply the developmental opportunities of capitalism. Either the ruler himself or his officials seize upon the new chances of acquisition, monopolize them and thus deprive the capital formation of the private economy of its sustenance, or the ubiquitous resistance of traditionalism is reinforced by them so as to hinder economic innovations that might endanger the social equilibrium or meet religious and ethical objections; the latter have to be taken into account because the patrimonial ruler's own authority is rooted in the sanctity of tradition. On the other hand, the wide latitude of the ruler's unrestricted discretion can reinforce the anti-traditional power of capitalism in a given case, as it happened in Europe during the period of absolutism. However, we must add that—apart from other peculiarities of this kind of privileged capitalism—the royal government was already bureaucratic-rational. As a rule, the nega-

tive aspect of this arbitrariness is dominant, because—and this is the major point—the patrimonial state lacks the political and procedural *predictability*, indispensable for capitalist development, which is provided by the rational rules of modern bureaucratic administration. Instead we find unpredictability and inconsistency on the part of court and local officials, and variously benevolence and disfavor on the part of the ruler and his servants. It is quite possible that a private individual, by skillfully taking advantage of the given circumstances and of personal relations, obtains a privileged position which offers him nearly unlimited acquisitive opportunities. But a capitalist economic system is obviously greatly handicapped by these factors, for the individual variants of capitalism have a differential sensitivity toward such unpredictable factors. Wholesale trade can tolerate them most easily, relatively speaking, and adapt itself to all changing conditions. Moreover, if the ruler does not monopolize trade himself, as under simple and transparent conditions, his self-interest demands that he permit the accumulation of wealth, so that he can draw on tax-farmers, farmers of official supplies and on credit sources. The "financier" is already known in the period of Hammurabi, and the formation of trade capital is feasible under almost all conditions of domination, especially under patrimonialism.

It is different with *industrial* capitalism. If it is to become the typical form of the industrial enterprise, it requires an organization of labor that aims at a mass market and depends upon the possibility of correct calculations. This is true the more capital-intensive industrial capitalism is, and especially the more saturated it is with fixed capital. Industrial capitalism must be able to count on the continuity, trustworthiness and objectivity of the legal order, and on the rational, predictable functioning of legal and administrative agencies. Otherwise those guarantees of predictability are absent that are indispensable for the large industrial enterprise. They are especially weak in patrimonial states with a low degree of stereotyped operations: conversely, they exist at an optimum under modern bureaucratism. Industrialization was not impeded by the Islam as the religion of individuals—the Tartars in the Russian Caucasus are often very "modern" entrepreneurs—, but by the religiously determined structure of the Islamic *states*, their officialdom and their jurisprudence.

This negative anticapitalist effect of patrimonial arbitrariness can be aggravated by a positive consequence, hitherto almost completely overlooked, which arbitrary patrimonialism may have, under otherwise suitable conditions, especially in a developed money economy. A peculiar type of artificial immobilization of wealth may result from the instability

of all legal guarantees under patrimonial justice and administration. By far its most important examples are a certain type of Byzantine monastic foundation and the Islamic *wakfs*, which apparently were patterned after this legal form. This type of Byzantine foundation may be sketched as follows: Land is given as an endowment, for example, building-sites in Constantinople; value and revenue will be tremendously increased by projected harbor installations. The monastery thus endowed must maintain a definite number of monks, through fixed prebends, and of the poor, through alms; in addition, there are administrative costs. However, the whole surplus of the monastery's income over its expenditures goes to the family of the founder. It is clear that the latter stipulation reveals the real purpose of the foundation: In the guise of a monastery, the foundation is in reality inalienable family property, with probably increasing revenues; it has sacred protection, *especially* against seizure by *secular*—that means, patrimonial-bureaucratic—*authorities*. (Besides, the founder also achieves the purpose of gaining favor with God and men and, under certain circumstances, of securing for his family an influence upon the filling of prebends; thus the family can grant favors to influential families, for many prebends were easy sinecures for the *garçons* of Constantinople; seclusion and even compulsory residence were not required. Another purpose was the securing of influence upon the administration of a family chapel.) The whole arrangement was a kind of surrogate, within a money economy, for the private churches (*Eigenkirchen*) of the feudal Occident.

It appears likely that endowments of a very similar form existed already under ancient Egyptian patrimonialism. At any rate, the same phenomenon can be observed during the Islamic Middle Ages in the *wakf*—an endowment for a mosque or a similar foundation—, as the records testify. At that time, too, objects which had an increasing financial value: building sites, rentable workshops (*ergasteria*) were given as endowments, without doubt for the same purpose and for the same reason. The consecration provided an optimal guarantee, although no absolute security, against arbitrary intervention of the secular officialdom. Thus the arbitrariness and unpredictability of patrimonial domination had the effect of strengthening the realm of subjection to sacred law. And since, on the other hand, the theoretical rigidity and immutability of the *shari'ah* was "corrected" by the judges through subjective and often quite unpredictable interpretation, the two components of patrimonialism, equally hostile to capitalism, reinforced one another. C. H. Becker probably assumes correctly that the very persistent immobilization of accumulated property in the form of *wakfs* was of very great importance for the economic development of the Orient.[8] This immobiliza-

tion corresponded fully to the spirit of the ancient economy which used accumulated wealth as a source of rent, not as acquisitive capital. (Through Spanish mediation, the institution of the profane "entailed estate" (*fidei commissum*), which is probably a secularized imitation of the *wakf* and first emerged in Spain, was imported to Germany in the 17th century.)

11. *Monopolism and Mercantilism*

In a relatively developed money economy and in periods in which it strongly approaches the rational bureaucratic system, patrimonialism has another influence upon economic development that results from its mode of "public finance." Just as the patrimonial state easily dissolved into a congeries of privileges, so the satisfaction of needs through monopolist-capitalist means and through positive and negative privileges—in the previously discussed meaning—was particularly frequent. With the help of a well-functioning patrimonial officialdom, it was easy to establish all kinds of fiscal enterprises and monopolies. State enterprises and monopolies emerged, on a sometimes very extensive scale, in Egypt, the late Roman empire and in the Near and Far East; the public enterprises (*Regiegewerbe*) of the rulers at the beginning of modern times were similar. Public financing through profit-making has by no means been limited to patrimonialism. During the Middle Ages and early in modern times, the cities too participated, often under great losses (for example, Frankfurt on the Main), in partly quite risky industrial and trading enterprises of a purely profit-making character. But the effective range of monopolies for state commercial enterprise was, generally speaking, greater in the patrimonial states, and therefore the public monopolies were on the whole more frequent and pervasive in them. Often, however, the satisfaction of needs through privileges could affect the economy even more strongly.

Public "financing" of a *negatively* privileging kind [that means, through functions *imposed* on certain status groups], the system of liturgies, was carried through most comprehensively by the most rational patrimonial-bureaucratic empires of Antiquity: Egypt and, imitating it, the Late Roman and Byzantine monarchy. The Egyptian economy of the Pharaohs acquired thereby a peculiar "state-socialist" strain, linked with periodically quite far-reaching hereditary ties to guilds and, at certain times, also to landed estates; it transmitted this trait also to the Late Roman economy. It is clear that this narrowed down considerably private capital formation and the realm of capitalist acquisition.

Next to, and instead of, this type of public finance which smothered capital formation and hence private capitalism, patrimonialism also uses a *positively* privileging type in the form of concessions to private trade or craft monopolies for high fees, a share in profit or a fixed annuity. Such positive privileges are found in many patrimonial states of the past all over the world. They played their last and most important role in the age of mercantilism, when the incipient capitalist organization of trades, the bureaucratic rationalization of patrimonial rulership and the growing financial needs of the military, external [foreign affairs] and internal administration revolutionized the financial techniques of the European states. Everywhere and in the most diverse forms the princely power, whether that of the Stuarts, the Bourbons, Maria Theresia, Catherine the Great and Frederick the Great, sought to create cash revenues through the establishment of monopolistic industries; these revenues did not require the approval of the estates of the realm, and in the *Ständestaat* and in parliamentary states they were often directly used as a political weapon. Here too the characteristic features of patrimonial capitalism emerged—and the bureaucracy of "Enlightened Despotism" was still as patrimonial as was the basic conception of the "state" on which it rested. This was recently shown very neatly by H. Levy with regard to the most impressive example: Stuart England.[1] There the question of the "monopolies" was one of the major issues in the struggle between the monarchy and the rising bourgeois classes; the monarchy strove for financial independence from parliament and for a rational-bureaucratic organization of the whole state and of the economy according to the pattern of a caesaropapist "welfare state," whereas in parliament the bourgeois class interests became increasingly decisive. Members and favorites of the royal family, courtiers, military men and officials grown rich, great speculators and adventurous inventors of "systems" of political economy such as that of John Law, outside of England often also Jews, at that time too made up the economically interested groups behind the royal monopolies and the industries which were imported, founded or protected on that basis. This was an attempt to transfer to modern industries patrimonial capitalism, which had existed everywhere in Antiquity and the Middle Ages of East and West, with only a few interruptions. It often furthered or awakened the "entrepreneurial spirit," at least for the moment. But the attempt itself failed by and large: The manufactories of the Stuarts, the Bourbons, Peter the Great and Frederick the Great survived the period of their sponsorship only in very few specialties. In England the compulsory monopolistic industry collapsed together with the autocratic welfare state of the Stuarts. Neither the period of Colbert nor of Frederick and Peter

succeeded in turning their countries into industrial states. The *economic* roots of this failure were the disregard of the economics of location, in England and elsewhere frequently the qualitative inferiority of protected products and the hindrance of the capital flow in directions indicated by the market conditions; the legal insecurity owing to the always doubtful duration of monopolies in view of possible new privileges was the *political* reason for this failure—hence the retarding factor was again the arbitrariness of patrimonial rulership.

12. *The Formation and Distribution of Wealth under Feudalism*

The feudal order has a different effect upon the economy than does patrimonialism, which in part furthers and in part deflects modern capitalism. The patrimonial state offers the whole realm of the ruler's discretion as a hunting ground for accumulating wealth. Wherever traditional or stereotyped prescription does not impose strict limitations, patrimonialism gives free rein to the enrichment of the ruler himself, the court officials, favorites, governors, mandarins, tax collectors, influence peddlers, and the great merchants and financiers who function as tax-farmers, purveyors and creditors. The ruler's favor and disfavor, grants and confiscations, continuously create new wealth and destroy it again. In contrast, feudalism, with its closely delineated rights and duties, does not only have a stabilizing effect upon the economy as a whole, but also upon the distribution of individual wealth.[8] To begin with, it achieves this effect through its legal order. The feudal association and also the related patrimonial forms that have a stereotyped status structure constitute a synthesis of purely concrete rights and duties. They amount, as we have pointed out, to a "constitutional state" (*Rechtsstaat*) on the basis of "subjective" rights, not "objective" law. Instead of a system of abstract rules, compliance with which permits everybody the free use of his economic resources, we find a congeries of acquired rights, which impede the freedom of acquisition and provide opportunities for capitalist acquisition only through the granting of further concrete privileges, as they were generally the basis of the oldest manufactories. To be sure, in this manner capitalist acquisition gains a support which is steadier than the personal changeable favors of patriarchal patrimonialism, but the danger that the granted privileges will be disputed persists since older acquired rights remain untouched.

Capitalist development is handicapped even more by the economic foundations and consequences of feudalism. Land granted as a fief

became immobilized, since it was normally inalienable and indivisible; the vassal's ability to discharge his obligations, to live in a knightly fashion and to raise his children properly depended upon the holding together of his property. Sometimes the vassals were not even permitted to alienate their own private lands, or restraints were imposed upon them, for example, the prohibition to sell their land to persons who were not status equals—witness the case of the Japanese vassals (*gokenin*) of the *shogun*. And since the revenues from the land grants, which the vassals normally do not work themselves, at least not in a capitalist fashion, are dependent upon the peasants' capacity to render goods and services, the restraints on property and economic management were extended downward under the seigneurial system. The spread of feudalism in Japan is paralleled by injunctions against subdivision, the selling of land—in order to prevent the rise of *latifundia*—and leaving the land: all this in the interest of preserving the peasants' economic capacities by protecting the existing livings. It is well known that exactly the same development occurred in the Orient. These restrictions and the feudal structure in general are not necessarily inimical to the *money* economy, as it is sometimes claimed. Tariffs, fees and revenue-yielding territorial rights, among them especially judicial powers, were also granted as fiefs. Wherever it appeared economically feasible, the manorial lord was strongly inclined to transform the peasants' services into taxes; this happened early in England. And wherever the peasants were economically unable to pay taxes, the landlord tended to resort to forced-labor enterprises (*Fronbetrieb*) and thus directly to capitalist acquisition; wherever feasible, the feudal lord of the manor or the political ruler attempted to sell his surplus in kind in order to get money. According to Rathgen, the Japanese *daimyos* maintained their agencies in Osaka primarily for the sale of their rice surplus. On a magnificent scale, the Teutonic Order —an economically rational community of collectively living monastic knights, whose vassals were the rural landlords—engaged in trade through its sales agencies in Bruges. The antagonism between the Order and the Prussian cities, Danzig and Thorn in particular, was essentially due to the competition between the Order's communal economy and the burghers. The Polish aristocrats, marketing grain from the hinterland, and the urban intermediary trade, co-operated against the monopolistic claims of the Order; this resulted in the cities' defection to the Poles and in the loss of Western Prussia for German culture (*Deutschtum*).

Of course, the manorial export trade did not only consist in the marketing of rent in kind but also of other products. The feudal landlord or political ruler can be a capitalist producer or creditor—witness

again the *daimyos*. With the help of serf labor feudal landlords often established commercial enterprises, manorial home industries and especially factories, for example in Russia. Therefore, the patrimonial foundation of feudalism implies by no means a necessary linkage with a natural economy. But partly for this very reason modern capitalism is impeded, since it depends upon the development of mass purchasing power for industrial products. However, the frequently massive tributes and services of the peasants to the landlords or feudal magistrates confiscate much of their purchasing power, which could have contributed toward the creation of a market for industrial products. The landlords' purchasing power, which derives from this confiscation, does not benefit mass-produced articles, upon which modern industrial capitalism largely depends; rather, it creates luxury demands, especially the consumption-oriented maintenance of personal servants. Moreover, since the manorial profit-making enterprises operate with forced labor and since in general the manorial household and craft enterprises utilize unpaid labor and hence waste manpower, they withhold labor from the free market and use it in a manner which largely fails to create capital, and sometimes simply consumes it. Insofar as these enterprises can compete with the urban trades because their workforce is paid little or nothing, wages cannot create mass purchasing power; and insofar as these enterprises cannot compete, in spite of this advantage, because of technological "backwardness"—and this is the rule—, the manorial lord tries to impede the capitalist development of the urban trades through political repression. In general, the feudal stratum tends to restrict the accumulation of wealth in bourgeois hands or at least to "declass" the *nouveaux riches*. This happened particularly in feudal Japan where eventually the whole foreign trade was greatly restricted, primarily in the interest of stabilizing the social order. In varying degrees similar phenomena can be observed everywhere. The social prestige of the manorial lords also motivates the *nouveaux riches* to invest their acquired wealth not in a capitalist venture but in land, in order to rise into the nobility if it be possible. All of this impedes the formation of productive capital; this was very typical of the Middle Ages, especially in Germany.

Thus feudalism more or less handicaps or diverts capitalist development; moreover, its strong traditionalism generally strengthens the authoritarian powers which distrust all new social formations. But the continuity of the legal order, which is after all much greater than in the non-stereotyped patrimonial state, may facilitate capitalist development. Where the bourgeois accumulation of wealth is not restricted as much as in Japan, it will be slowed down, but whatever is lost in this way, especially in comparison with the vacillating economic opportunities in the

patrimonial state, can eventually benefit the formation of a rational capitalist *system* through a more gradual and continuous development, and can further its advance within the interstices of the feudal system. Opportunities for individual acquisition were certainly much smaller in the Northern countries of the Occidental Middle Ages than for the officials and government purveyors of the Assyrian empire, the Caliphate and Turkey, or for the Chinese mandarins, or Spanish and Russian government purveyors and state creditors. But exactly because these chances were lacking, capital flowed into the channels of purely bourgeois acquisition through the putting-out system and the manufactories. And the more successfully the feudal stratum prevented the intrusion of *nouveaux riches*, excluded them from offices and political power, socially "declassed" them and blocked their acquisition of aristocratic landed estates, the more it directed this wealth to purely bourgeois-capitalist uses.

13. *Patrimonial Monopoly and Capitalist Privilege*

Patriarchal patrimonialism is much more tolerant than feudalism toward social mobility and the acquisition of wealth. The patrimonial ruler does not like independent economic and social powers, and therefore does not favor the rational enterprises based on the division of labor, that means, on the trades. But he also does not support status barriers, which he considers inconvenient limitations of his own power, in the area of free acquisition and trade, unless there are liturgical ties. Thus in the Ptolemaic empire complete freedom of trade and a highly developed monetary economy extended into the last household, and this despite the fact that the full patrimonial power of the king and his personal divinity persisted with far-reaching effects, just as in the times of the state socialism of the pharaohs. For the rest, diverse circumstances determine the extent to which patrimonialism tends more toward monopolies of its own, and therefore toward hostility to private capitalism, or more toward direct privileges for capital. The two most important factors are political:

1) The very structure of patrimonial domination, whether estate-like or patriarchal. In the former case the ruler is naturally more limited, *ceteris paribus*, in the free development of his own monopolies. Nevertheless, it is true that in modern times the Occident has known many monopolies by patrimonial rulers, much more so than China, at least during the same period; but it is also true that most of these monopolies were used only in the form of leases or licenses to capitalists, that means,

in private capitalist fashion. Furthermore, the ruler's monopolies evoked a very effective response from the ruled. Such a strong reaction would have been scarcely possible under strictly patriarchal domination; to be sure, state monopolies—as Chinese literature too seems to confirm—has everywhere been resented, but most of the time it was hated by the consumers, not, as in the Occident, by the (bourgeois) producers.

2) The second factor has already been mentioned in a different context: The privileges of private capital in patrimonial states were always the more developed, the more the power competition of *several* states made it necessary for them to woo the mobile money capital. Politically privileged capitalism flourished in Antiquity, as long as several states fought for ascendancy and survival; in China, too, it seems to have developed in the corresponding past. It flourished during the age of mercantilism in the Occident, when the modern power states entered upon their political competition. It disappeared in the Roman empire when the latter became a universal state and merely had to protect frontiers; it was almost completely absent in the Chinese empire, and relatively weak in the Oriental and Hellenistic states—the weaker, the more these states were "universal"—and also in the Caliphate. Of course, not every competition for power led to privileges for capital; this could only happen when capital formation was already under way. Conversely, pacification and the resulting decline of political demands for capital on the part of the great universal states eliminated the privileged position of capital.

Among the most important objects of government monopolies is *coinage*, which was monopolized by the patrimonial rulers primarily for purely fiscal purposes. In the Occidental Middle Ages the normal means for achieving these purposes consisted in depressing the value of bullion through establishing a monopoly for one's own coinage; deterioration of coinage was the abnormal means. But such practices are already indicative of a highly developed general use of coinage. Coins were used neither in Egyptian and Babylonian Antiquity nor in the Phoenician and pre-Hellenistic Indian culture; in the Persian empire and in Carthage they were used exclusively for payments in precious metals to soldiers and foreign mercenaries accustomed to this compensation (in Carthage, these mercenaries were Greeks); coins were not a means of economic exchange, which had to resort to weighing in the case of commercial exchange and to conventionally established forms of money in the case of retail transactions. Therefore coinage was limited to gold pieces in Persia. Conversely, the ruler's coinage in China created up to the present only means of exchange for *retail* trade, whereas *commerce* had to rely on weighing. These last two phenomena, which seemingly point into opposite directions, may serve as a warning not to consider

the state of coinage symptomatic for the advance of the money economy —especially in China where paper money was known. Rather, both symptoms refer to the same fact: the extensiveness of patrimonial administration and its resulting inability to force its coinage upon the merchants. Nevertheless, there is no doubt that the rationalization of coinage by the state and its increasing use greatly furthered the technical development of commerce. The superiority of the Hellenes with regard to trading techniques during the one and ¾ millennia from the 6th century B.C. to the supremacy of Venice and Genoa, on the one hand, and of Saracen trade on the other certainly was in part due to the fact that they were the first to exploit this advance. The development of an intensive money economy in the Orient, extending to India, after the conquests of Alexander was at least technically codetermined by it. However, the fate of the economy was from now on also more intimately connected with the ups and downs in the financial conditions of the powers issuing coinage. The catastrophe of the Roman finances in the third century, caused by the increasing grants to the army and the resulting monetary disorders, was by no means the cause for the return to a natural economy in late Antiquity, but it contributed to it. On the whole, however, the ordering of the monetary system by the government was much more determined by the given demands of the economy toward the state, which arose from the long-established conventions of commercial transactions, rather than being a condition of economic development. In Antiquity as well as in the Middle Ages the demand for rational coinage emanated in the cities, and urban development in the Occidental sense, especially the rise of independent crafts and indigenous retail trade, not wholesale trade, was reflected in the rationalization of coinage.

14. *Ethos and Style of Life*

The structure of domination affected the general habits of the peoples more by virtue of the *ethos* which it established than through the creation of these technical means of commerce. In this respect feudalism and patriarchal patrimonialism differ greatly. Both shaped strongly divergent political and social ideologies and through them a very different style of life.

Especially in the form of free vassalage and of the fief system, feudalism appeals to honor and personal fealty, freely assumed and maintained, as constitutive motives of action. Loyalty and personal fealty are also at the root of many plebeian forms of patrimonial or liturgical

feudalism (slave armies, soldiers settled as clerucbs, peasants or frontier guards, and especially levies of clients and *coloni*). However, they lack status honor as the integrating component. On the other hand, status honor counts for much in the army of "urban feudalism": the status honor of the Spartiates rests upon the warrior's knightly honor and etiquette; it employs the "duel of purification" for those who evaded combat or violated the etiquette; in attenuated form these features were generally characteristic of the early Hellenic armies of *hoplites*. But the personal relationship of fealty was absent. In the age of the Crusades Oriental prebendal feudalism sustained a sense of knightly status, but on the whole it remained formed by the patriarchal character of rulership. The combination of honor and fealty was only known, as we have seen, in Occidental feudalism and Japanese "vassalic" feudalism. Both have in common with Hellenic urban feudalism a special status education which aims at the inculcation of *ethos* based on status honor. But in contrast to Hellenic feudalism they made the vassal's fealty the center of a view of life which perceives the most diverse social relations, to the Savior as well as the loved one, from this vantage-point. The feudal consociation thus permeated the most important relationships with very personal bonds; their peculiarity also had the effect of centering the feeling of knightly dignity upon the cult of the personal. This contrasts violently with all impersonal and commercial relationships, which are bound to appear undignified and vulgar to the feudal ethic.

However, the antagonism toward commercial rationality also has other roots. First, there is the specific military character of the feudal system, which eventually is transposed to the political structure. The typical feudal army is an army of knights, and that means that individual heroic combat, not the discipline of a mass army, is decisive. The goal of military education is not, as in mass armies, drill for the sake of adaptation to an organized operation, but individual perfection in personal military skills. Therefore, one element finds a permanent place in training and general conduct, which, as a form of developing qualities useful for life, belongs to the original energy household of men and animals, but is increasingly eliminated by every rationalization of life—the *game*. Under feudal conditions it is just as little a "pastime" as in organic life, rather it is the natural form in which the psycho-physical capacities of the organism are kept alive and supple; the game is a form of "training," which in its spontaneous and unbroken animal instinctiveness as yet transcends any split between the "spiritual" and the "material," "body" and "soul," no matter how conventionally it is sublimated. Only once did the game find a specifically artistic perfection, imbued with genuine naiveté: in the wholly or semi-feudal Hellenic society of

warriors, first in Sparta. Among Occidental feudal knights and Japanese vassals the aristocratic status convention, with its stricter sense for distance and dignity, imposed a greater limitation on this kind of freedom than existed under the (relative) democracy of the citizenry of *hoplites*. But inevitably the game also occupies a most serious and important position in the life of these knightly strata; it constitutes a counterpole to all economically rational action. However, this kinship with an artistic style of life, which resulted from this aspect of the game, was maintained also directly by the "aristocratic" ethos of the dominant feudal stratum. The need for "ostentation," glamour and imposing splendor, for surrounding one's life with utensils which are not justified by utility but, in Oscar Wilde's sense, useless in the meaning of "beautiful," is primarily a feudal status need and an important power instrument for the sake of maintaining one's own dominance through mass suggestion. "Luxury" in the sense of rejecting purposive-rational control of consumption is for the dominant feudal strata nothing superfluous: it is a means of social self-assertion

Finally, positively privileged feudal strata do not view their existence functionally, as a means for serving a mission, that is, an idea that should be realized purposively. Their typical myth is the value of their "existence." Only the knightly fighter for the true faith has a different orientation, and wherever he was permanently dominant, most prominently in Islam, the free artistic game had only a limited importance. At any rate, feudalism is inherently contemptuous of bourgeois-commercial utilitarianism and considers it as sordid greediness and as the life force specifically hostile to it. Feudal conduct leads to the opposite of the rational economic ethos and is the source of that nonchalance in business affairs which has been typical of all feudal strata, not only in contrast to the bourgeois, but also to the peasants' proverbial shrewdness. This solidarity of feudal society is based on a common education which inculcates knightly conventions, pride of status and a sense of honor. This education is opposed to the charismatic magic asceticism of prophets and heroes through its secular orientation, to literary education through its belligerent heroic stance and to rational specialized training through its playful and artistic features.

In nearly all of these respects *patriarchal* patrimonialism has a different effect upon the style of life. Feudalism is always domination by the few who have military skills. Patriarchal patrimonialism is mass domination by one individual; as a rule it requires officials, whereas feudalism minimizes the demand for these. As far as it does not rely on alien patrimonial troops, it strongly depends upon the subjects' good will, which feudalism can afford to forego to a large extent. Against the dangerous

aspirations of the privileged status groups patriarchalism plays out the masses who everywhere have been its natural following. The "good king," not the hero, was the ideal glorified by mass legend. Therefore, patriarchal patrimonialism must legitimate itself as guardian of the subjects' welfare in its own and in their eyes. The "welfare state" is the legend of patrimonialism, deriving not from the free cameraderie of solemnly promised fealty, but from the authoritarian relationship of father and children. The "father of the people" (*Landesvater*) is the ideal of the patrimonial states. Patriarchalism can therefore be the carrier of a specific welfare policy, and indeed develops it whenever it has sufficient reason to assure itself of the good will of the masses. In modern history this happened, for example, in England under the regime of the Stuarts, when they fought against the anti-authoritarian forces of the Puritan bourgeoisie and of the semi-feudal *honoratiores*: Laud's Christian welfare policies had partly clerical, partly patrimonial roots. The minimization of administrative functions under feudalism, which is concerned about the welfare of the retainers only to the extent that this is indispensable for the lord's economic maintenance, contrasts with the maximization of administrative interests under patriarchalism. For every new administrative function which the patrimonial ruler appropriates means an elevation of his power and ideological significance and creates new benefices for his officials. The patrimonial ruler is not at all interested in a stereotyped distribution of property, especially of land. He establishes economic restrictions only to the extent that he satisfies his needs liturgically, he accomplishes this through collectively responsible bodies, within which an internal subdivision of property may take place. If he satisfies his needs through a money economy, then small landholdings and very intensive agriculture, combined with freely alienable land ownership, are very much compatible with his own interests. The patrimonial ruler does not abhor in the least new property formation through rational acquisition; in fact, he favors it under the condition that it does not establish new powers which gain authority independent of his approval.

Typical of patrimonialism is the determined rise from rags, from slavery and lowly service for the ruler, to the precarious all-powerful position of the favorite. In the interest of his domination, the patrimonial ruler must oppose the status autonomy of the feudal aristocracy and the economic independence of the bourgeoisie. Ultimately, every autonomous dignity and simply any sense of honor on the part of the "subjects" must be suspected of hostility to authority; the inner devotion to the authority of the sovereign indeed fared everywhere according to the outcome of the resultant historical struggles. The minimization of effec

tive administration by *honoratiores* and the ruler's dependence upon their voluntary participation in England, the success of revolutions in France and the other Latin countries, the independence of the social revolutionary ethos in Russia have impeded or destroyed that internalized devotion to authority which has remained an almost ineradicable legacy of unrestrained patrimonial rule in Germany and appears undignified to the outside observer. From a political viewpoint the German has indeed been the typical *Untertan* (subject) in the most poignant sense of the word, and therefore Lutheranism was his proper religiosity.

The only specific educational system of patriarchal patrimonialism is administrative training, which alone provides the basis for a stratum that in its most consistent form is an educated status group of the well-known Chinese type. However, education may also remain in the hands of the clergy as possessors of the skills useful for patrimonial administration, which needs accounting and clerical work unknown to feudalism. This happened in the Near East and in the Occidental Middle Ages. In this case education has a specifically literary character. Education may also be secular professional training in law, as it developed in the medieval universities, but even then it remains a literary education, and its increasing rationalization leads to the mentality of specialization and to the ideal of a "vocation" that is typical of modern bureaucracy. Patrimonial education always lacks the features of playfulness and elective affinity to art, of heroic asceticism and hero worship, of heroic honor and heroic hostility to the utilitarianism of business and office—features which feudalism inculcates and preserves. Indeed the administrative "organization" (*amtliche Betrieb*) is an impersonal "business" (*sachliches Geschäft*): The patrimonial official bases his honor not upon his "being," but on his "functions," he expects advantages and promotion from his "services"; the idleness, the games and the commercial nonchalance of the knight must appear to him as slothfulness and lack of efficiency. The status ethos adequate to the patrimonial official enters here into the avenues of the bourgeois business ethos. Already the philosophy of the ancient Egyptian officials, as we know it from exhortations by scribes and officials to their sons, has a distinctly utilitarian bourgeois character. In principle, nothing has changed since, apart from the increasing rationalization and professional specialization in the development from patrimonial officialdom to modern bureaucracy.

The main difference between the utilitarianism of the officials and the specifically bourgeois ethos has always been the former's abhorrence of the acquisitive drive, which is natural for a person who draws a fixed salary or takes fixed fees, who is ideally incorruptible, and whose performance finds its dignity precisely in the fact that it is not a source of

commercial enrichment. To that extent the spirit of patrimonial administration, interested as it is in public peace, the preservation of traditional means of livelihood and the satisfaction of the subjects, is alien to and distrustful of capitalist development, which revolutionizes the given social conditions; this was true, as we have seen, most of all of the Confucian ethos and to a moderate degree everywhere, especially since resentment against the emergent autonomous economic powers became an additional factor. So far it is no accident that specifically modern capitalism developed first in England where the rule of officials was minimized, just as under similar conditions ancient capitalism had reached its high point. This kind of resentment and the traditional status-oriented attitude of the bureaucracy toward rational economic profit eventually became the motives on which modern state welfare policies could rely and which facilitated them especially in bureaucratic states; however, these motives also determined the limitations and the peculiarities of these policies.

NOTES

1. Some of Weber's sources from the large German literature on feudalism have already been cited in the *Soc. of Law* and elsewhere (G. v. Below, H. Mitteis, etc.). Among Weber's contemporaries Otto Hintze in particular was impressed by his comparative approach. Hintze, who for a Prussian historian had a rare sense for the comparative method, wrote "Wesen und Verbreitung des Feudalismus" (1929), "Typologie der ständischen Verfassungen des Abendlandes" (1930), "Weltgeschichtliche Bedingungen der Repräsentativverfassung" (1931), and "Das monarchische Prinzip und die konstitutionelle Verfassung" (1911); see *id., Staat und Verfassung* (Göttingen: Vandenhoeck, 1962). Hintze also reviewed Weber's *Collected Essays on the Sociology of Religion* (1922) and *Wirtschaft und Gesellschaft* (1926); see *id., Soziologie und Geschichte* (Göttingen: Vandenhoeck, 1964).

For Otto Brunner's summary treatment of the literature on feudalism, see "Feudalismus. Ein Beitrag zur Begriffsgeschichte," *Akademie der Wissenschaften und der Literatur. Abh. der Geistes- und sozialwissenschaftlichen Klasse*, 1958, vol. 10, 3–39.

Apart from the standard works by Marc Bloch and François Ganshof on European feudalism, the English readers should consult John Whitney Hall, "Feudalism in Japan" (*Comparative Studies in Society and History*, V, Oct. 1962), since Japan is the other major case of feudalism. See also Vatro Murvar, "Some Reflections on Weber's Typology of *Herrschaft*," and Norman Jacobs, "The Patrimonial Thesis and Pre-Modern Japanese *Herrschaft*," both in *The Sociological Quarterly*, V:4, 1964, 374–95.

8. For a critique, see Alfons Dopsch, *Herrschaft und Bauer in der deutschen Kaiserzeit* (Stuttgart: Fischer, 1964; first publ. in 1939), 199ff. Dopsch, a contemporary of Weber, criticized him for asserting that the distribution of individual wealth was stabilized by feudalism and pointed to the busy trade in fiefs among the nobility and the monasteries during the 12th and 13th century. However, he ignored the comparative nature of Weber's statement, i.e., that it was made in comparison to patrimonial structures, as well as Weber's attempt to assess the balance of forces that restrain and favor the development of capitalism. Dopsch argues that the subleasing of fiefs, which Weber may have underestimated, furthered economic growth and that the feudal lords were motivated not by traditionalist economic standards (p. 210) but by a "rationally calculating economic spirit" (p. 207). However, Weber points out subsequently that feudal restrictions were not necessarily inimical to the money economy. Dopsch consistently blurs Weber's distinction between the ubiquitous acquisitive spirit and the specific motives and activities that entered into the making of modern capitalism. During the time Weber wrote *Economy and Society*, Dopsch tried to prove that the capitalist enterprise and market production existed as early as the Carolingian period (*Die Wirtschaftsentwicklung der Karolingerzeit*, 1912).

CHAPTER XIV

CHARISMA AND ITS TRANSFORMATION

i

The Nature and Impact of Charisma

1. *The Sociological Nature of Charismatic Authority*[1]

Bureaucracy and patriarchalism are antagonistic in many respects, but they share *continuity* as one of their most important characteristics. In this sense both are structures of everyday life. Patriarchalism, in particular, is rooted in the need to meet ongoing, routine demands, and hence has its first locus in the *economy*, to be precise, in those of its branches which are concerned with normal want satisfaction. The patriarch is the natural leader in matters of everyday life. In this respect, bureaucracy is merely the rational counterpart of patriarchalism. Bureaucracy, too, is a permanent structure and, with its system of rational rules, oriented toward the satisfaction of calculable needs with ordinary, everyday means.

All *extra*ordinary needs, i.e., those which *transcend* the sphere of everyday economic routines, have always been satisfied in an entirely heterogeneous manner: on a *charismatic* basis. The further we go back into history, the more strongly does this statement hold. It means the following: that the "natural" leaders in moments of distress—whether

psychic, physical, economic, ethical, religious, or political—were neither appointed officeholders nor "professionals" in the present-day sense (i.e., persons performing against compensation a "profession" based on training and special expertise), but rather the bearers of specific gifts of body and mind that were considered "supernatural" (in the sense that not everybody could have access to them).

The term "charisma" in this context must be used in a completely value-free sense. The heroic ecstasy of the Nordic berserk, the legendary Irish folk hero Cuchulain or the Homeric Achilles was a manic seizure. The berserk, for example, bit into his shield and all about himself, like a mad dog, before rushing off in bloodthirsty frenzy; for a long time his seizure was said to have been artificially induced through drugs. In Byzantium, a number of such "blond beasts" were kept just like war elephants in ancient times. The ecstasis of the Shamans is linked to constitutional epilepsy, the possession and testing of which proves the charismatic qualification. For us, both forms of ecstasy are not edifying; neither is the kind of revelation found in the Holy Book of the Mormons: if we were to evaluate this revelation, we would perhaps be forced to call it a rank swindle. However, sociology is not concerned with such value judgments. Important is that the head of the Mormons and those "heroes" and "magicians" proved their charisma in the eyes of their adherents. They practiced their arts, and they exercised their authority, by virtue of this gift ("charisma") and, where the idea of God had already been clearly established, by virtue of the Divine mission inherent in their ability. This was true of doctors and prophets just as much as of judges, military leaders, or the leaders of great hunting expeditions.

It is to Rudolf Sohm's credit that he worked out the sociological character of this kind of domination (*Gewaltstruktur*); however, since he developed this category with regard to one historically important case —the rise of the ecclesiastic authority of the early Christian church—, his treatment was bound to be one-sided from the viewpoint of historical diversity.[2] In principle, these phenomena are universal, even though they are often most evident in the religious realm.

In radical contrast to bureaucratic organization, charisma knows no formal and regulated appointment or dismissal, no career, advancement or salary, no supervisory or appeals body, no local or purely technical jurisdiction, and no permanent institutions in the manner of bureaucratic agencies, which are independent of the incumbents and their personal charisma. Charisma is self-determined and sets its own limits. Its bearer seizes the task for which he is destined and demands that others obey and follow him by virtue of his mission. If those to whom

he feels sent do not recognize him, his claim collapses; if they recognize it, he is their master as long as he "proves" himself. However, he does not derive his claims from the will of his followers, in the manner of an election; rather, it is their *duty* to recognize his charisma. Chinese theory makes the emperor's right to govern dependent upon popular consent, but this is just as little an instance of popular sovereignty as is the necessity of the prophet's "recognition" by the believers in the early Christian congregation. In the Chinese case this is simply the recognition of the charismatic character of the royal office, which requires his *personal* qualification and effectiveness. As a rule, charisma is a highly individual quality. This implies that the mission and the power of its bearer is qualitatively delimited from within, not by an external order. Normally, the mission is directed to a local, ethnic, social, political, vocational or some other group, and that means that it also finds its limits at the edges of these groups.

As in all other respects, charismatic domination is also the opposite of bureaucracy in regard to its economic substructure. Bureaucracy depends on continuous income, at least *a potiori* on a money economy and tax money, but charisma lives in, not off, this world. This must be understood properly. Frequently charisma abhors the owning and making of money—witness Saint Francis and many of his kind. But this is not the rule. In our value-free sense of the term, an ingenious pirate may be a charismatic ruler, and the charismatic political heroes are out for booty—especially, money. The point is that charisma rejects as undignified all methodical rational acquisition, in fact, all rational economic conduct. This accounts also for its radical difference from the patriarchal structure, which rests upon an orderly household. In its pure form charisma is never a source of private income; it is neither utilized for the exchange of services nor is it exercised for pay, and it does not know orderly taxation to meet the material demands of its mission; rather, if it has a peaceful purpose, it receives the requisite means through sponsors or through honorific gifts, dues and other voluntary contributions of its own following. In the case of charismatic warriors, the booty is both means and end of the mission. In contrast to all patriarchal forms of domination, pure charisma is opposed to all systematic economic activities; in fact, it is *the* strongest anti-economic force, even when it is after material possessions, as in the case of the charismatic warrior. For charisma is by nature not a continuous institution, but in its pure type the very opposite. In order to live up to their mission the master as well as his disciples and immediate following must be free of the ordinary wordly attachments and duties of occupational and family life. Those who have a share (κλῆρος) in charisma must inevitably turn

away from the world: witness the statute of the Jesuit order forbidding members to hold ecclesiastic offices; the prohibitions for members of other orders to own property, or for the order itself, as in the original rule of Saint Francis; the celibacy of priests and knights of an order; the actual adherence to the rule of celibacy on the part of numerous holders of prophetic or artistic charisma. According to the type of charisma and the conduct corresponding to it, the economic conditions of participation may contrast with one another. It is just as consistent for modern charismatic movements of artistic origin to consider "men of independent means"—in plain words, *rentiers*—the most qualified followers of the charismatic leader, as it was for the medieval monasteries to demand the economic opposite, the friar's vow of poverty.[3]

2. *Foundations and Instability of Charismatic Authority*

Charismatic authority is naturally unstable. The holder may lose his charisma, he may feel "forsaken by his God," as Jesus did on the cross [cf. Ps. 22:1, Mat. 27:46, Mark 15:34]; it may appear to his followers that "his powers have left him." Then his mission comes to an end, and hope expects and searches for a new bearer; his followers abandon him, for pure charisma does not recognize any legitimacy other than one which flows from personal strength proven time and again. The charismatic hero derives his authority not from an established order and enactments, as if it were an official competence, and not from custom or feudal fealty, as under patrimonialism. He gains and retains it solely by proving his powers in practice. He must work miracles, if he wants to be a prophet. He must perform heroic deeds, if he wants to be a warlord. Most of all, his divine mission must prove itself by *bringing well-being* to his faithful followers; if they do not fare well, he obviously is not the god-sent master. It is clear that this very serious meaning of genuine charisma is radically different from the convenient pretensions of the present "divine right of kings," which harks back to the "inscrutable" will of the Lord, "to whom alone the monarch is responsible."[4] The very opposite is true of the genuinely charismatic ruler, who is responsible to the ruled—responsible, that is, to prove that he himself is indeed the master willed by God.

For this reason a ruler such as the Chinese emperor, whose power still contains—in theory—important charismatic vestiges, may publicly accuse himself of his sins and insufficiencies, if his administration fails to banish the distress of the ruled, whether it is caused by floods or unsuccessful wars; we have witnessed this in China even during the

last decades. If this penitence does not propitiate the gods, the ruler faces deposition and death, often enough as an expiatory sacrifice. This is the concrete meaning of Meng-tse's (Mencius') statement that the people's voice is God's voice (according to him, the *only* way in which God speaks): If the people withdraw their recognition, the master becomes a mere private person—this is explicitly stated—, and if he claims to be more, a usurper deserving of punishment. This state of affairs is also found under primitive conditions, without the pathos of these highly revolutionary phrases. Since all primitive authorities have inherent charismatic qualities, with the exception of patriarchalism in the strictest sense, the chief is often simply deserted if success is unfaithful to him.

3. *The Revolutionary Nature of Charisma*

The mere fact of recognizing the personal mission of a charismatic master establishes his power. Whether it is more active or passive, this recognition derives from the surrender of the faithful to the extraordinary and unheard-of, to what is alien to all regulation and tradition and therefore is viewed as divine—surrender which arises from distress or enthusiasm. Because of this mode of legitimation genuine charismatic domination knows no abstract laws and regulations and no formal adjudication. Its "objective" law flows from the highly personal experience of divine grace and god-like heroic strength and rejects all external order solely for the sake of glorifying genuine prophetic and heroic ethos. Hence, in a revolutionary and sovereign manner, charismatic domination transforms all values and breaks all traditional and rational norms: "It has been written . . . , but *I* say unto you. . . ."

The specific form of charismatic adjudication is prophetic revelation, the oracle, or the Solomonic award of a charismatic sage, an award based on concrete and individual considerations which yet demand absolute validity. This is the realm proper of "*kadi*-justice" in the proverbial, not the historical sense. For the adjudication of the (historical) Islamic *kadi* is determined by sacred tradition and its interpretation, which frequently is extremely formalistic; rules are disregarded only when those other means of adjudication fail. Genuine charismatic justice does not refer to rules; in its pure type it is the most extreme contrast to formal and traditional prescription and maintains its autonomy toward the sacredness of tradition as much as toward rationalist deductions from abstract norms. We cannot compare here the recourse to the principle *aequum et bonum* in Roman law and the original meaning of "equity"

in English law to charismatic justice in general and the theocratic *kadi*-justice of the Islam in particular.[5] Both are products partly of a law that is already strongly rationalized and partly of abstract natural law; at any rate, the principle *ex fide bona* refers to standards of fairness in business relations and thus is just as little truly irrational justice as our own principle of "judicial discretion." By contrast, all adjudication which uses ordeals as evidence derives from charismatic justice. However, because such adjudication replaces personal charismatic authority by a regular procedure which formally determines the will of God, it belongs already to the realm of that depersonalization of charisma with which we will deal soon.

As we have seen, bureaucratic rationalization, too, often has been a major revolutionary force with regard to tradition. But it revolutionizes with *technical means*, in principle, as does every economic reorganization, "from without": It *first* changes the material and social orders, and *through* them the people, by changing the conditions of adaptation, and perhaps the opportunities for adaptation, through a rational determination of means and ends. By contrast, the power of charisma rests upon the belief in revelation and heroes, upon the conviction that certain manifestations—whether they be of a religious, ethical, artistic, scientific, political or other kind—are important and valuable; it rests upon "heroism" of an ascetic, military, judicial, magical or whichever kind. Charismatic belief revolutionizes men "from within" and shapes material and social conditions according to its revolutionary will. Of course, this contrast must be correctly understood. In spite of vast differences, "ideas" have essentially the same psychological roots whether they are religious, artistic, ethical, scientific or whatever else; this also applies to ideas about political and social organization. It is a time-bound, subjective value-judgment which would like to attribute some of these ideas to "reason" and others to "intuition" (or whatever other distinctions may be used). The mathematical imagination of a Weierstrass, for instance, is "intuition" in exactly the same sense as is that of any artist, prophet—or demagogue.[6] But not here lies the difference. (Parenthetically, in the value sphere, which does not concern us here, all these kinds of ideas—including artistic intuition—have in common that to objectivate themselves, to prove their reality, they must signify a grasp on demands of the "work" or, if you prefer, a being seized by them; they are not merely a subjective feeling or experience.) The decisive difference—and this is important for understanding the meaning of "rationalism"—is not inherent in the *creator* of ideas or of "works," or in his inner experience; rather, the difference is rooted in the manner in which the ruled and led experience and internalize these ideas. As

we have shown earlier," rationalization proceeds in such a fashion that the broad masses of the led merely accept or adapt themselves to the external, technical resultants which are of practical significance for their interests (as we "learn" the multiplication table and as too many jurists "learn" the techniques of law), whereas the substance of the creator's ideas remain irrelevant to them. This is meant when we say that rationalization and rational organization revolutionize "from the outside," whereas charisma, if it has any specific effects at all, manifests its revolutionary power from within, from a central *metanoia* [change] of the followers' attitudes. The bureaucratic order merely replaces the belief in the sanctity of traditional norms by compliance with rationally determined rules and by the knowledge that these rules can be superseded by others, if one has the necessary power, and hence are not sacred. But charisma, in its most potent forms, disrupts rational rule as well as tradition altogether and overturns all notions of sanctity. Instead of reverence for customs that are ancient and hence sacred, it enforces the inner subjection to the unprecedented and absolutely unique and therefore Divine. In this purely empirical and value-free sense charisma is indeed the specifically creative revolutionary force of history.

4. *Range of Effectiveness*

Both charismatic and patriarchal power rest on personal devotion to, and personal authority of, "natural" leaders, in contrast to the appointed leaders of the bureaucratic order, yet this basis is very different in the two cases. Just like the official, the patriarch benefits from devotion and authority as a bearer of norms, with the difference that these norms are not purposively established as are the laws and regulations of bureaucracy, but have been inviolable from times out of mind. The bearer of charisma enjoys loyalty and authority by virtue of a mission believed to be embodied in him; this mission has not necessarily and not always been revolutionary, but in its most charismatic forms it has inverted all value hierarchies and overthrown custom, law and tradition. In contrast to the charismatic structure that arises out of the anxiety and enthusiasm of an extraordinary situation, patriarchal power serves the demands of everyday life and persists in its function, as everyday life itself, in spite of all changes of its concrete holder and its environment. Both structures are found in all areas of life. Many of the old Teutonic armies fought in a patriarchal manner, each lineage group led by its head; the armies of *coloni* of ancient Oriental monarchs and the contingents of Frankish retainers, who took the field under their *seniores*, were patrimonial. The

patriarch's religious function and domestic worship persist side by side with the official community cult, on the one hand, and the great movements of charismatic prophecy, which are almost always revolutionary, on the other. Whether we look at Teutonic or American Indian tribes, the charismatic hero, who marches out with a voluntary following, appears next to the chieftain of peace, who is responsible for the routine economic affairs of the community, and next to the popular levy, which is mobilized in the case of tribal warfare. In an official war of the whole tribe, too, the normal peace-time authorities are often replaced by a warlord who is proclaimed *ad hoc* the "leader of the army" (*Herzog*), since he proved himself a hero in military exploits.

In contrast to the revolutionary role of charisma, the traditional everyday needs in politics and religion are met by the patriarchal structure, which is based upon habituation, respect for tradition, piety toward parents and ancestors, and the servant's personal faithfulness. The same is true in the economic field. As an orderly round of activities which procures the material means of want satisfaction, the economy is the specific locus of patriarchal rulership and, with the rise of the enterprise in the course of rationalization, also of bureaucratic domination. However, charisma is by no means alien to the economy. Under primitive conditions charismatic features are frequently found in one economic branch, the relevance of which declined with the advance of material culture: hunting, which was organized like a military operation, even at a later stage, as can be seen from the Assyrian royal inscriptions. However, the antagonism between charisma and everyday life arises also in the capitalist economy, with the difference that charisma does not confront the household but the enterprise. An instance of grandiose robber capitalism and of a spoils-oriented following is provided by Henry Villard's exploits. [In 1889] he organized the famous "blind pool" in order to stage a stock exchange raid on the shares of the Northern Pacific Railroad; he asked the public for a loan of fifty million pounds without revealing his goal, and received it without security by virtue of his reputation. The structure and spirit of this robber capitalism differs radically from the rational management of an ordinary capitalist large-scale enterprise and is most similar to some age-old phenomena: the huge rapacious enterprises in the financial and colonial sphere, and "occasional trade" with its mixture of piracy and slave hunting. The double nature of what may be called the "capitalist spirit," and the specific character of modern routinized capitalism with its professional bureaucracy, can be understood only if these two structural elements, which are ultimately different but everywhere intertwined, are conceptually distinguished.

5. The Social Structure of Charismatic Domination

It is true that the "purer" charismatic authority in our sense is, the less can it be understood as an organization in the usual sense: as an order of persons and things that function according to the means-ends scheme. However, charismatic authority does not imply an amorphous condition; it indicates rather a definite social structure with a staff and an apparatus of services and material means that is adapted to the mission of the leader. The personal staff constitutes a charismatic aristocracy composed of a select group of adherents who are united by discipleship and loyalty and chosen according to personal charismatic qualification. For the charismatic subject adequate material contributions are considered a dictate of conscience, although they are formally voluntary, unregulated and irregular; they are offered according to need and economic capacity. The more typical the charismatic structure, the less do followers or disciples obtain their material sustenance and social position in the form of benefices, salaries or other kinds of orderly compensation, titles or ranks. Instead, insofar as the individual's maintenance is not already assured, the followers share in the use of those goods which the authoritarian leader receives as donation, booty or endowment and which he distributes among them without accounting or contractual fixation. Thus the followers may have a claim to be fed at the common table, to be clothed and to receive honorific gifts from the leader, and to share in the social, political or religious esteem and honor in which he himself is held. Any deviation from this pattern affects the "purity" of the charismatic structure and modifies it in the direction of other structures.

6. The Communist Want Satisfaction of the Charismatic Community

Next to the household, charisma is thus the second important historical representative of *communism*, defined here as the absence of formal accountability in the *consumption* sphere, not as the rational organization of *production* for a common account (as under socialism). Every historical instance of communism in this sense has either a traditional, that means, patriarchal basis or the extraordinary foundation of charismatic belief; in the former case it is household communism, and only in this form has it been an everyday phenomenon; in the latter case it was, if fully developed, either the spoils communism of the camp or the monastery's communism of love with its variations and its degeneration into *caritas* and alms-giving. In various degrees of purity the spoils com-

munism of the camp is found in all charismatic warriors' organizations, from the pirate state of the Ligurian islands to the Islamic state of the caliph Omar and the military orders of Christianity and of Japanese Buddhism. In one form or another, the communism of love was paramount in all religions. It persists among the professional followers of the Divine: the monks. We also find it in numerous Pietist organizations—for example, among Labadie's followers—and in other high-strung religious groups of an exclusive character. The preservation of authentic heroism and saintliness appears to the adherents dependent upon the retention of a communist basis and the absence of the striving for individual property. And correctly so, since charisma is basically an extraordinary and hence necessarily non-economic power, and its vitality is immediately endangered when everyday economic interests become predominant, as it threatens to happen everywhere. The first step in this direction is the prebend—an allowance replacing the old communist maintenance out of common provisions—, which has here its real origin. With all available means the charismatic leaders attempt to limit this disintegration. All warrior states retained remnants of charismatic communism—Sparta is a typical example—and tried to protect the heroic individual against the "temptation" posed by responsibility for property, rational acquisition and a family, just like the religious orders did. The adjustment between these charismatic remnants and the individual's economic interests, which arise with prebendalization and persist ever after, may take the most diverse forms. Invariably, however, the reign of genuine charisma comes to an end when it can no longer withhold the unqualified permission to found families and to engage in economic pursuits. Only the common danger of military life or the love ethos of an unworldly discipleship can preserve such communism, which in turn is the only guarantor of the purity of charisma vis-à-vis everyday interests.

Every charisma is on the road from a turbulently emotional life that knows no economic rationality to a slow death by suffocation under the weight of material interests: every hour of its existence brings it nearer to this end.

ii

The Genesis and Transformation of Charismatic Authority

1. *The Routinization of Charisma*

Charismatic rulership in the typical sense described above always results from unusual, especially political or economic situations, or from extraordinary psychic, particularly religious states, or from both together. It arises from collective excitement produced by extraordinary events and from surrender to heroism of any kind. This alone is sufficient to warrant the conclusion that the faith of the leader himself and of his disciples in his charisma—be it of a prophetic or any other kind—is undiminished, consistent and effective only *in statu nascendi*, just as is true of the faithful devotion to him and his mission on the part of those to whom he considers himself sent. When the tide that lifted a charismatically led group out of everyday life flows back into the channels of workaday routines, at least the "pure" form of charismatic domination will wane and turn into an "institution"; it is then either mechanized, as it were, or imperceptibly displaced by other structures, or fused with them in the most diverse forms, so that it becomes a mere component of a concrete historical structure. In this case it is often transformed beyond recognition, and identifiable only on an analytical level.

Thus the pure type of charismatic rulership is in a very specific sense unstable, and all its modifications have basically one and the same cause: The desire to transform charisma and charismatic blessing from a unique, transitory gift of grace of extraordinary times and persons into a permanent possession of everyday life. This is desired usually by the master, always by his disciples, and most of all by his charismatic subjects. Inevitably, however, this changes the nature of the charismatic structure. The charismatic following of a war leader may be transformed into a state, the charismatic community of a prophet, artist, philosopher, ethical or scientific innovator may become a church, sect, academy or school, and the charismatic group which espouses certain cultural ideals may develop into a party or merely the staff of newspapers and periodicals. In every case charisma is henceforth exposed to the conditions of everyday life and

to the powers dominating it, especially to the economic interests. The turning point is always reached when charismatic followers and disciples become privileged table companions, as did the *trustis* of the Frankish king, and subsequently fief-holders, priests, state officials, party officials, officers, secretaries, editors and publishers, all of whom want to live off the charismatic movement, or when they become employees, teachers and others with a vested occupational interest, or holders of benefices and of patrimonial offices. The charismatically dominated masses, in turn, become tax-paying subjects, dues-paying members of a church, sect, party or club (*Verein*), soldiers who are systematically impressed, drilled and disciplined, or law-abiding "citizens." Even though the apostle admonishes the followers to maintain the purity of the spirit, the charismatic message inevitably becomes dogma, doctrine, theory, reglement, law or petrified tradition.

In this process the two basically antagonistic forces of charisma and tradition regularly merge with one another. This stands to reason, for their power does not derive from purposive-rational regulations and their observance, but from the belief in the sanctity of an individual's authority, which is unquestionably valid for the ruled (children, disciples, retainers or vassals), whether or not it really claims to be absolute. Both charisma and tradition rest on a sense of loyalty and obligation which always has a religious aura.

The external forms of the two structures of domination are also often similar to the point of being identical. It is not directly visible whether the companionage of a war leader with his followers has a patrimonial or a charismatic character; this depends upon the spirit which imbues the community, and that means upon the basis of the ruler's claim to legitimacy: authority sanctified by tradition, or faith in the person of the hero. The transition is fluid. As soon as charismatic domination loses its personal foundation and the acutely emotional faith which distinguishes it from the traditional mold of everyday life, its alliance with tradition is the most obvious and often the only alternative, especially in periods in which the rationalization of organizational techniques (*Lebenstechnik*) is still incipient. In such an alliance the essence of charisma appears to be definitely abandoned, and this is indeed true insofar as its eminently revolutionary character is concerned. It is the basic feature of this ever recurring development that charisma is captured by the interest of all economic and social power holders in the *legitimation* of their possessions by a charismatic, and thus sacred, source of authority. Instead of upsetting everything that is traditional or based on legal acquisition (in the modern sense), as it does *in statu nascendi*, charisma becomes a legitimation for "acquired rights." In this function, which is alien to its

essence, charisma becomes a part of everyday life; for the needs which it satisfies in this way are universal, especially for one general reason [namely, the legitimation of leadership and succession].

2. *The Selection of Leaders and the Designation of Successors*

Our earlier analysis of bureaucratic, patriarchal and feudal domination dealt only with the manner in which these everyday powers *functioned*. It did not explore the criteria for the selection of the highest-ranking bureaucratic or patriarchal holder of power. Even the head of a bureaucracy might conceivably be a high official who moves into his position according to general rules. However, it is no accident that this is usually not the case; at the least he is not selected according to the same norms as the officials in the hierarchy below him. Exactly the pure type of bureaucracy, a hierarchy of *appointed* officials, requires an authority (*Instanz*) which has not been appointed in the same fashion as the other officials. The holder of patriarchal power is naturally given in the nuclear family of parents and children, and in the extended family he is established through unambiguous traditional prescription. This is not equally true of the head of a patriarchal state or a feudal hierarchy.

For charismatic leadership, too, if it wants to transform itself into a perennial institution, the first basic problem is that of finding a successor to the prophet, hero, teacher or party leader. This problem inescapably channels charisma into the direction of legal regulation and tradition.

Given the nature of charisma, a free election of a successor is originally not possible, only the acknowledgment that the pretender actually *has* charisma. Hence the followers may have to wait for the epiphany of a personally qualified successor, temporal representative or prophet. Specific examples are the incarnations of Buddha and the Mahdis. Frequently, however, there is no such incarnation, or it may even be ruled out by dogmatic considerations, as in the case of Christ and originally of Buddha. Only genuine (Southern) Buddhism drew radical conclusions from this conception: After his death Buddha's followers continued to be a community of mendicant monks which maintained a minimal organization and consociation and, so far as possible, remained amorphous and intermittent. Wherever the old prescriptions of the Pâli texts were followed, as was often the case in India and Ceylon, there is neither a patriarch nor is the individual firmly attached

to a monastic consociation. The "dioceses" are only convenient geographical demarcations of areas within which the monks gather for the few communal ceremonies, which are free of any elaborate ritual. The "officialdom" is limited to the caretakers of clothes and a few similar functionaries. The renunciation of property on the part of the individual and the community and want satisfaction through the maecenatic system (gifts and alms) are carried as far as this is possible under the conditions of everyday life. Precedence in the order of seating or speaking at meetings is conferred only by seniority and by the relationship of the teacher to the novice who serves as his attendant (*famulus*). Resignation is possible at any time, and admission requirements are very low (including an apprenticeship, a recommendation and release by the teacher, and a minimum of ceremonies). There is neither dogma nor professional instruction and preaching. The two half-legendary *concilia* of the first centuries were not repeated.

It is certain that this highly amorphous character of the monastic community contributed heavily to the disappearance of Buddhism in India. It was, at any rate, possible only in a purely monastic community in which individual salvation was exclusively a personal matter. For in any other group such behavior, and a merely passive waiting for a new epiphany, will endanger the cohesion of the charismatic community, which yearns for the physical presence of the lord and master. If this strong desire to have a charismatic leader present all the time is accommodated, an important step in the direction of routinization has been made. Recurrent incarnation depersonalizes charisma. Its chosen holder must be sought either on the basis of some revealing characteristics and thus at least of some "rules"—like the new Dalai Lama, whose selection does not differ in principle from that of the Apis bull—; or some other definite and regular means must be available. In the latter category we find the belief, which easily emerges, that the holder of charisma himself is qualified to designate his successor or, if he is considered a unique incarnation such as Christ, his temporal representative. In all originally charismatic organizations, whether prophetic or warlike, the designation of a successor or representative has been a typical means of assuring the continuity of domination. But this indicates, of course, a step from autonomous leadership based on the power of personal charisma toward legitimacy derived from the authority of a "source." Pertinent religious examples are well-known. Instead we refer to the Roman magistrates, who designated their successors from among qualified persons before they were acclaimed by the assembled anny. The charismatic features of this mode of selection were preserved on a ceremonial level even after tenure in the office had been limited and formal *prior* consent ("elec-

tion") by the citizens' army had been introduced in an effort to curb the powers of the office. The designation of a *dictator* in the field, during military exigencies that called for an extraordinary man, remained for a long time a characteristic remnant of the old pure type of charismatic selection. The *princeps* emerged from the army's acclamation of the victorious hero as *imperator;* the *lex de imperio* did not make him the ruler, rather it acknowledged him as the rightful pretender. Hence, during the most typical period of the Principate, the only "legitimate" means of succession to the throne was the designation of a colleague and successor. This designation was regularly clothed in the form of an adoption. These customs, in turn, undoubtedly had a strong influence upon the Roman family, which came to accept the completely free designation of a *heres* to take the place of the late *pater familias* with respect to the gods and *familia pecuniaque* [family and property]. Even though the notion of the heritability of charisma was used in the case of succession by adoption—by the way, without ever being accepted as an explicit principle in the period of military emperorship—, the principate itself always remained an office and the *princeps* continued to be an official with specified bureaucratic jurisdiction as long as the military emperorship retained its Roman character. To have established the principate as an office was the achievement of Augustus, whose reform appeared to contemporaries as the preservation and restoration of Roman tradition and liberty, in contrast to the notion of a Hellenistic monarchy that was probably on Caesar's mind.

3. *Charismatic Acclamation*

If the charismatic leader has not designated a successor and if there are no obvious external characteristics, like those that usually facilitate identification in the case of incarnation, it may easily occur to the ruled that the participants (*clerici*) in his exercise of authority, the disciples and followers, are best suited to recognize the qualified successor. At any rate, since the disciples have in fact complete control over the instruments of power, they do not find it difficult to appropriate this role as a "right." However, since the effectiveness of charisma rests on the faith of the ruled, their approval of the designated successor is indispensable. In fact, acknowledgment by the ruled was originally decisive. For example, even after membership in the [medieval German] college of Electors as a screening committee had become firmly circumscribed, it remained a question of practical significance who of the Electors was to present the proposal to the assembled army, for in principle he was

able to procure the acclamation for his personal candidate irrespective of the wishes of his colleagues.

Thus designation by the closest and most powerful vassals and acclamation by the ruled is normally the end product of this mode of choosing a successor. In the "routine" patrimonial and feudal state we find this charismatically derived right of designation as the right of nomination (*Vorwahlrecht*) of the most important patrimonial officials or vassals. In this respect the election of the German king was patterned after the election of a bishop. The "election" of a new king, pope, bishop or priest through (1) designation by the disciples and followers (Electors, cardinals, diocesan priests, chapter, elders) and (2) subsequent popular acclamation was therefore not an "election" in the modern sense of a presidential or parliamentary election. In its essence it was something completely different, namely, the recognition or acknowledgment of a qualification older than the election, hence of a charisma, acceptance of which its bearer was in fact entitled to demand. In principle, therefore, a majority decision was at first not possible, for a minority, no matter how small, might be right in its recognition of genuine charisma, just as the largest majority might be in error. Only one person can be the genuine bearer of charisma; the dissenting voters thus commit a sacrilege. All rules of the papal election aim at unanimity, and the election of an anti-king is the same thing as a church schism: It obscures the correct identification of the "chosen" ruler. In principle, such a situation can be corrected only by Divine judgment as revealed in the outcome of a physical or magical combat, an institution found among pretenders to the throne, especially brothers, in certain African tribes and also elsewhere.

Once the majority principle has come to prevail, it is considered the moral duty of the minority to yield to the right cause proven by the election and to join the majority after the event. Yet charismatic domination begins to yield to a genuine electoral system once succession is determined by the majority principle. However, charisma is not alien to all modern, including all democratic, forms of election. Certainly the democratic system of so-called plebiscitarian rulership—the official theory of French caesarism—has essentially charismatic features, and the arguments of its proponents all emphasize this very quality. The plebiscite is not an "election," but the first or the renewed recognition of a pretender as a personally qualified, charismatic ruler; an example of the latter case is the French plebiscite of 1870. Periclean democracy, too, which according to the intent of its creator was the domination of the *demagogos* by means of a charisma of the spirit and the tongue, received its characteristic charismatic trait by virtue of the election of one

of the *strategoi* (the others being determined by lot, if Eduard Meyer's hypothesis is correct).[8] Wherever originally charismatic communities enter on the path of electing their rulers, the electoral procedures will in the long run be tied to norms. This happens above all because with the vanishing of the genuine roots of charisma the everyday power of tradition and the belief in its sanctity regain their preponderance, so that only the observance of tradition can henceforth guarantee the right choice. Acclamation by the ruled recedes increasingly behind the charismatically determined right of prior election (*Vorwahlrecht*) by clerics, court officials or great vassals, and ultimately an exclusive oligarchic electoral agency comes into being, as in the Catholic church and the Holy Roman empire. Indeed this is bound to happen wherever a group with procedural experience has the right of nomination or of prior selection. Throughout the history of the city, this prerogative everywhere turned into a right of cooptation on the part of ruling families, who in this fashion reduced the lord to the position of a *primus inter pares* (archon, consul, doge) and the electoral participation of the community to insignificance. In our own days we find a parallel, for example, in the development of the senatorial election in Hamburg. From a formal viewpoint this transformation is by far the most frequent "legal" road to oligarchy.

4. *The Transition to Democratic Suffrage*

However, the reverse may also happen: Acclamation by the ruled may develop into a regular electoral system, with standardized suffrage, direct or indirect election, majority or proportional method, electoral classes and districts. It is a long way to such a system. As far as the election of the supreme ruler is concerned, only the United States went all the way—and there, of course, the nominating campaign within each of the two parties is one of the most important parts of the election business. Elsewhere at most the parliamentary representatives are elected, who in turn determine the choice of the prime minister and his colleagues. The development from acclamation of the charismatic leader to popular election occurred at the most diverse cultural stages, and every advance toward a rational, emotionally detached consideration of the process could not help but to facilitate this transfonnation. However, only in the Occident did the election of the ruler gradually develop into the representative system. In Antiquity the *boiotarchai* represented [in the Boeotian League] their communities (as originally also the members of the House of Commons), not the voters as such, and

wherever, as in the case of Attic Democracy, the officials were really popular mandataries and representatives and the *demos* was subdivided into sections, the principle of rotation rather than of representation prevailed [and gave each section a turn]. However, if this principle is radically applied, the elected person is formally the agent and hence the servant of his voters, not their chosen master, just like in a system of direct democracy. This means that structurally the charismatic basis has been completely abandoned. But in countries with large administrative bodies such a radical application of the principles of direct democracy has very narrow limits.

5. *The Meaning of Election and Representation*

For purely technical reasons, it is not feasible to tie the mandate of the representative completely to the voters' will since situations are always unstable and unanticipated problems always arise. The recall of the representative through a vote of no confidence has been rarely tried, and the approval of parliamentary decisions through a referendum results primarily in a considerable strengthening of all irrational powers of inertia, since as a rule the referendum precludes horse-trading and compromises between the interested parties. Finally, increasing costs make frequent elections impossible. All attempts at subordinating the representative to the will of the voters have in the long run only one effect: They reinforce the ascendancy of the party organization over him, which alone can mobilize the people. Both the pragmatic interest in the flexibility of the parliamentary apparatus and the power interest of the representatives and the party functionaries converge on one point: They tend to treat the representative not as the servant but as the chosen "master" of his voters. Most constitutions express this in the formula that the representative—like the monarch—is free to decide as he sees fit and that he "represents the interests of all the people." His actual power may vary considerably. In France the individual deputy normally controls not only the patronage of all offices, but he is in the proper sense of the word the "master" of his electoral district—this explains the resistance to the proportional system and the absence of party centralization; in the United States this is precluded by the predominance of the Senate, whose members occupy a similar position; in England and even more so in Germany the individual deputy, for very different reasons, is less the master than the agent of the economic interests in his electoral district, and patronage is controlled by the influential party chiefs.

Here we cannot deal further with the manner in which the electoral system distributes power; this depends upon the historically given mode of domination, and largely upon autonomous, that is, technically determined factors. We have been concerned only with the principles. Any election may be purely formal without having any real significance. This happened in the *comitia* of early Imperial Rome and in many Hellenic and medieval cities, as soon as an oligarchic club or a despot managed to seize political power and in fact designated the candidates to be elected into office. Even where this is not formally the case, the observer is well advised, whenever historical sources speak in general terms of an "election" of the prince or any other power-holder by the community—as in the case of the Germanic tribes—, to understand the expression not in the modern sense but to interpret it as a mere acclamation of a candidate who was designated by some other authority and also elected from only one or a few qualified families. We are not at all dealing with an election, of course, when voting for a political ruler has a plebiscitary and hence charismatic character: when instead of a real choice between candidates only the power claims of a pretender are being acknowledged.

Normal "elections," too, can only be a decision between several candidates who have been screened before being offered to the voters. This decision is brought about in the arena of electoral agitation through personal influence and appeal to material or ideal interests. The electoral provisions constitute, as it were, the rules of the game for this "peaceful" contest. The designation of these candidates takes place within the parties, for it stands to reason that party leaders and their followers, not the amorphous activities of voters, organize the contest for votes and thus for office patronage. Quadrennial campaign costs in the United States already amount to about as much as a colonial war, and in Germany too election costs are increasing for all parties which cannot draw upon the cheap manpower provided by Catholic auxiliary clergymen, noble or office-holding notables, or salaried trade union and other secretaries.

In addition to the power of money, the "charisma of rhetoric" gains great influence under these conditions. Its impact is not necessarily dependent upon any particular cultural level; it is also known to the assemblies of Indian chiefs and to the African palavers. Under Hellenic democracy it experienced its first great qualitative efflorescence, with immense consequences for the development of language and thought. However, from a purely quantitative viewpoint modern democratic electioneering with its "stump speeches" surpasses anything seen previously. The more mass effects are intended and the tighter the bu-

reaucratic organization of the parties becomes, the less significant is the content of the rhetoric. For its effect is purely emotional, insofar as simple class situations and other economic interests do not prevail which must be rationally calculated and manipulated. The rhetoric has the same meaning as the street parades and festivals: to imbue the masses with the notion of the party's power and confidence in victory and, above all, to convince them of the leader's charismatic qualification.

Since all emotional mass appeals have certain charismatic features, the bureaucratization of the parties and of electioneering may at its very height suddenly be forced into the service of charismatic hero worship. In this case a conflict arises between the charismatic hero principle and the mundane power of the party organization, as Roosevelt's [1912] campaign demonstrated.

6. Excursus *on Party Control by Charismatic Leaders, Notables and Bureaucrats*

Almost all parties originate as a charismatic following of legitimate or caesarist pretenders, of demagogues in the style of Pericles, Cleon or Lassalle. If parties develop at all into routinized permanent organizations, they generally are transformed into structures controlled by *honoratiores*. Until the end of the 18th century this almost always meant a federation of nobles. In the Italian cities of the Middle Ages a person could be elevated into the ranks of the *nobili* as a political punishment (since the great urban vassals were almost always Ghibelline); this was tantamount to disqualification from office and political disfranchisement. However, it was very rare, even under the *popolani*, for a commoner to hold leading offices, even though here as always the bourgeois strata had to finance the parties. The decisive element was that the military power of the parties, which often resorted to direct force, was provided by the nobility, in case of the Guelphs, for example, according to fixed contributions. Huguenots and Catholic League, the English parties, including the Roundheads, indeed all parties before the French Revolution typically developed into associations of notables, mostly led by nobles, after they had passed through a period of charismatic excitement that broke down class and status barriers in favor of one or several heroes. The same was true of the so-called "bourgeois" parties in the 19th century, even the most radical ones: all of them fell under the control of *honoratiores*, for only they could govern a party or the state without compensation, and they had of course the advantage of status or economic influence. Whenever the owner of a landed estate changed

his party affiliation, it was more or less taken for granted in England, and in East Prussia until the eighteen-seventies, that not only his patrimonial subjects but also the peasants would follow him—except in times of revolutionary excitement. At least in the smaller towns, a somewhat similar role was played by the mayors, judges, notaries, lawyers, ministers and teachers, and often also by the manufacturers until the workers organized themselves as a class. We will discuss in a different context why the manufacturers, even apart from their class situation, were generally not suited for this role. In Germany the teachers constitute a stratum that—for reasons inherent in its particular status position—provides unpaid electoral agents to the so-called "bourgeois" parties, just as the clergy normally does for the authoritarian parties. In France the lawyers have always been available to the bourgeois parties, partly because of their technical qualifications and partly—during and after the Revolution—because of their status position.

During the French Revolution some party organizations began to evolve in a bureaucratic manner, but they were too short-lived to develop a definite structure; only in the last decades of the 19th century did bureaucratic organization gain the upper hand everywhere. The oscillation between subordination to charisma and obedience to *honoratiores* was succeeded by the struggle of the bureaucratic organization with charismatic leadership. The more bureaucratization advances and the more substantial the interests in benefices and other opportunities become, the more surely does the party organization fall into the hands of experts, whether these appear immediately as party officials or at first as independent entrepreneurs—witness the American boss. These experts systematically maintain personal relations with the ward leaders, agitators, controllers and other indispensable personnel, and keep the voters' lists, files and all other materials required for running the party machine. Henceforth only the control of such an apparatus makes possible an effective influence on the party's policies and, if need be, a successful secession. The [1880] *Sezession* [in the German National Liberal Party] became possible because the Reichstag deputy Rickert had the lists of the ward leaders; from the beginning the subsequent breakup of the *Freisinnige Partei* appeared likely since Eugen Richter and Rickert each retained his own apparatus; and the fact that the former Secessionists managed to seize control of the party's executive board was a more serious symptom of the forthcoming split than all the preceding rhetoric.[9] Conversely, the impossibility of merging the personnel of two rival organizations has been much more important than any substantive disagreement for the failure of attempts at party mergers; this is again illustrated by German experiences.

In normal times such a bureaucratic apparatus, more or less consistently developed, controls the party's course, including the vitally important nomination of candidates. However, in times of great public excitement, charismatic leaders may emerge even in solidly bureaucratized parties, as was demonstrated by Roosevelt's campaign in 1912. If there is a "hero," he will endeavor to break the technician's hold over the party by imposing plebiscitary designation and possibly by changing the whole machinery of nomination. Such an eruption of charisma, of course, always faces the resistance of the normally predominant pros, especially of the bosses who control and finance the party and maintain its routine operations, whose tools the candidates usually are. For not only the material interests of the job hunters depend upon the selection of the party candidates, but very much also those of the party sponsors—banks, contractors and trusts. Since the times of Crassus, a typical figure has been the great sponsor who at times finances a charismatic leader and who expects from the latter's electoral victory government contracts, tax-farming opportunities, monopolies or other privileges, and especially the repayment with interest of his advances. But the regular party organization also lives off party sponsors. Rarely sufficient are the ordinary revenues, such as dues and possibly kickbacks from the salaries of officials who got their government job through the party (as in the United States). The direct exploitation of the party's power position enriches the participants, but does not necessarily fill the party coffers. For propagandistic reasons dues are frequently abolished or depend upon the member's self-assessment; this puts the control over the party's finances even formally into the hands of the big sponsors. The regular manager and political professional, the boss or the party secretary, can expect their financial support only if he firmly controls the party machine. Hence every irruption of charisma is also a financial threat to the regular organization It happens quite frequently that the warring bosses or other managers of the competing parties combine in defense of their common economic interests to prevent the rise of charismatic leaders, who would be independent of the regular party apparatus. As a rule, the party organization easily succeeds in this castration of charisma. This will also remain true of the United States, even in the face of the plebiscitary presidential primaries, since in the long run the continuity of professional operations is tactically superior to emotional worship. Only extraordinary conditions can bring about the triumph of charisma over the organization. The peculiar relationship between charisma and bureaucracy that split the English Liberal party over the issue of the first home rule bill is well known: Gladstone's very personal charisma, which was irresistible to

Puritan rationalism, forced the caucus bureaucracy to make an about-face and to stand with him despite the most serious objections and the prognosis of an unfavorable outcome of the elections; this resulted in the split of the apparatus that Chamberlain had created and in the loss of the electoral battle. A similar thing happened in the United States last year [1912].

It stands to reason that a party's general character is significant for the chances that charisma has in its struggle with the party bureaucracy. These chances vary greatly with the character of the party, which may be a pragmatic group of patronage seekers with an *ad hoc* program for a given campaign, or primarily a party of notables or of a class, or again predominantly an ideological party with a *Weltanschauung*. These distinctions are, of course, always relative. In certain respects the chances of charisma are greatest in the first case. A patronage party makes it much easier, *ceteris paribus*, for impressive personalities to win the necessary following than do the petty-bourgeois organizations of notables of the German parties, particularly of the liberal ones, with their programs and *Weltanschauungen* which are forever the same; any attempt to adapt the latter to the momentary demagogic opportunities easily precipitates a catastrophe. However, it is probably not possible to generalize on this score. The internal dynamics of party organization and the social and economic conditions of each concrete case are all too intimately interwoven in any given situation.

7. *Charisma and the Persistent Forms of Domination*

As these examples show, charismatic domination is by no means limited to primitive stages of development, and the three basic types of domination cannot be placed into a simple evolutionary line: they in fact appear together in the most diverse combinations. It is the fate of charisma, however, to recede with the development of permanent institutional structures. As far as we know the early stages of social life, every concerted action that transcends the traditional mode of satisfying economic needs in the household has a charismatic structure. Primitive man perceives all external influences that shape his life as the actions of specific forces which are inherent in things and men, living and dead, and give them the power to do good as well as harm. The entire conceptual apparatus of primitive tribes, including their nature- and animal-fables, proceeds from such assumptions. Concepts like *mana*, *orenda* and similar ones, the meaning of which ethnography explains to us, denote such specific forces whose supernatural character is ex-

clusively due to the fact that they are not accessible to everybody but linked to some definite carrier—person or object. Magic and heroic qualities are nothing but particularly important instances of such specific powers. Every event transcending the routines of everyday life releases charismatic forces, and every extraordinary ability creates charismatic beliefs, which are subsequently weakened again by everyday life. In normal times the powers of the village chief are very limited, amounting to little more than arbitration and representation. In general, the members of the community do not claim the right to depose him, for his power is charismatic and not elective; however, if need be they desert him without hesitation and settle elsewhere. Among the Germanic tribes a king could still be rejected in this manner because of inadequate charismatic qualification. We might almost say that the normal condition of primitive communities was anarchy moderated by compliance with customs, which was either unreflecting or motivated by apprehension toward the uncertain consequences of innovation. The magician's social influence is similarly weak in everyday life.

However, the charisma of the hero or the magician is immediately activated whenever an extraordinary event occurs: a major hunting expedition, a drought or some other danger precipitated by the wrath of the demons, and especially a military threat. The charismatic hunting or war leader is often not identical with the peacetime chief who has primarily economic and also mediating functions. When the manipulation of deities and demons becomes an object of a permanent cult, the charismatic prophet and magician turns into a priest. When wars become chronic and technological development necessitates the systematic training and recruitment of all able-bodied men, the charismatic war leader becomes a king. The Frankish royal officials, count and *sakebaro*, were originally military and financial officials; all other tasks are of a later date, especially the judicial functions, which at first remained in the hands of the ancient charismatic communal arbitrators. The entrenchment of a war leader with a permanent staff is the decisive step to be linked with the notions of "kingship" and "state," as compared to the peacetime chief whose primary functions are sometimes more economic (regulating common economic concerns of the village or market community), sometimes more magic (religious or medical), sometimes more judicial (originally limited to arbitration). It is arbitrary to derive kingship and state, in adaptation of Nietzschean concepts, from the subjection of one tribe by another, which thereupon creates a permanent apparatus in order to maintain its ascendancy and to exact tribute.[28] For the same differentiation between arms-bearing and tax-exempt warriors and unarmed, service-rendering non-combattants can easily develop

within any tribe that is chronically threatened with war; incidentally, the dependence of the non-combattants is frequently not patrimonial. The chief's following may form a military brotherhood and exercise political rights, so that a feudal aristocracy emerges. Alternatively, the chief may increasingly resort to hiring his following, first in order to launch marauding expeditions and later to dominate his own people; for this case, too, there are examples. [The conquest theory] is correct only to the extent that kingship is normally charismatic war leadership that has become permanent and has developed a repressive apparatus for the domestication of the unarmed subjects. This apparatus naturally became strongest in conquered territories, because of the continuous threat to the ruling stratum. It is no accident that the Norman states, especially England, were the only feudal states in the Occident with a really centralized and highly developed administration; the same was true of the Arabic, Sassanid and Turkish warrior states, which were most highly organized in conquered areas. The development of hierocratic power followed the same pattern. The strict centralization of the Catholic church originated in the Occidental mission territory and was completed in the wake of the [French] Revolution which destroyed the power of the local clergy: as *ecclesia militans* the church created its technical apparatus. However, kingship and high-priesthood exist also without conquest and missionary activities, if we consider as the decisive feature the persistence of a bureaucratic, patrimonial or feudal structure of domination.

8. *The Depersonalization of Charisma: Lineage Charisma, "Clan State" and Primogeniture*

Whatever we have said until now about the possible consequences of the routinization of charisma has not affected its strictly personal quality. However, we will now turn to phenomena whose common feature is a peculiar depersonalization of charisma. From a unique gift of grace charisma may be transformed into a quality that is either (a) transferable or (b) personally acquirable or (c) attached to the incumbent of an office or to an institutional structure regardless of the persons involved. We are justified in still speaking of charisma in this impersonal sense only because there always remains an extraordinary quality which is not accessible to everyone and which typically overshadows the charismatic subjects. It is for this very reason that charisma can fulfill its social function. However, since in this manner charisma becomes a component of everyday life and changes into a permanent

structure, its essence and mode of operation are significantly transformed.

The most frequent case of a depersonalization of charisma is the belief in its transferability through blood ties. Thus the desires of the disciples or followers and of the charismatic subjects for the perpetuation of charisma are fulfilled in a most simple fashion. However, the notion of a truly individual inheritance was as alien here as it was originally to the household. Instead of individual inheritance we find the immortal household as property-holder vis-à-vis the succeeding generations. In the beginning, charisma too is hereditary only in the sense that household and lineage group are considered magically blessed, so that they alone can provide the bearers of charisma. This notion lies so close at hand that its genesis scarcely needs an explanation. Because of its supernatural endowment a house is elevated above all others; in fact, the belief in such a qualification, which is unattainable by natural means and hence charismatic, has everywhere been the basis for the development of royal and aristocratic power. For just as the charisma of the ruler attaches itself to his house, so does that of his disciples and followers to their houses. The *kobetsu*, the families who (allegedly) descended from the house (*uji*) of the Japanese charismatic ruler Jimmu Tennô, are considered to be permanently blessed and retain this preeminence over the other *uji*, among whom the *shinbetsu* constitute the charismatic aristocracy; the latter comprise the clans of followers which (allegedly) immigrated with Jimmu Tennô as well as those native ones that he incorporated into his following. This aristocracy assigns the administrative positions to its members. The two clans of the *Muraji* and the *Omi* occupied the highest charismatic rank. In these as in all the other clans, the same phenomenon occurred when the joint household disintegrated: one house is considered the Great House (*ô* = *oho*). The houses *O Muraji* and *O Omi* are the bearers of the specific charisma of their clans, and their heads therefore claim the right of occupying the corresponding positions at court and in the political community. Wherever the principle of charismatic blood relationship has been fully applied, all occupational status, down to the lowest craft, rests, at least theoretically, upon the tie between a specific charisma and a specific lineage group and between the prerogative of leadership within such a group and its charismatically qualified Great House. The political organization of the state depends upon lineage groups, their retainers and territorial holdings. As a type such a "clan state" (*Geschlechterstaat*) should be clearly distinguished from any type of feudal or patrimonial state or state with hereditary offices (*Amtsstaat*), regardless of the fluid historical transitions. For the rights of the individual lineage groups to their functions are legitimated by the charisma inherent in their

houses, not by any personal fealty that derives from a grant of property or office. As previously mentioned, the transition from this condition to the feudal state is regularly motivated by the ruler's interest in destroying the autonomous legitimacy of these lineage groups and in replacing it with a feudal legitimacy derived from his own person.

We are not interested here in the degree of correspondence between historical reality and the pure type of charismatic blood relationship; for our purposes it is sufficient that the principle existed in more or less developed form among the most diverse peoples. Remnants of it can be found in the historical period of Germanic as well as Greek Antiquity (witness the preeminence, by virtue of their blood line, of the Eteobutadai in Athens and, conversely, the disqualification of the Alkmaionidai by virtue of their blood guilt).

In historical times, however, the principle of dynastic and lineage charisma has generally been adhered to far less consistently. As a rule, the most primitive and the highest stages of culture only know the charismatic privilege of the ruling dynasty and possibly of a very limited number of other powerful families. Under primitive conditions the charisma of the magician, rainmaker, medicine-man and priest, as long as it is not fused with political authority, is much less frequently tied to the charisma of a house; only the development of a regular cult gives rise to those charismatic blood ties between certain priestly positions and aristocratic lineage groups that occur often and in turn affect the hereditability of other types of charisma. As physiological blood ties gain increasing importance, deification sets in, at first of the ancestors and eventually also of the incumbent ruler, if the process is not interrupted; we shall return to some of its consequences.

Lineage charisma, however, does not assure the unambiguous identification of the successor. This requires a definite rule of succession; hence the belief in the charismatic importance of blood relationship must be implemented by the belief in the charisma of primogeniture. For all other systems, including the system of "seniority" frequently applied in the Orient, lead to wild palace intrigues and revolts, particularly when polygamy is practiced and the wives' struggle for the succession rights of their children is added to the ruler's interest in eliminating potential pretenders in favor of his own offspring. In a feudal state the principle of primogeniture is usually established first for fief-holders because the division of hereditary fiefs must be limited in the interest of their service capacities. Subsequently, the principle is, so to speak, projected back to the apex of the feudal pyramid, as it happened in the course of Occidental feudalization. In a patrimonial state, whether of the Oriental or Merovingian variety, the validity of the principle of

primogeniture is much less certain. In its absence the alternative is either to divide the political powers just like any other patrimonial possession or to select the successor according to some regular procedure: Divine judgment (duelling among the sons, often practiced in primitive tribes), the oracular drawing of lots (which in reality means selection by the priests, as among the Jews since Joshua), or finally the normal form of charismatic selection through nomination and popular acclamation; this case, even more than the others, is fraught with the danger of double elections and of succession fights. At any rate, dominance of monogamy as the sole legitimate form of marriage has been one of the most important reasons for continuity of monarchic power; it benefited the Occidental monarchies, but under the Oriental conditions the mere thought of an impending or possible succession haunted the whole administration, and the actual succession always threatened to be catastrophic for the state.

On the whole, the belief in the hereditariness of charisma belongs to those conditions which account for the greatest historical "accidents" with regard to the structure and persistence of polities, especially since the principle of heredity may have to compete with other forms of designating a successor. The structure of Islam has been affected decisively by the fact that Mohammed died without male heirs and that his followers did not found the Caliphate on hereditary charisma, and indeed during the Omayyad period developed it in an outright anti-theocratic manner. It is largely owing to such differences about the ruler's qualification that Shiism, which recognizes the hereditary charisma of Ali's family and hence accepts the infallible doctrinal authority of an *imâm*, is so antagonistic to orthodox Sunna, which is based on tradition and *idshmâ* (*consensus ecclesiae*). Apparently it was easier to displace Jesus' family from its originally important position in the community. The fact that the German Carolingians and the subsequent royal dynasties died out just when hereditary charisma might have become strong enough to prevail over the electoral claims of the princes, has been highly significant for the decline of royal power in Germany, while in France and England, by contrast, the rise of kingship was strengthened by hereditary charisma. This has had probably even more far-reaching consequences than the fate of Alexander's family. In contrast to this role of heredity, almost all capable Roman emperors of the first three centuries ascended the throne by virtue of designation through adoption, not by virtue of blood relationship; and most of those who became emperors in the latter way weakened the office. The reasons for these divergent consequences are apparently connected with the difference between the political structure of a feudal state and that of an increasingly bureaucratized state that is dependent upon a

standing army and its officers. We will not pursue this difference at this point.

9. *Office Charisma*

Once the belief is established that charisma is bound to blood relationship, its meaning is altogether reversed. If originally a man was ennobled by virtue of his own actions, now only the deeds of his forefathers could legitimate him. Hence one became a member of the Roman nobility not by holding a nobilitating office, but because one's own ancestors had done so, and the office aristocracy delimited in this way endeavored to monopolize the offices. This reversal of genuine charisma into its exact opposite occurred everywhere according to the same pattern. The genuinely American (Puritan) mentality glorified the self-made man as the bearer of charisma and counted the heir for nothing, but this attitude is being reversed before our own eyes; now only descent—from the Pilgrim Fathers, Pocahontas and the Knickerbockers—or membership in the accepted families of "old" wealth is valued. The closing of the rolls of nobility, the tests of ancestry, the admission of the newly rich only as *gentes minores*, and similar phenomena are all equally an expression of the attempt to increase status by making it scarce. Economic motives are not only behind the monopolization of remunerative offices or of other connections with the state, but also behind the monopolization of the *connubium*; noble rank provides an advantage in the quest for the hands of rich heiresses and also increases the demand for one's own daughters.

In addition to the depersonalization of charisma in the form of inheritance, there are other historically important forms. First of all, charisma may be transferred through artificial, magical means instead of through blood relationship: The apostolic succession secured through episcopal ordination, the indelible charismatic qualification acquired through the priest's ordination, the king's coronation and anointment, and innumerable similar practices among primitive and civilized peoples all derive from this mode of transmission. Most of the time the symbol has become something merely formal, and in practice is less important than the conception often related to it—the linkage of charisma with the holding of an *office*, which itself is acquired by the laying on of hands, anointment, etc. Here we find that peculiar transformation of charisma into an institution: as permanent structures and traditions replace the belief in the revelation and heroism of charismatic personalities, charisma becomes part of an established social structure.

In the early Christian church the Bishop of Rome occupied an essentially charismatic position (originally together with the Roman *ecclesia*): The church of Rome acquired very early a specific authority and asserted it time and again against the intelletual superiority of the Hellenistic Orient, which produced almost all great church fathers, established the dogmas and held all ecumenical councils; this predominance lasted as long as the unity of the church was maintained on the basis of the firm belief that God would not permit the church of the world capital to err despite its much smaller intellectual endowment. This authority was nothing but charismatic; it was by no means a primacy in the modern sense of a definitive doctrinal authority (*Lehramt*), nor did it resemble universal jurisdictional powers in the sense of an appellate function or even an episcopal jurisdiction in competition with the local powers. Such notions had not yet been developed. Moreover, just like any other charisma, this one too was at first considered a precarious gift of grace; at least one Bishop of Rome was anathematized by a Council. But on the whole this charisma was believed to be a Divine promise to the church. Even Innocent III at the height of his power did not invoke more than the rather general and vague belief in this promise; only the bureaucratized and intellectualized church of modern history turned it into a charisma of office and differentiated, as does every bureaucracy, between the office (*ex cathedra*) and the incumbent.

The charisma of office—the belief in the specific state of grace of a social institution—is by no means limited to the churches and even less to primitive conditions. Under modern conditions, too, it finds politically relevant expression in the attitudes of the subjects to the state. For these attitudes may vary considerably according to whether they are friendly or hostile to the charisma of office. The specific lack of respect of Puritanism for mundane affairs, its rejection of all idolization, eradicated all charismatic respect towards the powers-that-be in the areas of Puritan predominance. The conduct of an office appeared as a business like all others, the ruler and his officials as sinners like everyone else —strongly emphasized by Kuyper—and as no wiser than anyone else. Through God's inscrutable will they chanced upon their position and thus gained the power to fabricate laws, statutes, judgments and ordinances. Whoever shows the marks of damnation must of course be removed from a church office, but this principle is inapplicable and also dispensable with regard to state offices. As long as the secular power-holders do not directly violate conscience and God's honor, they are tolerated, for any change would merely replace them with others just as sinful and probably just as foolish. But they do not have any inwardly

binding authority since they are merely parts of an order made by and for man. The office is functionally necessary, but it does not transcend its incumbent and cannot reflect upon him any dignity, such as is possessed, for example, by the lowest royal court (*königliches Amtsgericht*) according to normal German sentiment. This naturalistic and rational attitude toward the state, which has had very conservative or very revolutionary effects depending on the given conditions, has been basic to numerous important features of countries under Puritan influence. The fundamentally different attitude of the average German toward the *Amt*, toward the "supra-personal" authorities and their "nimbus" is of course conditioned in part by the peculiarities of Lutheranism, but also corresponds to a very general type: the endowment of powerholders with the office charisma of "God-given authority." The purely emotive state metaphysics, flourishing on this ground, has had far-reaching political consequences.

The Catholic theory of the priest's *character indelebilis* with its strict distinction between the charisma of office and the worthiness of the person constitutes the polar opposite of the Puritan rejection of office charisma. Here we encounter the most radical form of depersonalization of charisma and of its transformation into a qualification that is inherent in everybody who has become a member of the office hierarchy through a magic act, and that sanctifies official acts. This depersonalization was the means whereby an hierocratic organization was grafted upon a world which perceived magic qualifications everywhere. The bureaucratization of the church was possible only if the priest could be absolutely depraved without endangering thereby his charismatic qualification; only then could the institutional charisma of the church be protected against all personnel contingencies. Since pre-bourgeois man is still disinclined to moralize about the natural and the supernatural world, since he perceives the gods not as good but merely as strong, and believes that all kinds of animal, human and superhuman creatures have magic capacities, this differentiation between person and function conforms to widely accepted beliefs; the church only put them deliberately into the service of a great organizational idea: that of bureaucratization.

10. *Charismatic Kingship*[10]

A particularly important case of the charismatic legitimation of institutions is that of political charisma, as it appears with the rise of kingship.

Everywhere the king is primarily a warlord. Kingship originates in charismatic heroism. In the history of civilized peoples, kingship is not

the oldest form of political domination, that is, a power transcending patriarchal authority and differing from it because it does not primarily direct the peaceful struggle of man with nature but the violent struggle of one community against another. Kingship is preceded by all those charismatic forms which assure relief in the face of extraordinary external or internal distress or which promise success in risky undertakings. In early history, the precursor of the king, the chieftain, often has a double function: He is the patriarch of the family or sib, but also the charismatic leader in hunt and war, the magician, rainmaker, medicine man—hence priest and doctor—, and finally, the arbiter. Frequently each of these kinds of charisma has a special bearer. Next to the peacetime chieftain (the head of the sib), whose power originates in the household and who has mainly economic functions, stands the hunting and war leader, who proves his heroism in successful raids undertaken for the sake of victory and booty. (Even in historical times, in Assyrian royal inscriptions, hunting booty and cedars from the Lebanon—dragged along for construction purposes—are enumerated alongside the number of slain enemies and the size of walls of conquered cities which were covered with their skins.) In such cases charisma is acquired irrespective of its bearer's position in the sib or household, indeed, of any rules. This dualism between charisma and everyday life is often found among the American Indians, for instance, the Confederacy of the Iroquois, as well as in Africa and elsewhere.

Wherever war and big game hunt do not occur, we do not find the charismatic chieftain either: the "warlord," as we want to call him in order to avoid the usual confusion with the peacetime chieftain. In this case, especially when natural calamities—drought or epidemics—are frequent, a charismatic sorcerer may have an essentially similar power and become a "priestly ruler." The charisma of the warlord rises and falls with its efficacy and also with the demand for it; the warlord becomes a permanent figure when there is a chronic state of war. It is mainly a terminological question whether kingship and the state are said to begin with the annexation and incorporation of alien subjects into the community [cf. above, sec. 7]. For our purposes it remains expedient to use the term "state" in a much narrower way.

As a rule, the phenomenon of the warlord is *not* linked to tribal domination over another tribe and to the existence of individual slaves, but only to a chronic state of war and a comprehensive military organization. However, it is true that kingship develops frequently into a regular royal administration only when the military following controls the working or paying masses. But the subjection of alien tribes is not a necessary intermediate step. The internal stratification resulting from

the development of charismatic warriors into a ruling caste may have the same differentiating effect. At any rate, as soon as their domination has been stabilized, the royal power and those with vested interests in it, the royal following, search for legitimacy, that is, for the mark of the charismatically qualified ruler.[11]

11. *Charismatic Education*

Once charismatic qualification has become an impersonal quality, which can be transmitted through various and at first purely magic means, it has begun its transformation from a personal gift that can be tested and proven but not transmitted and acquired, into a capacity that, in principle, can be taught and learned. Thus charismatic qualification can become an object of *education*, even though at first not in the form of rational or empirical instruction, since heroic and magical capacities are regarded as inborn; only if they are latent can they be activated through a regeneration of the whole personality. Therefore, the real purpose of charismatic education is regeneration, hence the development of the charismatic quality, and the testing, confirmation and selection of the qualified person. [The elements of charismatic education are:] Isolation from the familiar environment and from all family ties (among primitive tribes the novices—*epheboi*—move into the forests); invariably entrance into an exclusive educational community; complete transformation of personal conduct; asceticism; physical and psychic exercises of the most diverse forms to awaken the capacity for ecstasy and regeneration; continuous testing of the level of charismatic perfection through shock, torture and mutilation (circumcision may have originated primarily as a part of such ascetic practices); finally, graduated ceremonious reception into the circle of those who have proven their charisma.

Within certain limits the transition between charismatic and rational specialized training is of course fluid. Every charismatic education includes some specialized training, depending on whether the novices are trained to be warriors, medicine men, rainmakers, exorcisers, priests or legal sages. This empirical and professional component, which is often treated as secret know-how for the sake of prestige and monopolization, increases quantitatively and in rational quality with professional differentiation and the accumulation of specialized knowledge; finally, in a world of predominantly specialized training and drill only the familiar juvenile phenomena of barrack and student life remain as residues of the ancient ascetic means for awakening and testing charis-

matic capacities. However, genuine charismatic education is the radical opposite of specialized professional training as it is espoused by bureaucracy. Between these two forms of education we find all those kinds that are concerned with "cultivation" (in the meaning defined above: the change of basic attitudes and of personal conduct) and retain only remnants of the original irrational means of charismatic education. The most important instance has been the training of warriors and priests, which once was primarily a selection of the charismatically qualified. He who does not pass the heroic trials of the warrior's training remains a "woman," just as he who cannot be awakened to the supernatural remains a "layman." In the familiar pattern, the standards of qualification are energetically defended and raised because of the material interests of the following, which forces the master to share the prestige and material opportunities of his rulership only with those who have passed the same trials.

In the course of these transformations charismatic education may become a state or ecclesiastic institution, or it may be left to the formally free initiative of organized interest groups. The actual developments depend upon the most diverse circumstances, in particular upon the distribution of power between the various competing kinds of charisma. This is especially true of the extent to which either military-knightly training or ecclesiastic instruction predominates in a community. In contrast to knightly training, the very *spiritualism* of ecclesiastic education facilitates its development toward *rational* instruction. The training of the priest, rainmaker, medicine man, shaman, dervish, monk, sacred singer and dancer, scribe and jurist as well as the training of the knight and warrior assumes many forms, but remains ultimately similar. Different is merely the relative impact of the various educational groups. This depends not only upon the power distribution between *imperium* and *sacerdotium* (which will be discussed again below), but first of all upon the extent to which military service is a matter of social honor, the duty of a stratum that is thereby specifically qualified. Only where such a duty exists does militarism establish its own educational system; conversely, the development of ecclesiastic education is usually a function of the bureaucratization of rulership, at first of sacred domination.

The basic Hellenic institution of the *epheboi*, a component of the individual's athletic-artistic perfection, is only a special case of a universal kind of military training, which includes in particular the preparations for the initiation rites, that is, for the rebirth as a hero, and the reception into the male fraternity (*Männerbund*) and the communal house of the warriors, which is a kind of primitive barracks. (This is the origin of the "men's house" which Schurtz traced everywhere with such loving care.)[11a] These are instances of lay education: the warrior

clans dominate education. The institution disintegrates whenever the member of the political community is no longer primarily a warrior and war is no longer chronic. An example for the far-reaching "clericalization" of education is provided by the control of the Egyptian priests over the training of officials and scribes in this typically bureaucratic state. In numerous other Oriental cases, too, the priesthood controlled the training of officials, and that means education in general, because it alone developed a rational educational system and provided the state with scribes and officials trained in rational thinking. In the Occidental Middle Ages the education offered by the church and the monasteries —as the agents of every kind of rational instruction—was also of paramount importance. There clerical-rational and knightly education coexisted, competed and cooperated with one another, owing to the feudal and status character of the ruling stratum, and imparted to Occidental medieval man and the Occidental universities their specific character. In contrast, there was no counterweight to the clericalization of education in the purely bureaucratic Egyptian state; the other patrimonial states of the Orient also failed to develop a specifically knightly education, since they lacked the requisite Estate structure; and finally, the completely depoliticized Jews, whose cohesion depended upon the synagogue and the rabbinate, developed a major type of strictly clerical education.

In the Hellenic polis and in Rome there was no state bureaucracy or priestly bureaucracy that might have created a clerical educational system. It was only in part a fateful historical accident that Homer, the literary product of a secular aristocracy which was most irreverent toward the gods, remained the major vehicle of literary education—which explains Plato's deep hatred against him—and prevented any theological rationalization of the religious powers. The decisive fact was the complete absence of a clerical system of education.

In China, finally, the character of Confucian rationalism, its conventionalism and its reception as the basis of education was conditioned by the bureaucratic rationalization of the secular patrimonial officialdom and the absence of feudal powers.

12. *The Plutocratic Acquisition of Charisma*

Every kind of training, whether for magical charisma or for heroism, may become the concern of a small circle of professional associates out of which may develop secret priestly fraternities or exclusive aristocratic clubs. The number of variations is great, ranging from systematic domination to occasional plundering by the political or magic brotherhood,

which especially in West Africa was often a secret society. All those groups that developed into clubs and brotherhoods, whether they originated in a voluntary military following or in the levy of all able-bodied men, share the tendency to replace charismatic capacities increasingly with purely economic qualifications. A young man had to be dispensable in the household before he could subject himself to charismatic training, which was time-consuming and economically not immediately profitable; however, such dispensability was the less frequent, the more the intensity of economic work increased. The result was a monopolization of charismatic education by the well-to-do, who purposively reinforced this trend. As the original magic or military functions lost importance, economic aspects came to predominate ever more.

At the end of this development, a person can simply buy his position in the various levels of political "clubs," as in Indonesia; under primitive conditions it may suffice to organize a rich feast. The transformation of the charismatic ruling stratum into a purely plutocratic one is typical of otherwise primitive peoples, whenever the practical importance of military and magic charisma declines. It is then not necessarily property itself that ennobles a person, but rather the style of life that is possible only on the basis of property. In the Middle Ages, a knightly style of life implied, among other things, above all the keeping of an open house. Among many tribes it is possible to secure the title of a chief simply by offering banquets, and to retain it in the same manner; this is a kind of *noblesse oblige* that has always easily impoverished the notables who taxed themselves in this fashion.

13. *The Charismatic Legitimation of the Existing Order*

As domination congeals into a permanent structure, charisma recedes as a creative force and erupts only in short-lived mass emotions with unpredictable effect, during elections and similar occasions. However, charisma remains a very important element of the social structure, even though it is much transformed. We must now go back to those economic motives mentioned above [*ii*: 1] that largely account for the routinization of charisma: the needs of privileged strata to legitimize their social and economic conditions, that is, to transform them from mere resultants of power relationships into acquired rights, and hence to sanctify them. These interests are by far the strongest motive for the preservation of charismatic elements in depersonalized form. Since genuine charisma is based neither on enacted or traditional order nor on acquired rights, but on legitimation through heroism and revelation, it is radically opposed to this motive. But after its routinization its very

quality as an extraordinary, supernatural and divine force makes it a suitable source of legitimate authority for the successors of the charismatic hero; moreover, in this form it is advantageous to all those whose power and property are guaranteed by this authority, that is, dependent upon its perpetuation. However, the forms of charismatic legitimation vary according to the relationship to the supernatural forces which establish it.

If the legitimacy of the ruler is not clearly identifiable through hereditary charisma, another charismatic power is needed; normally this can only be hierocracy. This is true even of a ruler who is a divine incarnation and hence possesses the highest degree of personal charisma. Insofar as he does not prove himself through his own deeds, his very claim must be confirmed by the experts in matters divine. Hence divine rulers are peculiarly subject to confinement by the groups which have the greatest material and ideal stakes in their legitimacy, the court officials and the priests; this confinement may result in permanent palace arrest and even in the killing of the God-King when he comes of age, so that he cannot compromise his divinity or emancipate himself from tutelage. In general, the very fact that the charismatic ruler carries such a heavy burden of responsibility in relation to the ruled tends to create an urgent need for some form of control over him.

Because of his exalted charismatic qualities such a ruler needs a person who can take over responsibility for the acts of government, especially for failures and unpopular measures; this is still true of the Oriental caliph, sultan and shah: They need the traditional figure of the Grand Vizier. In Persia, the attempt failed only a generation ago to abolish the position of the Grand Vizier in favor of bureaucratic ministries under the Shah's personal supervision, because this would have made him personally responsible for all the troubles of the people and for all administrative abuses; it also would have endangered, not only the ruler himself, but also his charismatic legitimacy. Therefore, the position of the Grand Vizier had to be restored so that it could protect the Shah and his charisma.

This is the Oriental counterpart to the responsible *chef du cabinet* in the Occident, especially in the parliamentary state. There we find the formula *le roi règne, mais il ne gouverne pas,* and the theory that for his dignity's sake the king should "not appear in public without his ministerial trappings"[12] or, even more so, that for the same reason he should completely abstain from interfering with the regular bureaucratic administration and instead defer to the leaders of the political parties who hold the cabinet posts. This corresponds to the insulation of the deified patrimonial ruler by the specialists in tradition and ceremony: the priests, court officials and high dignitaries. In all these cases the sociological

nature of charisma accounts for these limitations as much as do the interests of the court officials or party leaders and their following. The parliamentary monarch is retained in spite of his powerlessness, because, by his very existence and by virtue of the fact that power is exercised "in his name," he guarantees the legitimacy of the existing social and property order through his charisma; all those interested in this order must fear the subversion of the belief in its legitimacy if the king is removed. The function of legitimizing the governmental decisions of the victorious party as lawful acts can also be fulfilled by a president elected according to fixed rules. However, the parliamentary monarch fulfills another function which an elected president cannot fulfill: He formally limits the power struggle of the politicians by definitively occupying the highest position in the state. From a purely political viewpoint, this essentially negative function, which depends on the mere existence of a legitimate king, is perhaps in practice the most important one. In more positive terms, this function indicates in the most typical case that the king can take an active part in government only by virtue of his personal capacities or his social influence (*Kingdom of Influence*), not simply by virtue of his rights (*Kingdom of Prerogative*); recent events and personalities have shown that a king can exercise such an influence in spite of the parliamentary system. The "parliamentary" monarchy in England makes it possible to limit access to real power to politically qualified monarchs. For the king can lose his crown by a false move in foreign and domestic politics or by raising claims which do not accord with his personal gifts or his prestige. To that extent the English parliamentary monarchy is more genuinely charismatic than the Continental monarchy, which encourages the ruler to exercise power merely because of his birth right, whether he is a simpleton or a political genius.[18]

iii

Discipline and Charisma

1. *The Meaning of Discipline*

It is the fate of charisma to recede before the powers of tradition or of rational association after it has entered the permanent structures of social action. This waning of charisma generally indicates the diminish-

ing importance of individual action. In this respect, the most irresistible force is *rational discipline*, which eradicates not only personal charisma but also stratification by status groups, or at least transforms them in a rationalizing direction.

The content of discipline is nothing but the consistently rationalized, methodically prepared and exact execution of the received order, in which all personal criticism is unconditionally suspended and the actor is unswervingly and exclusively set for carrying out the command. In addition, this conduct under orders is uniform. The effects of this uniformity derive from its quality as social action within a mass structure. Those who obey are not necessarily a simultaneously obedient or an especially large mass, nor are they necessarily united in a specific locality. What is decisive for discipline is that the obedience of a plurality of men is rationally uniform.

Discipline as such is not hostile to charisma or to status honor. On the contrary, status groups that are attempting to rule over large territories or large organizations—the Venetian aristocracy of the Council, the Spartans, the Jesuits in Paraguay, or a modern officer corps with a prince at its head—can maintain effective superiority over their subjects only by means of a very strict internal discipline. The blind obedience of subjects, too, can be secured only by training them exclusively for submission under the disciplinary code. If a status group maintains a stereotyped prestige and style of life only for reasons of discipline, this deliberate and rational component will always become prominent and in turn affect all of the culture influenced by such a group; we shall not discuss these effects here. A charismatic hero may make use of discipline in the same way; indeed, he must do so if he wishes to expand his sphere of domination. Thus Napoleon created a strict disciplinary organization for France, which is still effective today.

Discipline in general, like its most rational offspring, bureaucracy, is impersonal. Unfailingly neutral, it places itself at the disposal of every power that claims its service and knows how to promote it. This does not prevent it from being intrinsically alien to charisma as well status honor, especially of a feudal sort. The berserk with manic seizures of frenzy and the feudal knight who measures swords with an equal adversary in order to gain personal honor are equally alien to discipline, the former because of the irrationality of his action, the latter because his attitude lacks matter-of-factness. Discipline puts the drill for the sake of habitual routinized skill in place of heroic ecstasy, loyalty, spirited enthusiasm for a leader and personal devotion to him, the cult of honor, or the cultivation of personal fitness as an art. Insofar as discipline appeals to firm ethical motives, it presupposes a sense of duty and con-

scientiousness—"men of conscience" versus "men of honor" in Cromwell's terms. All of this serves the rationally calculated optimum of the physical and psychic preparedness of the uniformly conditioned masses. Enthusiasm and unreserved devotion may, of course, have a place in discipline; every modern conduct of war weighs, frequently above everything else, precisely the morale factor in troop effectiveness. Military leadership uses emotional means of all sorts—just as the most sophisticated techniques of religious discipline, the *exercitia spiritualia* of Ignatius of Loyola, do in their way. It seeks to influence combat by "inspiring" the soldiers and, even more, by developing their empathy for the leaders' will. The sociologically decisive points, however, are, first, that everything is rationally calculated, especially those seemingly imponderable and irrational emotional factors—in principle, at least, calculable in the same manner as the yields of coal and iron deposits. Secondly, devotion is normally impersonal, oriented toward a purpose, a common cause, a rationally intended goal, not a person as such, however personally tinged devotion may be in the case of a fascinating leader.

The case is different only when the prerogatives of a slaveholder create a situation of discipline: On a plantation or in a slave army of the ancient Orient, on galleys manned by slaves or by prisoners in Antiquity and the Middle Ages. In these cases the only effective element is indeed the mechanized drill and the individual's integration into an inescapable, inexorable mechanism, which forces the team member to go along. However, this form of compulsory integration remains a strong element of all discipline, especially in a systematically conducted war, and it emerges as an irreducible residue in all situations in which the ethical qualities of duty and conscientiousness have failed.

2. *The Origins of Discipline in War*

The conflict between discipline and individual charisma has been full of vicissitudes. It has its classic seat in the development of the structure of warfare, in which sphere the conflict is to some extent purely determined by technology. However, the kind of weapons—pike, sword, bow—is not necessarily decisive, for all of them allow disciplined as well as individual combat; still, at the beginning of the known history of the Near East and of the Occident, the importation of the horse and, to some uncertain degree, the rise of the epoch-making iron tool have played decisive roles. The horse brought the war chariot and with it the hero driving into combat and possibly fighting from his chariot; this was the dominant figure in the warfare of the Oriental, Indian, and ancient

Chinese kings, as well as throughout the Occident, including the Celtic areas and Ireland until late times. Cavalry came after the war chariot, but lasted longer; from it the *knight* emerged—the Persian, Thessalian, Athenian, Roman, Celtic, and Germanic. The foot-soldiers, who certainly played some part earlier in the development of discipline, receded in importance for quite some time. The replacement of the bronze javelin by iron arms for close combat was probably among the factors that again pushed development in the opposite direction. Yet, just as in the Middle Ages gun powder can scarcely be said to have brought about the transition from undisciplined to disciplined fighting, so iron as such did not bring about the change; after all, long-range and knightly weapons were also made of iron. It was the *discipline* of the heavily armed Hellenic and Roman foot-soldiers (*hoplites*) which brought about the change. An oft-quoted passage shows that even Homer knew of the beginnings of discipline with its prohibition of fighting out of line. For Rome, the turning-point is symbolized by the legend of the execution of the consul's son who, in accordance with the ancient heroic fashion, had slain the opposing commander in individual combat. One after the other, we encounter the well-trained army of the Spartan professional soldier, the holy *lochos* of the Boeotians, the well-trained phalanx of the Macedonians equipped with long pikes (*sarissae*), and the more mobile but equally well-trained maniple of the Roman legions. These troops gained supremacy, in turn, over the Persian knight, the militias of the Hellenic and Italic citizenry, and the general levies of the Barbarians. In the early period of the Hellenic *hoplites*, attempts were made to exclude long-range weapons by "international law" as unchivalrous, just as during the Middle Ages there were attempts to forbid the cross-bow.

It is evident that the kind of weapon has been the result and not the cause of discipline. Exclusive use of the infantry tactic of close combat during Antiquity brought about the decay of cavalry, and in Rome the status of a knight became practically equivalent to exemption from military service. At the close of the Middle Ages it was the massed force of the Swiss, with its parallel and ensuing developments, which first broke the monopoly of knighthood to wage war. And even then the Swiss still allowed the Halberdiers to come forward for hero combat, after the main force had advanced in closed formation, with the pikemen occupying the outside positions. At first this resulted only in the lesser frequency of individual knightly combat. And in the battles of the sixteenth and seventeenth century, cavalry, as an increasingly disciplined force, still played a decisive role. Without cavalry it was im-

possible to wage offensive wars and actually to overpower the enemy, as the course of the English Civil War demonstrated.

It was discipline and not gun powder which initiated the transformation of warfare. The Dutch army under Maurice of the House of Orange was one of the first modern disciplined armies. It was shorn of all status privileges; the mercenaries, for examples, could no longer refuse rampart work as something beneath their dignity (*opera servilia*). The sober and rational Puritan discipline made Cromwell's victories possible, despite the fierce bravery of the Cavaliers. His Ironsides—the "men of conscience"—trotted forward in closed formation, aiming calmly and firing simultaneously before drawing their sabres. After the attack they remained in closed formation or immediately realigned themselves. This discipline was technically superior to the Cavaliers' *élan*. For it was the habit of the Cavaliers to gallop enthusiastically into the attack and then to disperse, either to plunder the enemy camp or prematurely to pursue single opponents in order to capture them for ransom. All successes were forfeited by such habits, as was typically and often the case in Antiquity and the Middle Ages—for example, at Tagliacozzo [where Charles of Anjou defeated Konradin, the last of the Hohenstaufen, in 1268]. Gun powder and all the war techniques associated with it became significant only with the existence of discipline—and to the full extent only with the use of war machinery, which presupposes discipline.

The economic bases upon which army organizations have been founded are not the only agent determining the development of discipline, yet they have been of considerable importance. In turn, however, the varying impact of discipline on the conduct of war has had even greater effects upon the political and social order, even though this influence has been ambiguous. Discipline, as the basis of warfare, gave birth to patriarchal kingship among the Zulus, where the monarch, however, was constitutionally limited by the power of the army commanders—similar to the [manner in which the] Spartan [kings were checked by the] ephors.[14] Similarly, discipline gave birth to the Hellenic *polis* with its *gymnasia*. When infantry drill was perfected to the point of virtuosity (as in Sparta), the *polis* had inevitably an aristocratic structure; when cities resorted to naval discipline, they had a democratic structure (Athens). Military discipline was also the basis of Swiss democracy, which in the heyday of the Swiss mercenaries was very different from the Athenian but controlled—in Greek terms—territories with inhabitants of limited rights (*perioeci*) or with no rights (helots). Military discipline was also instrumental in establishing the rule of the Roman patriciate and, finally, the bureaucratic states of Egypt, Assyria and modern Europe.

These examples show that war discipline may go hand in hand with totally different economic conditions. But it has always in some way affected the structure of the state, the economy, and possibly the family. For in the past a fully disciplined army has necessarily been a professional army, and therefore the basic problem has always been how to provide for the sustenance of the warriors. The original way of creating trained troops ready to strike was *warrior communism,* which we have already mentioned. It may take the form of the men's house, as a kind of barracks or casino of the professional warriors; in this form it is spread over the largest part of the earth; warrior communism may also follow the pattern of the communist community of the Ligurian pirates, the Spartan mess-hall (*syssitia*) principle, or the organization of Caliph Omar, or of the religious knightly orders of the Middle Ages. As we have noticed above, the warrior community may constitute either a completely autonomous, closed association or, as is the rule, it may be incorporated into a territorial political association. Thus, its recruitment may be determined by the larger order, but it may, of course, in turn exert decisive influence upon this order. Most of the time the linkage is relative. Even the Spartans, for example, did not insist upon "purity of blood," since military education was decisive for membership.

The communist warrior is the perfect counterpart to the monk, whose garrisoned and communistic life in the monastery serves the purpose of disciplining him in the service of his other-worldly master (and, resulting therefrom, perhaps also his this-worldly master). With consistent development of the warriors' community, the dissociation from the family and all private economic interests is found also outside the celibate knightly orders which were created in direct analogy to the monastic orders. The inmates of the men's house purchase or capture girls, or they claim that the girls of the subject community be at their disposal as long as they have not been sold in marriage. The children of the Areoi—the dominant status group in Polynesia—are killed. Men can join enduring sexual unions with a separate economy only after completing their service in the men's house—often only at an advanced age. The communist military organization, which is widely spread under conditions of chronic warfare and which requires warriors without home and family, may be reflected residually in several phenomena: differentiation according to age groups, which is sometimes also important for the regulation of sexual relationships; survivals of an allegedly primitive "endogamous promiscuity" or of a "primeval right" of all male warriors to all unappropriated women; likewise, abduction as the allegedly earliest form of marriage, and above all the "matrilineal family" (*Mutterrecht*).[15]

It is likely that the communist warrior community is everywhere a remnant of the following of charismatic warlords. These leaders decline when the following establishes a permanent association which endures in peacetimes. But under favorable conditions, the warrior chief may well gain complete control over the disciplined warrior formations. Accordingly, the military organization based on the "*oikos*" offers an extreme contrast to this communism of warriors who live on booty and from the contributions of women, those unfit to bear arms, and possibly serfs. The patrimonial army was sustained and equipped from the stores of its master, as we know it especially from Egypt, but its features were very often also components of other military organizations and hence provided the root of princely despotism. The reverse phenomenon, the emancipation of the warrior community from the unlimited power of the lord—as evidenced in Sparta through the institution of the ephors—proceeds only so far as the interest of discipline permits. In the polis, therefore, the weakening of the king's power—which meant the weakening of discipline—prevailed only in peacetime and in the homeland (*domi* in contrast to *militiae*, according to the technical terms of Roman administrative law). The Spartan king's prerogatives approached the zero point only in peacetime; in the interest of discipline, the king was omnipotent in the field.

An all-round weakening of discipline—but varying greatly in degree—usually accompanies any kind of decentralized military establishment, whether it is prebendal or feudal. The well-trained Spartan army, the κλῆροι of the other Hellenic and Macedonian and of several Oriental military establishments, the Turkish quasi-prebendal fiefs, and finally the feudal fiefs of the Japanese and Occidental Middle Ages—all of these were stages of the economic decentralization which usually goes hand in hand with the weakening of discipline and the rise of individual heroism. From the disciplinary aspect, just as from the economic, the seigneurial vassal represents an extreme contrast to the patrimonial or bureaucratic soldier. And the disciplinary aspect is a consequence of the economic aspect. The feudal vassal not only cares for his own equipment and provisions and directs his own baggage-train, but he summons and leads sub-vassals who, in turn, also equip themselves. Both the late medieval and early modern semi-capitalist recruiting of mercenary armies by *condottieri* and the raising and equipping of standing armies by means of public finance signify an intensification of discipline on the basis of an increasing concentration of the means of warfare in the hands of the warlord. We shall not describe here in detail the increasing rationalization of procurement for the armies; it began with Maurice of Orange, proceeded to the armies of Wallenstein, Gustavus Adolphus,

Cromwell, the armies of the French, of Frederick the Great and of Maria Theresia. We also cannot deal in detail with the transition from the professional army to the people's army of the French Revolution, its reorganization by Napoleon into a partly professional army, and the general introduction of universal conscription during the 19th century. This development indicated in effect, the increasing importance of discipline as well as the parallel advance from private capitalism to public finance as the basis of military organization.

Whether the exclusive dominance of universal conscription will be the last word in the age of machine warfare remains to be seen. The shooting records of the British navy, for instance, seem to be determined by the continuity of professional teams through the years. The belief in the technical superiority of the professional soldier for certain categories of troops is almost sure to gain influence, especially if the process of shortening the term of service—stagnating in Europe at the moment—should continue. Esoterically, this view is already held in some officers' circles. The introduction of a three-year period of compulsory service by the French army in 1913 was motivated here and there by the slogan of a "professional army," but this was somewhat inappropriate since no distinction was made between the various categories of troops. These still ambiguous possibilities, and also their possible political consequences, are not to be discussed here. In any case, none of them will alter the extreme importance of mass discipline. We wanted to show here that the separation of the warrior from the means of warfare, and the concentration of the means of warfare in the hands of the warlord have everywhere been basic to this mass discipline, whether the process occurred in a patrimonial, capitalist or bureaucratic context.

3. *The Discipline of Large-Scale Economic Organizations*

Military discipline gives birth to all discipline. The *large-scale economic organization* is the second great agency which trains men for discipline. No direct historical transitions link the Pharaonic workshops and construction projects (however little detail about their organization is known) with the Carthaginian-Roman plantation, the mines of the late Middle Ages, the slave plantation of colonial economies, and finally the modern factory. However, all of these have in common the one element of *discipline.*

The slaves of the ancient plantations slept in barracks, living without family and without property. Only the managers—especially the *villicus*

—had individual domiciles, somewhat comparable to the noncoms' [private] quarters or the housing provided the salaried supervisors on modern landed estates. Usually, the *villicus* alone had quasi-property (*peculium*, i.e., originally property in cattle) and quasi-marriage (*contubernium*). In the morning the slaves lined up in "squads" (*decuriae*) and were led to work by "whips" (*monitores*); their supplies were stored in a depot (to use a barrack term) and handed out according to need. Infirmary and stockade were not absent. The discipline of the manor of the Middle Ages and the modern era was considerably less strict because it was traditionally stereotyped, and therefore it somewhat limited the lord's power.

No special proof is necessary to show that military discipline is the ideal model for the modern capitalist factory, as it was for the ancient plantation. However, organizational discipline in the factory has a completely rational basis. With the help of suitable methods of measurement, the optimum profitability of the individual worker is calculated like that of any material means of production. On this basis, the American system of "scientific management" triumphantly proceeds with its rational conditioning and training of work performances, thus drawing the ultimate conclusions from the mechanization and discipline of the plant. The psycho-physical apparatus of man is completely adjusted to the demands of the outer world, the tools, the machines—in short, it is functionalized, and the individual is shorn of his natural rhythm as determined by his organism; in line with the demands of the work procedure, he is attuned to a new rhythm through the functional specialization of muscles and through the creation of an optimal economy of physical effort.[16] This whole process of rationalization, in the factory as elsewhere, and especially in the bureaucratic state machine, parallels the centralization of the material implements of organization in the hands of the master. Thus, discipline inexorably takes over ever larger areas as the satisfaction of political and economic needs is increasingly rationalized. This universal phenomenon more and more restricts the importance of charisma and of individually differentiated conduct.

9. In 1880 a section of the largest German liberal party, the National Liberal Party, seceded because it refused to go along with the party's acceptance of Bismarck's tariff increase. The Secessionists were largely committed to laissez-faire policies; in 1884 they merged with the leftwing liberals, the Progressives, into the *Freisinnige Partei*. The merger was motivated by the desire to create a strong new party that could provide a backing for the relatively liberal Crown Prince Frederick, whose ascendance to the throne was expected in the near future. As it was, Bismarck managed to decimate the party, which had begun with as many as one hundred deputies in the Reichstag, and Frederick ruled only three months in 1888. When his successor, William II, replaced Bismarck with Caprivi in 1890, the former Secessionists hoped for a more liberal government and tried to change the intransigent policy of Eugen Richter, the domineering leader of the old Progressive party and the united party. In the ensuing struggle the former Secessionists under Heinrich Rickert, who had retained his own apparatus, managed to gain a majority on the party's executive board, but Richter's grassroots organization and his newspapers proved strong enough to defeat the challenge. The precarious unity was destroyed and the party split in 1893. Cf. Thomas Nipperdey, *Die Organisation der deutschen Parteien vor 1918* (Düsseldorf: Droste, 1961), 206–17.

CHAPTER XV

POLITICAL AND HIEROCRATIC DOMINATION

1. *Charismatic Legitimation: Rulers versus Priests*

Just as the powerlessness of the parliamentary monarch permits the legitimate rule of the party leader, so the powerlessness of the "insulated" monarch, who is an incarnation, results either in priestly domination or, at least frequently, in the seizure of power by a family that is not encumbered with the monarch's charismatic obligations and hence can provide the real ruler (*maior domus, shogun*). Here too, the formal ruler must be retained because only his specific charisma can guarantee the proper relation to the deities, which is indispensable for the legitimacy of the whole political structure, including the position of the actual ruler. If the official ruler has genuine charisma—if it is personal, not derived—he cannot be removed in the same manner as the Merovingians, in whose case the papacy provided a charismatically qualified power for the legitimation of the new ruling house. If an incarnated deity or a descendant of deity (for example, the Mikado) exercises genuinely charismatic authority, any attempt at deposing not just the incumbent—which, of course, is always possible in some violent or peaceful manner—but the whole charismatic house will endanger the legitimacy of all powers and weaken all traditional buttresses of the subjects' compliance. Even under the worst conditions, therefore, such a removal is anxiously avoided by all groups which benefit from the existing order; it remains to be seen whether such a dethronement is permanently feasible even when the ruling dynasty is considered representative of an alien regime, as now in China [1911/13].

The papal confirmation of Carolingian rule is typical of all those numerous cases in which the ruler is not himself a deity or, at any rate,

cannot sufficiently legitimize himself through charisma that is unambiguously secured through hereditary succession or some other rule; hence he is dependent upon legitimation by another power, most naturally the priesthood. This has usually happened wherever the development of religious charisma into a priestly attribute was sufficiently advanced, and its bearers were not identical with the political power-holders. The qualified bearer of royal charisma is then legitimated by God, that means, by the priests, or, at the least, his legitimacy is confirmed by them; as experts in all things divine, they recognize the ruler who appears as the incarnation of a deity. In the Judaic Kingdom the priesthood consulted an oracle of lots (*Losorakel*) about the king; the priests of Amon-Re actually controlled the crown after defeating the descendants of the heretic pharaoh Akhenaton; the Babylonian king clasped the hands of the empire-god [Marduk]; there are many other examples up to the exemplary case of the Holy Roman Empire. In all these cases legitimation can, in principle, not be denied to any genuine bearer of charisma. This was also true of the Imperial Crown during the Middle Ages, and the Electors' resolution at Rhense [where they formed an alliance, in 1338, against the Pope's claim to confirm the election of the German king] reaffirmed this very principle. For it is a question of recognition, not of discretion, whether charismatic qualification exists. At the same time, however, it is believed that only the manipulations of the priests can assure the full effectiveness of charisma, and to that extent a depersonalization of charisma occurs here also. In the extreme case, the priests' control over the crown may lead to a priestly kingship, with the headpriest himself exercising secular authority. This has indeed happened several times.

In the reverse case the high priest is subject to secular authority: witness the Roman Principate, China, the Caliphate, perhaps the Arian rulers, and certainly the Anglican, Lutheran, Russian and Greek-Catholic rulers, who in part still hold this power. Secular control over the church varies greatly, from mere administrative and judicial prerogatives (*Vogteirechte*) to the Byzantine monarch's influence on the formulation of church doctrine and to the ruler's preaching function, as in the Caliphate.

2. *Hierocracy, Theocracy and Caesaropapism*

At any rate, the relations between secular and ecclesiastic power differ greatly depending on whether we deal with 1) a ruler who is legitimated by priests, either as an incarnation or in the name of God, 2) a high priest who is also king—these are the two cases of hierocracy

—or, finally, 3) a secular, caesaropapist ruler who exercises supreme authority in ecclesiastic matters by virtue of his autonomous legitimacy. Wherever hierocracy in this sense occurred—theocracy proper is limited to the second case—, it had far-reaching effects on the administrative structure. Hierocracy must forestall the rise of secular powers capable of emancipating themselves. Wherever a coordinate or subordinate royal position exists, hierocracy seeks to prevent the king from securing independent resources; it impedes the accumulation of the *thesauros* which was indispensable to all kings of early history, and the strengthening of his bodyguard in order to vitiate the establishment of an independent royal army—witness the early case of Josiah in Judah. Furthermore, hierocracy checks as much as possible the rise of an autonomous and secular military nobility, since this would threaten its predominance, and therefore it frequently favors the (relatively) peaceful "bourgeoisie." The elective affinity between bourgeois and religious powers, which is typical of a certain stage in their development, may grow into a formal alliance against the feudal powers; this happened rather frequently in the Orient and also in Italy at the time of the struggle over lay investiture [11th century]. This opposition to political charisma has everywhere recommended hierocracy to conquerors as a means of domesticating a subject population. Thus, the Tibetan, the Jewish and the late Egyptian hierocracy were in part supported, and in part directly created, by foreign rulers, and according to all available historical clues the Greek temple priests, especially those at Delphi, would have been willing to play a similar role in the event of a Persian victory. It appears that the most significant features of Hellenism and Judaism are products, respectively, of the defense against Persian domination and of subjection to it. How effective domestication by hierocratic powers can be is demonstrated by the fate of the Mongols, who were almost completely pacified by Lamaism; time and again, during one and a half thousand years, they had invaded the neighboring pacified civilization and had endangered the very survival of culture.[1]

Everywhere state and society have been greatly influenced by the struggle between military and temple nobility, between royal and priestly following. This struggle did not always lead to an open conflict, but it produced distinctive features and differences, whether we refer to the relationship between the priestly and the warrior caste in India, the partly manifest and partly latent conflict between military nobility and priesthood in the oldest city-states of Mesopotamia, in Egypt and Palestine, or to the complete takeover of priestly positions by the secular nobility in the Hellenic polis and particularly in Rome. The clash of the two powers in medieval Europe and in the Islam resulted in the

greatest differences between the cultural development of the Orient and the Occident.

The extreme opposite of any kind of hierocracy, caesaropapism—the complete subordination of priestly to secular power—, can nowhere be found in its pure type. Caesaropapist powers are wielded not only by the Chinese, Russian, Turkish and Persian ruler but also by the English and German ruler, who is the head of the church (*summus episcopus*), yet these powers are everywhere limited by autonomous ecclesiastic charisma. The Byzantine *basileus*, like the pharaoh, Indian and Chinese monarchs, and also the Protestant *summi episcopi*, attempted repeatedly, and mostly without success, to impose religious beliefs and norms of their own making. Such attempts were always extremely dangerous for them. In general, the subjugation of religious to royal authority was most successful when religious qualification still functioned as a magical charisma of its bearers and had not yet been rationalized into a bureaucratic apparatus with its own doctrinal system—two usually related phenomena; subjugation was feasible especially when ethics or salvation were not yet dominant in religious thought or had been abandoned again. But wherever they prevail, hierocracy is often invincible, and secular authority must compromise with it. By contrast, magic-ritual forces were controlled most thoroughly in the ancient polis, rather well by the feudal powers in Japan and the patrimonial ones in China, and at least reasonably well by the bureaucratic state in Byzantium and Russia. But wherever religious charisma developed a doctrinal system and an organizational apparatus, the caesaropapist state, too, contained a strong hierocratic admixture.

As a rule, priestly charisma compromised with the secular power, most of the time tacitly but sometimes also through a concordat. Thus the spheres of control were mutually guaranteed, and each power was permitted to exert certain influences in the other's realm in order to minimize collisions of interest; the secular authorities, for example, participated in the appointment of certain clerical officials, and the priests influenced the educational institutions of the state. These compromises also committed the two powers to mutual assistance. Examples of this kind are found in the ecclesiastic and secular organizations of the predominantly caesaropapist Carolingian empire, in the Holy Roman empire, which had similar features under the Ottonian and early Salic rulers, and in the many Protestant countries that were largely caesaropapist. Under a different power distribution, such compromises also occurred in the areas of the Counter-Reformation, the Concordats and the Bulls of Circumscription.[2] The secular ruler makes available to the priests the external means of enforcement for the maintenance of their

power or at least for the collection of church taxes and other contributions. In return, the priests offer their religious sanctions in support of the ruler's legitimacy and for the domestication of the subjects. Powerful ecclesiastic reform movements, such as the Gregorian, attempted at times to negate completely the autonomous charisma of the political power, but they were not permanently successful. Similar to the [way in which the] doctrine of equal social rank [was adjusted by the nobility], the Catholic church today acknowledges the autonomy of political charisma by the very fact that it makes acceptance and submission a religious duty in the face of every government that indisputably holds *de facto* power, as long as such a regime does not despoil the church.

Some theocratic or caesaropapist elements tend to be present in every legitimate political power, since ultimately every charisma is akin to religious powers in that it claims at least some remnant of supernatural derivation; in one way or another, legitimate political power therefore always claims the "grace of God."

It should be clearly understood that the dominance of any of these systems does not depend upon the influence that religion in general exerts upon the life of a people. Hellenic, Roman or Japanese life was as much pervaded by religion as that of any hierocratic community; the ancient polis has even been interpreted—correctly, but with some exaggeration—as primarily a religious association; by and large, a historian like Tacitus related no fewer prodigies and miracles than did medieval folk literature, and the Russian peasant is immersed in religion as much as any Jew or Egyptian. Only the manner in which social domination is organized varies greatly, and this has consequences for the course of religious development.

Caesaropapist government treats ecclesiastic affairs simply as a branch of political administration. A rather pure type is found in the states of Occidental Antiquity, and regimes of lesser degrees of purity are found in the Byzantine Empire, the Oriental states, the states of the Eastern church, and in the era of "enlightened" despotism in Europe. Gods and saints are deities of the state, their worship is a state affair, and new gods, dogmas and cults are accepted or rejected at the ruler's discretion. If the political official does not fulfill these religious obligations himself, merely with the assistance of the priestly professionals, these technicalities will be put into the hands of a priesthood which is politically controlled. The state-maintained priesthood lacks economic autonomy, property and an independent administrative apparatus. All official priestly acts are supervised by the state. There is no specifically clerical way of life, apart from some technical training for ritual functions, and hence also no specifically priestly education.

Theology proper does not develop under these conditions, and this in turn prevents an autonomous hierocratic regulation of the laymen's way of life: Hierocratic charisma is degraded to the level of mere administrative technique. Moreover, a caesaropapist nobility transforms the high-ranking priestly positions into hereditary family property, exploitable as sources of income, prestige and power, and the lower-ranking ones into prebends which it fills like positions on its manorial dependencies; monastic and similar foundations become "welfare" benefices for unmarried daughters and younger sons, and compliance with the traditional ritual prescriptions becomes part of the aristocratic status ceremonial and status conventions. Whenever caesaropapism predominates in this fashion it is inevitable that the substance of religion is stereotyped in terms of the purely technical, ritualist manipulation of supernatural powers, and any development toward a religion of salvation is impeded.

3. *The Church*

Wherever hierocratic charisma is stronger than political authority it seeks to degrade it, if it does not appropriate it outright. Since political power claims a competing charisma of its own, it may be made to appear as the work of Satan; time and again the most consistent ethico-hierocratic trends in Christianity have tried to impose this viewpoint. Alternatively, since God has permitted the existence of political power, it may also be considered an inevitable concession to the sinfulness of the world; the believer should resign himself to political power, but he should avoid contact with it as much as possible; at any rate its specific form appears ethically irrelevant. This was the attitude of Christianity in its eschatological early period. Finally, political authority may be considered a God-given tool for the subjection of anti-ecclesiastic forces, and then it is expected to put itself at the disposal of the hierocratic authority. In practice, therefore, hierocracy seeks to turn the political ruler into a vassal and to deprive him of independent means of power, insofar as this is compatible with its own interests in the survival of the political structure. If the priests do not assume political powers directly, they legitimize the king through the oracle (as in the case of Judah), or by confirming, anointing and crowning him. They may prevent him from accumulating a *thesauros*, so that he cannot create a personal following and maintain his own mercenaries (witness again the characteristic case of Josiah in Judah). Hierocracy creates an autonomous administrative apparatus, a tax system (tithes) and legal forms (endow-

ments) for the protection of ecclesiastic landholdings. The charismatic administering of magic blessings, which is at first a freely chosen vocation and living, develops into the patrimonial office of royal or seigneurial benefice-holders, for whose maintenance a benefice—as an endowment —may be established with some temple, where it is to some extent protected from unholy powers. A case in point are the commensality of the Egyptian, Oriental and East Asian temple priests, and the prebends in kind deriving therefrom.

Four features characterize the emergence of a *church* out of a hierocracy: 1) the rise of a professional priesthood removed from the "world," with salaries, promotions, professional duties, and a distinctive way of life; 2) claims to universal domination; that means, hierocracy must at least have overcome household, sib and tribal ties, and of a church in the full sense of the word we speak only when ethnic and national barriers have been eliminated, hence after the levelling of all non-religious distinctions; 3) dogma and rites (*Kultus*) must have been rationalized, recorded in holy scriptures, provided with commentaries, and turned into objects of a systematic education, as distinct from mere training in technical skills; 4) all of these features must occur in some kind of compulsory organization. For the decisive fact is the separation of charisma from the *person* and its linkage with the institution and, particularly, with the *office*: from this fact derive all the above features, which we find developed in different degrees of typicality. Sociologically, the church differs from the sect by considering itself the trustee of a "trust fund" of eternal blessings that are offered to everyone; as a rule, it is not joined voluntarily, like an association, but its members are born into it; hence even those who lack religious qualification, who are heretical, are subject to its discipline. In one word, the church is the bearer and trustee of an office charisma, not a community of personally charismatic individuals, like the sect. In the full sense of the term, churches have arisen only in Islam and Lamaist Buddhism, apart from Christianity; in a more restricted sense—because of the national delimitation—churches were also created by Mahdism, Judaism and, apparently, the ancient Egyptian hierocracy.

4. *Hierocratic Reglementation of Conduct and Opposition to Personal Charisma*

The church advances its demands toward the political power on the basis of its claims to office charisma. This charisma is used for a radical elevation of its bearer's dignity. For its officials the church secures im-

munity from secular jurisdiction, exemption from taxation and all other public duties, and protection, through heavy penalties, against any show of disrespect. In particular, the church establishes a distinctive way of life for its officials. This requires a specific course of training and hence a regular hierocratic education. Once it has created the latter, it also gains control over lay education and, through it, provides the political authorities with officials and subjects who have been properly brought up in the hierocratic spirit.

By virtue of its power, the hierocratic church also establishes a comprehensive ethico-religious reglementation of all spheres of conduct; in principle, this system has never tolerated any substantive limitations, just as today Catholic doctrine cannot recognize any limits for its claims upon the *disciplina morum*. For the enforcement of its claims hierocracy disposes of very considerable means of power, even beyond the support of the political authorities. Excommunication, the exclusion from the church service, has the same effect as the strictest social boycott, and in one way or another all hierocracies resort to economic boycott by means of the injunction against social intercourse with those ostracized. Insofar as this reglementation of conduct is determined by hierocratic power interests—and that, after all, is true to a large extent—, it is directed against the rise of competing powers. This has several consequences: The "weak"—those subject to non-hierocratic power—are defended; hence slaves, serfs, women and children are championed against the arbitrariness of their master, and petty-bourgeois strata and peasants against usury; the rise of economic powers that cannot be controlled by hierocratic means is impeded, especially that of new powers alien to tradition, such as capitalism; in general, any threat to tradition and the belief in its sanctity is opposed, since this is the inner basis of hierocratic power; therefore, the established and traditional authorities are strongly supported.

In this manner hierocracy leads to typification just as much as its very opposite, especially in its most characteristic features. The rational organization for administering divine blessings is an institution (*Anstalt*), and charismatic sanctity is transferred to the institution as such; this is typical of every church. Hence fully developed office charisma inevitably becomes the most uncompromising foe of all genuinely personal charisma, which propagates and preaches its own way to God and is prophetic, mystic and ecstatic. Office charisma must oppose it, in order to preserve the dignity of the organization. Whoever works miracles on his own, without an office, is suspect as a heretic or magician. (An early example can be found in the inscriptions of the period of the Sutras, and one of the four deadly sins of the Buddhist monastic order

is the claim to personal supernatural powers.) The miracle is incorporated into the regular organization, as for example the miracle of the sacraments. Charismatic qualification is depersonalized; it adheres to the ordination as such and is, in principle, detached from the personal worthiness of the officeholder (*character indelebilis*)—this was the subject matter of the Donatist controversy. In accordance with the overall scheme, the incumbent is distinguished from the office; otherwise his unworthiness would compromise the office charisma. The position of the charismatic prophets and teachers in the old church declines as the church administration is bureaucratized in the hands of the bishops and presbyters, again in accordance with the familiar scheme of depersonalization. The structure of the apparatus is adapted, in technical and economic respects, to the conditions of everyday operations. This results in an office hierarchy with delimited jurisdictions, regular channels, reglementation, fees, benefices, a disciplinary order, rationalization of doctrine and of office-holding as a "vocation"—in fact, these features were first developed, at least in the Occident, by the church as the heir to ancient traditions, which in some respects probably originated in Egypt. This is not at all surprising, since the typically bureaucratic policy of distinguishing the unworthy incumbent from the holy office had to be carried through consistently as soon as the development toward the charisma of office had gotten under way.

5. *The Hierocratic Ambivalence Toward Asceticism and Monasticism*

Here arises one of the great problems of hierocracy. How is the official apparatus to cope with the emergence of a charismatic following of God, the monks, who adhere to the demands of the charismatic founder and therefore reject any compromise with mundane concerns? Monastic asceticism can have two very different meanings: (1) Individual salvation through finding a personal, direct path to God. This has been of primary importance in the religions of salvation, hence for Hindu, Buddhist, Islamic and Christian ascetics. The radical demands of the revolutionary and almost always eschatological charisma can never be realized within those religious organizations that insist upon compromises with the economic and other mundane power interests, and the withdrawal from the world—from marriage, occupation, office, property, political and any other community—is only the consequence of this state of affairs. Originally, in all religions the successful ascetic, accomplishing the extraordinary, acquires the charismatic ability of forcing God's hands and of working of miracles. Of course, such per-

sonal charisma is ultimately irreconcilable with the hierocratic claims of an institution of salvation (*Heilsanstalt*) that seeks to monopolize the way to God—*extra ecclesiam nulla salus* is the motto of all churches. This conflict is exacerbated when such saintly men form exclusive communities; such a step negates the universalist and levelling claims to domination which the church shares with every bureaucracy, as well as the exclusive significance of its office charisma. But each of the great churches was forced to compromise with monasticism. A monastic order is unknown only in Mahdism and Judaism, which in principle recognize no other path to salvation but the faithful observance of the law. There were perhaps monastic beginnings in the late Egyptian church. The Christian church, in particular, could not reject the consistent application of its scriptural principles. But it reinterpreted asceticism as a specific "vocation" within its own ranks. The *consilia evangelica* were the highest ideal, but considered too demanding for the average believer. Therefore, full adherence to them was treated as an extraordinary achievement to be utilized as a repository of blessings for the benefit of those deficient in charismatic gifts.

(2) Eventually, asceticism is completely reinterpreted into a means, not primarily of attaining individual salvation in one's own way, but of preparing the monk for work on behalf of the hierocratic authority—the foreign and home mission and the struggle against competing authorities. Buttressed by its own charisma, such innerworldly asceticism always remained dubious to ecclesiastic authority, which relied solely on office charisma. But the advantages prevailed. Asceticism thus leaves the monastic cell and seeks to dominate the world; through its competition it imposes its own way of life, in different degrees, upon the office-holding priesthood and partakes in the administration of the charisma of office vis-à-vis the subjects (laymen). However, the tensions always persist. The integration of ecstatic asceticism into the Islamic church, through the orders, can hardly be considered consistent, even though it was theologically facilitated by al-Ghazâlî's establishment of the orthodox dogma. Buddhism had the smoothest solution, since from the beginning it was a religion created by and for monks and propagated by them: the church was completely dominated by the monks, who constituted a charismatic aristocracy. Theologically, this solution was particularly easy in the case of Buddhism. The Eastern churches found an essentially mechanical solution by increasingly reserving all higher-ranking offices for the monks. On the one hand, irrational and individual asceticism was glorified, on the other there were institutionalized churches which had been bureaucratized by the state; in Russia the church did not even have its own monocratic leader. This inconsistency corresponded to a hierocratic development that was deflected by foreign

domination and caesaropapism. In Russia the reform movement of the Josephites [see n. 5 to ch. VI, sec. *vii* above] offered its services to caesaropapism as the strongest power, and therefore only useful instrument of reform, just as the Cluniac reformers found their support in Henry III [1039–56].

Friction and compromise can be observed most clearly in the Occidental church, whose internal history is largely made up of them. Eventually a consistent solution was found by integrating the monks into a bureaucratic organization; subject to a specific discipline and removed from everyday life by the vows of poverty and chastity, they became the troops of the monocratic head of the church. This development took the form of the ever recurrent founding of new orders. It is quite possible that Irish monasticism, which for a time was the trustee of a significant part of the cultural traditions of Antiquity, might have created a distinctively monastic church in the Occidental mission territories if it had not entered into close relations with the Holy See. By contrast, the Benedictine order established monastic manors once its charismatic period was over. Even the Cluniac Benedictines (and all the more so, the Premonstratensians) were seigneurial orders of notables, whose very moderate asceticism—witness their lenient dress regulations—was limited to what was compatible with their status. Here, too, interlocal organization existed only in the form of filiation. The significance of these orders consisted essentially in the re-emergence of monasticism as an instrument of hierocratic control. The Cistercian order combined the first strong interlocal organization with an ascetic organization of agricultural work which made possible its well-known achievements in colonization.

6. *The Religious-Charismatic and the Rational Achievements of Monasticism*

In its charismatic stage monasticism is anti-economic, and the ascetic is the anti-type of the acquisitive bourgeois as well as of the feudal lord who enjoys his wealth ostentatiously. He lives alone or in freely formed "herds"; he is unmarried and hence free of family responsibilities, unconcerned with political and other powers, he lives from gathered fruits or alms, and he has no abode in the "world." The original rule of the Buddhist monks required an itinerant way of life, except during the rain period, and limited the time which a monk could spend at any given location—for the sake of an asceticism that was wholly irrational in its goals and means, that is, oriented toward shedding the economic and physical shackles of earthly existence and toward gaining the union

with the Divine. In this form monasticism is indeed part of the specifically non-economic force of genuine charisma. The monks are the old charismatic disciples and followers, but instead of a visible hero, the prophet removed to the hereafter is their invisible leader. Yet this stage is not the last one. Rational economic considerations and luxury needs cannot compete with the achievements of religious charisma, which are "extraordinary," like charisma itself. This is also true of the achievements of hierocratic power in general. The pyramids appear preposterous unless we realize that the subjects firmly believed in the king as god incarnate. The Mormon achievements in the salt desert of Utah violate all rules of rational settlement. This is all the more typical of the monastic achievements, which almost always accomplish that which appears economically not feasible. In the midst of the Tibetan snow and sand deserts Lamaist monasticism produced economic and architectural wonders that in magnitude, and apparently also in quality, measure up to the largest and most famous artifacts of men: witness the *Potala* [Palace in Lhasa]. From an economic viewpoint, the monastic communities of the Occident were the first rationally administered manors and later the first rational work communities in agriculture and the crafts. The artistic achievements of the Buddhist monks had a tremendous impact on the Far East; this was as extraordinary as the almost unbelievable fact that remote Ireland, which today may seem condemned to eternal marginality, was for several centuries the bearer of the cultural traditions of Antiquity and that its missionaries had a decisive share in shaping the Occidental church, whose peculiar development was of such paramount historical importance. Furthermore, the fact that the Occident alone developed harmonic music,[3] as well as the distinctiveness of its scientific thought can be ascribed in large measure to Benedictine, Franciscan and Dominican monasticism.

At this point we focus on the rational achievements of monasticism, which appear irreconcilable with its charismatic anti-rational, specifically anti-economic, foundations. However, this phenomenon is similar to that of the routinization of charisma in general: Asceticism becomes the object of methodical practices as soon as the ecstatic or contemplative union with God is transformed, from a state that only some individuals can achieve through their charismatic endowments, into a goal that many can reach through identifiable ascetic means just as in the charismatic training of the guilds of magical priests. Everywhere the method was at first basically the same as that developed by the most ancient monasticism, the Indian, with the greatest consistency and variety. In its basic regulations the method of the Indian monks is very similar to that of the Christian monks, although perhaps it is there more physiologically refined (breathing control and similar techniques of the yogis and other

virtuosi) and here more psychologically (confessional, tests of obedience, the *exercitia spiritualia* of the Jesuits). Moreover, even though the crucially important treatment of work as an ascetic instrument was not confined to the Occident, it was here developed far more consistently and universally. Everywhere, however, the central concern of the monk is the achievement of complete control over his self and his natural drives, for these impede a union with God. This goal alone necessitates the ever further rationalization of conduct, and this has in fact occurred wherever monasticism established a strong organization. As a result of this development we find the usual forms of the charismatic and corporate novitiate, the hierarchy of ordinations and other positions, the abbot, eventually the merger of cloisters into a congregation or an order, but above all the cloister itself and the monastic rule that controls every detail of conduct.

Henceforth, however, monasticism must operate within the realm of economic life. It is no longer possible for the monks to maintain themselves permanently through purely anti-economic means, especially mendicancy, even though the principle may be retained as a fiction; on the contrary—as we will discuss later—rational, methodical self-control cannot but strongly influence economic behavior. The very fact that the monks were a community of ascetics accounts for the astonishing achievements that transcend those attainable through routine economic activities. Among the believers the monks are the elite troops of religious *virtuosi*. Just like feudalism, monasticism reaches its heroic age and its most consistent organization in hostile areas: the domestic and foreign mission territories. It is no accident that Buddhism evolved the Lamaist hierarchy, which corresponds even in the ceremonial details to the Occidental *curia*, not in India but in Tibet and Mongolia, where it was continuously threatened by the wildest barbarian peoples of the world. In the same manner, the Occidental mission produced the most typical form of Latin monasticism in barbarian countries.

We will not pursue this phenomenon further at this point and will turn instead to the relations between monasticism and the political and hierocratic powers.

7. *The Uses of Monasticism for Caesaropapism and Hierocracy*

Caesaropapism has various political reasons for favoring monasticism, foremost, the need of its own legitimation and of domesticating the subjects; these needs will be discussed below [sec. 8]. At the height

of his power Gengis Khan established relations with the Buddhist monks, as did the Tibetan and Chinese rulers. These relations had probably the same motivation as those of the Germanic, Russian and other rulers to the monastic movements, and as the friendly contacts of Frederick II of Prussia with the Jesuits which facilitated the order's survival despite the bull *Dominus ac redemptor noster* [1773]. As ascetics, the monks are the most methodical and, politically, the least dangerous teachers; at least initially, they are the cheapest instructors, and in fact they are the only available ones in an agricultural state. If the political ruler wants to create an apparatus of officials and a counterweight against the nobility, the natural opponent of such a patrimonial or bureaucratic rationalization, he cannot wish for a more reliable support than the influence of the monks on the masses. As long as this influence persists, the hierocratic control of conduct is usually as effective as in the case of hierocratic domination proper. However, the political authorities must pay a high price for this support. The monks readily place themselves at the disposal of the ruler's interest in rational church reform—whether he be Emperor Henry III or King Asoka—, but their charismatic religiosity rejects all caesaropapist intervention in religious affairs much more vigorously than does any regular priesthood, and their strict ascetic discipline permits them to establish a very strong power position. Once monasticism has gained strength, it will clash sooner or later with caesaropapist claims. Then the secular power may be expropriated, as it happened in Tibet, or monasticism may be completely destroyed, as in the course of the repeated persecutions in China.

Far more problematic are the relations between monasticism and hierocratic office charisma. On the surface, they are relatively smooth if there is no patriarch, as in genuine Buddhism; it is true that in ancient Indian Buddhism the highest-ranking dignitary was called a patriarch, but his position seems to have been very weak because of the caesaropapist policies of the rulers, who usurped a role similar to that of the Byzantine emperors. The relations between monasticism and hierocracy are also relatively easy if the patriarch is selected and controlled mainly by the monks, as in Lamaism, and governs almost exclusively with monastic officials. But even then the inherent tensions emerge, the more genuine monasticism is preserved or restored as a radical fulfillment of divine discipleship which disdains any compromise with the sinful world of power and property and which is independent of institutional charisma because its own charisma is immediate to God.

The institution of lay brotherhood, created to free the monks for purely spiritual duties, carried the aristocratic stratification into the cloister, but at the same time attenuated the latter's feudal basis even

further. In contrast to the agrarian Cistercians, the centralist mendicant orders were tied to urban residence, in line with their original, purely charismatic form of maintenance, and their activities—preaching, care of souls and charitable labors—were also primarily oriented to the needs of urban strata. These orders were the first to carry asceticism from the cloisters into the streets for the sake of systematic missionary efforts among laymen. The (at least formally) strict enforcement of the principle of poverty, and the abolition of the *stabilitas loci*, which turned charity operations into itinerant activities, increased the utility of these unconditionally available monks for the direct control of all urban strata; the latters' systematic affiliation through the tertiary orders carried the monastic ethos beyond the confines of monasticism. The Capuchins and similar younger orders were also increasingly oriented toward belaboring the masses, and the last great attempts, by the Carthusians and Trappists, to restore the original asocial idea of asceticism, individual salvation, could no longer reverse the overall development of monasticism toward social goals, that means, toward serving the church.

The gradual rationalization of asceticism into an exclusively disciplinary method reached its apex in the Jesuit order. Gone were the individual charismatic propagation and dispensation of salvation, whose elimination from the old orders, especially the Franciscan, had been so difficult for the church which was bound to view such efforts as a threat to its office charisma. Gone, too, was every irrational meaning of asceticism as an individual search for salvation—another dubious idea from the viewpoint of office charisma. Gone were all nonrational means, that is, practices the result of which is not calculable. The rational end becomes dominant (and "sanctifies" the means—a principle not only of Jesuit but of every relativist or teleologic ethic; this principle is here distinctive only because it accentuates the rational reglementation of life). With the aid of this bodyguard, which took a special oath of unconditional obedience to the Holy See, the bureaucratic rationalization of the church was carried through. Much earlier, the introduction of celibacy had represented a reception of monastic forms; accepted upon the insistence of the Cluniac movement, one of its major purposes during the conflict over lay investiture was the prevention of the feudalization of the church and the safeguarding of the office character of clerical positions. Even more important was the impact of the monastic spirit upon the principles of conduct in general. As the exemplary religious individual, the monk was the first *professional*, at least in those orders that practiced rationalized asceticism, most of all the Jesuit order. The monk lived in a methodical fashion, he scheduled his time, prac-

ticed continuous self-control, rejected all spontaneous enjoyments and all personal obligations that did not serve the purposes of his vocation. Thus he was predestined to serve as the principal tool of bureaucratic centralization and rationalization in the church and, through his influence as priest and educator, to spread corresponding attitudes among the religious laymen. For centuries the local church authorities (bishops, parish clergy) opposed this overwhelming monastic competition: As out-of-town, and therefore popular, father confessors, the monks could easily underbid the ethical demands of the local clergy, just as under conditions of free competition such celibate ascetics could underbid the secular teachers, who had to support their families. This struggle of the local authorities was at the same time directed against the bureaucratic centralization of the church.

Monasticism did not have such a great impact in any other church, with the exception of Buddhism, which, however, had a hierarchic head only in Lamaism. In the Eastern church monasticism was formally in control, since all higher-ranking positions were occupied by monks, but the caesaropapist subjection of the church destroyed the power of monasticism. In Islam the orders played a leading role only in the eschatological (methodist) movements. In Judaism monasticism was completely absent. No other church rationalized asceticism, and used it for hierocratic purposes, as the Occidental church has done, most consistently through the Jesuit order.

8. *Compromises Between Political and Hierocratic Power*

The antagonism of political and magic charisma is primeval. "Caesaropapist" as well as "hierocratic" rulers can be found in African villages no less than in big states. Even under the most primitive conditions, or rather especially under them, the gods or saints are in part regional, in part local. Particularly at the stage of the permanent settlement *par excellence*, the city, local deities are preeminent; this results in a considerable coincidence of religion or, better, of cult object and political territory. The city god or patron saint is indispensable for the founding and existence of every political community, and the polytheist concessions of all great monotheistic religions are inevitable, as long as the power of the city is the basis of the individual's political and economic existence. At this stage, every establishment of a great state is necessarily accompanied by a synoikism in the new capital of the gods and saints of the affiliated or conquered cities and government seats. This happened as late as the unification of the Moscovite empire when

the relics were transported to Moscow from the cathedrals of the other cities; there are other well-known examples. The "tolerance" of the Roman state was of a similar character: The state accepted the worship of all gods of affiliated states, if this was (qualitatively) at all feasible and, during the Empire, if they subordinated themselves in turn to the politically motivated cult of the emperor. Resistance came only from Judaism, which was tolerated for economic reasons, and from Christianity. The political boundaries and the geographical extension of a religion tend to coincide, as soon as this stage has been reached. It may be brought about by the political as well as the hierocratic power: The triumph of one's own god is the definite confirmation of the ruler's triumph, an effective guarantee of political obedience, and a means of turning allegiance away from other rulers; moreover, the religion of an autonomous priesthood finds its natural missionary object in the political subjects and is eager to proceed to the *coge intrare*, especially if it is a religion of salvation. It is true that Islam permitted an horizontal divide, the use of religion as an index of a status order, but this was connected with the economic privilegation of its adherents. Ideally at least, Occidental Christianity was a political community, and this had certain practical consequences.

It is very rare that the antagonism between political and hierocratic power claims finds a simple solution in the full victory of one side or the other. The history of all churches demonstrates that even the most powerful hierocracy is continuously forced to compromise with the economic and political realities; and in general, the caesaropapist ruler cannot afford to intervene into questions of dogma and even less, of sacred rites. For every change in the ritual endangers its magic efficacy, and thus mobilizes all the interests of the subjects against the ruler. From this perspective the great schisms in the Russian church—over whether one should cross oneself with two or three fingers and similar issues—appear readily understandable.[4]

Whether an individual compromise between political and hierocratic power tends more toward caesaropapism or hierocracy depends of course upon the power constellation of the status groups concerned, and to that extent indirectly upon economic codeterminants. However, no meaningful generalizations can be made on this score. Moreover, the compromise is strongly influenced by the specific character of the religion. Especially important is whether a religion has a divinely ordained ecclesiastic institution that is separate from the secular power. This is the case only indirectly in Buddhism outside Lamaism (through the prescription of the one and only right path to salvation); it is true to a limited extent of Islam and the Eastern church, not at all of Lutheran-

ism, but clearly of the Catholic church and Calvinism. Since Islam was linked from the very beginning to the expansionist interests of the Arabs and advocated the forcible subjugation of the infidels, the prestige of the caliph became so great that no serious attempt was made to subject him to hierocratic control. Even though the Persian Shiites reject this very role of the caliph and place their eschatological hopes in the *parousia* of the prophet's legitimate successor in Persia, the Shah's position is predominant; this is not changed by the fact that the mood of the local population is considered in the appointments of priests. The Catholic church has tenaciously resisted caesaropapist tendencies; in spite of some temporarily necessary concessions, it eventually succeeded, since it had its own administrative organization, which rests on Roman tradition and is *divini iuris* for the believers. Luther was completely indifferent toward the organization of the church as long as the Word could be spread in its purity. This indifference, deriving from the individualist nature of his piety and also from an eschatological streak in his personal faith, in effect surrendered his church to the caesaropapism of the secular power. This was facilitated by the political and economic conditions of the territories in which Lutheranism originated. For Calvinism the Biblical theocracy, in the presbyterian form, was divinely ordained. However, it could establish a theocracy only for a limited time and only in local areas: in Geneva and New England, incompletely among the Huguenots, and in the Netherlands.

A considerable degree of hierocratic development, especially the existence of an autonomous office hierarchy and education, is the normal precondition for the rise of systematic theological thought; conversely, the emergence of theology and of theological training is one of the strong buttresses of hierocratic power, compelling even the caesaropapist state to permit an hierocratic influence on the subjects. A fully developed ecclesiastic hierarchy, with an established body of dogmas and particularly a well-organized educational system, cannot be uprooted at all. Its power rests upon the principle that "God must be obeyed more than men," for the sake of spiritual welfare both in the here and the hereafter. This has been the most ancient check on all political power, the most effective one up to the great Puritan Revolution and the declarations of the Rights of Man.

As a rule, a compromise is concluded between the otherworldly and the thisworldly powers; this is indeed in their mutual interest. The political power can offer exceedingly valuable support to the hierocracy by providing the *brachium saeculare* for the annihilation of heretics and the exaction of taxes. In turn, two qualities of the hierocracy recommend an alliance to the political authorities. First of all, as a

legitimating power hierocracy is almost indispensable even (and especially) to the caesaropapist ruler, but also to the personally charismatic (for example, the plebiscitarian) ruler and all those strata whose privileges depend upon the "legitimacy" of the political system. Furthermore, hierocracy is the incomparable means of domesticating the subjects in things great and little. Just as in Italy the most anticlerical radical parliamentarian does not like to do without the domesticating influence of the convent schools on women, so the Hellenic *tyrannis* furthered the cult of Dionysus; most importantly, hierocracy has been used for the control of subjugated peoples. Lamaism pacified the Mongols and thus stopped forever the continually renewed barbarian invasions from the steppe into pacified, civilized areas. The Persian empire imposed the "law" and hierocratic domination upon the Jews, in order to render them harmless. The quasi-ecclesiastic development in Egypt also appears to have been advanced by the Persians. In Hellas all oracles of Orphic or other prophets expected and hoped for a Persian victory, in order to offer themselves for the same purpose. The battles of Marathon and Plataeae were also a decision in favor of the secular character of Hellenic civilization.

The domesticating role of hierocracy is even greater with regard to internal control. It is true that military or commercial notables resort to religion only in a strictly traditionalist fashion, since it creates a dangerous competing power based on the emotional needs of the masses; at any rate, they divest religion of any charismatic-emotional character. Thus the Hellenic aristocracies rejected, at least in the beginning, the cult of Dionysos, and the centuries-old rule of the Roman Senate systematically erased ecstasis in any form, degrading it to the level of *superstitio* (the liberal translation of the Greek ἔκστασις) and suppressing all its means, especially the dance. This happened even in the rites: the dance of the *salii* was a procession, and the *fratres Arvales*, significantly, performed their age-old dance behind closed doors. This has had the greatest consequences for the characteristic differences between Roman and Hellenic culture (for example, in music). In contrast to this rule by notables, the personal ruler everywhere seeks the support of religion. The resulting compromise between secular and religious power may vary greatly, and the actual distribution of power may shift without any formal modification of the compromise. Fateful events play a tremendous role: Perhaps a powerful hereditary monarchy would have turned the Western church into a similar direction as the Eastern, and without the Great Schism the decline of hierocratic power might never have occurred in the way it actually happened.

9. *The Social Preconditions of Hierocratic Domination and of Religiosity*

Since the outcome of the struggles between political and hierocratic power depends so largely upon historical "accidents," it is not easy to generalize about their determinants. In particular, these struggles are not determined by the general degree of religiosity among the people. Roman and, even more, Hellenic life was permeated by religion, and yet hierocracy did not succeed. If we wanted to stress the dualistic development of transcendentalism, which was absent there, we would have to say that it was also completely absent in Judaism at the time the hierocracy emerged; conversely, it may be said that the rise of transcendental speculation resulted at least in part from the rational development of the hierocratic system, as appears certain for Egypt and India.

Neither are some other presumptive determinants really decisive. The extent of dependence on natural conditions, on the one hand, and on one's own labor on the other does not provide a universal explanation. It is true that the inundations of the Nile were important for the development of hierocracy, but only insofar as they helped to link the parallel rational development of state and priesthood with astronomical observation and transcendental speculation. The rule of the alien Hyksos over Egypt [ca. 1650–1550 B.C.] apparently preserved the priesthood as the only guarantor of internal unity, just as in the West the tribes of the Teutonic Migration retained the bishops. The perpetual danger of earthquakes in Japan, for example, did not prevent the feudal clans from forestalling any extended hierocratic rule. "Natural" or economic factors were as unimportant for the rise of the Jewish hierocracy as for the relations between feudalism and Zoroastric hierocracy in the Sassanid empire or for the historic accident which provided Arabian expansionism with a great prophet.

Of course, there are many diverse connections between the history of hierocratic structures and the concrete socio-economic conditions under which they must operate. The few generalizations that may be ventured on this score refer to the hierocracy's relations to the "bourgeoisie," on the one hand, and to feudal powers on the other. Bourgeois strata protected hierocracy against imperialism and feudalism not only in medieval Italy—the Guelph support could have been due to a unique historical constellation—, but we know of comparable conditions from the earliest Mesopotamian inscriptions. In Greece the bourgeois strata were the main supporters of the cult of Dionysos; the ancient Christian church was a specifically urban institution. (In the Empire, *paganus*

denotes the "civilian" as well as the "heathen": the term encompasses everything that is socially despised, corresponding to our use of the term *Pisang*, which derives from *paysan*.) The church was urban for Thomas Aquinas, too, who ranked the peasants lowly. Finally, the Puritan hierocracy and almost all medieval sects, with the memorable exception of the Donatists, originated in the cities, just as in their day the most passionate supporters of the papacy.

This contrasts with the ancient aristocracy, above all, the early Hellenic urban nobility, which treated the gods with complete lack of respect in the Homeric epic—an attitude fateful for the whole development of Hellenic religion—; it also contrasts with the Cavaliers of the Puritan period and the feudal nobility of the early Middle Ages. After all, the feudal state arose on the basis of Charles Martel's secularization, which verged on robbery. It is true that the Crusades were by and large an exploit of French knights, but this is not indicative of hierocratic sympathies; the Crusades were undertaken largely with a view toward securing fiefs for descendants, an interest to which Pope Urban appealed explicitly in his well-known address. It should be clear that we do not deal here with the contrast between piety and impiety, but with the *type* of religiosity and the related emergence of a "church" in the technical sense.

The bourgeoisie depends economically on work which is continuous and rational (or at least empirically rationalized); such work contrasts with the seasonal character of agricultural work that is exposed to unusual and unknown natural forces; it makes the connection between means and ends, success and failure relatively transparent. The product of the potter, weaver, turner and carpenter is much less affected by unpredictable natural events, especially by organic reproduction that involves the mystery of "creation" for which only phantasy can provide an explanation. The resulting rationalization and intellectualization parallel the loss of the immediate relationship to the palpable and vital realities of nature, because the work is done largely within the house and is removed from the organically determined quest for food; perhaps it is also relevant that the largest muscles of the body are not used. The forces of nature become an intellectual problem as soon as they are no longer part of the immediate environment. This provokes the rationalist quest for the transcendental meaning of existence, a search that always leads to religious speculation. Ecstatic frenzy or dreaming are replaced by the paler forms of contemplative mysticism and of common-sense contemplation. At the same time, the steady professional nature of the artisan's work for his customers easily suggests the conception of duty and reward as the basis of conduct, and since the social context of his

work requires a relatively rational order, religiosity tends to be imbued with moralistic considerations.

By contrast, a feeling of sinfulness, which developed from the older idea of ritual purity, is incompatible with the feudal lord's sense of dignity, and for the peasant, "sin" is even today difficult to understand. These agricultural strata do not seek redemption, in fact, they do not quite know from what they should be redeemed. Their gods are strong beings, whose passions resemble those of man; they may be brave or treacherous, friendly or hostile to one another and to man; at any rate, like man they are completely amoral, amenable to bribery through sacrifices and subject to magic influences, which may make the human manipulator even stronger than they are. At this stage there are as yet no incentives to construe a theodicy or to pursue any type of ethical speculation about the cosmic order. In a directly utilitarian fashion, the priesthood and strict adherence to ritual prescriptions serve as means of magical control over nature, especially as a defense against demons whose ill will might bring bad weather, attacks by predatory animals and insects, diseases and animal epidemics. The internalization and rationalization of religiosity usually develops parallel to a certain degree of handicraft production, most of the time to that of the urban trades. This involves the projection of ethical criteria and commandments, and the transfiguration of gods into ethical powers which will reward good and punish evil; now the gods themselves must conform to moral expectations and the individual's sense of sinfulness and his desire for redemption can emerge. It is impossible to reduce this parallel development to an unambiguous relation of cause and effect: Religious rationalization has its own dynamics, which economic conditions merely channel; above all, it is linked to the emergence of priestly education. Although we do not know much about Mahdism, it appears that it lacked any economic basis. It is very doubtful that it was an hierocratic outgrowth of old Islamic religion, the work of the founder of a sect who was driven across the border into a remote region. However, it seems certain that the rational-moralistic evolution of the religion of Yahwe was influenced by the great centers of civilization; yet prophecy and, even more so, the older moralism arose when the city and the trades were still undeveloped, at any rate in comparison with contemporary Mesopotamia and Egypt. However, the hierocracy was established by the city priests of Jerusalem in their struggle with the countryside, and the elaboration of the Law and its imposition were the work of the exiles living in the city of Babylon. The ancient Mediterranean polis, on the other hand, did not rationalize religion, in part because of Homer's influence as the accepted means of literary education, but

primarily because of the absence of a priesthood that was hierocratically organized and clerically educated.

In spite of all these differences, it is quite clear that there is an elective affinity between priesthood and urban petty-bourgeois strata. Above all, the opponents are typically the same in Antiquity and the Middle Ages—the great feudal families; in their hands was both the political power and the usurious loan business. For this reason bourgeois strata have often tended to support every move of an hierocracy in the direction of autonomy and rationalization. Thus, the urban population in Sumeria, Babylonia, Phoenicia and Jerusalem supported the hierocratic claims, and the Pharisees (i.e., Puritans) drew their following against the Sadducaic patricians from the cities, just as all emotional cults of Mediterranean Antiquity had an urban base. The early Christian church was made up of petty-bourgeois congregations; the papal autonomy claims, just as the medieval Puritan sects found their strongest support in the cities; certain trades produced heretic movements as well as religious orders, such as the *Humiliati*—both tendencies border on one another. In the long run, ascetic Protestantism in the broadest sense of the term (Calvinist and Baptist Puritans, Mennonites, Methodists and Pietists) drew the core of its following from the middle and lower ranks of the bourgeoisie, just as the unshakable religious law-consciousness of Judaism began only with its urban entrenchment and depended on it.

This does not mean that religious movements have usually been class movements. Nothing is as wrong as the idea that Christianity, which for compelling political and cultural reasons had to be unacceptable to the ruling strata of Antiquity, was a "proletarian" movement. Buddhism was founded by a prince and imported into Japan with the active support of the nobility. Luther addressed the "Christian nobility" (i.e., the highest nobles, the princes). At the height of their great struggles, the French Huguenots and Scottish Calvinists were led by nobles, but the Puritan Revolution was successful because of the cavalry provided by the rural gentry. These examples show that, by and large, religious cleavage cuts vertically through all strata. This remains true for the period of enthusiastic devotion to transcendental interests, a devotion that almost always has an eschatological orientation.

In the long run, however, an elective affinity between spiritually prescribed conduct and the socially conditioned way of life of status groups and classes asserts itself as the eschatological expectations recede and the new religious beliefs are routinized. Horizontal stratification increasingly displaces vertical divisions. Thus, the Huguenot and Scottish nobility later stopped fighting for Calvinism, and everywhere the

further development of ascetic Protestantism became the concern of the bourgeois middle classes. We cannot pursue these problems in detail, but we can at least consider it certain that the evolution of hierocracy into a rational means of domination, and the related rational-ethical development of religious thought, usually finds strong support in the bourgeois classes, especially their lower strata, despite the conflicts between hierocracy and bourgeoisie with which we must deal in a different context [sec. 10].

In periods of manorial-feudal domination this rational (bureaucratic) apparatus is always threatened. The high-ranking functionaries of the church (the bishops) become great vassals by virtue of land and political rights granted to them, and the ordinary priests receive benefices from their manorial lord and thus become part of the patrimonial officialdom. Only in cities and in a monetary economy can the priests be maintained from church wealth administered by the bishop and donated by the believers. In a manorial natural economy the independence of the clerical apparatus can be secured only through monastic communal living; that means, the monks, combining a manorial setup with living in a completely, or almost, communist fashion, become the bodyguard of hierocracy. Monastic communal living made possible the extraordinary importance of the Irish and Benedictine monks and of the quasi-monastic chapters (which followed Chrodegang's rule) for the development of the Occidental church and of civilization in general; the same was true of the Lamaist monastic church in Tibet and Buddhist monasticism in feudal Japan.

10. *The Impact of Hierocracy on Economic Development*

A. THE ACCUMULATION OF CHURCH LANDS AND SECULAR OPPOSITION

Beyond the few remarks we have made here, it is difficult to generalize about the economic preconditions of hierocracy. They are, of course, always a co-determining factor, but it is easier to state the importance which hierocratic domination has had for economic development.

To begin with, the economic imperatives of hierocracy result in typical clashes with the economic interests of certain classes. The church attempts to secure its economic autonomy primarily through substantial endowments, preferably of real estate. Since the church is interested not in quick profit-making but in permanent, safe revenues and minimal friction with its retainers, it generally pursues a conservation

policy toward the peasants; in this it resembles the monarch as against the private manorial lords. Just as in modern history the large ecclesiastic holdings did not participate significantly in the practice of enlarging manorial estates at the expense of peasant land, so in Antiquity the emphyteutic and other clerical landholding rights resembling hereditary leases originated probably on temple land. Considering the rational character of asceticism, it is natural that in their own farming operations the monastic manors, especially those of the Cistercians, were among the first rational enterprises.

However, the increase of inalienable real estate (*mortmain*), which limits the supply of land, arouses the resistance of interested groups, first of all the secular nobility which views this as a threat to the availability of land for its descendants. The great secularization by Charles Martel was an act of church robbery in favor of the nobility; in the course of the Middle Ages the nobles, in their roles as vassals or bailiffs (*Vögte*) of ecclesiastic estates, persistently attempted to gain control of church lands; and the so-called amortization laws [i.e., laws against alienation in mortmain], enacted by modern states with a view toward limiting the increase of church-owned real estate, were initiated by nobles. It is well-known that eventually bourgeois land speculation became interested in church lands, and that the great confiscation during the French Revolution benefitted primarily the bourgeoisie. Finally, the royal power opposed the expansion of church and monastic lands partly because of its competition with the hierocracy and partly for mercantilist reasons, insofar as it was not guided by the same interests as the nobility; only in the early Middle Ages had the king viewed the enlargement of church land as a means of consolidating his power, as long as the ecclesiastic dignitaries were in fact his most reliable vassals because they were not interested in hereditary succession. Opposition by the political power was most severe and most successful in China, where the annihilation of monasticism and the confiscation of its substantial landholdings was explained with the argument that the monks detracted the people from work and directed them to idle and economically sterile contemplation.

Where the hierocratic accumulation of land proceeds freely, it may lead to a far-reaching elimination of land from the open market. Especially in the Orient during Byzantine and Islamic times, this accumulation often served the purpose of lending sacred protection to private landholdings. To refer to an earlier example [chapter XIII·10], a typical Byzantine monastic endowment of the 11th or 12th century may be established in the following way: A founder provides a large tract of land—in Constantinople, building land that will increase in value—

for a monastery; from this a fixed number of monks receive prebends, which sometimes may even be used outside the monastery; in return the monks must support, in a stipulated fashion, a fixed number of poor people and fulfill certain religious duties. However, for a certain time, not only the secular administration of the monastery is reserved to the founder's family, but also—and this is far more important—the surplus of the increasing revenues over the fixed expenditures. Thus, in reality an entailed estate (*fidei commissum*) has been created, but as church property it can no longer be seized by the secular powers without committing sacrilege. It appears that many Islamic *wakf* holdings, which through their size alone have played a very considerable role in all Oriental countries, came into being for similar reasons.

In the Occident, too, monasteries and other foundations were always exposed to aristocratic attempts at utilizing them for the maintenance of the younger nobles, and almost all of the numerous monastic reforms aimed at eliminating this aristocratic monopolization and alienation from hierocratic purposes.

B. HIEROCRATIC AND BOURGEOIS TRADING AND CRAFT INTERESTS

Hierocracy clashes directly with "bourgeois" interests through monastic trade and craft activities. Particularly in a natural economy, temples and cloisters accumulate great stocks of precious metals, in addition to agricultural products of many kinds. In Egypt and Mesopotamia the grain supplies of the temples seem to have been used to counteract rising prices, similar to the royal magazines. If the natural economy is clearly predominant, precious metals will be hoarded (as, for instance, in the Russian monasteries). But the sacred peace of the temples and cloisters, protected by the fear of Divine wrath, has always been the immune basis of international and interlocal trading; its tax proceeds, in addition to the gifts of the believers, filled the treasury. The much-talked-about institution of temple prostitution was apparently related to the needs of the commercial travelers (who have remained the largest contingent of visitors to the brothels). Everywhere, and on the largest scale in the Orient, did temples and cloisters participate in financial transactions, accept deposits, grant loans and diverse advances in kind or money against interest. They also seem to have acted as intermediaries of commercial transactions. The Hellenic temples functioned partly as a central bank (like the treasury of Athena—this had the advantage that in the democratic period at least some restraints were imposed on the raiding of the state treasury), and partly as depository and savings banks.[5] The Delphic Apollo provides a typical example for

the emancipation of slaves: The temple bought the slave's freedom from his master, of course, not with Apollo's means but with the deposits of the slave, who had no property rights in relation to his master, but whose savings were safe from seizure in the temple. The ancient temples and the medieval monasteries were the most trustworthy and safest depositories. The popularity of the church as debitor included in the Middle Ages—as Schulte has correctly emphasized—the bishop himself, since the sanction of excommunication threatened him no less than cashiering nowadays menaces the indebted lieutenant.[38a] Occasionally the lay merchants viewed these monetary transactions of the temples and cloisters as a competition. But it is also true that the extraordinary financial power of the church, especially of the pope and his tax-collectors, provided private business with the opportunity to make tremendous and often risk-free profits.

Matters were quite different especially with regard to the monastic crafts. Even though the older Benedictine rule seems to have viewed physical work primarily as a hygienic compensation for spiritual exercises, the consistent ascetic use of physical work and the disposition over a large number of lay brothers and serfs often created a major competition for the secular crafts. The cloister crafts were necessarily in a superior position since they could rely on man-power that was celibate and ascetic and considered work as a vocation (*Beruf*) for the sake of salvation; they also had a rational division of labor and benefitted from connections and patronage that guaranteed steady sales. Therefore, they were one of the substantial economic gravamina of the petty-bourgeois strata just before the Reformation, as are prison work and consumer co-operatives today. The secularization of the Reformation, and even more so of the French Revolution, later decimated the clerical enterprises.

In comparison with private capitalism, the economic operations of ecclesiastic institutions, whether they are undertaken directly, through agents, or in the form of participation, have lost much of their former importance. At present we cannot estimate their significance for church finance, since usually such participations are carefully masked. Today the monasteries produce only some specialties. The Curia has reportedly lost much money through participation in building-land speculation (in Rome), and doubtlessly even more through abortive bank foundations (in Bordeaux). Even today churches and cloisters prefer to acquire real estate as soon as the accumulation in mortmain is permitted. However, most of the funds are raised not through industrial and commercial activities but through enterprises such as Lourdes, through patronage,

endowments and mass contributions, insofar as they are not provided by state budgets, state donations, taxes and perquisites.

C. HIEROCRATIC AND CHARISMATIC ETHICS VERSUS NON-ETHICAL CAPITALISM

Through its structure of domination and its peculiar ethical regulation of conduct hierocracy affects the economic sphere much more than through its own economic activities. It is true that the great ecclesiastic religions differ greatly, especially during their early stages, in their structure of domination and their basic ethics, as it is expressed in rules of conduct. Thus, Islam developed out of a charismatic community of warriors led by the militant prophet and his successors; it accepted the commandment of the forcible subjection of the infidels, glorified heroism, and promised sensual pleasures in the here and the hereafter to the fighter for the true faith. Conversely, Buddhism grew out of a community of sages and ascetics who sought individual salvation not only from the sinful social order and individual sin but from life itself. Judaism developed out of an hierocratic and bourgeois community that was led by prophets, priests and, eventually, theologically trained intellectuals; it completely disregarded the hereafter, and strove for the reestablishment of its secular nation state, and also for bourgeois well-being through conformity with a casuist law. Finally, Christianity grew out of the community of participants in the mystical Christ cult of the Lord's Supper; initially, this community was filled with eschatological hopes for a divine universal kingdom, rejected all force and was indifferent to the social order, whose end appeared imminent; it was guided charismatically by prophets and hierocratically by officials. But these very different beginnings, which were bound to result in different attitudes toward the economic order, and the equally different historical fate of these religions did not prevent the hierocracies from exerting rather similar influences on social and economic life. These influences corresponded to the universally similar preconditions of hierocracy, which assert themselves once the charismatic heroic age of a religion has passed and the adaptation to everyday life has been made. However, we will see that there were certain important exceptions.

Hierocracy is the most important typifying power in existence. The *ius divinum*, the Islamic *shari'ah*, the Torah of the Jews are inviolable. On the other hand, in those areas not regulated by the *ius divinum* hierocracy is the least rationally predictable power: Charismatic justice in the form of the oracle, ordeal, *fetwa* of a *mufti* or judicature of an Islamic ecclesiastic court, is irrational and at best decides a given case

according to considerations of equity. These formal elements of adjudication, which we have mentioned several times before, had an anti-capitalist impact, but in addition hierocracy necessarily felt a deep antipathy toward the non-traditional power of capitalism, even though it occasionally collaborated with it. This antipathy is rooted in the natural community of interest with all traditionally sanctified authorities whose monopoly appears to be threatened by the domination of capital.

However, another reason for this antipathy is inherent in capitalism. It is true that only Occidental hierocracy, which was more rationalized than all the others, developed a rational trial procedure—in its own interest, to be sure—, in addition to a rational canon law; moreover, it threw its full weight to the side of the reception of a rational law: Roman law. Nevertheless, the intervention of the ecclesiastic courts has been barely tolerated, evaded or openly rejected by the capitalist bourgeoisie. [The reasons for this mutual antipathy must be sought in the fact that] the domination of capital is the only one which cannot be ethically regulated, because of its impersonal character. Most of the time this domination appears in such an indirect form that one cannot identify any concrete master and hence cannot make any ethical demands upon him. It is possible to advance ethical postulates and to attempt the imposition of substantive norms with regard to household head and servant, master and apprentice, manorial lord and dependents or officials, master and slave, or patriarchal ruler and subject, since their relationship is personal and since the expected services result therefrom. Within wide limits, personal, flexible interests are operative here, and purely personal intent and action can decisively change the relationship and the condition of the person involved. But for the director of a joint-stock company, who is obliged to represent the interests of the stockholders as the masters proper, it is very difficult to relate in this manner to the factory workers; it is even more difficult for the director of the bank that finances the joint-stock company, or for the mortgage holder in relation to the owner of property on which the bank granted a loan. Decisive are the need for competitive survival and the conditions of the labor, money and commodity markets; hence matter-of-fact considerations that are simply non-ethical determine individual behavior and interpose impersonal forces between the persons involved. From an ethical viewpoint, this "masterless slavery" to which capitalism subjects the worker or the mortgagee is questionable only as an institution. However, in principle, the behavior of any individual cannot be so questioned, since it is prescribed in all relevant respects by objective situations. The penalty for non-compliance is extinction, and this would

not be helpful in any way. More important is that such economic behavior has the quality of a *service* toward an *impersonal* purpose.

In all ethically rationalized religions, these conditions conflict perennially with the most elementary social postulates of the hierocracy. Every ethically oriented religiosity begins with eschatological hopes and hence rejects the world. These beginnings are directly anti-economic, also in the sense that they lack the notion of a specific dignity of work. However, insofar as the adherents of a religious community cannot live from patronage or begging, or do not live under warrior communism, as in the case of militant Islam, exemplary members live from their own work—Paulus as well as Saint Aegidius. This was recommended by the early Christian church as well as by Saint Francis, but not because work as such was esteemed. It is simply a fairy tale that work received any greater dignity in the New Testament. The exhortation "to abide in the same calling" [Corinth. 7:20] expresses complete eschatological indifference, just as the prescription "to render unto Caesar the things that are Caesar's" [Luke 20:25]. This is not, as it is often alleged today, an inculcation of duties toward the state, but the expression of absolute indifference toward anything that happens in the political sphere—this exactly constitutes the difference from the Judaic parties. Work attained dignity much later, beginning with the monastic orders who used it as an ascetic means. During the charismatic period of a religion, the perfect disciple must also reject landed property, and the mass of believers is expected to be indifferent toward it. An expression of this indifference is that attenuated form of the charismatic communism of love which apparently existed in the early Christian community of Jerusalem, where the members of the community owned property "as if they did not own it." Such unlimited, unrationalized sharing with needy brothers, which forced the missionaries, especially Paulus, to collect alms abroad for the anti-economic central community, is probably what lies behind that much-discussed tradition, not any allegedly "socialist" organization or communist "collective ownership." Once the eschatological expectations fade, charismatic communism in all its forms declines and retreats into monastic circles, where it becomes the special concern of the exemplary followers of God (*Gottesgefolgschaft*). But even there we always find the tendency toward prebendalization. It becomes necessary to advise against abandoning one's vocation and to warn against missionary parasites—Paulus' famous saying: "Whoever does not work shall not eat" [2 Thess. 3:10] is addressed only to them. The maintenance of the indigent and unemployed brothers becomes the task of a regular officer, the deacon. Some ecclesiastic revenues are set aside for them (in Islam as well as Christianity). For the rest, poor relief

becomes the concern of the monks. As a remnant of the charismatic communism of love, Islam, Buddhism and Christianity equally consider the giving of alms as pleasing to God, despite their greatly different origins.

However, the churches always retain some distinctive, more or less articulate attitude toward the economic order. It is true that they can no longer denounce it as a Satanic creation, since they must use it and ally themselves with it. Just like the state, the economic order appears either as a concession to the world's sinfulness, which God permitted to arise and hence must be accepted as inevitable, or even as a divinely ordained means for the subduing of sin, and then it is important to imbue the bearers of an economic order with an ethic that will make them use their power for this purpose. However, this attempt meets difficulties in all capitalist relationships, even in their most primitive forms. For *caritas*, brotherhood, and ethically imbued personal relations between master and servant remain the foundation of every ecclesiastic ethic, from Islam and Judaism to Buddhism and Christianity; they are the residues of the old ethos of love of the charismatic brotherhood. In the economic realm the rise of capitalism makes these ideas just as meaningless as the implicit pacifist ideals of early Christianity have always been in the political realm in which all domination ultimately rests on force. For under capitalism all patriarchal relationships are divested of their genuine character and become impersonal; in principles, a person can practice *caritas* and brotherhood only outside his vocational life.

D. THE BAN ON USURY, THE JUST PRICE AND THE DOWNGRADING OF SECULAR VOCATIONAL ETHICS[6]

All churches have viewed with deep distrust the rise of this alien, impersonal power, and most of them took a stand against it. We cannot follow here in detail the history of the two major moral demands: the injunction against usury and the commandment to demand and give the "just price" (*iustum pretium*) [cf. *supra*, ch. VI:*xii*:4] for commodities and labor. Both belong together and originate in the primeval ethic of the neighborhood, which knows barter only as the exchange of occasional surpluses or of products of one's own labor, work for others only as neighborly help, and loans only as help in need. Among "brothers" one does not haggle for the price but asks merely for the restitution of one's own cost (including the "living wage"), if an exchange takes place at all; mutual labor assistance is either provided without compensation or in return for a meal, and no gain, hut possibly reciprocity, is expected from the loan of dispensable goods. Interest is demanded by the ruler; profit by the tribal alien, not by a brother.

The debtor is (actually or potentially) a serf or—*a potiori*—a "liar."[7] Religious brotherliness demands the transfer of this primitive neighborhood ethic to economic relationships among members of the same religious group (for the commandment is originally limited to them, especially in Deuteronomy and still in early Christianity). Just as early trade is exclusively exchange of goods between different tribes, and the trader an alien, so in religious ethics he remains burdened with the odium of the non-ethical quality of his vocation: *Deo placere non potest.* However, despite these obvious connections, the injunctions against usury should not be deduced in too materialist a manner as "reflections" of a specific situation—the predominance of consumer credit. Interest-free producer's credit is known to Oriental law in the earliest extant contracts (as loan of seed-corn for a share in the yield).

The Christian absolute ban on usury derives, in the formulation of the Vulgate: *mutuum date nihil inde sperantes,* perhaps from the translation of an incorrect reading (μηδὲν ἀπελπίζοντες instead of μηδένα ἀπελπίζοντες, according to A. Merx).[8] Historically, it applied at first only to the clergy, and even there only in relation to brothers, not aliens. In the early Middle Ages, when the natural economy and consumers credit predominated, the ban was disregarded time and again by the clergy itself. However, it was taken seriously almost at the same moment when capitalist production credit (more correctly, commercial credit) became important, at first in the overseas trade. The ban was not a product, or a reflection, of economic situations, but rather the result of the growing internal strength and autonomy of the hierocracy, which now began to apply its ethics to the economic institutions; the efflorescence of theology provided a comprehensive casuistry for that purpose. The effect of the prohibition of usury cannot be described here, and at any rate, it cannot easily be summarized. For commerce the ban was tolerable at first because in the most important cases credit was taken up only against shares in profit and loss, in view of the great risks involved; it took a long time before fixed, at times publicly regulated, percentage rates became customary (as in the case of the *dare ad proficuum maris* in Pisa). At any rate, the formation of partnerships was the customary form for the procuring of production capital, and the purchase of annuities or perpetual rent (*Rentenkauf*) for the providing of mortgage credit. Nevertheless, the prohibition of usury strongly affected the legal forms of doing business and often greatly impeded economic transactions. The merchants protected themselves through blacklists against appeal to the ecclesiastic court (as the [German] Exchanges do nowadays against the invocation of the *Differenzeinwand* type of protest [which voids an illegal speculative contract by denouncing it to the courts]); some guilds (for example, the [Florentine] *Arte di Calimala*) periodically bought

a general absolution for the inevitable *usuraria pravitas;* at the end of his life, the individual merchant paid "conscience money," or stipulated it in his will, and the ingenuity of the lawyers exhausted itself in the invention of legal forms which circumvented the prohibition of usury in the capitalist interest. The church, in turn, established the *montes pietatis* ["mounts of piety": pawn shops] for emergency loans to the petty bourgeoisie.

However, the ban on usury was nowhere really successful in curbing the development of capitalism; increasingly it became a mere impediment of commercial life. Calvinism produced the first theoretical justification of interest, by Salmasius [*de usuris*, 1638]. In competition with Calvinism, the Jesuit ethic made all conceivable concessions before the church surrendered officially in the 18th and, completely, in the 19th century, despite the Vulgate passage and the *ex cathedra* decisions of the popes. This surrender occurred on the occasion of inquiries about the admissibility of subscribing to interest-bearing loans of the city of Verona: the Holy Office advised the *patres confessores* no longer to ask the communicants about this violation and to grant absolution, provided it appeared certain that the communicant would comply with a possible future decision of the Holy See to revert to the prohibition. With regard to the theory of the *iustum pretium* [teaching of the "just price"], late medieval doctrine had already made great concessions.

In general, it appears scarcely admissible to say that the church had an economic program. The church did not decisively influence basic institutions. In Antiquity as well as the Middle Ages, for example, it had no major share in the waning of such a fundamental institution as slavery. Insofar as it took a stand in modern history, it lagged behind the economic facts and later behind the protest of the Enlightenment. And insofar as religious influences were important, they emanated from the sects, especially the Quakers, although in practice even they often ignored their hostility to slavery.[8] In all other respects, too, the church endorsed, if it intervened at all, the traditionalist and "minimum subsistence" measures of the cities and princes. Nevertheless, the influence of the medieval church was not insignificant but extraordinarily great. But it did not make or unmake institutions as much as it molded attitudes, and even then its influence was essentially negative. Against the forces of capitalism, the church has reinforced all personal patriarchal authority and all peasant and petty-bourgeois traditionalist interests—fully in accordance with the rationale of all hierocracy. The mentality furthered by the church is non-capitalist, and partly anti-capitalist. The church does not condemn the acquisitive drive (*Erwerbstrieb*—a concept, by the way, which is wholly imprecise and better not used at

all); instead, the church condones it, as it does all worldly things, in those who do not have the charisma necessary for adhering to the *consilia evangelica*. However, the church cannot bridge the gap between its highest ethical ideals and a rational, methodical orientation toward the capitalist enterprise which treats profit as the ultimate goal of a vocation and—this is the main point—regards it as a measure of personal virtue. The church outbids secular morality in marriage, state, vocation and business through the monastic ethic as the higher principle, and thus reduces everyday life, especially in the economic sphere, to an ethically inferior level. Only for the monk did the church create a methodical ascetic way of life oriented toward a unified goal. This applies to the church of the Occident just as much as to Buddhism, which in its beginnings was a religion purely for monks. The church looks at the layman's doings with a certain tolerance if he bows to its authority and, in Buddhism, presents it with gifts. Most importantly, the church lets the layman periodically relieve himself of his sins in the aural confession, the clergy's most impressive power instrument, which only in the Occidental Christian church was developed with full consistency. But through the confession, and by stressing to the layman its own role as a charismatic institution of salvation, the church inevitably weakens the believer's motivation for living his worldly and occupational life methodically and exclusively on his own responsibility: The highest religious ideals could not be followed in this manner anyway, for they are not of this world.

It is true that, all in all, the conduct of the medieval Catholic in his secular vocation was much less bound by tradition and law than that of the Jew about whom we will have to say more below [sec. 13], and in some respects even that of the Mohammedan or Buddhist. Yet whatever seemed to be gained thereby for capitalist development was lost again because of the lack of incentives for the methodical fulfillment of a secular vocation, especially in business. There was no psychic premium on work in one's secular vocation. *Deo placere non potest* remained, in spite of all attenuation, the last word for the believer with regard to the idea that his economic conduct should serve a rational, impersonal, profit-oriented enterprise. Thus persists the dualism between the "world" and ascetic ideals that can be realized only by leaving it. Buddhism is even less familiar with a secular vocational ethic, since it is a monastic religion and also because of the whole trend of its idea of salvation. In Islam, the naive exaltation of worldly goods and enjoyment, which is a remnant of its origin as a warrior religion, is not at all conducive to a vocational ethic in our sense; not even the rudiments of such a development can be found. The caesaropapist Eastern church never arrived at a clear position.

HIEROCRATIC RATIONALIZATION AND THE UNIQUENESS OF OCCIDENTAL CULTURE

The more favorable constellation for capitalist development that Occidental Catholicism offered (in comparison with these Oriental religions) was primarily due to the rationalization of hierocratic domination undertaken in continuation of ancient Roman traditions. This refers especially to the manner in which science and jurisprudence were developed. The Oriental religions preserved the unrationalized charismatic character of religiosity more than did the Occidental church; in part at least, this was a consequence of the purely historical fact that not they but the secular powers, whose paths they crossed, were the carriers of spiritual and social culture, and that they always remained subject to caesaropapist control, Buddhism excepted. The Eastern church lacks an hierocratic apparatus with a monocratic head. Since the catastrophe of Patriarch Nikon and the abolition of the patriarchal position during the reign of Peter the Great, the *Oberprokuror* has been the dominant figure of the Russian Holy Synod, a purely bureaucratic organization of state-appointed clerical dignitaries. The Byzantine patriarchs were never capable of claiming a monocratic position. The Sheik ul-Islam, theoretically the superior of the caliph, a layman, was yet appointed by him; moreover, just like the Byzantine *basileus*, the caliph had religious authority of his own, even though it was unstable. Buddhism has a monocratic head only in Lamaism, but he is a Chinese vassal and, moreover, "insulated" as an incarnation in the sense discussed above [ch. XV:1 and ch. XIV:iii:2]. Hence, there is no infallible doctrinal authority. In Islam, Buddhism and the Eastern church the sole source of new knowledge is the *consensus ecclesiae;* in the two former cases this brought about considerable flexibility and growth potential, but also greatly impeded the rise of rational philosophical thought evolving out of theology. Finally, there was no rational judicial system of the kind established by the Occidental ecclesiastic apparatus. The church created a trial procedure—inquisition—in order to obtain evidence in a rational manner, primarily for its own purposes; this, in turn, strongly affected the development of secular justice. There was also no continuous lawmaking on the basis of rational jurisprudence, such as the Occidental church developed on the model of Roman law, or encouraged through its example.

All in all, the specific roots of Occidental culture must be sought in the tension and peculiar balance, on the one hand, between office charisma and monasticism, and on the other between the contractual character of the feudal state and the autonomous, bureaucratic hiero-

cracy. At least from a sociological viewpoint, the Occidental Middle Ages were much less of a ***unified culture*** (*Einheitskultur*) than the Egyptian, Tibetan and Jewish cultures after the hierocracy's victory, or than China since the triumph of Confucianism, Japan—if we disregard Buddhism—since the victory of feudalism, Russia since the rise of caesaropapism and state bureaucracy, and Islam since the definite establishment of the caliphate and the prebendalization of domination; finally, even Hellenic and Roman culture were more unified than medieval Europe. This generalization appears to be largely correct even though all these cultures were unified in a different sense. The alliance between political and hierocratic power reached two high points in the Occident: The first time in the Carolingian empire and during certain periods in which the Holy Roman Empire attained the height of its power; the second time in the few cases of Calvinist theocracy and, in strongly caesaropapist form, in the states of the Lutheran and Anglican Reformation and in the great unified states of the Counter-Reformation: Spain and Bossuet's France. But even during these periods of co-operation Occidental hierocracy lived in a state of tension with the political power and constituted its major restraint; this contrasted with the purely caesaropapist or purely theocratic structures of Antiquity and the Orient. In the Occident authority was set against authority, legitimacy against legitimacy, one office charisma against the other, yet in the minds of rulers and ruled the ideal remained the unification of both political and hierocratic power. The individual, however, did not have any legitimate sphere of his own against these two types of legitimate domination, with the exception of the independent family charisma in the clan state or the contractually guaranteed, direct or derived autonomy of the vassal. The extent to which the state of Antiquity, hierocracy, the patrimonial state or caesaropapism assert their power over the individual has already been discussed in passing or remains to be treated; at any rate, this is a purely factual question, the answer to which depends primarily upon the survival interests of the ruling group and its form of organization. The point is that a legitimate limitation of authority in favor of the individual as such does not exist.

11. *Hierocracy in the Age of Capitalism and of Bourgeois Democracy*

The rise of modern bourgeois democracy and of capitalism has greatly changed the preconditions of hierocratic domination. At first sight it appears that hierocracy did not benefit from this development.

Capitalism advanced triumphantly in spite of the protest and frequently the direct resistance of the clergy. The *grande bourgeoisie* increasingly outgrew the historical connections between bourgeoisie and hierocracy. The carriers of magic gifts of grace and, in particular, those hierocratic claims that were most authoritarian and backed the traditional authorities, suffered from their own attempts to regulate social conduct and from their own objections to modern science, the technical basis of capitalism; they were also adversely affected by the growing rationalism that made social life less opaque and more amenable to reconstruction. It would be wrong to assume that anti-ethical or non-ethical, libertarian tendencies of the rising bourgeois strata played a major role in this process; after all, by means of the confessional, the church went far to compromise with the kind of ethical laxity that has always been characteristic of entrenched feudal strata. Rather, it is the rigoristic ethics of bourgeois rationalism that is ultimately bound to clash with the hierocratic claims, for it endangers the ecclesiastic Power of the Keys and the value of dispensing grace and absolution. Therefore, the hierocracy has always treated such rigoristic ethics as a stepping stone to heresy if it did not conform to clerically controlled asceticism.

As capitalism and the bourgeoisie advanced, all traditionalist strata sought the protection of the church: the petty-bourgeoisie, the nobility, and even the monarchy, after the age of alliance between securely established princes and capitalism had passed and the political aspirations of the bourgeoisie had become dangerous. The bourgeoisie has done the same, wherever its position has been endangered by the assault of the working class. But the church, too, accommodates itself to established capitalism; this can easily be demonstrated by looking at the development of the German Center Party from Bishop Ketteler [1811–1877] up to the present. It is true that for a time the hierocracy put economical eschatological hopes into "Christian," that means, hierocratically dominated "socialism," by which diverse, mostly petty-bourgeois utopias were understood; it is also true that the hierocracy helped undermine the belief in the bourgeois economic system, but the typical and almost inevitable hostility of the labor movement to authority changed its attitude. The modern proletarian is not a petty-bourgeois. He is threatened not by demons and natural forces that must be magically checked, but by social conditions that can be rationally understood. The economically strongest strata of the working class often reject any guidance by the hierocracy or accept it merely as a gratuitous interest representation—provided the hierocracy actually represents their interest. The more certain the indestructibility of the capitalist order becomes, the more do hierocratic interests require compromises with the new authorities. In

accordance wi h its natural ethical in erests, hierocracy endeavors to transform the capitalist dependency of the working class into a personal authoritarian subordination amenable to *caritas;* in particular, the hierocracy recommends those "welfare institutions" which restrict the workers' anti-authoritarian freedom of mobility; it also furthers as much as possible the home industry, which seemingly favors family bonds and patriarchal work relations, as against the concentration of the workers in factories, which promotes anti-au horitarian class consciousness. Wi h deep distrust the hierocracy views an an i-authoritarian weapon such as the strike and all organizations which facilitate it; it opposes these most when they hrea en to result in interdenominational solidarity.

The conditions of hierocratic rule are also transformed by democracy itself. The strength of the hierocracy vis-à-vis the political powers and hostile social forces comes to depend upon the number of deputies pledged to its will. Hierocracy has no choice but to establish a party organization and to use demagogic means, just like all other parties. This necessity reinforces the bureaucratic tendencies, since the hierocractic apparatus must be equal to he tasks of a party bureaucracy. The strength of the central authorties and of the agencies required for the political struggle and for public manipulation grows at the expense of the old local powers (i.e., the bishops and parish priests); this is typical of every large group hat is engaged in a struggle. The means employed are similar to hose of the other mass parties—apart from the highly emotive devotional means that were created by the Counter-Reformation for the purpose of mass agita ion. They comprise the establishment of co-operatives, which are controlled by the hierocracy; for example, the granting of loans may depend outright upon written proof of confession or, at least, credit worthiness may be identified wi h religious conduct. Other means are workingmen's associations, youth groups and, especially, the control of education. If education is public, the hierocracy demands control over instruction or tries to underbid the public schools with convent schools. Wherever possible, the traditional compromise with the state will be retained, assuring privileges under criminal and civil law as well as economic subsidies to he churches and their missions. The subordination of the state in all ecclesiastically regulated spheres of life remains he real will of God. However, in a democracy where power is vested in the hands of elected deputies, the hierocracy can tolerate the "separa ion of church and sta e." This formula can denote many things; for example, the resulting flexibility and freedom from state control may provide the hierocracy with so much power hat it can overcome the loss of its formal privileges. One could have surmised that the elimination of the budget for religious affairs would

gravely affect the hierocracy, but in the country with the strictest constitutional separation of church and state—the United States—, municipal councils with a Catholic majority can subsidize parochial schools and thus reintroduce a latent subsidy that is much more convenient for the hierocracy than an official one.[8] If, furthermore, restrictions on the accumulation of real estate and property are removed, the perhaps slow but irresistible growth of inalienable church property is today as certain as it was in earlier times.

The cohesion of the hierocratic partisans is naturally greatest in countries with a denominationally mixed population, as in Germany amongst opponents, or in countries like Belgium where the agrarian and petty-bourgeois strata are geographically separate from the industrial population. In such countries the hierocracy throws its weight usually against any predominance of the two "capitalist" classes, the bourgeoisie and, especially, the working class.

12. *The Reformation and Its Impact on Economic Life*

A. THE POLITICAL AND RELIGIOUS CAUSES OF THE RELIGIOUS SPLIT

The Reformation, which greatly changed the position of hierocracy, was certainly codetermined by economic factors. On the whole, however, their influence was indirect. To be sure, the peasants were interested in the new doctrine primarily because they wanted their land to be freed from the payments in kind and the services that were not justified by the Bible, just as is true today of the Russian peasants. But the immediate interests of the bourgeoisie clashed only with the monastic crafts; everything else was secondary. Nowhere is the prohibition of usury mentioned as an issue. Decisive for the transformation was the weakening of papal authority through the Great Schism [1378–1417], which in turn had political reasons, and through the resulting conciliar movement, which further reduced papal authority in the remote Northern countries where it had been less strong than in the South. Papal authority was also diminished by the persistent and successful struggle of the princes and Estates against its interference with the granting of domestic benefices and against its tax and fee system; it lost ground because of the caesaropapist inclinations and secularizing tendencies of the princes who had strengthened their power tremendously through administrative rationalization, and after the ecclesiastic tradition became discredited in the eyes of the intellectual circles and the noble and bourgeois strata.

However, these tendencies toward emancipation were almost completely unrelated to any desires for an emancipation from a religious way of life, and connected only slightly with a desire for diminishing the hierocratic restraints. It would be completely wrong to assume that a society longing for an affirmation of worldly life, "freedom of the individual," or even beauty and sensual enjoyment felt fettered by ecclesiastic hostility to these aspirations. In practice, the church left nothing to be desired in this respect. The very opposite is true: The reformers believed that the religious penetration of worldly life through the hierocracy did *not go far enough*, and this was believed especially by bourgeois groups. The church never dared to demand the self-control, asceticism and ecclesiastic discipline that the great ideological opponents of the papacy, the Anabaptists and related sects, imposed upon themselves, to a degree sheerly incomprehensible for us today. It was precisely the unavoidable compromise of the hierocracy with the secular powers and with sin which provoked them. The ascetic varieties of Protestantism have prevailed wherever the bourgeoisie was a social power, and the least ascetic churches of the Reformation, Anglicanism and Lutheranism, wherever the nobility or the princes had the upper hand. It was the peculiar piety of the intensely religious bourgeois strata that made them side with the reformist preachers against the traditional ecclesiastic apparatus, just as they had sided earlier with the hierocracy against the Empire and with the mendicant orders against the secular clergy; their piety was characterized by a relatively rational ethics, by the nature of bourgeois occupations and by a relatively strong preoccupation with self-justification before God, features which corresponded to a mode of life that was less determined by organic natural events than peasant life. These strata would have much preferred an internal reform of the church to an ecclesiastic revolution, if the former would have satisfied their ethical demands. However, the hierocracy was confronted with certain difficulties that it could not resolve in time, since they were rooted in the historical legacies of its organization and connected with concrete power interests. The massive impact of specific economic and, especially, political constellations on the course of the religious split is well-known, but must not be allowed to blur the great importance of the ultimately religious motives.

B. LUTHERANISM

The Reformation in turn strongly affected economic development, but its impact varied with the peculiarities of the new creeds. The attitude of the Lutheran churches toward the two capitalist classes, bour-

geoisie and proletariat, differs from the Catholic only in degree. Luther's views on economic affairs were strictly traditional and far less "modern" than those of the Florentine theoreticians.[10] His church was founded explicitly upon the office charisma of the minister, whose calling was the preaching of the Gospel; his church was bluntly hostile to any rebellion against the God-given authorities. The most important innovation, also in economic respects, was the elimination of the *consilia evangelica*, which had surpassed the standards of secular morality and social order; thus, the monasteries and monastic asceticism were abolished as a useless and dangerous expression of seeking salvation through good works—a measure to which at first Luther was not at all committed. Henceforth, the Christian virtues could be pursued only within the secular social order, in marriage, state and vocation. The duty of safeguarding the primary task, the propagation of the pure Gospel, fell in Lutheranism to the political power, since the hierocracy as well as the attempt at forming autonomous religious communes had failed—the latter, of course, in part for political and economic reasons—and since the office charisma of the church, as a redemptory institution for the obligatory preaching of the word, was retained. The resulting caesaropapism was tremendously strengthened through the great secularizations of the Reformation period.

c. ETHICS AND CHURCH IN CALVINISM

An anti-capitalist ethos and welfare orientation is, in effect, a common characteristic of all religions that promise salvation. However, there are two exceptions, differing from one another: *Puritanism* and *Judaism*. Only one of the Puritan communities (in the broad sense that comprises all essentially ascetic Protestant groups) is not a sect, but a church in the sociological meaning used here, that means, an hierocratic institution: *Calvinism*.

The character of the Calvinist church differs from that of all other churches, Catholic, Lutheran and Islamic. In view of the limited space available to us, we will, perforce, summarize our theory of Calvinism in a purposively accentuated manner.[11] The basic dogma of strict Calvinism, the doctrine of predestination, makes it impossible for the church to administer sacraments whose reception can have any significance for eternal salvation. Moreover, the actual behavior of the believer is irrelevant to his fate, which has been determined from eternity through God's inscrutable and immutable will. The elect need no church for their own sake. Its very existence, and largely also its organization, rests exclusively upon God's commandment, just like all other political and

social institutions and all social duties of the believers. The reasons for this commandment are unknown to the believers, but it has been definitively revealed in the Bible; its details can be supplemented and interpreted by human reason, which exists for this purpose. By no means does the church exist for the salvation of souls and the sinners' community of love; its sole purpose is the augmentation of God's glory and honor, thus a cold Divine *raison d'état*. The church exists not only for the blessed but also the condemned, so that, for the greater glory of God, it can suppress sinfulness, which is common to all men and separates all beings irremediably from God: The church is a scourge and not a vehicle of salvation. Every attempt at resorting to magic sacraments is a foolish infringement on God's established order; the church does not dispose of such means. Thus the church has here been completely divested of its charismatic character and has become a mere social institution. However, its establishment is a duty *divini iuris;* its dignity surpasses that of all other institutions and its form of organization is the only one prescribed by God. Yet apart from this feature, the duty to maintain the church is ultimately not different from the social obligation to support the equally God-willed state and from the duties in a worldly calling. In contrast to all other churches, these duties cannot consist in the endeavor to attain a specific state of grace, in the manner of the monks, by surpassing secular morality, for such attempts are meaningless in the face of predestination; rather, these duties consist in serving God's glory within the given order and within a "calling."

The notion of a "calling" derives in all Protestant countries from the Bible translations, and among the Calvinists it explicitly includes the legal profit from capitalist enterprises. With the consistent development of Calvinism—which is not identical with Calvin's own attitudes—such profit and the rational means of its realization received an ever more positive evaluation. The inscrutability of predestination to either salvation or damnation was naturally intolerable to the believer, he searched for the *certitudo salutis,* for an indication that he belonged to the elect. Since otherworldly ascetism had been rejected, he could find this certainty, on the one hand, in the conviction that he was acting according to the letter of the law and according to reason, repressing all animal drives; on the other, he could find it in visible proofs that God blessed his work. "Good works" of the Catholic variety were meaningless in the face of God's unchangeable decree; however, for the believer and his community, his own ethical conduct and fate in the secular social order became supremely important as an indication of his state of grace. A person was judged elect or condemned as an entity; no confession and absolution could relieve him and change his position

before God and, in contrast to Catholicism, no individual "good deed" could compensate for his sins. Therefore, the individual could only be sure of his state of grace if he felt reason to believe that, by adhering to a principle of methodical conduct, he pursued the sole correct path in all his action—that he worked for God's glory. Methodical conduct, the rational form of asceticism, is thus carried from the monastery into the world. The ascetic means are in principle identical: Rejected are all vain glorification of the self and of all other things of the flesh, feudal pride, the spontaneous enjoyment of art and life, "levity," all waste of money and time, eroticism, or any other activity that detracts from the rational work in one's private vocation and within the God-willed social order. The curtailment of all feudal ostentation and of all irrational consumption facilitates capital accumulation and the ever-renewed utilization of property for productive purposes; this-worldly asceticism as a whole favors the breeding and exaltation of the professionalism needed by capitalism and bureaucracy. Life is focused not on persons but on impersonal rational goals. Charity becomes an impersonal operation of poor-relief for the greater glory of God. And since the success of work is the surest symptom that it pleases God, capitalist profit is one of the most important criteria for establishing that God's blessing rests on the enterprise.

It is clear that this style of life is very closely related to the self-justification that is customary for bourgeois acquisition: profit and property appear not as ends in themselves but as indications of personal ability. Here has been attained the union of religious postulate and bourgeois style of life that promotes capitalism. Of course, this was not the purpose of the Puritan ethic, especially not the encouragement of money making; on the contrary, as in all Christian denominations, wealth was regarded as dangerous and full of temptation. However, just as the monasteries time and again brought this temptation on themselves by virtue of the ascetic rational work and conduct of their members, so did now the pious bourgeois who lived and worked ascetically.

13. *Hierocracy and Economic Ethos in Judaism*

Judaism must be formally classified as a church, since it is an institution into which a person is born, not an association of persons with specific religious qualifications. However, it differs even more from other hierocracies than Calvinism. Like the latter, Judaism does not know magic charisma, institutional gifts of grace and monasticism. In-

dividual mysticism is simply one of several religious activities that please God and bring the believer nearer to him; hence it does not produce the strong tensions in relation to office charisma that occurred in Christianity. Since the destruction of the Temple there existed neither priests nor a worship (*Kultus*) in the genuine meaning of the term that ancient Judaism shared with other religions: an institutional *hierurgy* [religious service for the believers]; rather, there are only assemblies for the purpose of preaching, praying, singing and the reading and interpretation of the Scripture. The individual, not the institution, must perform the decisive religious act by strictly adhering to the Law. Everything else is secondary. Adherence to the Law is not, as among the Puritans, the cognitive basis for gaining God's blessings, but their direct cause, from which the individual's this-worldly life, his descendants and his people will benefit. The belief in individual immortality, however, Judaism accepted only late, and its eschatological expectations are this-worldly.

For the economic ethos, insofar as it was codetermined by religious factors, these this-worldly expectations of salvation have been of great significance; just like in Puritanism, God's blessings are recognized in the economic success of the individual. Also very important was the highly rational character of conduct, which at the least was strongly influenced by the nature of religious instruction. In this respect, too, Judaism and Protestantism are similar. For the Catholic, the detailed knowledge of dogmas and sacred texts is dispensable, since the church, as an agency of salvation, intervenes for him; it is sufficient if he trusts its authority by believing its prescriptions as a whole (*fides implicita*). Faith is here a form of obedience toward the church, whose authority does not rest upon sacred texts; rather, the church gurantees their sanctity, which the believer himself cannot verify. By contrast, for Jews and Puritans the Holy Scripture is a binding law, which the individual must know and interpret correctly. One result is the tremendously intensive Jewish instruction in the Torah and its casuist interpretation, another the Protestant zeal for founding elementary schools; characteristically, the Protestant Pietists had a strong preference for the teaching of "practical" knowledge (*Realien*). The resulting disciplining of thought has no doubt been beneficial to the rational economic ethos and, among the Jews, to their typical dialectical rationalism. As against this, the Second Commandment led to the complete atrophy of the plastic arts, diminished the artistic sublimation of sensuality and facilitated the latter's naturalist and rational treatment. The same happened under ascetic Protestantism, which made even smaller concessions to the realities of sensuality. In both cases the strict rejection of all things of the flesh had a rationalizing

impact by promoting the bourgeois style of life and by opposing all concessions to feudal "wastefulness." The positive evaluation of bourgeois acquisition was already established in the Mishna. The specifically urban, yet unassimilable and international character of Judaism, which was the same in ancient and in later times, has two causes. On the one hand, there are ritual motives: circumcision is retained in an environment which does not practice it, and the Jewish butcher is indispensable because of the food regulations; even today this precludes an individual dispersion of orthodox Jews. On the other hand, the hierocracy was completely destroyed, yet messianic hopes persisted.

To that extent Jewish religiosity may have shaped the Jewish economic ethos. It is difficult to say whether its impact went even further. For the rest, the peculiarity of this unique pariah people should be explained primarily in terms of its historical legacies and its special situation, since here too "racial" codeterminants are nowhere demonstrable, although they probably exist in one sense or another.

(A) EXCURSUS ON INTERPRETATIONS OF THE JUDAIC ECONOMIC ETHOS. However, an historical explanation too must proceed cautiously. The Israelites were probably never a "desert people" in the sense that their law had Bedouin origins, as Merx has maintained, or that they were shaped by desert conditions, as Sombart believed.[12] At the time that they might have been a nomad people, neither camel nor horse existed in the Arabian desert. Their oldest historical document, the Song of Deborah, just like their later tradition, shows them as a sworn confederacy of mountain tribes which time and again defended its independence against the urban patriciate of the Canaanite and Philistine cities, fighting their charioteers with foot soldiers; and just like the Swiss and, for a time, the Samnites, they eventually subjected some of the nearby cities. Thus they gained control of the trade route from Egypt to Mesopotamia, just as the Swiss controlled the Alpine passes and the Samnites those of the Apennines. For a God like Yahwe who is worshipped on mountains, Mount Sinai appears the proper seat because it has the highest elevation. If the migration from Egypt is not historical (as it appears possible to me), the release from "Egyptian serfdom" may have referred to the "liberation" from the Jerusalemite monarchy, which had followed the Egyptian example of imposing compulsory services and had been condemned by the priesthood.

The rise of the hierocracy, especially during the period of alien domination, shaped the further course of events and led in particular to the absolute segregation from all who were not of the same blood. The increasing concentration upon the financial trades and, secondarily, upon commerce is an early result of the Diaspora; equally ancient is its

indispensability for the alien environment. In all essentials, the Jews held a similar position in the Roman Empire as they did during the Middle Ages—note the dispensation from the cult of the Emperor, to which the Christians were forced. Jewish crafts existed in Arabian Spain and do exist in the Orient and—from sheer necessity—in Russia. For a time a Jewish knighthood existed in Syria during the Crusades. Hence the economic specialization of the Jews seems to increase with the growing differentiation from the environment; even so all of these cases are exceptional. It appears to me unprovable that Jewish law greatly facilitated the development of modern forms of securities, as Sombart has assumed;[13] rather, it appears likely that Jewish commercial law was strongly influenced by Byzantine law (and through it perhaps in a generally Oriental manner).

(B) JUDAISM AND CAPITALISM. Wherever the Jews appeared, they were the agents of the money economy, especially, and in the High Middle Ages exclusively, of the loan business, but they also engaged widely in commerce. For the development of cities they were as indispensable to German bishops as to Polish nobles. Their prominent, and often dominant, participation is established with regard to the purveying and loan transactions of the early modern states, the founding of colonial companies, the colonial and slave trade, trade in cattle and agricultural goods, and in particular for the modern stock market trade in securities and for the floating of new issues.

It is a different question whether the Jews can be assigned a major role in the development of modern capitalism. The following must be considered: Capitalism living from loan usury, or from the state, its credit and supply needs, and from colonial exploitation, is nothing specifically modern. These are features which modern Occidental capitalism has in common with the capitalism of Antiquity, the Middle Ages and the modern Orient. In comparison with Antiquity (and the Near East and Far East) modern capitalism is characterized by the capitalist organization of *production*, and here the Jews have not had a decisive influence. Moreover, the mentality of the unscrupulous big financier and speculator can be found at the time of the prophets no less than during Antiquity and the Middle Ages. The decisive institutions of modern trade: the legal and economic forms of securities as well as the stock markets have a Romanic and Germanic origin. However, the Jews contributed to giving the Exchange its present importance.

Finally, the typical Jewish commercial spirit, insofar as one can speak of it concretely, has general Oriental characteristics, in part even petty-bourgeois features that are peculiar to the precapitalist age. With the Puritans the Jews have in common the purposive legitimation of

formally legal profit, which is considered a sign of Divine blessings, and the idea of the calling, although it does not have as strong a religious foundation as in Puritanism. The most important influence of the Jewish Law upon the modern capitalist ethic was perhaps the fact that its legalistic ethic was absorbed by the Puritan ethic and thus put into the context of modern-bourgeois economic morality.

14. *Sect, Church and Democracy*[14]

A sect in the sociological sense of the word is not a *small* group: The Baptists, one of the most typical sects, are one of the largest Protestant denominations in the world. Moreover, the sect is not a group that is split off from another that does not recognize it or persecutes it and condemns it as heretical. Rather, the sect is a group whose very nature and purpose precludes universality and requires the free consensus of its members, since it aims at being an aristocratic group, an association of persons with full religious qualification. The sect does not want to be an institution dispensing grace, like a church, which includes the righteous and the unrighteous and is especially concerned with subjecting the sinner to Divine law. The sect adheres to the ideal of the *ecclesia pura* (hence the name "Puritans"), the *visible* community of saints, from whose midst the black sheep are removed so that they will not offend God's eyes. The typical sect rejects institutionalized salvation and office charisma. (The term "sect" must, of course, be carefully freed from all connotations due to ecclesiastic calumniations.)

The individual may be qualified as a member in various ways: by virtue of divine predestination, as in the case of the Particular Baptists, the elite troops of Cromwell's Independents; by virtue of the "inner light" or of the pneumatic ability to experience ecstasis; by virtue of the "struggle for penitence" (*Busskampf*) and the resulting "breakthrough" (*Durchbruch*), as in the case of the old Pietists; at any rate, qualification derives either from specific "pneumatic" abilities [i.e., susceptibility to the Holy Spirit], as in the case of all predecessors of the Quakers, the Quakers themselves and the majority of "pneumatic" sects, or from other kinds of given or acquired charisma. The metaphysical reasons for establishing a sect may be most diverse. Sociologically important is the fact that the community functions as a selection apparatus for separating the qualified from the unqualified. At least in the pure case, the elect or the qualified must avoid contact with the condemned. During its rigorous periods, every church, including the Lutheran and, of course, Judaism has employed the power of excommunication against

those who were persistently disobedient and unbelieving. Excommunication usually implied an economic boycott, especially in the early periods of a church. Some churches would prohibit any physical contact, sexual or economic, with the outsiders: for example, the Zoroastric church and the Shiites, but most of the time only caste religions such as Brahminism went so far. Most sects, too, were not so radical, but such a step is as consistent for them as for monasticism. At least those persons expelled for their lack of qualification were subjected to the strictest boycott. Their admission to the service, especially to the Lord's Supper, would have evoked God's wrath and have dishonored him. The idea that the elimination of those visibly condemned by God is the task of every member strongly reinforced the importance of the congregation vis-à-vis any office. This can be observed already in Calvinism, which resembles the sects by virtue of its aristocratic charismatic principle of predestination and the degradation of office charisma. An example is the ecclesiastic revolution of the strict Calvinists in the Netherlands during the 1880's; the revolution, which was led by Kuyper[15] and which had such great political consequences, occurred because the higher bodies of the national church demanded that the individual congregations admit confirmees of lax predicants to the Lord's Supper. Consistent sects subscribe to the principle of the absolute sovereignty of the congregation, since only those who know one another personally and in everyday life can judge each other's religious qualifications. For this reason, when individual congregations of the same creed unite and form a larger community, they establish a merely instrumental association and retain the ultimate decisions for themselves. The individual congregation is primary and inevitably has "sovereignty," if we may apply this term at all. For the same reason [i.e., the requirement of personal acquaintance] it is always the *small* congregation, the *ecclesiola* of the Pietists, which is most suited for these functions. This is the negative side of the congregational principle, which culminates in the rejection of the expansive universalist charisma of office. For the individual, this basic nature of a congregation formed by selective admission has the practical significance of legitimating his personal qualification. Anyone admitted as a member can thereby demonstrate to the world that he has measured up to the congregation's religious and moral standards after a thorough examination. This may have the greatest consequences for him, also in economic respects, if the examination is regarded as strict and as including economically relevant qualities. A few illustrations may be given: In the writings of the Quakers and Baptists of some two hundred years ago we find jubilation over the fact that the Godless deposit or invest their money not with their own ilk but with the pious brethren, whose no-

torious honesty and reliability appear as more valuable than a security, they also note that the clientele of their retail stores is growing since the Godless know that even their children and servants will be charged nothing but the fixed and fair price and will receive only priceworthy goods. Quakers and Baptists compete for the honor of having replaced "Oriental" bargaining with the system of fixed prices in the retail trade —a system that is important for capitalist calculation in all fields. Matters are not different today, especially in the major domicile of the sects, the United States. As a traveling salesman, the typical sect member, just like the Freemason, prevails over any competition, even outside his own group, since the customers are convinced that his prices are fair. A person who wants to open a bank joins the Baptists or Methodists, for everybody knows that baptism, respectively admission, is preceded by an *examen rigorosum* which inquires about blemishes in his past conduct: frequenting an inn, sexual life, cardplaying, making debts, other levities, insincerity, etc.; if the result of the inquiry is positive, credit-worthiness is guaranteed, and in countries like the United States personal credit is almost unthinkable on any other basis. The ascetic demands upon the true Christian happen to be the same as those that capitalism makes upon its novices, at least where the maxim "Honesty is the best policy" is valid. A sect member of this kind is preferred in all responsible positions of the capitalist apparatus: as board member, director, promoter or foreman. Wherever he goes, the member finds a small congregation of fellow-believers which receives him as a brother, upon recommendation from his previous congregation, and legitimates and recommends him—a practice that is still current in the United States, and an advantage shared by all diaspora religions, such as Judaism. He will soon gain an economic foothold in a way which is denied to the outsider. The member's reputation largely corresponds to his actual qualities, for the intensity of indoctrination and the impact of exclusion are much more effective than any authoritarian ecclesiastic discipline can be.

The Old Methodist confession in the weekly meetings of the small groups set up for this purpose, the class meetings and the mutual control and admonition of the Pietists and Quakers contrast with the Catholic's auricular confession, which in this sense is uncontrolled and serves the sinner's relief but rarely aims at changing his mind. More important than any other factor is the fact that a man must hold his own under the watchful eyes of his peers. This basis of self-esteem spread with increasing secularization from the sects into all walks of American life, by virtue of the numerous associations and clubs, most of which recruit their members through balloting; these associations exist for all con-

ceivable purposes and extend down to the level of the boys' clubs in the schools. Even today the middle-class "gentleman" is legitimated by the badge of some association. Even though many of these traditions are disintegrating, it is still true that American democracy is not a sand-pile of unrelated individuals but a maze of highly exclusive, yet absolutely voluntary sects, associations and clubs, which provide the center of the individual's social life. American students may even consider it a cause for committing suicide if they fail to be elected into an exclusive club. Of course, analogies can be found in many voluntary associations, for the question of being joined by other individuals is considered frequently —and in non-economic associations predominantly—not merely from the functional viewpoint of the group's manifest purpose; rather, membership in exclusive clubs is everywhere regarded as a status elevation. Nowhere was this as true as in America's classic era: The sect and its derivations are one of her unwritten but vital constitutional elements, since they shape the individual more than any other influence.

By virtue of the dictum that "We must obey God rather than men" [Acts 5:29], hierocracy claimed an autonomous charisma and law of its own, secured obedience and firmly restrained the political power. With its office charisma, hierocracy protects those over whom it claims domination against encroachment from other authorities, whether the interfering person be the political ruler, the husband or the father. Since both the mature political and hierocratic power raise universalist demands, that is, since they both want to define the extent of their control over the individual, their adequate relation is a compromise or an alliance for the sake of joint domination in which their spheres of influence are mutually delimited. The formula of the separation of church and state is feasible only if either of the two powers has in fact abandoned its claim to control completely those areas of life that are in principle accessible to it.

In contrast to hierocracy, the sect opposes the charisma of office. The individual can exercise hierocratic powers only by virtue of his personal charisma, just as he can become a member only by virtue of a publicly established qualification, the most unambiguous symbol of which is the "rebaptism" of the Baptists, in reality, the baptizing of qualified adults. The services of the Quakers are a silent waiting in order to see whether the Divine spirit will overcome a member on this day. Only he will speak up to preach or pray. It is already a concession to the need for regulation and order if those who have proven their qualification to preach the Word of God are put on special seats and are now compelled to help along the coming of the spirit hy preparing sermons; this is done in most Quaker congregations. However, in contrast to all consistent

churches, all rigorous sects adhere to the principle of lay preaching and of every member's priesthood, even if they establish regular offices for economic and pedagogic reasons.

Moreover, pure sects also insist upon "direct democratic administration" by the congregation and upon treating the clerical officials as servants of the congregation. These very structural features demonstrate the elective affinity between the sect and political democracy. They also account for its peculiar and highly important relationship to the political power. The sect is a specifically antipolitical or at least apolitical group. Since it must not raise universal demands and endeavors to exist as a voluntary association of qualified believers, it cannot enter into an alliance with the political power. If it concludes such an alliance, as the Independents did in New England, the result is an aristocratic rule by the ecclesiastically qualified; this leads to compromises and to the loss of the sect character—witness the so-called Halfway Covenant [of the Congregational churches in 1662]. The greatest experiment of this kind was the abortive rule by Cromwell's Parliament of Saints. The pure sect must advocate "tolerance" and "separation of church and state" for several reasons: because it is in fact *not* a universalist redemptory institution for the repression of sin and can bear political as little as hierocratic reglementation; because no official power can dispense grace to unqualified persons and, hence, all use of political force in religious matters must appear senseless or outright diabolical; because the sect is simply not concerned with outsiders; because, taking all this together, the sect just cannot be anything but an absolutely voluntary association if it wants to retain its true religious identity and its effectiveness. Therefore, consistent sects have always taken this position and have been the most genuine advocates of "freedom of conscience."

Other communities, too, have favored freedom of conscience, but in a different sense. It is possible to speak of this freedom and of tolerance under the caesaropapist regimes of Rome, China, India and Japan, since the most diverse cults of subjected or affiliated states were permitted and since no religious compulsion existed; however, in principle this is limited by the official cult of the political power, the cult of the emperor in Rome, the religious veneration of the emperor in Japan, and probably also the emperor's cult of Heaven in China. Moreover, this tolerance had political, not religious reasons, as did that of King William the Silent or, much earlier, Emperor Frederick II, or manorial lords who used sect members as skilled labor, and in the city of Amsterdam, where the sectarians were major agents of commercial life. Thus, economic motives played an important role. But the genuine sect must demand the nonintervention of the political power and freedom of conscience for spe-

cifically religious reasons—there are transitional forms, but we leave them aside deliberately.

A fully developed church—advancing universalist claims—cannot concede freedom of conscience; wherever it pleads for this freedom, it is because it finds itself in a minority position and demands something which, in principle, it cannot grant to others. "The Catholic's freedom of conscience," Mallinckrodt said in the Reichstag "consists in being free to obey the pope," that means, in following *his own* conscience. However, if they are strong enough, neither the Catholic nor the (old) Lutheran Church and, all the more so, the Calvinist and Baptist old church recognize freedom of conscience for *others*. These churches cannot act differently in view of their institutional commitment to safeguard the salvation of the soul or, in the case of the Calvinists, to protect the glory of God. By contrast, the consistent Quaker applies the principle of the freedom of conscience not only to himself but also to others, and rejects any attempt to compel those who are not Quakers or Baptists to act as if they belonged to his group. Thus the consistent sect gives rise to an inalienable personal right of the governed as against any power, whether political, hierocratic or patriarchal. Such freedom of conscience may be the oldest Right of Man—as Jellinek has argued convincingly;[16] at any rate, it is the most basic Right of Man because it comprises all ethically conditioned action and guarantees freedom from compulsion, especially from the power of the state. In this sense the concept was as unknown to Antiquity and the Middle Ages as it was to Rousseau's social contract with its power of religious compulsion. The other Rights of Man or civil rights were joined to this basic right, especially the right to pursue one's own economic interests, which includes the inviolability of individual property, the freedom of contract, and vocational choice. This economic right exists within the limits of a system of guaranteed abstract rules that apply to everybody alike. All of these rights find their ultimate justification in the belief of the Enlightenment in the workings of individual reason which, if unimpeded, would result in the at least relatively best of all worlds, by virtue of Divine providence and because the individual is best qualified to know his own interests. This charismatic glorification of "Reason," which found a characteristic expression in its apotheosis by Robespierre, is the last form that charisma has adopted in its fateful historical course. It is clear that these postulates of formal legal equality and economic mobility paved the way for the destruction of all patrimonial and feudal law in favor of abstract norms and hence indirectly of bureaucratization. It is also clear that they facilitated the expansion of capitalism. The basic Rights of Man made it possible for the capitalist to use things and men freely, just as the this-worldly

asceticism—adopted with some dogmatic variations—and the specific discipline of the sects bred the capitalist spirit and the rational "professional" (*Berufsmensch*) who was needed by capitalism.

NOTES

Unless otherwise indicated, all notes and emendations are by Roth.

1. Cf. sec. 8 below.—For a flat rejection of the view that Lamaism had the effect of pacifying the Mongols, see Owen Lattimore, *Inner Asian Frontier of China*. New York: American Geographical Society, 1951 (first published in 1940), 86f. In Tibet, Buddhism was received in the 7th century, but the Lamaist church served at first as an instrument of the secular kings before establishing its own supremacy. The great Mongol conqueror Kublai Khan (13th century) favored Lamaism, but in the next century it disappeared in Mongolia in the wake of China's resurgence. In the 16th century Lamaism was adopted again by Altan Khan as an integrative instrument of secular rule. Subsequently, however, the Manchu empire brought about a stalemate between state and church in Mongolia, whereas the Tibetan church maintained its supremacy by allying itself with the Manchu interests (cf. Lattimore, 216–221). Hence, Lama-Buddhism seems to illustrate at least Weber's generalization that in its competition with secular authority a hierocracy may seek the support, or be the tool, of foreign powers. For a more recent discussion of Lamaist government with its mixture of feudal and bureaucratic features, and on the Chinese influence, see Pedro Carrasco, *Land and Polity in Tibet* (Seattle: University of Washington Press, 1959), esp. 207, 217, 224–8.

4. This refers to the "Greek" reform movement under Patriarch Nikon (see sec. 10:E) in the 1650's, which tried to bring the Russian liturgy in line with the older Greek practices. No dogmatic issues were involved, but in view of the magic efficacy of the traditional Russian rituals, a large part of the clergy and of the population—who came to be called the Old Believers—resisted the reforms at the risk, and often the price, of annihilation. The Old Believers continued to make the cross with two fingers, instead of three as the reformers decreed. An epidemic of self-burning seized Russia for fifteen years in the wake of the Nikonian reforms. See Herbert Ellison, *History of Russia* (New York: Holt, Rinehart and Winston, 1964), 78.

CHAPTER XVI

THE CITY (NON-LEGITIMATE DOMINATION)[1]

i

Concepts and Categories of the City

1. *The Economic Concept of the City: The Market Settlement*

The notion of the "city" can be defined in many different ways. The only element which all these definitions have in common is the following: the city is a relatively closed settlement, and not simply a collection of a number of separate dwellings. As a rule the houses in cities—but not only in them—are built very close to each other, today normally wall-to-wall. The common concept further associates with the word "city" a purely quantitative aspect: it is a *large* locality. In itself, this is not imprecise. Sociologically speaking, this would mean: the city is a settlement of closely spaced dwellings which form a colony so extensive that the reciprocal personal acquaintance of the inhabitants, elsewhere characteristic of the neighborhood, is lacking. But on this definition only very large localities would qualify as cities, and the special conditions of various cultures would have to determine at which size the absence of personal acquaintance would be characteristic. Many localities which in the past had the *legal* character of cities were not marked by this

feature. Conversely, in present-day Russia there are "villages" which, with many thousands of inhabitants, are much larger than many of the old "cities"—for example, in the Polish settlement area of the German East—with only a few hundred inhabitants. Size alone, certainly, cannot be decisive.

If we were to attempt a definition in purely economic terms, the city would be a settlement whose inhabitants live primarily from commerce and the trades rather than from agriculture. It would not be expedient, however, to call all localities of this type "cities." For this would include in the concept settlements of kinship groups practicing a single, practically hereditary trade such as the "craft villages" of Asia and Russia. A further characteristic, hence, might have to be a certain multiplicity of the trades practiced. But even this would, by itself, not appear suitable as a decisive characteristic. Economic diversity can be called forth in two ways: by the presence of a court, or by that of a market. A feudal, and, especially, a princely court constitutes a center whose economic or political needs evoke specialization of craft production and exchange of goods. However, a seigneurial or princely *oikos* with an attached settlement of artisans and small merchants encumbered with tribute and service obligations, even if it be of large size, we would not usually call a "city," though it is true that a large proportion of important cities have their historical origin in such settlements and that the production for a prince's court remained a highly important, if not the chief, source of income for the inhabitants of such "princely towns" for a long time. A further characteristic is required for us to speak of a "city": the existence of a regular, and not only occasional, exchange of goods in the settlement itself, an exchange which constitutes an essential component of the livelihood and the satisfaction of needs of the settlers—in other words: a market. But again: not every "market" converts the locality in which it is conducted into a "city." The periodic fairs and markets for the long-distance trade, at which travelling merchants gathered at fixed times in order to sell their wares in large or small lots to each other or to consumers, very often took place in localities which we would call "villages."

Accordingly, we shall speak of a "city" in the economic sense of the word only if the local population satisfies an economically significant part of its everyday requirements in the local market, and if a significant part of the products bought there were acquired or produced specifically for sale on the market by the local population or that of the immediate hinterland. A city, then, is always a market center. It has a local market which forms the economic center of the settlement and on which both the non-urban population and the townsmen satisfy their wants for

craft products or trade articles by means of exchange on the basis of an existing specialization in production. It was originally quite normal for the city, wherever it was structurally differentiated from the countryside, to be both a seigneurial or princely residence *and* a market place and thus to possess economic centers of both types, *oikos* and market. Frequently, in addition to the regular local market, it might also have periodical fairs for the long-distance trade of travelling merchants. But the city, as we use the word here, is essentially a "market settlement."

The existence of the market is often based on concessions and guarantees of protection by the lord or prince. On the one hand these political masters are interested in a regular supply of foreign articles and craft products on the long-distance market, and in the tolls, the escort moneys and the other protection fees, the market taxes and the fees from law suits which the fairs give rise to. On the other hand, they might also hope to profit from the local settlemen. of taxable tradesmen and merchants and, once a settlement rises around the market, from the ground rents which this produces. Such opportunities gain in significance by the fact that these are monetary revenues which augment the seigneurs' hoards of precious metals.

It also occurs that a city has no attachment whatsoever, not even physical proximity, to a seigneurial or princely residence. Such a city might originate as a pure market settlement at some suitable transshipment point, either on the basis of a charter granted by a non-resident seigneur or prince, or on the basis of usurpation of urban rights by the interested parties themselves. A settlement entrepreneur might be given a charter to found a market and to recruit settlers for it, as was the case frequently during the Middle Ages, especially in the East-, North- and Central-European territories where towns were created by deliberate acts of foundation, and occasionally in many other places and periods. But cities could also arise without either attachment to the court of a prince or charter grant by a prince, namely through an association of foreign invaders, of sea-faring warriors or of merchant settlers or, finally, of domestic groups with an interest in the middleman's position; in early Antiquity this occurred frequently on the Mediterranean littoral, and sometimes also in the early Middle Ages. Such a city could be a pure market place. However, the coexistence of the two institutions, large princely or seigneurial patrimonial households on the one hand, and a market on the other, is found much more often. The lordly court, as one economic center of the city, could in this case satisfy its wants either primarily in the ways of a natural economy, through *corvées*, taxes in kind and service obligations placed upon the local dependent artisans and tradesmen, or it could supply itself to a greater

or lesser extent through exchange on the urban market whose most important client it was. The more pronounced the latter relation, the more strongly the market aspect of the city came to the fore; it then ceased to be a mere appendage—albeit with a market—of the *oikos* and turned into a market city. As a rule the quantitative expansion of cities which had originated as "princely cities" and the growth of their economic significance went hand in hand with an increase in the market-orientation of the satisfaction of wants by the princely court and the large urban households of vassals and major officials attached to it.

2. *Three Types: The "Consumer City," the "Producer City," the "Merchant City"*

The "princely city," that is, one whose inhabitants are directly or indirectly dependent on the purchasing power of the court and the other large households, is similar in type to other cities in which the purchasing power of other large consumers—and that means: of *rentiers*—determines the economic opportunities of the resident artisans and traders. These large consumers can be of very different types, depending upon the kind and sources of their incomes. They may be officials spending their legal or illegal revenues, or manorial lords and political power holders consuming their non-urban ground rents or other more politically determined incomes in the city. In both cases the city is very similar to the type of the "princely city" in that it depends upon patrimonial and political revenues which supply the purchasing power of the larger consumers. An example for a city of officials might be Peking, for a city of land-rent consumers Moscow before the abolition of serfdom.

From these cases we must differentiate the only apparently similar case in which *urban* land-rents, based on the "monopoly of location" of urban land lots, are concentrated in the hands of a city aristocracy. Here the source of the spending power is the urban trade and commerce itself. This city type has been ubiquitous, especially in Antiquity from the beginnings up to the Byzantine period and also in the Middle Ages. The city is in that case economically not of a *rentier* type, but rather, depending upon the circumstances, a merchant or producer city, and those rents are a tribute exacted by the real-estate owners from the economically active population. But the conceptual differentiation of this case from that in which the rents stem from extra-urban sources should not cause us to overlook the historical interrelation of the two forms.

Finally, the large consumers can also be *rentiers* consuming business incomes in the city—today mainly interest on bonds, royalties or dividends on shares; the purchasing power then rests primarily on revenue sources based on the (capitalistic) money economy. An example would be the city of Arnhem. Or it is based on state pensions and interest on government bonds, as in a "pensionopolis" like Wiesbaden. In these and many other similar cases one may speak of a "consumer city," for the residence of these various types of large consumers is of decisive importance for the economic opportunities of the local producers and merchants.

Conversely, the city may be a "producer city." The population expansion and the purchasing power of this population would then depend, as in Esssen or Bochum, on the location there of factories, manufactures or putting-out industries which supply outside territories. This is the modern type. In the Asian, ancient, and medieval type, it would depend on the existence of local crafts which ship their goods to outside markets. The large consumers on the local market are the entrepreneurs, if they are locally resident—which is not always the case—, and the mass consumers are the workers and craftsmen. Another set of large consumers may be formed by the merchants and local landowners who are indirectly maintained by the city's productive activity.

Besides a "consumer city" and a "producer city," we can also distinguish a "merchant city," a type in which the purchasing power of the large consumers rests on the profits derived either from the retailing of foreign products on the local market (as in the case of the woolen drapers of the Middle Ages), or from the sale abroad of domestic products or at least of products obtained by domestic producers (as the herring of the Hanseatic towns), or finally from the purchase of foreign products and their resale abroad with or without local stapling ("*entrepôt* cities"). Very often all these activities are combined: the essence of the *commenda* and *societas maris* contracts of the Mediterranean countries[2] was that a *tractator* (travelling partner) carried to the Levantine markets domestic products purchased entirely or in part with capital entrusted to him by local capitalists—although often he may have journeyed entirely in ballast—and after the sale of these products returned with Oriental articles for sale on the domestic market; the profits were to be divided between *tractator* and capital-supplier according to a formula set in the contract. Thus the purchasing power and tax yield of the merchant city, like that of the producer city, and in contrast to that of the consumer city, rest on the local economic enterprises. The economic opportunities of the shipping and transport trades and of numerous small and large secondary activities are tied

up with those of the merchants, although only in the case of local retail sales do these benefits materialize entirely on the local market, while in long-distance trade a considerable part is realized abroad. A similar state of affairs prevails in a modern city which is the seat of the national or international financiers or of the giant banks (London, Paris, Berlin), or of large joint stock companies and cartels (Düsseldorf). Today, of course, it happens more than ever before that the larger part of the profits of an enterprise flows to localities other than that in which the producing plant is situated. Moreover, an ever increasing part of the gains is consumed by the recipients not at the metropolitan seat of the business headquarters, but in the suburbs, and increasingly even more in rural summer homes and international hotels. Parallel to these developments, the town centers tend to atrophy to mere business sections, to "The City."

It is not our intention here to produce the further casuistic distinctions and specialization of concepts which would be required for a strictly economic theory of the city. Nor do we need to stress that actual cities almost always represent mixed types and hence can be classified only in terms of their respective predominant economic components.

3. *Relation of the City to Agriculture*

Historically, the relation of the city to agriculture has in no way been unambiguous and simple. There were and are "agrarian cities" (*Ackerbürgerstädte*), which as market centers and seats of the typically urban trades are sharply differentiated from the average village, but in which a broad stratum of the burghers produces food for their own consumption and even for the market. Normally, to be sure, it would be true that the larger a city, the less likely it is that its inhabitants would dispose of farmland sufficient for their food needs—nor would they have the pasturage and forest utilization rights typical of the "village." The largest German city of the Middle Ages, Cologne, apparently from the very beginning almost completely lacked the *Allmende* (commons) which at that time was part of every normal village. But other German and foreign medieval cities owned, at the least, considerable pastures and woods which stood at the disposal of their burghers. And the further to the south or back toward Antiquity one turns, the more frequent becomes the presence of large amounts of farmland within the territory (*Weichbild*) of the towns. If today we are quite correct in regarding the typical "townsman" as a man who does not grow his own food, the

contrary was originally true for the majority of typical cities (*poleis*) of Antiquity. We shall see that the urban "citizen" with full rights was in Antiquity, in contrast to the Middle Ages, identified precisely by the fact that he owned a *kleros* or *fundus* (in Israel: *helek*): a full lot of arable land, which fed him.[3] The "citizens" of Antiquity were "agrarian burghers."

Agricultural holdings in the hands of the large merchants were even more frequent both in the Middle Ages, when they were found more often in the south than in the north of Europe, and in Antiquity. In both medieval and ancient city states large land holdings are found, occasionally of quite exorbitant size, which might be under the political rule—or even the seigneurial property—of the municipal authorities of powerful cities in their official capacity, or the seigneurial possession of individual eminent citizens. As examples we might take the *seigneurie* of Miltiades on the Chersonese, or the political and seigneurial possessions of medieval urban aristocratic families such as those of the Genoese Grimaldi in Provence and across the sea.[4] As a general rule, however, these foreign estates and seigneurial rights of individual citizens were not the objects of the city state's economic policy, although a curiously mixed situation in which such properties were *de facto* guaranteed to the individuals by the city was bound to arise whenever the owners belonged to the most powerful patrician groups and had actually obtained these properties and held on to them only with the indirect help of the state power. The ruling group, in turn, might in that case share in the economic and political usufruct of such holdings. Such cases were quite frequent in the past.

4. *The "Urban Economy" as a Stage of Economic Development*

The relation of the city as the carrier of the craft and trading activities to the countryside as the supplier of food forms one aspect of that complex of phenomena which has been called the "urban economy" (*Stadtwirtschaft*), juxtaposed, as a special economic stage, to the "household economy" (*Eigenwirtschaft*), on the one hand and the "national economy" (*Volkswirtschaft*) on the other (or to a multiplicity of similar conceptual "stages").[5] In this concept, however, categories relevant to measures of economic *policy* are fused with purely economic categories. The reason for this is that the mere facts of the crowding together of merchants and tradesmen and of the satisfaction of everyday

wants on a regular basis in the market do not by themselves exhaust the concept of the "city." If closed settlements are differentiated [from the countryside] *only* by the degree to which they supply themselves with agricultural goods or—which is not the same thing—by the relationship of agricultural production to non-agricultural earnings, and by the presence of markets, then we shall speak of artisan- or merchant-localities and of market hamlets, but not of "cities." Nor can the city be differentiated from the village by the fact that, beside being an agglomeration of habitations, it is in addition an economic organization (*Wirtschaftsverband*) with its own landed property and a budget of revenues and expenditures, for the same is true also of the village, however great the qualitative difference may be. Finally, it was not a characteristic peculiar to the city alone that it, at least in the past, was both an economic organization and an organization regulating the economy (*wirtschaftsregulierender Verband*). In the village, too, we find economic regulations: cultivation under compulsory common rules (*Flurzwang*), pasture regulations, export prohibitions for wood and straw, all of which constitute an economic *policy* of the organization as such.

It is not the mere fact of regulation which differentiated the cities of the past from other types of settlements, but the kinds of regulations: the objects of regulatory economic policy, and the range of measures which were characteristic for it. The bulk of the measures of "urban economic policy" (*Stadtwirtschaftspolitik*) were based on the fact that, under the transportation conditions of the past, the majority of all inland cities were dependent upon the agricultural resources of the immediate hinterland (a statement which, of course, does not hold for maritime cities—as shown by the grain policies of Athens and Rome), that the hinterland provided the natural marketing area for the majority of the urban trades, and finally that for this natural local process of exchange the urban market place provided, if not the only, then at least the normal locality, especially in the case of foods. This policy further took account of the fact that the predominant part of non-agricultural production was performed with craft technology, organized with little or no capital in small shops employing strictly limited numbers of journeymen trained in long apprenticeship, and that, in economic terminology, it took the form of "wage work" or of "price work" for customers,[8] just as the sales of the local retailers were largely on custom orders. It was these naturally given conditions of the urban economy which the specifically "urban" economic policy attempted to stabilize by means of economic regulations in the interest of permanency and cheapness of the food supply and of stability of the

economic opportunities of artisans and merchants. However, as we shall see, economic regulation was not the sole object of the urban economic policy, nor did it always exist in those places where we find it in certain historical periods. In its full development it emerges only in periods of political domination by the craft guilds. Finally, it cannot be proved to be a transitional stage in the development of all cities. In any case, this economic *policy* does not represent a universal stage in the development of the *economy*. What can be stated is the following: The urban local market with its exchange between agricultural and non-agricultural producers and local traders, its personal customer relationships, and its low-capital small shops, represents a kind of "exchange-economy" counterpart to the "exchangeless" internal economy of the *oikos*, which draws on systematically allocated service prestations and commodity deliveries of dependent specialized production units and integrates these activities from the manor. The *regulation* of the exchange and production conditions in the city represents the counterpart to the *coordination* of activities of the units combined in the economy of the *oikos*.

5. *The Politico-Administrative Concept of the City*

The very fact that in these observations we had to employ categories such as "urban economic policy," "urban territory" and "urban authority" indicates that the concept of the "city" can and must also be analyzed in terms of a series of categories other than the purely economic ones hitherto discussed, namely, in terms of political categories. It is quite true that the initiator of the urban economic policy may be a prince in whose political territory the city and its inhabitants belong. In this case, whenever a specifically urban economic policy exists at all, it is determined *for* the city and its inhabitants and not *by* it. However, this does not have to be the case, and even if it is, the city must still to some extent be a partially autonomous organization, a "community" (*Gemeinde*) with special administrative and political institutions.

The economic concept of the city previously discussed must, at any rate, be clearly differentiated from the political-administrative concept. Only in the latter sense may a special urban *territory* be associated with it. A locality can be thought of as a city in the political-administrative sense even though it could not claim this name in the economic sense. The inhabitants of some medieval settlements with the legal status of "cities" derived nine-tenths or more of their livelihood from agriculture, a far larger fraction than those of many places with the legal status of "villages." Naturally, the dividing lines between such

"agrarian cities" and the "consumer," "producer," and "merchant" cities are completely fluid. But in all settlements which are differentiated administratively from the village and are treated as "cities," one point, namely the nature of land ownership, is as a rule quite different from that prevailing in the countryside. Economically speaking, this is due to the specific basis of the earning capacity of urban real estate: house ownership, to which land ownership is merely accessory. But from the administrative point of view, the special position of urban real estate is connected above all with divergent principles of taxation; at the same time, however, it is closely connected with another trait which is decisive for the political-administrative concept of the city and which stands entirely outside the purely economic analysis, namely, the fact that the city in the past, in Antiquity and in the Middle Ages, outside as well as within Europe, was also a special kind of a *fortress* and a *garrison*. At present this feature of the city has been entirely lost, and even in the past it was not universal. In Japan, for example, it was not the rule. One might, therefore, with Rathgen,[7] doubt the existence there of "cities" in the administrative sense. In China, by contrast, every city was surrounded with rings of gigantic walls. However, it is also true that many agricultural localities there, which were not cities in the administrative sense (in China this means, as we shall discuss later, that they were not the seat of state authorities), have at all times possessed walls. In some Mediterranean areas, as e.g. in Sicily, we find almost no one living outside urban walls, not even agricultural workers —a phenomenon due to century-long insecurity. By contrast, in old Hellas the polis of Sparta was remarkable for the absence of walls, but on the other hand it was in the most specific sense a "garrison-town," which despised walls precisely because it was the permanent open military camp of the Spartans. Although it is still uncertain how long Athens went without walls, it possessed in the Acropolis a rock-protected castle, as did probably all Hellenic cities except Sparta. In the same manner, Ekbatana and Persepolis were royal castles with surrounding settlements. The castle or wall, at any rate, normally were indispensable parts of Oriental as well as of ancient Mediterranean and medieval cities.

6. *Fortress and Garrison*

The city was neither the sole nor the oldest fortress. In disputed frontier territory and during chronic states of war every village fortifies itself. Under the constant danger of attack in the area of the Elbe and Oder rivers, Slavic settlements, which earlier seemed to have had the

national form of a village extended along a road (*Strassendorf*), were fortified in the form of the hedge-enclosed circular village (*Rundling*) with a single entrance which could be locked and through which at night, the cattle were driven into the center of the village. An alternative form, hill retreats surrounded by ditches and banks, was wide-spread throughout the world, in Israelite East Jordan as well as in Germany, unarmed persons sought refuge there for themselves and their cattle. The so-called "cities" of Henry I in the German East[8] were merely systematically established fortresses of this sort. In England during the Anglo-Saxon period, each shire had a *burh* (borough) after which it was named, and the guard and garrison services fell on certain persons or pieces of land as the oldest specifically "civic" burdens. If such fortresses did not stand empty in normal times, but were manned by a permanent garrison of guards or "burgmen" paid in money or in land, we have a phenomenon very similar to the Anglo-Saxon "garrison city" of Maitland's theory with "burgesses" (*burgenses*) as inhabitants. The burgess received his name from his political and legal position which, like the legal nature of the specifically "bourgeois" land and house property, was determined by the duty of maintaining and guarding the fortifications.[9]

However, historically, neither the palisaded village nor the emergency fortification are the primary forerunners of the city fortress, but rather the seigneurial castle: a fortress which was inhabited by a lord with his warriors, subordinated to him either as officials or as his personal following, together with their families and servants.

The construction of military castles is very old, doubtlessly older than the war chariot and the military use of the horse. The war chariot has everywhere at some time determined the development of knightly and royal warfare: in ancient China of the period of the classic songs, in the India of the Vedas, in Egypt and Mesopotamia, in Canaan and Israel at the time of the Song of Deborah, in Greece of the Homeric epics, and among the Etruscans, Celts, and Irish. Similarly, castle construction and castle-seated princes were diffused universally. The early Egyptians sources knew the castle and castle commanders, and we can be almost certain that these castles originally housed just as many petty princelings. In Mesopotamia the development of the later territorial kingdoms was preceded, to judge by the oldest documents, by a castle-seated princedom such as existed in western India at the time of the Vedas and such as is probable for Persia at the time of the oldest [Zoroastrian] Gathas. In northern India, on the Ganges, the castle apparently was universally dominant during the period of political disintegration: the old Kshatriya, whom the sources

show to have had a peculiar intermediary position between the king and the nobility, was obviously a castle-seated prince. Castle-dwelling princedoms existed in Russia at the time of Christianization [A.D. 988] and in Syria during the dynasty of the Thutmose[10] as well as at the time of the Israelite confederation (Abimelech), and even old Chinese literature gives fairly certain evidence of their original existence. The Hellenic and Anatolian sea-castle must surely have been as universal as piracy: the unfortified palaces of Crete almost certainly owe their existence to an interim period of very unusual pacification. Castles like that of Decelea,[11] which was so important in the Peloponnesian War, were originally the fortresses of noble families. The development of a politically autonomous nobility in the Middle Ages begins in Italy with the construction of *castelli*, and the independence of the vassals in northern Europe starts with their massive castle construction; von Below draws attention to the fact that even in more recent times individual membership in the regional noble estate (*Landstandschaft*) in Germany was contingent upon the possession by the family of a castle, even if it be only the most decrepit ruin of one.[12] Possession of a castle, of course, signified military domination over the countryside. The only question was who should exert it—whether the lord of the castle for himself, or a confederation of knights, or a ruler who could rely on the trustworthiness of the vassals, *ministeriales*, or officers whom he placed in charge of the fortification.

7. *The City as a Fusion of Fortress and Market*

In the first stage of its development into a special political form, the fortified city either was itself a castle, or it contained or lay adjacent to a castle, the fortress of a king, a nobleman, or an association of knights. Such lords either resided in the fortress themselves, or they maintained a garrison of mercenaries, vassals, or bondsmen in it. In Anglo-Saxon England the right to possess a *haw* (a fortified house) in a *burh* was bestowed by charter on certain landowners of the nearby countryside, just as in Antiquity and in medieval Italy the city-house of the nobleman was held in addition to his rural castle. As "burghers" (*burgenses*), the inhabitants of the castle or the residents living just outside the walls—sometimes all of them, sometimes only special strata—owed the performance of definite military duties to the military lord of the city. These might consist in building and repairing the walls, in guard duty, or in defense and other military services, such as the carrying

of messages and the provisioning of the garrison. The burgher was in this case a member of his status group only by virtue (and to the extent) of his participation in the military association of the city. Maitland brought out this aspect with special clarity for the case of England: the houses of the *burh* are in the possession of people whose primary duty it is to maintain the fortification; *this* constitutes the difference from the village. The royally or seigneurially guaranteed "peace of the market," from which the urban market benefits, is paralleled by a military "peace of the borough."[13] The pacified castle and the military-political center of the city: the drill field and assembly place of the army and hence of the citizenship, on the one hand, and the pacified economic market of the city on the other, often stand in plastic dualism beside one another. It is true that they are not always spatially separated; thus, the Attic *pnyx*[14] was much younger than the *agora*, which originally [probably] served for both the economic transactions *and* the political and religious acts. But in Rome the *comitium* and the *campus Martius*[15] were always separate from the economic *fora*, and in the Middle Ages the *piazza del campo* in Siena (a tournament plaza still used today for the annual race between the wards of the city) in front of the municipal palace was distinct from the *mercato* at the rear. Analogously, in Islamic cities the *kasbeh*, the fortified camp of the warriors, is spatially separate from the *bazaar*, and in southern India the political "city of *honoratiores*" stands apart from the economic city.[15a]

The problem of the relationship between the garrison, the political citizenry of the fortress, on the one hand, and the civilian, economically active population, on the other hand, is frequently exceedingly complex, but it is always of crucial importance for the constitutional history of the city. The following is clear: wherever a castle existed, artisans came in or were brought in to satisfy the needs of the seigneurial household and of the warriors; the purchasing power of a military court and the protection which it guarantees always attracted merchants and, furthermore, the lord himself was always interested in attracting these classes since they put him in a position to procure money revenues, either by taxing trade and the crafts or by participating in them through capital advances, or by conducting trade on his own account, or even by monopolizing it. The lord of a coastal castle could always, as shipowner or ruler of the port, procure a share in violent or peaceful "sea-borne" profits. It is also clear that his resident followers and vassals were in the same position if he permitted them to partake of these chances, either voluntarily or under compulsion because of his dependence upon their good will. On a vase painting from an early Hellenic city, Cyrene, we see the king assisting in the weighing of *silphion*, the local export good.[16]

and in the earliest Egyptian records a trading fleet belonging to the Pharaoh of Lower Egypt is reported.

A process that can be observed all over the world, but especially in coastal localities (not in "cities" alone) where the trade middlemen are easily controlled, was that the interest of the resident warrior families in participation in the profits from trade would grow, and so would their power to assert this interest, until they eventually shattered the monopoly (if it had existed) of the local chieftain or prince of the castle. If this occurred, the prince was usually reduced to the position of a *primus inter pares*, and perhaps ultimately to an approximately equal member of the urban *gentes*, elected for a short period only and with severely restricted powers, which he then had to share with the patrician "families" owning urban land and participating either in peaceful commerce—in person or merely with their capital (in the Middle Ages frequently in the form of the *commenda*)—or in the bellicose pursuits of piracy and maritime war. This process, in the form of the gradual emergence of an office tenure restricted to one year, can be observed in the ancient coastal cities from the Homeric period on and, in very similar form, several times in the early Middle Ages. Instances are the evolution of the dogedom in Venice, and similar developments in other typical trading cities where, however, the composition of the opposing parties varied greatly, depending upon whether the urban seigneur was a royal count or *vicomte*, a bishop, or some other notable. In this context it is necessary always to differentiate between the urban capitalist trading "interests"—the financiers of commerce and typical *honoratiores* of the early ancient and early medieval city—and the actual "operators" continuously engaged in the trading activities, the merchants proper, native or naturalized. This conceptual differentiation must be observed even though in fact these two strata frequently tend to blend into each other. However, with this we already anticipate points to be discussed later.

In landlocked territory the beginning and end points or intersections of river and caravan routes—such as Babylon, for instance—can become the locations of similar developments. There the temple priest or the priestly lord of a city would sometimes offer competition to the secular prince of the castle or the city. The temple districts of widely known gods provide a religious sanctuary to inter-ethnic—and hence politically unprotected—trade, so that, in their shadow, city-like settlements can arise which find their economic sustenance in the purchasing power of the temple revenues, just as the princely city lives from the tributes to the prince.

Whether, and to what extent, the prince's interest in money

revenues from privileges granted to craftsmen and traders pursuing a taxable occupation independent from the lord's court predominated over his interest in satisfying his needs to the largest extent from the production of his own labor force, and in monopolizing trade in his own hands, depended upon the circumstances of the individual case; he also had to consider, when he was attracting strangers through the offer of such privileges, the interests and the important tax- and service-yielding economic capacity of his resident political and manorial dependents. To these developmental variations must be added the variations of the politico-military structure of the "ruling organizations" within which the founding or development of the city took place. These give rise to certain phenomena which we must now consider.

8. *The "Commune" and the "Burgher": A Survey*

A. FEATURES OF THE OCCIDENTAL COMMUNE

Not every "city" in the economic sense, nor every garrison whose inhabitants had a special status in the political-administrative sense, has in the past constituted a "commune" (*Gemeinde*). The city-commune in the full meaning of the word appeared as a mass phenomenon only in the Occident; the Near East (Syria, Phoenicia, and perhaps Mesopotamia) also knew it, but only as a temporary structure. Elsewhere one finds nothing but rudiments. To develop into a city-commune, a settlement had to be of the nonagricultural-commercial type, at least to a relative extent, and to be equipped with the following features: 1. a fortification; 2. a market; 3. its own court of law and, at least in part, autonomous law; 4. an associational structure (*Verbandscharakter*) and, connected therewith, 5. at least partial autonomy and autocephaly, which includes administration by authorities in whose appointment the burghers could in some form participate. In the past, such rights almost always took the form of privileges of an "estate" (*Stand*); hence the characteristic of the city in the political definition was the appearance of a distinct "bourgeois" estate.

B. LACK OF COMMUNAL FEATURES IN THE ORIENT

It should be noted that if the above definition were to be strictly applied, even the cities of the Occidental Middle Ages would qualify only in part—and those of the eighteenth century only to the smallest part

—as true "city-communes." But the cities of Asia, with the possible exception of very isolated cases, would not, so far as we know, fit this classification at all. It is true that they all had markets and that they also were fortresses. In China—but not in Japan—all large seats of trades and commerce and most of the small ones were fortified. The same is true for similar towns in Egypt, the Near East, and India. Separate court districts for the larger trade and craft towns of these countries were also quite frequent. The seat of the administrative authorities of the large political associations was, in China, Egypt, the Near East, and in India, always in these towns—a statement which does *not* apply to precisely the most typical Occidental cities of the early Middle Ages, especially those of the North. However, the Asian cities did not know a special substantive or trial law applicable to the "burghers" by virtue of their membership in the city-commune, or a court autonomously appointed by them. They experienced an approximation only in the case of guilds or (in India) castes which, if they primarily or exclusively inhabited a single city, might then develop a special law and their own courts. But from the point of view of the law, the urban seat of these organizations was purely accidental and of no significance. Autonomous administration of the city was unknown or merely vestigial. Most importantly, the associational character of the city and the concept of a *burgher* (as contrasted to the man from the countryside) never developed at all or existed only in rudiments. The Chinese townsman was legally a member of his sib and hence of his native village, where the temple of his ancestor-cult stood and with which he carefully upheld his association. Similarly, the Russian member of a village community who earned his living in the city remained a "peasant" in the eyes of the law. The Indian townsman was, in addition, a member of his caste.

It is true that, as a rule, town dwellers were also members of local professional associations, of guilds and crafts with a specifically urban location, and that they were members of the urban administrative districts, city wards, and blocks into which the city was divided by the local authorities—and that in these capacities they had definite duties and, at times, even certain rights. The city ward or block, as a collective entity, could in particular be made liturgically responsible for the security of persons and for other police purposes. For this reason they might be organized into communes with elected officials or hereditary elders, as in Japan, where we find one or several civilian administrative agencies (*machi-bugyo*) superordinated to the self-administration of the city blocks.[11] But a special status of the town dweller as a "citizen," in

the ancient and medieval sense, did not exist and a corporate character of the city was unknown. Of course, the city as a whole might form a separate administrative district, just as it did in the Merovingian and Carolingian realms. Yet, in strong contrast to the medieval and ancient Occident, we never find the phenomenon in the Orient that the autonomy and the participation of the inhabitants in the affairs of local administration would be more strongly developed in the city—that is, in nonagricultural-commercial and relatively large localities—than in the countryside. In fact, as a rule the very opposite would be true. In China, for example, the confederation of the elders was practically all-powerful in the village, and the *taotai*[18] therefore had to cooperate with it even though it had no standing in the law. In India, too, the village community had very far-reaching competencies, and the Russian *mir* ruled almost autonomously within its bailiwick until the bureaucratization under Alexander III. In the entire Near Eastern world the elders (in Israel: *zekenim*),[19] originally those of the sibs and later the chiefs of the patrician clans, were the representatives and administrators of the [*non-urban*] localities and the local courts. In the Asian *city* this could never occur, because it was usually the seat of the high officials or of the prince himself and thus directly under the cudgel of their military bodyguards. The [Asian] city was a princely fortress; hence it was administered by officials (in Israel: *sarim*)[20] and military officers of the prince, who also held all judicial powers. The dualism of the officials and the elders can be clearly observed in Israel of the Time of Kings. The royal official always gained the upper hand in the bureaucratic monarchies. To be sure, he was not all-powerful; in fact, he often had to take account of popular opinion to an amazing degree. The Chinese official, in particular, was quite powerless vis-à-vis the local organizations, the sibs and occupational associations, if they formed a common front on a particular issue; whenever they seriously combined in opposition, he lost his office. Obstruction, boycotts, closing of shops and refusal to work were common reactions of the artisans and merchants to measures of oppression, which set limits to the power of the officials. However, these limits were of a completely indeterminate kind. Guilds or other occupational associations, on the other hand, had certain competencies, in China as well as in India, or at least claimed them in such a way that the officials had to reckon with them. The heads of these associations at times exercised far-reaching coercive powers even over nonmembers. Normally, however, these were only competencies or factual powers of a *particular* association with respect to *particular* issues touching on its concrete group interests. But ordinarily, there existed no association which could represent the commune of burghers as such. The very con-

cept of an urban burgher and, in particular, a specific status qualification of the burgher was completely lacking. It can be found neither in China nor in Japan or India, and only in abortive beginnings in the Near East.

In Japan, the status structure was purely feudal: the *samurai* (mounted) and the *kasi* (unmounted servitors) were juxtaposed to the peasants (*no*) and to the merchants and craftsmen, some of whom were organized in occupational associations. The concept of a "bourgeois" estate (*Bürgertum*), however, was as absent as was that of a "city commune." The same was true of China in its feudal period. Since the beginning of bureaucratic domination, however, we find the *literati*, with their various academic degrees obtained by examination, confronting the "illiterate" strata; economically privileged guilds of merchants and occupational associations of artisans also appear at this time. But here, too, the notions of the "burgher" and the "city commune" are missing. In China as well as in Japan, "self-administration" was a feature of the professional associations and of the villages, but not of the cities. In China the city was a fortress and official seat of the imperial agencies; in Japan the "city" in this sense was completely unknown. In India the cities were royal seats or official centers of the royal administration as well as fortresses and market centers. We also find merchant guilds and the castes, to a large extent coterminous with the occupational associations, both of which enjoyed considerable autonomy, above all in the fields of legislation and administration of justice. But the hereditary caste structure of Indian society, with its ritual segregation of the occupations, precludes the emergence of a "bourgeoisie" as well as that of a "city commune." Although several merchant castes and very many craft castes with innumerable subcastes existed (and still exist), they cannot be equated as a group with the Occidental burgher estate, nor could they themselves combine to form something corresponding to the medieval craft-ruled city, for caste barriers prevented all intercaste fraternization. It should be noted, however, that in the period of the great religions of salvation we do in fact find in India that the guilds, headed by their hereditary elders (*shreshtha*), combine into an association in many cities; residues of this still exist at present in some cities (Ahmedabad) which are led by a common urban *shreshth* corresponding to a Western lord mayor. There also existed, in the period prior to the large bureaucratic kingdoms, some cities which were politically autonomous and were ruled by a local patriciate recruited from those families who served in the army with elephants.[20a] But all this later disappeared almost completely; the triumph of ritual caste barriers shattered the guild association, and the royal bureaucracy in alliance with

the Brahmans swept away all such budding developments except for the remnants which survived in north-western India.

In Near Eastern and Egyptian Antiquity the cities were fortresses or official administrative centers with royal market privileges. However, during the domination of the great territorial kingdoms they lacked autonomy, municipal organizations, and a privileged burgher estate. During the Middle Kingdom in Egypt we find office feudalism, and during the New Kingdom bureaucratic administration by scribes. The "city privileges" were grants to the feudal or prebendal holders of the powers of office in these localities, similar to the privileges granted to the bishops in medieval Germany, but not grants to an autonomous "bourgeois" estate. Not even the beginnings of a "city patriciate" have so far been found.

In Mesopotamia and Syria, and above all in Phoenicia, by contrast, we find in the early period the typical city kingdoms of the shipping and caravan markets, sometimes ecclesiastic, but more often of a secular character, and later, which is also typical, the rising power of the patrician families in the "city hall" (*bitu* in the Tel-el-Amarna tablets) of the days of chariot warfare.[21] The Canaan league of cities was an association of the town-dwelling knighthood of war-charioteers; this stratum held the peasantry in debt-bondage and clientship, as also in the early period of the Hellenic polis. Relationships seem to have been similar in Mesopotamia where the "patrician," the landowning citizen with full rights and the economic resources for military service, is differentiated from the peasant and the capital cities were granted immunities and liberties by royal charter. However, with the mounting power of the military kingdom this disappeared here, too. Later, neither politically autonomous cities and a burgher stratum of the Occidental type nor a special urban law alongside the royal law can be found in Mesopotamia. Only the Phoenicians retained the city state under the domination of a landed patriciate which employed its capital in trade. The Phoenician coins with the inscription *'am Ṣôr* and *'am Karthadaš* can hardly be used to prove that the *demos* dominated in Tyre and Carthage;[22] if this should nevertheless have been the case, the period involved would have to be a rather late one.

In Israel, Judah became a city state. But the *zekenim* (elders), who in the early period had led the administration of the cities as heads of the patrician clans, were pushed into the background under the rule of the kings; the *gibborim* (knights) became royal servitors and soldiers, and precisely in the large cities—in contrast to the countryside—the administration came to be conducted by the royal *sarim* (officials).[23] It

is only after the Exile that the "congregation" (*kahal*) or the "brotherhood" (*heber*) on the basis of a ritual segregation makes its appearance as an institution—but by that time it was under the hierocratic rule of the priestly clans.[24]

C. PRE-COMMUNAL PATRICIAN CITIES—MECCA

Nevertheless, it is in this area, on the Mediterranean littoral and on the Euphrates, that we first find phenomena analogous to the ancient polis, at a stage of development about equivalent to that of Rome at the time of the immigration of the *gens* Claudia [5th century B.C.]. Authority is always in the hands of an urban patriciate, whose power rests on monetary wealth gained in trade and invested in landed property, enslaved debtors and purchased slaves, and on their military training in knightly warfare. The patriciate would often be rent by bitter intramural feuds; on the other hand, its clans could live in several cities at once and form interlocal alliances. Headed by a king as *primus inter pares*, or by *shofetim*[25] or *zekenim* with a position similar to that of the *consules* at the head of the Roman nobility, such patrician groups were always threatened with the power seizure and *tyrannis* of a charismatic war hero supported by mercenary bodyguards (Abimelech, Jephthah, David).[26] Prior to the Hellenistic period, this stage of development was nowhere surpassed, or at least not permanently.

The cities of the Arabian coast at the time of Mohammed seem also to have been arrested at this stage, which persisted in the Islamic cities wherever the autonomy of the city and its patriciate was not, as in the large territorial states, completely destroyed by the monarchy. Very often, however, the ancient and Oriental conditions appear to have been preserved under Islamic rule. We then find the urban patrician families retaining a rather unstable autonomy vis-à-vis the princely officials. The mainstay of the patriciate's power position was its wealth, derived from participation in the urban economic opportunities and usually invested in land and slaves. Even without formal legal recognition, the princes and their officials had to reckon with this power of the patriciate, just as the Chinese *taotai* had to reckon with the obstruction of the village clan elders and the merchant guilds and other associations of the cities. However, this strength of the patrician clans did not generally or necessarily cause the city to consolidate into a separate and independent association; in fact, frequently the very opposite occurred.

We shall illustrate this with an example. The Arab cities—Mecca, for instance—were typical clan towns all through the Middle Ages and

almost up to the present. Snouck Hurgronje's graphical description[27] shows the city of Mecca surrounded by the *bilads* [territories]: the seigneurial estates of the individual *dèwis*, the Hasanid sib and other noble sibs descended from [Mohammed's son-in-law] Ali. The various estates of different clans, which were settled with peasants, clients and protected Bedouins, lay intermingled. A *dèwi* was any clan which could claim a "sherifian" ancestor.[28] The She ˆ [of Mecca] himself—since A.D. 1200 always a member of the Alidic branch descended from Qatadah [ruled ca. A.D. 1201–1221]—should legally have been appointed by the Caliph's governor, who was often a man of unfree birth and under Harun al Rashid once a [freed] Berber slave; in fact, however, he obtained his position from the *dèwi* chiefs residing in Mecca, who selected a member of the qualified family for the post. For this reason—and because the residence in Mecca offered the chance to participate in the exploitation of the pilgrims—the clan heads (the *emirs*) lived in the city. Among them there usually existed certain "ties," i.e., agreements for preserving the peace and dividing the spoils. But these "ties" could at any moment be broken, and this initiated feuds within as well as outside of the city in which slave troops were employed. The defeated would be exiled from the city. Nevertheless, the community of interest between the hostile families against outsiders survived the feuds, and the victor, lest he be threatened by a revolt of his own partisans, would have to observe the courtesy of sparing the goods and the lives of family and clients of the defeated exiles.

In more recent times, the following official authorities have existed in Mecca: 1. Largely on paper, the collegiate administrative council (the *mejlis*) installed by the Turks; 2. As an effective authority, the Turkish governor, who had taken over the position of the earlier "lord protector" (in former times this had usually been the ruler of Egypt); 3. The four *kadis* of the orthodox rites,[29] always noble Meccans, of whom the most eminent—the *Shafi'i* one—has for centuries come from the same family, appointed by the Sherif or nominated by the lord protector; 4. The Sherif himself, at the same time the head of the corporation of the urban nobility; 5. The craft guilds, foremost of which was the "craft" of the pilgrim guides, followed by the butchers, grain merchants, and others; 6. The city wards with their elders. These authorities competed with each other in many ways without firmly established jurisdictions. A plaintiff in a legal suit would select that authority which appeared most favorably inclined to him or which seemed to be able to bring most power to bear on the accused. The governor could never prevent an appeal to the *kadi*, who competed with his jurisdiction

in all matters touching on religious law. The Sherif was accepted as the real authority by the indigenous population, and especially in all matters concerning the Bedouins and the pilgrim caravans the governor was utterly dependent upon his good will. Finally, here as in other Arabic areas the corporation of the nobility was of decisive importance precisely in the cities.

We are reminded of Occidental developments when we hear that in the ninth century, when the Tulunids and the Saffarids fought in the streets of Mecca, the position taken by the richest guilds (those of the butchers and the grain merchants) could decide the outcome of the conflict.[30] At the time of Mohammed, by contrast, only the attitude of the noble Quraysh families would have been of any military and political significance. Nevertheless, it never came to a guild regiment. The slave troops of the urban noble families, maintained from their shares in the [pilgrim trade] profits, must have safeguarded the predominant position of the clans time and again, just as in the medieval Italian cities power tended ever again to gravitate into the hands of the knightly families, the wielders of military power. Any association of the kind that might have united the city into a corporative unit was lacking in Mecca, and this constitutes the characteristic difference from both the ancient synoikized *poleis*[31] and even the earliest medieval Italian *comune*. Apart from this, however, we can regard these Arabian conditions, making allowance for the specifically Islamic traits or transposing them into their Christian equivalents, as quite typical also for Occidental cities, in particular for the sea-trading ones, of the period *before* the rise of the communal association.

All safely founded information about Asian and Oriental settlements which had the economic characteristics of "cities" seems to indicate that normally only the clan associations, and sometimes also the occupational associations, were the vehicles of organized action (*Verbandshandeln*), but never the collective of urban citizens as such. Transitions, of course, are fluid here too. But this statement holds precisely for the largest settlements, which sometimes embraced hundreds of thousands, and even millions of inhabitants. In medieval Christian Constantinople, the representatives of the *city wards* (which also financed the circus races, as is still the case for the horse races of Siena) were the agents of the party formations—the *Nika* insurrection under Justinian was a product of this type of local party division.[32] And in the Constantinople of the Islamic Middle Ages—i.e., up into the nineteenth century—merchant guilds and corporations are the only representatives of bourgeois interests. Besides them we find the purely military associations of the Janis-

saries and the Spahis and the religious organizations of the Ulemas and the Dervishes, but no general corporation of the burghers. In late Byzantine Alexandria the situation was similar insofar as only the burgher militias of the individual city wards seem to have existed as organized bourgeois powers beside the competing dominant powers: the Patriarch who relied on the strength of his very sturdy monks, and the Governor who was supported by a small garrison. Within the wards, rival circus parties of the "Greens" and the "Blues" represented the leading organizations.

NOTES

Unless otherwise indicated, all notes in ch. XVI are by Wittich.

1. This chapter was first published separately after Weber's death in *AfS*, vol. 47 (1921), 621–772, under the title "The City. A Sociological Investigation." In the fourth German edition of *Wirtschaft und Gesellschaft* it was given the title "Non-Legitimate Domination. The Typology of Cities" which appears in Weber's first outline plan for the work. We use a compromise title since the essay has become well known as "The City" in an earlier translation. "Non-Legitimate Domination" (*nichtlegitime Herrschaft*) refers to what was for Weber the decisive feature of the Occidental city, observable already in Antiquity: Its break with the ruler's traditional legitimacy, and the substitution of authority (*Herrschaft*) based on various types of usurpatory consociations of the ruled (*demos, plebs, comune, popolo, coniuratio,* etc.). Cf. especially *infra*, 1250f., and "Politics as a Vocation," in Gerth and Mills, *From Max Weber*, 84.

2. On the medieval forms of partnership, *commenda* and *societas maris*, as well as on the "sea loan," cf. Weber, *Handelsgesellschaften*, 323–44; *id.*, *Economic History*, 158f; *Cambridge Economic History of Europe*, III, 49–59.

3. Cf. *Economic History*, 243; *Ancient Judaism* (henceforth *AJ*), 73.

4. For the curious story of the establishment of the elder Miltiades, an Athenian patrician of the Peisistratid period (6th century B.C.), as "tyrant by invitation" of the Thracian Chersonese (the Gallipoli Peninsula on the Dardanelles Straits), see Herodotus' *Histories*, vi:34ff. The Philaid family held its dominions there, which Weber frequently mentions, until the Persian wars of the 5th century, when the younger Miltiades, the later victor of Marathon, was expelled by the invaders.—The Grimaldi overseas possessions were in southern Italy and Sicily, where the family was granted large estates by the Angevin rulers of the kingdom of Naples. In Provence, of course, they still rule Monaco.

22. The legends on the coins can be translated as "people (*demos*) of Tyre" and "people (*demos*) of Carthage." (W)

23. On the status of the *zekenim*, *gibborim* and *sarim* in the early Israelite cities, cf. *AJ*, 16–20.

24. On the ritualistically exclusive *kahal* of Ezra and Nehemiah (mid-fifth century B.C.), cf. *AJ*, 358ff, and on the *heber* of the Pharisees, *ibid.*, 385–91.

25. *Shofetim*, "judges," were the Phoenician senior magistrates in Tyre, Carthage and Marseilles.

26. For the power seizures of Abimelech and Jephthah with the help of

"hired vain and light persons," cf. *Judg.* 9 and 11; for David's rise as an army leader posing a challenge to the king, I *Saml.* 19–31.

27. Christiaan Snouck Hurgronje, *Mekka*, Vol. I: *Die Stadt und ihre Herren* (den Haag: Nijhoff, 1888), ch. 3, *passim* and esp. 112–118.

28. The term *sherif*, originally meaning "nobleman," eventually became restricted to the numerous Alid descendants of the Prophet; this is the meaning used here. Cf. Snouck Hurgronje, *op. cit.*, 56f. This meaning should be distinguished from the Sherif (or prince) of Mecca.

29. On the four basic schools of law, the *Anasi*, *Hanafi*, *Shafi'i*, and *Hanbali* schools and their significance in Islam, cf. *Selected Works of C. Snouck Hurgronje*, ed. G. H. Bousquet and J. Schacht (Leiden: Brill, 1957), 52ff.

30. In 883 troops and representatives of the Egyptian and the Persian ruling dynasties, the Tulunids and the Saffarids, both nominally vassals of the waning Abbasid Caliphate, battled in the streets of Mecca over a question of precedence in a religious ceremony. The guilds mentioned above helped, "for good money," to decide the conflict in favor of the Egyptians. Cf. Snouck Hurgronje, *Mekka*, I, 46.

31. On *synoikismos*, see below, sec. *ii*:2 and sec. *ii*, n. 9.

32. Revolt in A.D. 532 of the "Blues" and the "Greens," political parties with a race-track background, which is also revealed by the name: *nika* means "wins." It was bloodily suppressed by Belisar.

ii

The Occidental City

1. *Character of Urban Landownership and Legal Status of Persons*

A striking contrast to the Asian conditions is presented by the city of the medieval Occident, in particular by the city of the lands north of the Alps wherever it developed in a form approximating the ideal type.

Like the Asian and Oriental city, the European city was a market center, the seat of trade and of the crafts, and a fortress. In both areas the cities had merchant and artisan guilds, and even the creation of autonomous constitutions by such guilds is found throughout the world, differences being questions of degree only. Again like the Asian city, both the ancient and the medieval city of the Occident—although with qualifications, to be specified later, in the case of the latter—contained the seigneurial seats of patrician families which held manorial estates

outside of the city in addition to urban properties, often large ones which in time were further increased out of the profits from the participation of the patriciate in the urban economic opportunities. Most Occidental cities of the Middle Ages also knew "lord protectors" and officials of outside political lords who exercised varying degrees of authority within the walls.

Finally, as in most of the rest of the world, the law applying to urban house lots differed in some way from that applying to agricultural land. But in the Occidental medieval city such differences in the real estate law constituted an essential feature, one that was almost never lacking except in certain transitional stages. Urban landed property was always alienable without restriction, inheritable, unencumbered with feudal obligations or obligated only to fixed rent payments, while peasant land was always restricted in multiple ways by rights reserved to the village, the manor, or both. In Asia and in the ancient world this distinctive treatment of urban real property cannot be observed with similar regularity.

If the contrast with respect to land law was only relative, the contrast between the East and the ancient world on the one hand and the medieval West on the other with respect to the legal status of the person was absolute. Everywhere, whether in the early Middle Ages or in Antiquity, in the Near or in the Far East, the city arose from a confluence and settling together of outsiders, and because of the poor sanitary conditions of the lower classes it was able to maintain itself only through continuous new immigration from the countryside. Hence it has everywhere contained the most varied social elements. Examined office candidates and mandarins live within the walls together with illiterates despised as "mere mechanicks" and with men of the (very few) impure occupations in East Asia. Castes of many kinds live together in the Indian city, members of the patrician clans and landless artisans in the cities of the Near East and of Mediterranean Antiquity, freedmen, serfs and slaves together with manorial lords, their court officials and servitors, *ministeriales* and mercenaries, priests and monks in the early medieval city. Seigneurial courts of all kinds could be located within the city, or the city itself with its entire territory could belong to the manor of a lord; the repair and the guard of the walls might then be entrusted to a group of castle vassals or to a stratum holding privileged "castle fiefs" or other special rights. Very strong status differences stratified the town dwellers of Mediterranean Antiquity. To a much lesser degree this is true also of the early Middle Ages and of Russia up to the threshold of the present, even after the aboli-

tion of serfdom. The Russian immigrant from the countryside continued to be legally bound to his village of origin, and the *mir* could force him to return by revoking his internal passport. To be sure, the non-urban status order was almost everywhere modified in certain ways within the city. In India this took the form that the emergence of specifically urban activities resulted in the formation of new castes which in fact, though not in law, were specific to the city. In the Near East, in Antiquity, in the early Middle Ages, and in Russia before the abolition of serfdom, an important influence was exerted by the development that the broad strata of town-dwelling slaves or serfs would in fact—although again this found no immediate recognition in the law—merely pay a money tribute to their lord, but otherwise would join the class of economically independent burghers on the same level with others who were legally free. The circumstance that the city was a market with relatively permanent opportunities to earn money through commerce or the trades induced many lords to exploit their slaves and serfs not as workers in their own houses or enterprises but as sources of annuities; they trained them to be artisans or small merchants and permitted them to pursue their livelihood in the city in return for the payment of a body rent (*Leibzins*); at times (as in Antiquity) they also equipped them with working capital. In the public construction works of Athens we can thus find slaves and free men employed for wages in the same piece-work category. In the Roman territories, unfree men—either *institores*[1] of their master or slaves working with their *merx peculiaris*[2] as independently as any small burgher—can be found alongside free men in the crafts and in retail trade as well as belonging to the same secret religious communities (mysteries). The possibility of purchasing his freedom intensified the economic effort especially of the unfree petty burgher; it is hence no accident that in Antiquity and in Russia a large part of the first fortunes acquired through continuous rational operation in trade or industry is found in the hands of freedmen. The Occidental city thus was already in Antiquity, just like in Russia, a place where *the ascent from bondage to freedom* by means of monetary acquisition was possible. This is even more true for the medieval city, and especially for the medieval inland city. In contrast to all known urban development elsewhere, the burghers of the Occidental city engaged in status-conscious policies directed toward this goal.

In the early period of ample economic opportunities, the inhabitants of the cities had a common interest in their full utilization. Population growth through immigration was seen as a way to increase the oppor-

tunities for sales and acquisition of every individual. For the same reason the burghers had a common interest in the elimination of the possibility that a serf, once he had become prosperous in the city, would be requisitioned for house and stable service by his lord, if for no other reason than to extort a ransom from him. This was repeatedly practiced by Silesian noblemen as late as the eighteenth century and by Russians still in the nineteenth century. The urban citizenry therefore usurped the right to dissolve the bonds of seigneurial domination; this was the great—in fact, the *revolutionary*—innovation which differentiated the medieval Occidental cities from all others. In the central and northern European cities appeared the well-known principle that *Stadtluft macht frei*,[3] which meant that after a varying but always relatively short time the master of a slave or serf lost the right to reclaim him. The principle was translated into fact to very differing degrees. Very often, in fact, cities were forced to promise not to admit unfree men, and with the narrowing of economic opportunities this barrier was often not unwelcome to them. Nevertheless, in general the principle prevailed. In the cities the status differences disappeared—at least insofar as they signified a differentiation between "free" and "unfree" men.

On the other hand, there developed in many of the northern European urban settlements, where originally internal political equality of the settlers and free election of the municipal officials had obtained, a stratum of *honoratiores:* Council-seated families (*Ratsgeschlechter*), monopolizing the municipal offices by virtue of their economic independence and power, became differentiated from the other burghers. Furthermore, in many cities of the South, but also in some rich Northern (including German) cities, even as in Antiquity, we find from the very beginning a division into *equites*—people who maintained a stable (we would call it a "racing stable" today since it was kept for tournament purposes)—or *Konstaffeln*[4] on the one hand, and common burghers on the other. The former group constituted a specifically urban nobility; hence this was evidently a status (*ständische*) differentiation.

However, this development was countered by another one tending to enhance the status unity of the urban citizenry, whether noble or not, vis-à-vis the non-urban nobility. Toward the end of the Middle Ages, at least in northern Europe, the "nobility" of the urban patricians was no longer acknowledged by the knightly nobility of the countryside because of their participation in economic acquisition and—this was particularly stressed—because they sat together with the craft guilds in the municipal governments. Consequently, the urban patriciate was denied the qualification for tournament, for participation in noble en-

dowments (*Stiftsfähigkeit*), connubium with the nobility and the capacity to enter into feudal relations and to hold fiefs (the latter in Germany with the only temporary exception of the burghers of the privileged "Free Imperial" cities).

Of the two trends, one toward a relative levelling of status differences, and the other toward more internal differentiation within the city, the latter generally dominated in the long run. At the close of the Middle Ages and at the beginning of modern times, nearly all Italian, English, French, and German cities—insofar as they had not become monarchical city states as in Italy—were ruled by a council-patriciate or a burgher corporation which was exclusive towards the outside and a regime of *honoratiores* internally; this was true even when—as a holdover from the period of crafts dominance—such notables were still obliged to maintain formal membership in one of the craft guilds.

The cutting of status ties with the rural nobility was carried out quite consistently only in the municipal corporations of northern Europe, while in the South, specifically in Italy, by contrast, almost the entire nobility moved into the cities as the power of the municipalities increased. This latter trait was even more characteristic of Antiquity, where the city originated precisely as the seat of the nobility. The ancient and, to a lesser extent, the medieval southern European city thus in a sense form a transitional stage in this respect between the Asian and the northern European city types.

Beside these differences, the decisive common quality of the ancient Occidental and the typical medieval city lies in the institutionalized association, endowed with special characteristic organs, of people who as "burghers" are subject to a *special law* exclusively applicable to them and who thus form a legally autonomous status group. This quality of the *polis* or *comune* as a special status group (*Stand*) can be found, as far as is known, in all legal systems other than the Mediterranean and Occidental only in the most rudimentary form. The most likely places [where its existence might still be shown by further research] would be Mesopotamia, Phoenicia, and Palestine at the time of the wars of the Israelite confederacy with the Canaanite city nobility; perhaps it might be found also in some maritime cities of other areas and periods. For instance, in the cities of the Fanti tribes of the Gold Coast, which were described by Cruickshank[5] and after him by Post,[6] a city king presided over a "council" as *primus inter pares* among the members, in whose hands were the court of law and the administration; the members included 1. the *cabboceers*, heads of patrician families distinguished by wealth and a socially appropriate style of life (hospitality and con-

spicuous consumption); 2. the elected foremen of the city quarters which were organized as military associations directed by elders and elected foremen, were quite independent of each other, and in fact often feuded with each other; 3. the *pynins*, hereditary police officials of the city quarters. Similar preformations of a polis or commune constitution may have appeared elsewhere in Asia or Africa. However, nothing is known of corporate "burgher rights."

2. *The Rise of the City as a Confraternity*

The fully developed ancient and medieval city was above all constituted, or at least interpreted, as a fraternal association, as a rule equipped with a corresponding religious symbol for the associational cult of the burghers: a city-god or city-saint to whom only the burghers had access. It is true that many Chinese cities also had a special god (often an apotheosized mandarin), but there he retained the character of a functional deity in the pantheon.

In the Occident, the association of the city community as such owned and controlled property. While the famous dispute of the Alids with the community over the "Gardens of Fadak"—the first economic cause for the separation of the *shi'ah*—was a conflict over dynastic versus community property, the "community" in whose name the representatives of the caliph claimed the land was the religious community of Islam, and not a political "community" of Mecca which, in fact, did not exist.[7] A "commons" owned by the urban settlement may have existed elsewhere, just as it did in village communities. Also, princes sometimes had specifically urban tax sources. But a municipal financial administration, such as was known in the ancient or medieval city, appears at best only in the barest rudiments.

One of the foremost factors responsible for the peculiarities differentiating the Mediterranean city of all periods from the Asian city is the absence of magical and animistic caste and sib constraints and of the corresponding taboos among the free townsmen. In China it has been the exogamous and endophratric sib, in India (since the victory of the patrimonial kings and the Brahmans) in addition the endogamous and exclusive caste with its taboos which has prevented any kind of fusion of city dwellers into an association of burghers based on religious and secular equality before the law, *connubium*, commensality, and solidarity against non-members. Because of the taboo-protected caste closure this applies to India even more strongly than to China; it is at least

in part due to this factor that India had a population which, from the legal point of view, was 90 per cent rural, whereas in China the city played a considerably more significant role. While for the inhabitants of an Indian city a communal cult meal was an impossibility, the Chinese, due to their sib organization and the overwhelming importance of the ancestor cult, had no need for one. However, only taboo-bound people like the Indians and (to a much lesser degree) the Jews went so far as to exclude even private commensality. In India this was taken to such length that even the mere glance of one outside the caste suffices to defile the kitchen.[8]

It was still true in Antiquity that the religious ceremonies of the *gens* were as inaccessible to non-members as was the Chinese ancestor cult. On the other hand, already for the ancient polis it was (according to the Hellenic tradition) one component of the (real or fictitious) act of "housing together" (*synoikismos*) that the individual *prytaneia* of the communities joining in the establishment of the city, the localities of their cultic meals, were replaced by a common city *prytaneion*.[9] This was originally an indispensable feature of the city which symbolized the commensality of the urban clans in the wake of their confraternization. Nevertheless, officially the ancient city at first continued to be organized in sibs and superordinate groups which often rested (at least fictionally) on common descent and formed strictly exclusive cult associations. Membership was purely personal [i.e., not territorial or occupational]. It was the belief of the ancient townsmen—which was not without practical consequences—that their cities had originated as freely-willed associations and confederations of groups which were partly of a clan character and partly (as is probable for the phratries) of a military character, and which in the later reorganizations of the cities had become schematized along technical-administrative lines. For this reason the cities of Antiquity were religiously exclusive not only toward the outside, but also internally against everyone who did not belong to one of the confederated sibs—that is, against the plebeians, and for this reason they remained compartmentalized into initially very exclusive cult associations.

With respect to this trait—that of a confederation of noble families—the southern European city of the early Middle Ages, especially the maritime city, closely resembles the ancient city. Within the walls each noble family had its own fortress or, if not, a fortress shared with other families, in which case its use was regulated in great detail (as is documented for Siena).[10] Feuds between noble families raged as violently within the city as outside, and some of the oldest urban ward systems (for example, the division into *alberghi*) presumably were delimitations

of feudal power claims. However, it is most important that there were no residues—such as had still been present in Antiquity—of religious exclusiveness of the sibs toward each other and toward the outside. This was a consequence of the historically memorable event which Paulus justly thrust into the foreground in his Epistle to the Galatians: that Peter, in Antiochia, had partaken of the (ritual) communal meal with uncircumcised brethren [*Gal.* 2]. Ritual exclusiveness had already begun to wane in the ancient city; the clanless *plebs* obtained at least the principle of ritual equality. In medieval Europe, especially in the central and northern European cities, ritual exclusiveness was never strong, and the sibs soon lost all importance as constituencies of the city. The city became a confederation of the *individual* burghers (heads of households), and the membership of the burghers in non-urban associations also lost all practical significance for the city commune itself. Already the ancient polis was thus on the road to becoming an institutionalized "commune" (*Gemeinde*) in the mind of its inhabitants. However, in Antiquity the concept of the "commune" was fully differentiated from that of the "state" only with the city's incorporation into the large Hellenistic or Roman territorial states, which at the same time robbed the city of its political independence. The medieval city, by contrast, was a "commune" from the very beginning, even though the legal concept of the "corporation" as such was only gradually formulated.

3. *A Prerequisite for Confraternization: Dissolution of Clan Ties*

In the Occident, taboo barriers like those of the Indian and Equatorial areas were absent, as were the magical totemic, ancestral and caste props of the clan organization which in Asia impeded confraternization into a city corporation. A thorough totemism and the casuistic adherence to sib exogamy arose—probably at a relatively late point of time—precisely in those areas where large-scale politico-military and, in particular, urban associations never developed. In the religions of Western Antiquity we find only traces of these phenomena, either residuals or rudiments. The reasons for this, insofar as they are not specifically religious, can only be vaguely guessed. The mercenary soldiering and the piratical life of the early period, the military adventures, and the numerous inland and overseas colony foundations, inevitably leading to intimate permanent associations between tribal or at least clan

strangers, seem with equal inevitability to have broken the strength of the exclusive clan and magical ties. Even though in Antiquity clan ties were everywhere artificially reinstituted, for tradition's sake, by the division of the newly founded communities into "gentile" associations and phratries, it was not the sib association but the military association of the polis which now constituted the basic unit. The century-long wanderings of conquering warrior-associations of the Germanic tribes before and during the Great Migration (*Völkerwanderung*), their mercenary soldiering and their war expeditions under elected leaders, must have resulted in an equal number of impediments to the rise of taboo and totemic ties. Even though they are said to have settled, wherever possible, according to real or fictitious sibs, other forms of association were much more important. The legislative-judicial and military association of the "hundreds," the "hide"-system as the basis for the allocation of public burdens, later the relationship to a prince: following and vassaldom—these were the decisive elements, and not some magical clan ties which never really developed, perhaps precisely because of these circumstances. When Christianity became the religion of these peoples who had been so profoundly shaken in all their traditions, it finally destroyed whatever religious significance these clan ties retained; perhaps, indeed, it was precisely the weakness or absence of such magical and taboo barriers which made the conversion possible. The often very significant role played by the parish community in the administrative organization of medieval cities is only one of many symptoms pointing to this quality of the Christian religion which, in dissolving clan ties, importantly shaped the medieval city. Islam, by contrast, never really overcame the divisiveness of Arab tribal and clan ties, as is shown by the history of internal conflicts of the early caliphate; in its early period it remained the religion of a conquering army of tribes and clans.

4. *Extra-Urban Associations in the Ancient and Medieval City*

Let us recapitulate the basic distinctions. A common trait of all cities in the world is that they were to a large extent settlements of people previously alien to the given location. Chinese, Mesopotamian, Egyptian, and occasionally even Hellenistic warlords founded cities, relocated them, and settled in them not only voluntary immigrants but also human livestock rustled from here and there as need and oppor-

tunity dictated. This was most pronounced in Mesopotamia, where the forced settlers first had to dig the canal which made possible the construction of the city in the desert. As the prince with his official administrative apparatus in such cases remains the absolute master, no municipal association can develop or only the most feeble beginnings of one. The urban population often retains its tribal identity with connubial segregation or, where this is not the case, it at least retains the membership in its former local and clan associations. Not only the Chinese town-dwellers normally stayed members of their rural communities of origin, but also broad strata of the non-Greek population of the Hellenistic Orient. Thus, the legend of the New Testament justifies the birth of the Nazarene in Bethlehem with the explanation that the sib of his father had its land there (its *Hantgemal,* in the words of the [9th century] German translation, the *Heliand*),[11] for which reason—thinks the legend—it also had to undergo the census count there. The situation of the Russian peasant migrating into the city was no different until very recently: he retained his right to the land as well as the duty to share, upon demand of the village community, in the public burdens of his native village. Under such circumstances no legal status of urban citizenship (*Stadtbürgerrecht*) arose, but only an association for sharing the burdens and privileges of those who happened to inhabit the city at any given time.

The Hebraic *synoikismos,* too, was based on sib associations. The reconstitution of the polis of Jerusalem by Ezra and Nehemiah was effected, as the tradition has it, according to clans, namely by settling together delegations of each rural sib which possessed full political rights; only the clanless, politically rightless *plebs* was organized according to place of origin.[12] Even though a man was a citizen as an individual in the ancient Greek and Roman city, [he obtained this quality] originally only as a member of his sib. Every Hellenic and Roman *synoikismos* and every colonizing conquest of early Antiquity took a form, at least according to tradition, which was similar to the reconstitution of Jerusalem, and even Democracy was initially unable to abolish the organization of the citizenry into sibs (*gentes*) and the superordinated phratries and phylae, but had to rely on indirect means to render politically innocuous these purely personal cult associations which were dominated by the aristocratic families.

In Athens, qualification for the "legitimate" offices was restricted to members of clans which had a cult center (a Ζεὺς ἑρκεῖος). The Roman tradition knows of many cases of cities founded through the settling together of natives and peoples of alien tribes; ritual acts confirmed the

formation of a fraternal religious community out of the separate elements, with a communal hearth and a municipal god housed on the capitol, but at the same time the population was organized into *gentes* (clans), *curiae* and *tribus* (the latter two the equivalents of the Greek phratries and phylae). These divisions, an indispensable feature of every ancient city, quite early became to be created artificially (as is indicated by the round numbers of such units—typically 3, 30, or 12) for the allocation of the public burdens. Nevertheless, membership in one of these associations remained the distinguishing mark of the citizen with full rights, entitled to participation in the religious cult and qualified for all offices which required communication with the gods (in Rome: participation in the *auspicia*). It was the need to qualify for participation in the religious rites which made such membership indispensable, for an association with claims to legitimacy could rest only on the basis of the traditional, ritually oriented organizational forms such as the clan, the military association (phratry), and the political tribal association (*phyle*), or at least had to create such a basis by fiction.

All this was quite different in the medieval "founded" cities, particularly in the North. Here, at least in a new foundation, the burgher joined the citizenry as an individual, and as an individual he swore the oath of citizenship. His personal membership in the local association of the city guaranteed his legal status as a burgher, not his tribe or sib. Here, too, the city foundations often encompassed persons originally foreign to the particular locality and at times even merchants of altogether alien extraction. At least in the case of new foundations this happened when the founders extended the privileges of citizenship to all comers; of course it occurred to a much lesser degree when old settlements were transformed into cities. As is quite natural, the foreign merchants attracted from the entire Western orbit, from Rome to Poland, who are documented in Cologne, did not become members of the urban *coniuratio* [of A.D. 1112], the creation of which was, rather, the work of precisely the native propertied strata. Nevertheless, sometimes even complete foreigners were enfranchised.

A special position, corresponding to that of the "guest peoples" in Asia, was occupied in the medieval cities only by the Jews—a fact which in itself is interesting. In an Upper Rhine document, it is true, a bishop stresses that he invited Jews into his town "for the greater glory of the city,"[13] and in the [12th century] Cologne parish documents registering real estate transactions, the *Schreinsurkunden*, the Jews appear as owners of lots intermingled with those held by Christians.[14] Nevertheless, the ritual exclusion of *connubium*—otherwise foreign to the Occident—and the actual impediments to table community between Jews

and non-Jews, but above all the absence of a common share in the ritual of the Lord's Supper, effectively prevented fraternization. The medieval city, after all, was still a cultic association. The city church, the city saint, participation of the burgher in the Lord's Supper, the official celebrations of the church holy days—all these are obvious features of the medieval city. But the *sib* had been deprived of all ritual significance by Christianity, for by its very nature the Christian congregation was a religious association of individual believers, not a ritual association of clans. The Jews, therefore, remained from the beginning outside the burgher association.

In spite of all this, the medieval city, just like the ancient city, was a secular foundation, even though it still required the bond of a shared cult and ecclesiastic parishes were often (perhaps always) among its constituencies. The parishes acted not as ecclesiastic associations nor by means of ecclesiastic representatives, but rather through the lay elders of the parish communities who, together with the purely secular board of *Schöffen* and at times the merchant guilds, participated on behalf of the burghers in the legally decisive acts. Full membership in the ecclesiastic community was the prerequisite for urban citizenship, rather than birth into a sib which satisfied certain cult requirements as in Antiquity. Initially, the differences between the medieval and the Asian city were not as yet of a fundamental nature. The local god, corresponding to the local saint of the medieval city, and the cult community of the citizens were indispensable elements of all early cities of Near Eastern Antiquity. However, the resettlement policies of the men-hunting Great Kings apparently destroyed this tie between the cult community and the city and turned the city into a purely administrative district within which all inhabitants, whatever their tribal or cult membership, shared the same manner of life and the same opportunities. Evidence for this conclusion may be seen in the fate of the Jews carried into [the Babylonian] Exile: only the state offices, which demanded a knowledge of writing and apparently also ritual qualifications, seem to have been closed to them. Officials of the urban "commune" or municipality as such do not seem to have existed in the [Near Eastern] cities. The various foreign groups, just like the exiled Jews, had their own elders and priests—in other words, they remained "guest peoples." In pre-Exile Israel, the metics (*gerim*) stood outside the ritual community (they were originally not required to be circumcised); among these we find almost all the artisans.[15] Hence they were guest tribes, just like those of India. There it was the caste taboo which ruled out ritual confraternization of the city inhabitants. In China, each city had its own god (often a former mandarin of the city who had become the object of a cult).

But in all Asian cities, including the Near Eastern ones, the phenomenon of a "commune" was either absent altogether or, at best, present only in rudiments which, moreover, always took the form of kin-group associations that extended also beyond the city. The religious commune of the Jews after the Exile, [a seeming exception,] was ruled in a purely theocratic manner.

5. *The Sworn Confraternization in the Occident: Legal and Political Consequences*

The Occidental city—and especially the medieval city, which for the time being shall be our only concern—was not only economically a seat of trade and the crafts, politically in the normal case a fortress and perhaps a garrison, administratively a court district, but beyond all this also a sworn confraternity. In Antiquity the symbol of a confraternity was the joint election of the *prytaneis*.[16] In the Middle Ages the city was a sworn *comune* which had the legal status of a corporation, although this was attained only gradually. Hatschek points out that as late as 1313 English cities could not obtain a "franchise" because, to put it in modern terms, they had no "legal personality"; only under Edward I [1272–1307] had cities first appeared as corporations.[17]

Everywhere, not only in England, the burgher associations of the emerging cities were initially treated by the political power, the lord of the city, as passive liturgical associations of urban land owners who shared in certain specific tasks and duties as well as privileges: market monopolies and staple rights, rights of practicing and of controlling the practice of certain trades, participation in the city court, special military and taxation treatment. Moreover, the economically most important of these privileges initially were not in a formal legal sense acquisitions of the burgher associations, but the property of the political or manorial lord of the city. It was he, rather than the burghers, who formally acquired these important rights which were to the immediate economic advantage of the burghers; the lord's indirect financial benefit lay in the tax resources which he thus developed. In Germany, for instance, such rights were in the oldest cases royal grants to a bishop, on the basis of which he could and did treat his town-dwelling subjects as privileged. At times, as in Anglo-Saxon England, permission to settle in the market town was an exclusive privilege of the neighboring manorial lords, to be bestowed upon their own serfs only (but not upon those of any other lord), whose revenues they then proceeded to tax. The urban court was

either a royal or a seigneurial court; the *Schöffen*[18] and other court functionaries were not representatives of the burghers, even when they were elected by them; as officials of the lord they judged according to his statute. The *universitas civium*, which term soon appears everywhere, thus was initially heteronomous and heterocephalous; it was incorporated in other political and frequently also in manorial associations. However, this situation did not remain unchanged for long.

The city became an institutionalized association (*anstaltsmässige Vergesellschaftung*), autonomous and autocephalous (even though to varying degrees), an active "territorial corporation"; the urban officials, in their entirety or in part, became officials of this institution (*Anstalt*). It is of great importance for the development of medieval cities that from the very beginning the privileged position of the burgher was a right of the individual also vis-à-vis outside parties. This was not only a consequence of the "personalist" approach to law, common to both Antiquity and the Middle Ages,[19] under which the members of a group were considered to have—as a matter of group privilege—a "subjective" right to be dealt with under a common "objective" law. Another source for this position of the burgher, especially for the Middle Ages, is to be sought, as Beyerle stressed quite correctly,[20] in survivals from the Germanic judicial system and in particular in the concept of the *Ding*-community. As an active member in that community —and that means, as a judge in the *Ding*-court—the burgher and member of a legally autonomous group himself creates the "objective" law to which he is subject. We have previously spoken about the significance of this institution for the formation of law.[21] A right of this type did not exist for those subject to the law of almost all cities of the world. (Only in Israel can traces of it be found, and we shall see what special circumstances caused this exception.)

For the development of the medieval city into a burgher association two circumstances were of central significance: on the one hand, the fact that at a time when the economic interests of the burghers urged them toward institutionalized association (*anstaltsmässige Vergesellschaftung*) this movement was not frustrated by the existence of magic or religious barriers, and on the other hand the absence of a rational administration enforcing the interests of a larger political association. Even if only one of these conditions was violated—as in Asia—the strongest common economic interests of the city inhabitants enabled them to achieve no more than transitory unification. The rise of the medieval autonomous and autocephalous city association, with its administrative council headed by the *Konsul, Majer* [mayor] or *Bürger-*

meister, is a process that differs in its very nature not only from the development of the Asian city but also from that of the ancient polis. We will have to discuss this in detail later [*infra*, ch. XVI:*iii*:6–8], but may note now that the specifically urban constitution of Antiquity under the domination of *honoratiores* from the militarily qualified sibs always represented—and most pronouncedly so in its most typical examples—a transformation of the power of the city king on the one hand, and of that of the sib elders on the other. Especially in those medieval cities which are most typical for their time, matters were quite different.

In the analysis of this process it is, however, indispensable to keep apart the formal juridical and the sociologically and politically relevant aspects—a precaution which has not always been observed in the disputes over the various "city theories." In a formal legal sense the corporation of the burghers and its authorities had their "legitimate" origin in (real or fictitious) privileges granted by the political and at times by the manorial powers. It is true that to some extent the actual process corresponded to this formal pattern. But quite often, and especially in the most important cases, the real origin is to be found in what is from the formal legal point of view a revolutionary usurpation of rights. To be sure, this cannot be said of all cases. We can distinguish a "spontaneous" and a "derived" formation of medieval city associations. In the "spontaneous" case, the commune was the result of a political association of the burghers in spite of, or in defiance of the "legitimate" powers or, more correctly, of a series of such acts. Formal recognition by the legitimate authorities came only later, if at all. A "derived" burgher association was formed through a contracted or legislated grant of more or less limited rights to autonomy and autocephaly, issued by the city founder or his successors; it is found frequently in the case of new foundations as a grant to the settlers and their descendants.

The "spontaneous" usurpation through an act of rational association, a sworn confraternization (*Eidverbrüderung*: *coniuratio*) of the burghers, is found especially in the bigger and older cities, such as Genoa or Cologne. As a rule, however, a combination of events of both kinds occurred. In the documentary sources of urban history, which by their nature overemphasize the continuity of legitimacy, such usurpatory confraternizations are as a rule not mentioned at all; it is usually only by accident that one can be documented. As a result, the frequency of the "derived" origin is almost certainly overrepresented in the sources, at least with respect to cities which were already going concerns at the time of the commune formation. Only a single laconic note mentions the Cologne *coniuratio* of 1112. The *Schöffenbank* of the Cologne *Altstadt*

and the parish representatives particularly of the Saint-Martin suburb, the new settlement of the *mercatores*, probably appear on the documented transactions precisely for the reason that they were "legitimate" authorities.[22] And the opponents of the burgher association, the city lords, would naturally always be ready to make an issue of questions of formal legitimacy, such as (in Cologne) that some of the aldermen had not sworn an oath [of obedience],[23] or to use similar pretexts for complaint. It was, after all, in such things that usurpatory innovations would find their formal expression. The edicts of the Hohenstaufen emperors against urban autonomy took a different line: they did not forbid this or that form of legal innovation, but the very *coniurationes* themselves.[24] It is quite indicative of what strata were the driving power behind such acts of usurpation that in Cologne, even at a much later time, the *Richerzeche* (guild of the rich), which from the point of view of legitimacy was nothing but a private club of wealthy citizens, could successfully assert the right to confer citizenship—a quality which was legally quite independent from membership in this club. The majority of the larger French cities obtained their urban constitutions in a similar way through acts of sworn confraternization of the burghers.

6. *The* coniurationes *in Italy*

The real home of the *coniuratio*, however, is obviously to be found in Italy.[25] In the overwhelming majority of cases the city constitution was here formed in the "spontaneous" way, by *coniuratio*. It is in Italy, therefore, that in spite of the ambiguity of many sources the sociological meaning of the burgher association can best be determined. Its general precondition was the partly feudal, partly prebendal appropriation of powers of domination characteristic for the Occident. We have to picture urban conditions prior to the *coniuratio* on the whole as rather similar, in spite of differences in detail and between cities, to the peculiar anarchy prevailing in Mecca, which for this reason was described above at some length. Numerous claims to authority stand side by side, overlapping and often conflicting with each other. Episcopal powers of seigneurial and political nature; appropriated vicontiel and other political office powers resting partly on chartered privileges and partly on usurpation; powers of great urban feudatories or freed *ministeriales* of the king or the bishops (*capitanei*); those of rural or urban subfeudatories (*valvassores*) of the *capitanei*;[26] allodial clan properties of most varied origin; countless owners of castles fortified on their own

authority or that of some other power, a privileged estate wielding authority over a broad stratum of *clientes*, either bound or free; occupational unions of the urban economic classes; judicial powers based on manorial law, on feudal law, on territorial law and on ecclesiastic law —all these are found in the same city. Temporary treaties, similar to the "ties" of the Meccan patrician sibs, interrupted the feuds of the armed interests within and outside the city walls. Officially the legitimate lord of the city was either an imperial vassal or—as in most cases—the local bishop; by virtue of his combination of secular and religious instruments of power, the latter usually stood the best chance of imposing an effective rulership.

The type of *coniuratio* which under the name of a *compagna communis*[27] or some similar designation prepared the way for the political association of the later "city" was likewise concluded for a concrete purpose, and usually for a definite time period or until further notice; it could thus be dissolved again. At times, during the early period, several such "companies" can be found within the same city walls, but permanent significance was reached only by the sworn association of the "whole" community—i.e., of all those groups which at the given time effectively claimed and held military power within the city. In Genoa this association was at first renewed every four years. The opponent varied with the conditions of the locality. In Milan the *coniuratio* of the arms-bearing townsmen of A.D. 980 was directed against the bishop, while in Genoa the bishop and the vicontiel families (who had appropriated the secular seigneurial rights—later on transformed into tax claims) seem initially to have been members of the urban *coniuratio*.[28] But here, too, the later *compagna communis* was directed against the power claims of the bishop and the Visconti.

The immediate positive aim of the sworn confraternity was the unification of the local landowners for protective and defensive purposes, for the peaceable settlement of internal disputes, and for the securing of an administration of justice in correspondence with the interests of the townsmen. But there were further goals. One was the monopolization of the economic opportunities offered by the city: only the members of the sworn association were to be permitted to share in the commerce of the city. In Genoa, for example, membership was a prerequisite for permission to invest capital in overseas trade in *commenda* partnerships. Another aim was the delimitation of the obligations owed to the city lord: the replacement of arbitrary taxation by fixed lump sum payments or by high [but determinate] annual payments. Finally, the city association took in hand the military organization for the purpose of expand-

ing the political and economic power sphere of the commune against the outside. Hence we find, only a short time after the formation of the *coniurationes*, the beginning of the wars of the communes against each other, which by the early eleventh century had already become a chronic phenomenon.

Within the city, the mass of the burghers was forced to join the sworn confraternization. The noble and patrician families which had founded the association would administer an oath to all inhabitants qualified by landownership; those who did not agree to take it were forced into exile. This was not always immediately accompanied by a formal change in the existing organization of offices. The bishop or secular city lord often retained his position as head of an urban district which continued to be administered through his *ministeriales;* the great transformation was felt only in the existence of the burgher assembly.

But this did not continue for long. In the last decades of the eleventh century annually elected *consules* appear everywhere, often numbering up to a dozen or more; officially they were elected by the citizenry directly or by an electoral college of *honoratiores*, itself in theory elected by the burghers but in practice merely certified by acclamation, which probably always usurped the right to nominate the officials. The consuls, salaried and entitled to take fees, completed the revolutionary usurpation by seizing all or the major part of judicial powers and the supreme command in wartime; they administered all affairs of the commune. In the beginning the consuls seem to have been often recruited from the noble judicial officials of the episcopal or seigneurial *curia*, who now obtained office from the sworn burgher fraternity by election rather than from the city lord by appointment.

A college of *sapientes* (sages), often called the *credenza*, strictly controlled the consuls; it was formed at times by the former [i.e., episcopal or seigneurial] *scabini*, at times by *honoratiores* appointed by the consuls themselves or by an electoral college. In practice it usually consisted of the heads of the economically and politically most powerful families, who divided these positions among themselves.

The initial *coniurationes* still observed the status separation into vassals (*capitanei*), subvassals, *ministeriales*, castle lords (*castellani*), and *cives meliores*—that is, persons economically qualified for military service; office and council positions were assigned proportionally to these groups. However, very soon the anti-feudal character of the movement came to the fore. It was forbidden to the consuls to accept fiefs or to "commend" themselves as vassals to a lord. The razing of the imperial, episcopal and seigneurial castles within the city, their removal

to a place without the walls (this is found especially in the city privileges granted by the Salic emperors), the establishment of the principle that no castles could be built within a specified area around the city and that the emperor or other city lords should not have the right to be quartered within the city walls—these were among the first *political* achievements of the new regime, obtained either by force or by extorted or purchased grant from the emperor or the bishop.

The main *legal* achievement of the urban revolutions was the creation of a special trial procedure which excluded irrational means of evidence and in particular the test by duel (this is mentioned in many eleventh century privileges). The same interests thus assert themselves here as were catered to by the concessions of the English and French crowns to the burghers. The legal gains further comprised the prohibition against hailing burghers before non-urban courts, and the codification of a special rational law for urban citizens which the court of the consuls was to apply.

In this manner the purely personal and temporary *coniurationes* developed into permanent political associations whose members were collectively, as urban citizens, subject to a special and autonomous law. Formally, the new urban law signified the extinction of the old personality principle of the law. Substantively, it meant the destruction of the feudal associations and of patrimonialism, but not yet in favor of the principle of general compulsory membership for all inhabiting a given territory. The "bourgeois" law was, rather, a status right of the members of the sworn fellowship of burghers; one was subject to it by virtue of membership in a status group which comprised the full citizens and their dependent clients. Even in the sixteenth century we still find in areas where the domination of the noble families in the cities had been preserved—as, for instance, in most Dutch communities—that the urban delegations to the provincial diets and to the Estates General did not represent the city as such, but only the urban nobility; this is revealed by the fact that frequently, in addition to the patrician delegation, representatives of the craft guilds or other non-noble strata of the same city appear, who voted separately and definitely were not combined with the delegation of the patriciate of their city into a common city representation. This particular phenomenon did not appear in Italy, but in principle the situation was often similar. Although normally the urban nobility should at least have severed its ties with the feudal association, this was by no means always the case. The nobleman usually owned castles and manorial estates outside the walls in addition to his townhouse, and was thus as a feudal lord and fellow landowner a member

also of political associations other than that of the urban commune. In the early period of the Italian *comune* the municipal regiment was in practice firmly in the hands of families with a knightly style of life, regardless of whether the act of consociation formally prescribed a different arrangement and of whether the non-noble strata had in the past even effectively obtained a temporary share in the regiment. The military importance of the knighthood gave it predominance.

In northern Europe, particularly in Germany, the old scabinic families (*Schöffengeschlechter*) played a decisive role to an even stronger degree than in the South, retaining administrative control in the early period even formally, or at least informally by combining offices in a personal union. At times, depending upon the distribution of power, the previous agents of the city lord, especially of the bishops, the dependent seigneurial servitors (*ministeriales*), also regained a share in the administration. Especially in cases where the usurpation had not been completely effective—and this was not infrequent—the lord, usually a bishop, obtained membership in the council for his *ministeriales*. In large cities like Cologne and Madgeburg the bishops had staffed their administration entirely or in part with free "bourgeois" *Schöffen;* these now tended to turn from sworn officials of the city lord into sworn representatives of the commune, associated with representatives of the *coniuratio* or sharing the administrative tasks with them. In the cities of Flanders, Brabant and the Low Countries, *échevins* appointed by the count began to be joined in the thirteenth century by town councillors or *jurati* (i.e., sworn delegates—their very name indicates the origin in an usurpatory *coniuratio*) and by "burghermasters." These administrative representatives of the burgher strata were usually organized into separate "colleges," although at times they met with the *échevins* in a common assembly. They were delegates of a burgher fraternity which in Holland continued to exist into a later period as the corporation of the *Vroedschap*.[29]

One must picture the conditions of this early period as very unstable, with almost no formal regulation of the distribution of powers and competencies. Personal influences and connections were decisive as individuals gathered functions of many types into a single set of hands. A formally separate municipal administration with special office buildings and a town hall did not exist. In Italy as in Cologne, the citizenry ordinarily assembled in the cathedrals, while the executive committees probably met in private houses or in club rooms. Meetings in club houses can be specifically documented. During the time of the revolutionary usurpation in Cologne [early 12th century] the "house of the rich" (*domus divitum*) seems to have been identical with the "house

of the burghers" (*domus civium*), i.e., the seat of the administration, just as the leaders of the club of the rich—the *Richerzeche*—must to a large extent then and later have been identical with the holders of the scabinic and other important municipal offices. Both of these hypotheses presented by Beyerle are almost certainly correct.[30] An urban knighthood as significant as that in Italy did not exist in Cologne. In England and France the merchant "companies" played the leading role.[31] In Paris, the wardens of the hanse of water merchants were even formally recognized as representatives of the citizenry.[32] In most of the large and old French cities, too, the urban communes originated in revolutionary usurpation by associations of burghers, merchants and urban *rentiers* who either united with the resident knights—as in the South—or with the *confraternitates* and guilds of the artisans—as in the North—to seize political power.

7. *The* confraternitates *in the Germanic North*

Associations such as the above-mentioned were not identical with the *coniuratio*, but they played an important role in its genesis, especially in the North. Due to the lack of an urban knighthood, the sworn confraternities of the Germanic North displayed archaic traits that were largely missing in the southern European countries. The confraternities might, of course, be specifically created for the purpose of political association and usurpation of power from the city lord. But the revolutionary movement in the North and in England could also take its point of departure from the mutual protection guilds (*Schutzgilden*) which had there sprung up in great numbers. These had by no means been primarily created for the purpose of influencing political conditions. Originally they were substitutes for something their members frequently very much missed in the early medieval city: the backing of a clan, and its protective guarantees. They provided the services otherwise supplied by the clan: help in case of personal injury or threats, aid in economic distress, elimination of feuds between members by means of peaceful conciliation, and payment of the wergild liabilities of members (in an English case[33]). The guilds provided for the members' social needs by holding periodic feasts—a practice traceable to pagan ritual meals—and for his funeral with the participation of the brethren; they guaranteed salvation of his soul through good deeds and secured for him from the common treasury indulgences and the benevolence of powerful saints. It goes without saying that such protective associations also represented joint interests, including economic interests.

While the city unions in northern France were primarily sworn peace unions without other guild attributes, the Nordic and English city unions regularly bore the character of a guild. In England the typical form of the city union was the [single] Gild Merchant, which monopolized retail trade within the city.[34] The German merchant guilds were in the majority of cases specialized in terms of particular branches of trade as, for example, the often powerful drapers' guild and the retailers' guild. This branch differentiation led to the use of the guild as the organizational form of long-distance trade—a function which does not concern us here.

The cities did not, as was thought by many,[35] originate in the guilds. But the converse is always true: the guild originated in the cities. Furthermore, the guilds actually obtained domination only in a small number of cities (primarily in the North, and especially in England, as *summa convivia*);[36] it was rather the patrician "families"—not at all identical with the guilds—who initially seized power in the cities. For the guilds were not identical with the *coniuratio*, the sworn city union. Lastly, it should also be noted that the guilds were never the only type of association in the city. Beside them we find the religious associations, comprising representatives of several or of all occupations, and the purely economic, occupationally differentiated associations, the craft guilds (*Zünfte*).[37] Throughout the Middle Ages the creation of religious unions, the *confraternitates*, occurred alongside that of associations with a political, guild or craft character, and the two types of movements overlapped and intersected in many ways. Especially among the artisans the religious associations played a significant role, which varied over time. The fact that the oldest documentable religious society of artisans in Germany, the *fraternitas* of the Cologne bedsheet weavers (*Bettziechenweber*) of 1149, is younger than the corresponding occupational association[38] does not in itself prove that the occupational union, or rather the specifically professional purpose of the union, has everywhere been the original and earlier form of organization. Nevertheless, for the craft guilds this seems to have been the rule. It may be explained with the supposition that the associations of free craftsmen, at least outside of Italy, had been formed in the image of the seigneurial organization of dependent tributary artisans in units headed by a master. But in other cases the religious *fraternitas* may have been the crystallization-point for the later occupational association. Thus, as recently as in the last generation, the formation of a Jewish trade union in Russia would begin with the purchase of the articles most important for the orthodox Jew: the rolls of the Torah. Similarly, numerous medieval

associations of a basically occupational orientation would bring social and religious interests to the fore or would at least, if they were primarily occupational, attempt to obtain some religious recognition. This was done by most guilds and in fact by all types of associations in the Middle Ages. This was by no means merely a cover-up for strong material interests. The fact that the earliest conflicts of the journeymen associations of later centuries arose not over working conditions, but over questions of religious etiquette, such as rank order in processions and similar problems, demonstrates again how strongly even the status evaluations of the clanless burgher were conditioned by religious elements. But at the same time the other important point becomes quite clear: the enormous contrast between this type of social situation and that of taboo-closed castes which would have precluded any kind of confraternization into a commune.

By and large, the membership of these religious and social fraternities, whether they be thought older or younger in origin, was only approximately coterminous with that of the official occupational associations, the merchant companies and craft guilds, of which we will have to say more later on. The occupational groupings themselves, in turn, were not always, as is often believed, splinter organizations which had withdrawn from an original unitary guild of all burghers (although this did in fact occur at times), for some of the craft guilds were considerably older than the oldest *coniurationes*. Nor were occupational unions initial stages or forerunners of *coniurationes*, for they appear throughout the world, even where no burgher commune has ever arisen. The effect of all these associations was essentially indirect. They facilitated the city union by habituating the burghers to the formation of coalitions in the pursuit of common interests, and by providing models for the cumulation of leadership positions in the hands of persons who had gained experience and social influence in the direction of such associations.

It was quite natural, as the further development confirms, that in the North, too, it should everywhere have been the rich burghers with an interest in the independence of urban trading policy who actively participated alongside the nobility in the formation of the *coniuratio*, financed it, kept the movement going, and forced the mass of the citizenry to adhere to it by swearing the oath—an activity of which the right of the Cologne *Richerzeche* to grant membership in the commune is apparently a survival. Wherever economic associations of the burghers participated at all in the *coniuratio* movement alongside the patrician "families," only the merchant guilds were normally involved. In England we find the petty burghers, at that time in revolt against the merchantry, complaining as late as the reign of Edward II [1307–1327]

that the *potentes* were demanding oaths of obedience from them and from the craft guilds, and that they were levying taxes by virtue of such usurped powers.[39] Similar phenomena could probably observed in most of the "spontaneous" cases of usurpatory urban confraternization.

Once the revolutionary usurpations had met with success in several large cities, the political lords who founded new cities or granted new charters to existing ones hurried, for reasons of competition, to concede to their burghers varying portions of the rights elsewhere obtained without waiting for the formation of formal unions. Thus the attainments of the city unions tended to spread universally. This was further aided by the fact that the entrepreneurs managing the settlement operation or the prospective settlers themselves, wherever they carried sufficient weight vis-à-vis the city founder by virtue of wealth or social rank, secured charters that granted the use of the municipal law of one of the old-established cities. Thus the burghers of Freiburg received a charter grant of the Cologne law, numerous South German cities were chartered with the law of Freiburg, and Eastern cities received the law of Magdeburg. In disputed cases the court of the city whose law had been granted was appealed to for authoritative interpretation. The wealthier the settlers desired by a city founder, the larger were the concessions he found himself forced to grant. The 24 *coniuratores fori* in Freiburg, for instance, to whom Konrad von Zähringen vowed the preservation of the liberties of the burghers in his new city,[40] played a role equivalent to that of the *Richerzeche* in Cologne. They were granted considerable personal privileges, and as *consules* of the commune they initially had the city government in their hands.

Among the most important attainments that were gained when princes or manorial lords founded a city or granted privileges to it was the organization of the citizenry as a "commune" (*Gemeinde*) with its own administrative organs. In Germany these were headed by a "council" (*Rat*), which was considered an indispensable aspect of a "city" and its freedom. The burghers claimed the right of autonomously appointing its members—a right which was not obtained without struggle. As late as 1232, Emperor Frederick II prohibited all city councils and mayors instituted by the burghers without consent of the bishops, and the Bishop of Worms obtained for himself or his representative the chairmanship in the council and the right to appoint its members.[41] In Strassburg toward the end of the twelfth century a council, consisting of representatives of the citizenry and five episcopal *ministeriales*, replaced the bishop's administration. In Basel the bishop managed to obtain an Imperial edict abolishing the council even though, as Hegel

assumes,[42] its original establishment had been approved by the Emperor himself. But in numerous South German cities the town magistrate (*Schultheiss*) appointed or confirmed by the lord remained the actual head of the city; the burghers could get rid of this control only by purchasing the office from the city lord. In the documents of almost all South German cities we find with increasing frequency, beside the *Schultheiss*, a *Bürgermeister*, who in the end generally assumes first rank. In contrast to the *Schultheiss*, he was always a representative of the city guild, and his office thus originated in usurpation, not in the seigneurial administration. However, this fourteenth-century *Bürgermeister* was—due to the different social composition of many German cities—usually no longer a representative of the patrician families, as the Italian *consules* had been, but rather the representative of the occupational associations. Thus he belongs to a later stage of development, whereas the German counterparts of these Italian magistrates were the *scabini non jurati* and *consules* of an earlier period.[43]

In the beginning, active membership in the burgher association was bound up with possession of urban land which was inheritable and transferable, exempt from compulsory services, and either free of a seigneurial charge (*Zins*) or charged only with a fixed amount. However, urban land was for city purposes subject to a municipal tax (*Schoss*); in Germany, in fact, this became the identifying characteristic of bourgeois land tenure. Later other kinds of property also became subject to municipal taxation, especially money or monetary metals. Townsmen not possessing land of this kind originally could only be protected guest residents of the city, regardless of their social status.

8. *The Significance of Urban Military Autonomy in the Occident*

The right to participate in urban offices and in the council underwent various changes which shall be discussed in the next section. But first we must once again raise the question of what ultimately caused the development of cities to start around the Mediterranean, and later in Europe, while preventing it in Asia. One answer has already been supplied, namely, that the development of an urban *confraternity*, and thus of an urban *commune*, was elsewhere impeded by the magic ties of the sib association and, in India, of the castes. In China the sibs were the bearers of the central religious concerns, the ancestor cult, and were therefore indestructible. In India the castes were carriers of a specific

conduct of life, upon the observance of which the individual's fate in his next incarnation hinged; hence they were ritually exclusive vis-à-vis each other. But while the ritual obstacles to confraternization were indeed absolute in India, the same cannot be said for China—and even less for the Near East—where the sib ties constituted only a relative impediment. For these areas a quite different element still needs to be considered: the differences in the military constitution and, above all, in its economic and sociological foundations.

The necessity of river regulation and an irrigation policy in the Near East and in Egypt, and to a lesser degree also in China, caused the development of royal bureaucracies; initially these were charged only with construction tasks, but from this core ensued the bureaucratization of the entire administration which enabled the king, through this apparatus and the revenues supplied by it, to take the army administration under his own bureaucratic management. The "officer" and the "soldier," an army recruited by compulsory draft and equipped and fed from storehouses, became the foundation of military power. The result was the separation of the soldier from [ownership of] the means of warfare and the military defenselessness of the subjects. On such ground no political commune of burghers independent from the royal power could arise. The burgher was here simply the non-soldier. Things were quite different in the Occident where up to the time of the Roman emperors the principle of *self-equipment* of the armies prevailed, whether these were peasant levies, knightly armies, or burgher militias. But this signified the military *autonomy* of the individual obligated to military service. The position of King Clovis vis-à-vis his military following illustrates a principle which is basic for all self-equipped armies: that the lord is to a very large extent dependent upon the good will of the soldiers whose obedience is the sole basis of his political power.[44] He is more powerful than any individual one of them and also stronger than small groups, but any larger association of his military men against him leaves him quite powerless. In this political structure the lord lacks the bureaucratic apparatus—an instrument of compulsion which is blindly obedient because of its complete dependence; if the strata on whom his rule is based coalesce against him, he cannot have his way unless he comes to terms with the militarily and economically independent *honoratiores* who staff his administrative positions and supply his dignitaries and local officials. But such associations have always taken shape in the Occident whenever the lord approached his militarily independent subjects with new *economic* demands, particularly if these were demands for *money* payments. The rise of the "Estates" in the Occident—and only there—can be ex-

plained from these relationships, and the same goes for the development of the corporate and autonomous city commune. The financial strength of his urban subjects forced the lord to turn to them in case of need and to negotiate with them. To be sure, the guilds of India and China and the "money men" of Babylon also possessed financial strength which compelled the king even there to impose certain restraints upon himself in order not to scare them away. But it did not enable the townsmen, however rich they may have been, to unite and to offer a *military* check to the city lord. By contrast, all *coniurationes* and city unions of the Occident, beginning with those of early Antiquity, were coalitions of the *armed* strata of the cities. This was the decisive difference.

NOTES

1. In Roman law, the *institor* was a person appointed by the owner of a commercial undertaking to operate it in his stead; he could conclude contracts for which the principal was liable. Usually slaves or persons under the *patria potestas* were utilized for this purpose. Cf. art. "institor" in *Paulys Realencyclopädie der classischen Altertumswissenschaft*, newly edited by Georg Wissowa (Stuttgart 1894–1965; henceforth cited as: Pauly-Wissowa, *RE*), vol. IX (1916), cols. 1564–65.

2. That is, with merchandise (*merx*) forming part of their *peculium*, on which see "Soc. of Law," above, ch. VIII: ii, n. 124.

3. "Town air makes free." On the substantive content of his proverbial principle, see Hans Strahm, "Stadtluft macht frei," in *Das Problem der Freiheit in der deutschen und schweizerischen Geschichte* (Institut für geschichtliche Landesforschung des Bodenseegebiets, "Vorträge und Forschungen," ed. Th. Mayer, vol. II; Konstanz: Thorbeke, 1955), 102–121.

4. On this military fellowship in the 14th century Zurich, see below, sec. *iv*, n. 1.

5. Brodie Cruickshank, *Eighteen Years on the Gold Coast of Africa* (London: Hurst & Blackett, 1853), I, 240–52 (*Cabboceers*, 242; *pynins*, 250). (W)

7. "The main reason for the discontent of [Mohammed's son-in-law] Ali with [the first Caliph] Abu Bekr was that the latter was not willing to treat certain pieces of land, which the Prophet had owned as head of the community, as the inheritance of the family of Mohammed; the conflict over the 'gardens of Fadak' in particular induced Ali to found his party" (Snouck Hurgronje, *Mekka*, I, 32). *Shi'ah* means "party"; in time the term became restricted to that section of the Moslem movement which considered only the Alids rightful successors of the Prophet.

8. On the Chinese sibs and Indian castes in their relation to the city, cf. Weber's more extensive observations in "Konfuzianismus und Taoismus" and

"Hinduismus und Buddhismus," *GArRS* I, 290ff., 353ff., 375ff.; II, 36ff. (*Religion of China*, 13ff., 66ff., 86ff.; *Religion of India*, 34ff.).

9. A tradition of a single founding act, called *synoikismos* (i.e., housing or settling together), existed in many Greek *poleis*. In some places this may have reflected an actual fact; in others, the tradition interpreted as one single act a merger and subjugation process in which a territory with perhaps several *poleis* and other political communities had gradually become united under a single center. This was certainly the case with the Attic *synoikismos* ascribed to the mythical hero Theseus. Cf. Victor Ehrenberg, *The Greek State* (New York: Norton, 1964), 26ff.

10. On the *consorterie* of the Sienese nobility, cf. Ferdinand Schevill, *Siena. The History of a Medieval Commune* (New York: Harper Torchbooks, 1964), 278–280. Some details of the statutes of the tower associations are described in CasimirChledowski, *Siena* (Berlin: Cassirer, 1913), I, 68ff.

11. A *Hantgemal* was the inheritable family estate of free, especially knightly families in the Germanic Middle Ages. In the Old-Saxon *Heliand*, the Saviour and his Apostles are featured in "contemporary" dress as a Germanic warrior-king with his military following.

12. After the Exile, ca. 450 B.C. For the listings of the clan delegations and the organization of the *synoikismos*, separating those who "could not shew their father's house nor their seed," cf. *Ezra* 8; *Neh.* 7 and 11.

13. Bishop Rüdiger of Speier, who stated in 1084 that "putavi milies amplificare honorem loci nostri, si et Judeos colligerem." Cf. Karl Hegel, *Die Entstehung des deutschen Städtewesens* (Leipzig: Hirzel, 1898), 113.

14. *Kölner Schreinsurkunden des zwölften Jahrhunderts*, ed. Robert Hoeniger (Gesellschaft für rheinische Geschichtskunde, "Publikationen," I/1–2; Bonn: Weber, 1884–1892). A Cologne guild document of 1149 shows even the "town hall," the *domus civium*, as *inter Judeos sita*. Cf. Hegel, *Städtewesen*, *op. cit.*, 115.

15. On the *gerim*, cf. *AJ*, 32ff.

16. City councillors. The point Weber (again) wishes to make here seems to be that in Antiquity the traditional or artificial "tribal" subdivisions of the city were confraternities, but not the city as a whole, for the Attic prytans were delegations of the individual phylae (tribes). Under the Cleisthenian constitution each of the ten phylae sent 50 *prytaneis*, chosen by lot, to the Council of Five Hundred; each of these delegations served as the executive committee of the city for one tenth of the year, which periods were called "prytanies." On the working of this system see Ehrenberg, *The Greek State*, 31, 63ff.; A. H. M. Jones, *Athenian Democracy* (Oxford: Blackwell, 1964), ch. V.

17. J. Hatschek, *Englische Verfassungsgeschichte*, 113 ("*communa non est sine pax libertatis*"), 269 (first appearance as corporations). (W)

18. Lay judges; a Carolingian institution found as *schepen*, *échevins*, *scabini* throughout continental Europe. On their significance, see "Soc. of Law," above, ch. VIII:*iii*, n. 53.

19. On "personal law" and "personality principle," cf. "Soc. of Law," above, ch. VII:*ii*:5.

20. Konrad Beyerle, "Die Entstehung der Stadtgemeinde Köln," *Zeitschrift der Savigny-Stiftung für Rechtsgeschichte*, Germ. Abteilung, XXXI (1910), 1–57. (W)

21. On the *Ding* (or *thing*: the Germanic judicial assembly) and *Dinggemeinschaft*, cf. "Soc. of Law," above, ch. VIII:*iii*:6.

22. I.e., rather than the new organs probably created by the 1112 *coniuratio;* the latter do not become prominent in the documents until half a century to a century later. The *Schöffenbank* (board of lay judges) also served many administrative functions under the rule of the city lord (here: the archbishop) and together with the *magistri* of the parish communities constituted the old administrative structure. The *Altstadt* was the old Roman settlement, the only walled part of the city until 1106 when after the temporary expulsion of the archbishop several suburbs were included in a new town wall; the Saint-Martin suburb outside the old wall on the river flats was the market settlement. See Beyerle, "Die Entstehung der Stadtgemeinde Köln," *loc. cit.*, 67.

23. Complaint by Archbishop Konrad of Hochstaden, in his *Schiedsspruch* of 1258. Cf. Hegel, *Städtewesen, op. cit.*, 185; id., *Städte und Gilden der germanischen Völker im Mittelalter* (Leipzig: Duncker & Humblot, 1891), II, 335–40.

24. On the edicts of Emperor Frederick II of 1232, cf. below, n. 40.

25. For much of the following, cf. Carl Hegel, *Geschichte der Städteverfassung in Italien* (Leipzig: Weidmann, 1847), II, chs. 4–6, which Weber seems to have had at hand while writing this section.

26. On the status of *capitanei, valvassores* and *cives*, cf. Hegel, *Städteverfassung, op. cit.*, II, 144ff. and 161f.

27. *Compagna communis* was the name of the association in Genoa, probably from 1099 on. Cf. Hegel, *Städteverfassung, op. cit.*, II, 178ff.

28. The alliance of the bishop and the Genoese Visconti, descendants of the tenth-century *vicecomes* Ydo, in the *compagna* of 1099 and later years was directed against the imperial margrave. The office revenues appropriated by the viscountal families included gate, port, market and passport fees. Cf. Erik Bach, *La cité de Gênes au XII^e siècle* (Kopenhagen: Nordisk Forlag, 1955), 34, 37, 43.

29. On the development in the Low Countries, cf. Hegel, *Städtewesen, op. cit.*, 190ff. For details on the *Vroedschap* (i.e., wisdom—the *sapientes* of the Latin terminology) guild, which existed in various Dutch towns into the 15th century, see Hegel, *Städte und Gilden, op. cit.*, II, 267–72.

30. Beyerle, "Die Entstehung der Stadtgemeinde Köln," *loc. cit.*, 64–67. The hypotheses actually were first proposed by H. Keussen in "Die Entwicklung der älteren Kölner Verfassungsgeschichte und ihre topographische Grundlage," *Westdeutsche Zeitschrift*, XXVIII (1910), 503ff.

31. On English merchant "companies" and their role in local government, cf. Sylvia Thrupp, *The Merchant Class of Medieval London 1300–1500* (Ann Arbor: The University of Michigan Press, 1962), chs. I–II.

32. On the Paris *hanse des marchands de l'eau*, cf. Henri Pirenne, *Economic and Social History of Medieval Europe* (New York: Harcourt, Brace Harvest ed., n.d.), 94 and sources given *ibid.* in fn. 14; Hegel, *Städte und Gilden, op. cit.*, II, 86–110.

33. Cf. Hegel, *Städte und Gilden, op. cit.*, I, 20.

34. On the English Gild Merchant, cf. *Cambridge Economic History of Europe*, III, 190ff.

35. Allusion to a dispute that was bitterly fought among German historians of the turn of the century. For the latest position and a summary of the debate, cf. Edith Ennen, *Frühgeschichte der europäischen Stadt* (Bonn: Röhrscheid, 1953), 165–179 ("Gilde und coniuratio").

36. The Danish term for guild was *gelag:* drinking bout, feast. In the Latin documents this was rendered as *convivium;* a *summum convivium* or supreme

city guild is mentioned in the Schleswig *Stadtrecht* of ca. 1200. Cf. Hegel, *Städte und Gilden, op. cit.*, I, 6, 149, 163.

37. Following the standard German terminology, Weber differentiates between *Gilden* and *Zünfte*, the former associations in which mercan le interests were dominant, often single associations of the "whole town," and the latter groupings in which the producers were more important. The dividing line, however, is not hard and fast (see Weber's own caution below, in sec. *iii*:5). In medieval English the latter kind of union used to be called a "craft" or "mistery," but modern English usage applies the term "guild" to both groups. We render the German *Zunft* alternatively as craft guild or "craft," reserving the unadorned term for the German *Gilde*.

38. Cf. Hegel, *Städtewesen, op. cit.*, 120f.

39. Cf. Hatschek, *Englische Verfassungsgeschichte*, 267f.

40. In the foundation charter of 1120. Hegel, *Städtewesen, op. cit.*, 38ff., reprints part of the document.

41. *Statutum in favorem principum*, issued at the Diet of Ravenna, 1231–1232, at the behest of Bishop Heinrich of Worms and some other bishops and princes. Bishop Heinrich established his rights through a treaty with the city in the following year after having obtained an Imperial ban against his recalcitrant subjects. Cf. Hegel, *Städtewesen, op. cit.*, 177f.

42. Hegel, *Städtewesen, op. cit.*, 182. This prohibition (of 1218) does not seem to have been very effective, for a few years later the Basel council was still —or again—in existence. On the Strassburg developments, see *ibid.*, 178–180.

43. E.g., in the unsworn Cologne *Schöffen* of 1258 (cf. *supra*, at n. 23) and the *Richerzeche* members of the Cologne *coniuratio* of 1112 mentioned earlier.

44. Clovis (Chlodovech), Merovingian king, ruled 481–511. Weber undoubtedly has in mind the famous incident of the vessel of Soissons related by Gregory of Tours (*Historia Francorum*, ii:27). Clovis, wishing to return to the church from which it had been seized a certain sacred vessel, had to beg the assembled army to let him have it *extra partem*, i.e., beyond his share of the booty as determined by lot. The refusal of a single warrior thwarted the ing. The sequel of the story, however, indicates that even under these conditions the early feudal king was not without certain disciplinary powers: at the next regular "Marchfield" or inspection-of-arms, King Clovis, like any experienced master sergeant, found reason to criticize this man's weapons and lawfully bashed in his head.

iii

The Patrician City in the Middle Ages and in Antiquity

1. *The Nature of Patrician City Rule*

Since as a rule all landowners of the city participated in the *coniuratio* (and not only the leading *honoratiores*), the burgher assembly—in Italy called the *parlamentum*—was officially considered the highest and sovereign organ of the commune. This notion of popular sovereignty was often formally retained, even though in fact the notables were completely dominant, especially in the early period. The qualification for the offices and for participation in the council was soon also formally restricted to a limited number of patrician "families," and in many cases it was commonly understood from the very beginning, if only implicitly, that they alone were qualified for the council seats. Even where this was not the case, a limited ruling circle evolved quite naturally—as can be observed especially clearly in England—from the fact that only those who could afford it economically participated with regularity in the meetings of the burgher assembly and, what is more important, took the time to consult with each other on the management of affairs. For participation in urban administration everywhere was at first felt to be a burden, which was accepted only to the extent that an explicit obligation existed. In the early Middle Ages the burghers had to be present at the three regular meetings (*echte Dinge*), but those who did not have direct political interests stayed away from the non-compulsory "bid" meetings (*gebotene Dinge*). The *direction* of affairs quite naturally fell to men who were respected because of their wealth and, not to be forgotten, their military power, which in turn rested upon wealth.

Hence, as the later documents on the procedures of the Italian *parlamenta* show, these mass-meetings very rarely represented anything more than audiences which either passed the proposals of the notables by acclamation or rioted against them. In the early period, as far as is

known, they never determined the elections or influenced the measures of the city administration in any continuous and decisive manner. Often the majority was formed by people economically dependent upon the notables. It is thus logical that the later rise to power of the *popolo* was everywhere accompanied by the displacement of the tumultuous general burgher assemblies in favor of a smaller assembly consisting of delegates or of a narrowly circumscribed group of qualified burghers. And it is equally logical that the beginning of the tyrannies and the overthrow of the *popolo* should have been marked, [as in Florence in 1531], by the revival of the old popular "parliaments," against which even Girolamo Savonarola had [less than forty years] earlier been warning the people of Florence.

In fact, even though often not in formal law, the city arose as or soon became a status association led by a group—of varying size—of *honoratiores*. The peculiarities of this stratum have been discussed elsewhere. The *de facto* domination could either turn into a legally sanctioned monopolization of the city government, or it could be undermined or completely removed by a series of further revolutions. The notables monopolizing the urban administration are usually termed a "patriciate" (*"die Geschlechter"*—literally: "the families"), and the period of their predominance in administration we call "patrician domination" (*Geschlechterherrschaft*).

The patrician "families" were not altogether homogeneous. What they had in common was that their power position rested on landed property and an income not derived from their own production establishments. But beyond this they could show the most diverse characteristics. In the Middle Ages one particular trait of the external conduct of life had a special significance for the formation of status groups, namely: a knightly mode of life. From this derived the eligibility to participate in tournaments, the capacity to receive a fief, and all other attributes of status equality with the non-urban petty nobility in general. At least in Italy, but in the majority of cases also in the North, only the urban strata that had these characteristics were counted among the patriciate. If nothing to the contrary is specified, we shall in the following *a potiori* always think of this trait when the patrician "families" are under discussion—keeping in mind, of course, that there always exist fluid transitional stages.

In some extreme cases patrician domination led to the emergence of a specifically urban nobility. This happened in particular wherever the development was strongly influenced, as in Antiquity, by the overseas policy of a trading city. The classic example is Venice.

2. *The Monopolistically Closed Rule of the* Nobili *in Venice*[1]

The early development of Venice was shaped by the increasing localization of general administration and, in particular, of army recruitment which had begun already in Hadrian's reign [A.D. 117–138] and which was furthered by the ever more liturgical character of the late Roman and Byzantine state. The soldiers of the local garrisons were increasingly recruited from the local population, which in practice meant that they were furnished from among their dependent *coloni* by the local estate owners. The [military unit, the] *numerus*, was commanded by a *dux* and his subordinate officers, the *tribuni*. The tribunate, too, had formally become a liturgical burden, but at the same time it was in fact a privilege of the local *possessores*, the estate-owning families who supplied these officers. As everywhere else, this dignity had in practice become hereditary in certain families. The *dux*, however, continued to be appointed from Byzantium into the eighth century.

This military nobility of tribunitian families formed the core of the oldest urban patriciate. With the shrinking of the money economy and the increasing militarization of the Byzantine Empire, the power of the tribunitian nobility completely overshadowed the *curiae* and the *defensores*, [the civilian local authorities] of the Roman period.[2] The revolution which initiated the process of city formation in Venice was directed, as in all of Italy in A.D. 726, against the iconoclastic government of that period and its officials and brought about, as a permanent result, the election of the *dux* (doge) by the tribunitian nobility and the clergy. But soon afterwards began the struggle of the doge, who wanted to develop his position into a hereditary patrimonial city-kingship, against his adversaries, the nobility and the patriarch whose interests were violated by the prince's attempts to set up a patrimonially controlled church (*Eigenkirche*)—a conflict which was to last for three centuries. The doge was supported by the imperial courts of the East and the West [Byzantium and Germany]. Byzantium favored his appointment of his son as coregent, a device for establishing hereditability of the office which was quite in accord with the ancient tradition. The dowry of Waldrada, a niece of the German emperor, supplied the last Candiano[3] with the means once more to expand his foreign following and, above all, the personal bodyguard upon which the ducal regime had been based since 811.

The character of the doge's rule in that period as a patrimonial city-kingship stands out in sharp relief if the following details are con-

sidered: The doge was simultaneously a great manorial lord and a great merchant; he monopolized (partly for political reasons) the letter mails between the Orient and the Occident, which had to pass through Venice, and after A.D. 960, utilizing the occasion of church protests against it, also the trade in slaves;[4] he appointed and dismissed patriarchs, abbots, and priests, despite the protests of the church; he was head of the courts (*Gerichtsherr*), appointed the judges and cashiered disputed judgments, although in this respect he was somewhat restricted by the associational principles of the *Ding*-community which had penetrated into Venice under Frankish influence. The ducal administration was conducted through patrimonial officials and vassals and, especially in the Venetian foreign settlements, also by means of the church. The dynastic tendencies are seen not only in the nomination of a coregent, but in one case even in the disposal over the rulership by a testamentary declaration. The doge's own possessions were not differentiated from public property. He equipped the fleet out of his private means, maintained mercenary troops and disposed over the labor services that artisans owed the ducal palace and which at times he arbitrarily increased. One such increase, apparently caused by the growing requirements of his foreign policy, provided the final impulse for a successful revolt in 1032 and offered the hostile nobility the means for reducing the power of the doge. As is always the case under conditions of military self-equipment, the doge was far stronger than any individual patrician family, a match even for most coalitions, but he could not cope with an association of them all. It was such an association which prevailed, as it would nowadays, as soon as he approached the patriciate with *financial* demands.

The domination of the urban nobility living in Rialto[5] began in the wake of these events under rather democratic legal forms. The first act of the new regime, appropriately described [by Kretschmayr] as the "first constitutional law of the Republic,"[6] was to forbid the appointment of a coregent, a measure directed against establishment of a hereditary succession on the Roman pattern. After a quasi-feudal interim period during which rights and burdens were divided between the doge and the *comune* as elsewhere between the territorial prince and the feudal estates, the election concessions [of each new doge] took care of the rest; they formally demoted the doge to the status of a strictly controlled salaried official hemmed in by obstructive court ceremonials, and socially reduced him to a *primus inter pares* in the corporation of noblemen.

It has been quite correctly observed by Lenel that, just as the power position of the doge had formerly been strengthened by his relationship with foreign powers, its reduction now also began in the foreign policy field, which the council of *sapientes* (first documented in 1141) brought

under its own control.[7] It should be stressed more strongly, however, than has been done that here, just as elsewhere, it was primarily the *financial* pressure of a bellicose colonial and trading policy which had made the sharing of public administration with the patriciate unavoidable; in a similar way the financial needs of princely wars under conditions of a money economy were later to initiate the rise of the Estates on the Continent. The Chrysobullon of Emperor Alexios marked the end of the commercial reign of the Greeks and established the trade monopoly of the Venetians in the East in exchange for maritime protection and frequent financial aid to the Byzantine Empire.[8] An increasing part of the public, ecclesiastic, and private wealth of the Venetians came to be invested in the eastern Empire in trade, in *ergasteria* of all kinds, in the farming of government revenues, and also in landed property. The military power developed for the protection of these investments led to the participation of Venice in the war of conquest of the Latin knights by which she acquired the famous three-eighths share (*quarta pars et dimidia*) in the Latin Empire.[9] After the codifications of Dandolo,[10] all colonial conquests were carefully treated as legally belonging to the commune and its officials, not to the doge; his impotence was thereby made final. A public debt and continuous money expenditures of the *comune* were the obvious concomitants of this foreign policy. Such financial requirements, in turn, could be met only out of the means of the patriciate—i.e., that sector of the old tribunitian aristocracy, doubtlessly reinforced by some new nobles, which, because of its urban residence, was in a position to participate in the urban opportunities for accumulating wealth through investing its capital in trade under *commenda* and other types of contracts and in other profit-producing lines of business. It was in the hands of this group that both monetary wealth and political power came to be concentrated.

The dispossession of the doge was therefore paralleled by a concentration of all political power in the patrician-ruled city of Venice, whereas the rural territories of the duchy increasingly lost all political rights. Up into the twelfth century the (originally tribunitian) *honoratiores* of the countryside were at least nominally represented at the *placita* of the doge.[11] But with the formation of the *comune Venetiarum*, first documented in 1143, this ceases to be true. After this date, the "Council of *Sapientes*" appears, which was elected by the *civitas* and to which the doge swore his oath on the constitution. This council seems to have been restricted exclusively to the great landlords residing in Rialto, men who had their primary economic interests in the overseas utilization of capital.[12]

The differentiation between a "large" (legislative) and a "small" (administrative) council of notables, which existed in almost all patrician cities, can be first documented for Venice in 1187. The *de facto* disenfranchisement of the assembly of all landowners, whose acclamation formally continued to be secured until the end of the fourteenth century; the nomination of the doge by a small electoral college of *nobili;* the *de facto* limitation of the selection of officials to families considered eligible for council seats, and also the final formal closure of their list (the *Serrata del Gran Consiglio,* carried out 1297–1315; the list was the precursor of the later Golden Book)—all these represent only a continuation of the above developments, the details of which are here of no interest to us.

The tremendous economic superiority of the patrician families participating in the overseas political and economic opportunities facilitated the monopolization of power in their hands. The constitutional and administrative techniques of Venice are famous because of the development of a patrimonial tyranny of an urban patriciate, extending over a large land and sea area, with the simultaneous preservation of very strict mutual control of the noble families over each other. The discipline of the nobility was never shaken because, like the Spartiates, they managed to keep all means of power very tightly under their grip and maintained a more rigidly observed system of secrecy of office than can be found anywhere else. That this was possible can in the first instance be explained by the solidarity, patently obvious to every individual, of the foreign and domestic interests of all members sharing in the huge monopoly profits of the association. This solidarity of interests compelled the integration of the individual nobleman into the collective which exercised the tyranny. In terms of administrative techniques it was accomplished: 1. By means of competitive separation of powers; the office authorities of the central agencies overlapped, and the different boards of the specialized administrations were almost always furnished with both judiciary and administrative power and competed with each other for jurisdiction. 2. By means of mutually controlling division of functions between the officials administering the subject territories; the judiciary, the military, and the financial administration were always in the hands of different officials, who were all taken from the nobility. 3. By means of short tenures of office and a system of travelling control officials. 4. Since the fourteenth century, also by means of a political court of inquisition, the "Council of the Ten"; originally formed [in 1310] to investigate a single case of sedition, it turned into a permanent agency with jurisdiction over political offences which ultimately supervised the

entire political and personal conduct of the *nobili*, not infrequently annulled even decisions of the "Great Council," and altogether acquired a kind of tribunitian power, the exercise of which in a swift and secret procedure secured it paramount authority in the commune. It was feared only by the nobility, and was by far the most popular agency with the subjects, who, being excluded from political power, found in it the only effective means for bringing a successful complaint against a noble official. In this respect it was far more effective than the Roman *quaestio repetundarum*.[13]

The Venetian empire, expanding over ever larger mainland territories and increasingly based on the support of mercenary armies, presents an especially pure and extreme case of the development of a patrician city. But from the very beginning, a phenomenon of a very different kind accompanied this concentration of power over large territories in the hands of an urban commune and, within it, in those of a patriciate. The mounting expenses of the commune, which had made it dependent upon the financing patriciate, were caused not only by the costs of troops, naval construction and war materials, but also by a far-reaching change in the system of administration. For the patriciate had found assistance of a peculiarly Occidental sort, in its struggle with the doge, in the growing strength of the church bureaucracy. It was no accident that the weakening of the ducal power had occurred simultaneously with the separation of state and church in the wake of the Investiture Struggle; in fact, the Italian cities in general had turned to their advantage the breaking of this bond, which had its origin in the princely rights to establish and control their own churches (*Eigenkirchenrecht*) and had hitherto constituted one of the strongest supports of patrimonial and feudal power. Up into the twelfth century, churches and monasteries had substituted for and made superfluous a secular power apparatus by leasing the administration of the Venetian foreign colonies. But their elimination from the secular administration, an inevitable consequence of their separation from the political authority, necessitated the creation—at first in the foreign colonies—of a salaried lay officialdom.[14] This development, too, reached a conclusion for the time being in Enrico Dandolo's days. The system of short tenures of office, which was based on political considerations, but also on the desire to give as many persons as possible a turn in such positions; the limitation of eligibility for office to the noble families; the non-bureaucratic, strictly collegiate administration of the ruling capital city itself —all these presented barriers to the development of a really professional officialdom, barriers which were inherent in the character of the regime as a rule by notables.

3. *Patrician Rule in Other Italian Communes: The Absence of Closure and the Institution of the* Podestà

In the other Italian communes developments took a considerably different course in this respect, even during the rule of the patriciate. In Venice the permanent closure of the guild of the urban nobility against all outsiders had been successful: The acceptance of new families into the circle of those elegible for a seat on the "Great Council" occurred only on the basis of political deserts and by decision of the corporation of the nobility; later it ceased entirely. The Venetian nobility had also managed to suppress all feuds between its members, a success facilitated by the awareness of the permanently endangered position of the collective. None of this can be said of the other Italian communes of the period of patrician rule. The orientation to the maintenance of overseas trade monopolies was nowhere else so unequivocal and in the awareness of each individual so self-evidently crucial as the basis for the entire existence of the nobility as it was in Venice during the decisive period. And one consequence of the feuds raging in all other cities between the ranks of the urban patriciate was that even in the period of its untrammelled rule the nobility found itself compelled to grant a certain amount of consideration to the non-noble strata of *honoratiores*. Finally, the feuds and the deep mutual mistrust of the great patrician families precluded the creation of a rational administrative system on the Venetian pattern. Almost everywhere, a few great families, especially richly endowed with land and large followings of clients and allied with numerous families of lesser wealth, confronted each other for centuries, always attempting to exclude each other (and each other's allies) from the offices and the economic opportunities of the urban administration and, if possible, to drive each other from the city altogether. As in Mecca, at almost any given time one part of the nobility was decreed ineligible for municipal office, perhaps exiled and frequently even—in contrast to the mutual "courtliness" observed in Arabia—outlawed, in which case the victorious party would sequester the properties of the vanquished; a reversal of political fortunes simply brought an exchange of roles.

A natural result of this situation was the formation of interlocal interest groups. The creation of the Guelf and Ghibelline parties, however, was conditioned also by the politics of the Empire and by social factors: the Ghibellines, in the large majority of cases, were families that had been vassals of the Imperial crown, or they were led by such

families.[14a] But for the remaining and more enduring part, these formations had their origin in the clash of interests between competing cities and, within the cities, in the competing interests of interlocally organized aristocratic groupings. These associations, particularly that of the Guelf party, were permanent organizations with statutes and registers of war contributions which determined—in a form similar to that of the German *Römerzug* roll[15]—what manpower contingents the knighthood of individual cities had to supply in the event of a levy.

Even though the services of the trained knighthood were decisive in all military respects, already in the days of patrician rule the non-knightly burgher could not be dispensed with for the *financing* of warfare. The interests of this class in a rational administration of justice, on the one hand, and the mutual jealousy of the parties of the nobility on the other, caused the development in Italy and some bordering areas of the peculiar institution of an aristocratic professional officialdom which exercised its functions, so to speak, in travelling the rounds: the institution of the *podestà*. This official replaced the early administration by *consules* drawn from the local aristocracy, executives who formally were elected, although in fact the nomination was restricted to and contested by only a few families.

The institution of the *podestà* originated in the period of the intense struggles between the communes and the Hohenstaufen emperors, a time which had especially increased the need for internal unity and the burdens on the financial capacity of the cities. Its high point was reached in the first half of the thirteenth century. The *podestà* was an elected official, in most cases called in from another community, appointed for a short term of office, equipped with the highest judicial power, and normally paid a fixed salary [rather than in fees] which made his compensation relatively high compared to that of the *consules*. He was usually a nobleman, but by preference one with a university education in the law. He was elected either by the council or, as was typical also for most other elections in Italy, by a committee of notables appointed specifically for that purpose. The appointment frequently was the subject of negotiations with the candidate's native commune, which had to give its approval and which occasionally was requested to nominate a candidate. The granting of such a request was considered a politically friendly act, the denial one of hostile foreign policy. At times we find a direct swap of *podestà* between two communes. The appointees themselves not infrequently insisted that hostages be supplied as insurance for good treatment; they haggled for conditions like modern professors and refused the call if the offer was not attractive enough. The *podestà* had to bring along a knightly following, and especially his

auxiliary personnel—not only the subalterns, but also the jurists, court assistants, and deputies, often his entire staff, whom he paid from his own funds. His essential task was the maintenance of public safety and order, and above all of internal peace in the city—it was for this that an outside official was needed; in addition he often held the military command, and he always had control over the courts. All these duties were performed under the supervision of the council. His influence on legislation was everywhere rather limited. Not only was the person of the *podestà* frequently changed as a matter of principle, but also, and intentionally, the locality from which he was called. On the other hand, the communes sending out such officials seem to have placed some value on seeing their citizens officiate in as many positions abroad as possible. Hanauer is certainly right in assuming that this had economic as well as political motives:[16] The high salaries paid abroad constituted a valuable prebendal revenue source for the local nobility.

The most important aspects of the institution are found in the very formation of a noble professional officialdom, and in the effect of the *podestà* system on the development of the law. We begin with the former. In an investigation of only sixteen out of sixty cities, Hanauer documented, for the fourth decade of the thirteenth century, seventy persons who had occupied two, and twenty who had held half a dozen or more different *podestà* positions.[17] Often a man made a life-long career in such offices. For the century during which the institution flourished, Hanauer reckons with 5,400 *podestà* terms of office to be filled in the roughly sixty [larger] communes [of Imperial northern Italy].[18] Some individual noble families provided candidates through several generations. In addition, a very large number of auxiliary officials with legal training was required. Beyond the fact that a part of the nobility was being schooled in the conduct of an impartial administration which, in the nature of the case, was especially strictly supervised by the public opinion of the employing communities, a second important aspect has to be weighed. In order that the administration of justice by a foreign-born *podestà* might be possible at all, the applicable law had to be codified, rationally elaborated, and interlocally somewhat standardized. Whereas elsewhere it was the interest of princes and their officials in facilitating the transfer of the latter from one place to another that led to rational codification of the law, and especially to the propagation of Roman law, in Italy it was the institution of the *podestà*.

In its most typical form, this institution was a phenomenon limited essentially to the Mediterranean area. But some parallels can be found also in the North—in Regensburg, for instance, where in 1334 natives were excluded from the office of the *Bürgermeister* and a knight from

out of town was called in, who was then succeeded by "foreign" mayors for an entire century. This produced a period of relative internal peace in a city that had previously been wracked by feuds between the patrician families and wars with exiled noblemen.[19]

4. *English City Oligarchies and Their Constraint by the Royal Administration*

In Venice the formation of an urban nobility grew without break out of a very pronounced regiment of *honoratiores*, and in the remaining Italian communes patrician rule characterized the beginning of city development. In the North, by contrast, the formation of a closed patriciate proceeded on a different basis and, in part, from quite opposite motivations. The development of the English city oligarchy presents an extreme but "typical" case.

The decisive element in shaping English urban development was the power of the crown, even though it did not confront the city from as firm a position during the early period—not even during the period after the Norman conquest—as it could command later. William the Conqueror did not attempt to take London by force after the battle of Hastings; aware of the fact that possession of this city had always been crucial for aspirants to the English throne, he obtained the homage of the burghers by treaty. For even though, under the Anglo-Saxons, the bishop and the portreeve appointed by the king had been the "legitimate" authorities of the city—to whom consequently also the charter of the Conqueror was addressed—the votes of the London patriciate had carried a decisive weight in nearly every election of the Anglo-Saxon kings. The burghers even held that without their voluntary consent the English royal prerogatives did not include rule over their city, and as late as in King Stephen's time,[20] their agreement was indeed decisive. Nevertheless, once he had received the oath of homage, the Conqueror built his Tower in London, and thereafter the city, like any other, was in principle subject to taxation at the king's discretion.

During the Norman period, the military importance of the cities diminished as a result of the unification of the kingdom, the decline of threats from the outside, and the rise of the great feudal barons. The feudal lords now constructed their fortified castles outside the cities, thus setting into motion the separation of the burghers from the feudal military power which, as we shall see later, was characteristic for the non-Italian Occident. In contrast to the Italian towns, the English cities

at that time almost completely lost the dominance over the countryside which they formerly seem to have possessed in the form of extensive city "marches"; they became corporate bodies essentially oriented to economic pursuits. The barons, for their part, began here—as everywhere—to found cities of their own to which they granted privileges of very varying extent. But nowhere in England do we hear of violent uprisings of the citizenry against the king or other city lords, nor of usurpations by means of which a royal or seigneurial castle might have been broken or, as in Italy, the lord might have been forced to transfer it out of the city. Nor do we hear of a burgher militia created to fight the city lord, to obtain by violent means the right to an autonomous jurisdiction with elected officials instead of the judges appointed by the king, and to defend the application of a special urban law. To be sure, royal grants created in England, too, special urban courts which had the privilege to grant the burghers a rational trial procedure without duels and which had enough autonomy to be able to reject certain innovations of the royal trial procedure, in particular the trial by jury. But the creation of the law itself remained firmly in the hands of the king and the royal courts. The king granted the special courts to the cities in order to retain them on his side against the feudal nobility, so that to this extent they, too, profited from the typical conflicts of the feudal period.

Much more important than these court privileges, however, was the autonomy in fiscal administration which the cities managed to obtain over time. This fact in itself confirms the superior position of the crown. From the point of view of the kings up to the time of the Tudors, the city was primarily an object of taxation. The privileges of the burghers, the *gratia emendi et vendendi* [the rights to buy and sell] and the trade monopolies, had their counterpart in tax burdens also specific to urban citizens. Tax collection, however, was farmed out, and the most important applicants for these tax farms, next to the rich burghers, were the wealthier royal officials. The burghers increasingly succeeded in excluding their competitors and in obtaining from the king, for a lump sum, the right to collect their own taxes (the *firma burgi*);[21] by means of special payments and gifts they also secured additional privileges, the most important being the right to elect the sheriff.

Despite the presence of groups with pronounced seigneurial interests in the urban citizenry, purely economic and financial interests were ultimately decisive for the constitution of the English city. The *coniuratio* of the Continent is to be found in English cities, too, but here it typically took the form of a [single] monopolistic city guild. This is not true everywhere—in London, for instance, it did not arise. But in numerous other cities the guild, as the guarantor of the urban fiscal

obligations, became the decisive union of the city. Like the *Richerzeche* in Cologne, it often bestowed the citizenship rights. In manorial cities it was usually the city guild which secured an autonomous court, but its jurisdiction was exercised over the townsmen as guild members rather than as burghers. Nearly everywhere the city guild was in fact, although not in law, the governing association of the city. For in law it was still true that burghers were all those who shared the "bourgeois" burdens owing to the king (guard and military duties, court service, tax payments) with the other townsmen. Hence not only residents were burghers, but as a rule also all the neighboring landowners, the "gentry." In particular, the London commune included in the twelfth century among its members nearly all the great noble bishops and officials of the country, because they all owned town houses in the city, the seat of the king and of the administrative agencies—a phenomenon which has its parallels in republican Rome, but is much more interesting because of the characteristic deviations from the Roman conditions. Any individual who was unable to share in the burden of the collective tax guarantee and paid the royal taxes only from assessment to assessment—thus primarly anyone not wealthy—was *eo ipso* excluded from the stratum of active burghers.

All privileges of the city rested on royal and seigneurial grants which, however, were interpreted rather freely. Of course this was true in Italy too. In one respect, however, city development in England took an entirely different course from that of Italy: The cities became, within the system of Estates, privileged corporations whose organs possessed definite individual rights derived from the acquisition of special legal titles; they held these in the same way as individual barons or trading corporations held their specific rights obtained by individual grant. This development came once the concept of the *corporation* was finally admitted into English law. The transition was fluid from the privileged "company"[22] to a city guild and from there to the incorporated city. The special legal status of the English burghers thus was composed of a bundle of privileges obtained within the partly feudal, partly patrimonial overall association of the kingdom; it did not derive from membership in an autonomous association which had organized its own system of political domination.

Let us recapitulate the development in its rough outlines. Initially the English cities were compulsory associations burdened by the king with liturgical obligations—only with different ones than the villages. Later on, in the period of massive new city foundations equipped by the king or manorial lords with economic or legal privileges, a basic equality of rights for all burghers with urban landholdings and a certain

limited autonomy of the cities was established. The initially private guilds came to be accepted as the guarantors of the cities' fiscal obligations and were acknowledged in royal charters. Ultimately the towns would be endowed with the rights of a corporation.

London developed into a "commune" in the Continental sense. Henry I [1100–1135] had granted the residents the right to elect the sheriff, and from the end of the twelfth century we find the commune as an association of the burghers, recognized by King John [Lackland, 1199–1216], with a mayor who, like the sheriff, was elected, and with aldermen[23] who, from the late thirteenth century, joined together with an equal number of elected councillors to form a city council. The farming by the commune of the Middlesex sheriff's office initiated its domination over the surrounding districts. By the fourteenth century the mayor of London bore the title "lord."

The majority of the remaining cities, however, remained—or better, became after temporary but abortive attempts to form political communes—simple compulsory associations with certain special privileges and firmly regulated rights of corporate autonomy. The development of the "craft" constitution (*Zunftverfassung*) will have to be discussed later,[24] but it may be pointed out already here that it did not alter the basic character of the cities. It was the king who mediated the dispute over predominance between the "crafts" and the *honoratiores*. The cities continued to be under obligation to grant the crown's tax demands until the strengthening of the Estates permitted the creation, in Parliament, of a *collective* protection against discretionary taxation which no individual city, nor even all the cities together in joint action, had been able to obtain by virtue of independent power. The rights of active citizenship, however, remained hereditary rights of corporation members which it was possible to acquire through purchase of membership in certain associations. The difference between the English and the Continental development, although to some extent only a difference of degree, is nevertheless of basic significance: because of the particular form which the English law of corporations assumed, the notion of the commune as a territorial institution did never arise in England.

The reason for this contrast is to be sought in the power of the royal administration, always unbroken and extended even further after the accession of the Tudors, which constituted the basis for the political unity of the country and for the unity of its law. It is true that the royal administration was always strictly supervised by the Estates, and that it had to rely on the collaboration of the *honoratiores*. But this very fact had the consequence that the economic and political interests [of the notables] were oriented not to the individual closed urban com-

mune, but rather to the central administration whence they expected economic opportunities and social advantages, guaranteed monopolies and aid against violators of their own privileges. The crown, which was financially and administratively utterly dependent upon the privileged strata, feared these groups. But the political strategy of the English kings was essentially one of rule through the central parliament. In the main they tried to influence the urban constitutions and the composition of the city councils only in the interest of their parliamentary election politics; hence they supported the oligarchy of notables. The urban notables, for their part, could find a guarantee for their monopoly position vis-à-vis the non-privileged strata in the central administration, and only there.

In the absence of a bureaucratic apparatus of their own, and in fact precisely because of the centralization of administration, the kings were dependent on the cooperation of the notables. The power of the burghers in England was based not on their own military might, but mainly on the "negative" foundation that the feudal administration, in spite of its relatively advanced technical development, was unable to maintain a truly permanent domination over the country without the constant support of the economically powerful *honoratiores*. For the military power of the large majority of English cities was comparatively unimportant in the Middle Ages. The financial power of the townsmen, however, was considerable. But it was exerted collectively—within the status union of the commoners represented in Parliament—as the power of an *estate* of privileged urban interests. It was around this grouping that all interests transcending the utilization of purely local monopolies revolved. Here we thus find for the first time an interlocal, *national* bourgeoisie. The increasing power of the burghers in Parliament and within the royal administration, which was conducted through the justices of the peace—their power, that is, in the national polity of notables—prevented the development of a strong movement for political independence in the *individual* communes. Not the local interests of municipalities as such, but the interlocal interests of the townsmen, formed the basis for the political unification of the bourgeoisie. The same development also favoured the bourgeois and mercantile character of the English city oligarchy. The development of the English cities thus was similar to that in Germany until about the thirteenth century. But thereafter it increasingly turned into a domination of the "gentry," which was never again broken; this contrasts with the at least relative democracy developing in Continental cities. The offices, above all that of the alderman, which originally had been based on annual elections, came increasingly to be occupied for life and frequently came to be

filled either by cooptation or as patronage of neighboring manorial lords. For reasons already indicated the royal administration supported this development, just as the ancient Roman administration had supported the oligarchy of the landed nobility in the dependent cities.

5. *Rule of the Council-Patriciate and of the Crafts in Northern Europe*

The conditions of development in the Continental cities of northern Europe differed from those of either England or Italy. In some cases the rise of the patriciate in this area was based on status and economic differences already present at the time of creation of the burgher association. This was true even for newly founded cities: The 24 *coniuratores fori* in Freiburg, from the very beginning, were privileged in tax matters and appointed as *consules* of the new city. However, in the majority of newly founded cities—and even in many Northern maritime cities which by their very nature tended toward a merchant plutocracy—the formal closure of the group of families qualified for a seat on the council came about only gradually. Typically the frequently existing formal right of the officiating council to propose its successors, or the mere habit of following its advice, or perhaps simply the social weight of the circles in question together with the objective need to keep experienced men in the council, ultimately led to the *de facto* practice of replenishing the council through cooptation, and thus of surrendering the executive boards of the city to a closed circle of privileged families. It will be remembered how easily a similar development can occur even under modern conditions: in Hamburg, for instance, the complementation of the Senate has recently sometimes tended in the same direction, in spite of the right of the House of Burgesses to elect the senators. We cannot pursue the details here; at any rate, such tendencies have asserted themselves everywhere, the only variation consisting in the extent to which they have found formal legal expression.

The patrician families monopolizing the council seats could everywhere maintain this closure easily only as long as no strong contrast of interests arose between them and the excluded part of the citizenry. But once such conflicts emerged, or once the self-esteem of the outs, based on growing wealth and education, and their economic indispensability for administrative work had risen to a point where they could no longer tolerate the idea of being excluded from power, the makings of new revolutions were at hand. Their agents were once again sworn

burgher unions, but behind these new unions stood—at time directly identical with them—the craft guilds (*Zünfte*). In connection with this period one has to be careful not to identify the term *Zunft* primarily or even exclusively with the artisan guilds of the handicraft workers. The movement against the patrician families was in its first period by no means a movement primarily of the artisans. Only in the further course of events, which we shall have to discuss later [sec. *iv* below], did the artisans assume an autonomous role. In the first period they were almost always led by the non-artisan "crafts." The variable success of the "craft" revolutions could in extreme cases lead, as we shall see, to a composition of the council exclusively of representatives of the craft guilds and to the tying of full citizenship to membership in one of the "crafts."

Only this rise of the "crafts" signified the real seizure of power, or at least general participation in the rule, of the "bourgeois" classes in the economic sense of the term. Wherever "craft"-rule (*Zunftherrschaft*) was installed at all effectively, this coincided with the peak of the city's external power and its greatest internal political independence.

The similarity of these "democratic" developments with the fate of the ancient city is very striking. Most cities of Antiquity experienced a similar early period of growth as "cities of the nobility," beginning roughly with the seventh century B.C., and a later rapid spurt to political and economic power which was accompanied by the development of Democracy or at least a trend in this direction. These similarities exist even though the ancient polis arose from a very different historical background. We shall first have to compare the ancient *patrician* city with the medieval one.

6. *Family-Charismatic Kingdoms in Antiquity*

The Mycenaean culture of the Greek mainland, at least in Tiryns and Mycenae itself, must have been based on a patrimonial kingship of Oriental character, though of far smaller dimensions, supported by forced labor.[85] Its buildings, unequalled before the classical period, are inconceivable without forced labor of the subjects. On the frontiers of the Hellenic cultural area of that day towards the Orient, on Cyprus, there even seems to have existed a state which—quite in the Egyptian manner—employed a script for purposes of billing and list-keeping: a bureaucratic patrimonial storehouse administration. By contrast, even in Athens of the classical period administration was still conducted almost completely verbally and without the use of writing. This script,

and in fact the entire culture, later disappeared without leaving a trace.

The "catalogue of ships" of the *Iliad* lists hereditary kings who rule over large territories, each of which contains several and in some cases numerous localities which later were known as cities, but which then probably were mere castles;[26] a great ruler like Agamemnon was prepared to give several of these in fief to Achilles. In Troy we find the old men from noble houses, exempt from military service because of their age, acting as advisors to the king. Hector is considered the Trojan war-king, while Priam himself has to be fetched for the conclusion of treaties. Only one written document is mentioned, and this may actually have been in symbols [rather than in regular script].[27] But all other relationships described in the epics rule out the existence of a regular administration based on forced labor and a patrimonial kingship. Homeric kingship rests on family charisma. However, the epic can ascribe also to Aeneas, a foreigner to the city, the hope of obtaining King Priam's office if he were to kill Achilles, for kingship is conceived as an office-like "dignity" rather than as a possession. The king is leader of the army and participates with the nobles in the court sessions; he represents the group before the gods and to outsiders, and is furnished with a special royal domain. But his power, especially in the *Odyssey*, is essentially that of a chieftain, based on personal influence rather than on regulated authority. The military (normally maritime) expeditions, too, have for the noble families more of the character of the knightly *aventiure* of a leader with his companions than that of a military levy: the companions of Odysseus are called *hetairoi*, just like the later followership of the Macedonian kings. The long-term absence of the king is not considered a source of serious trouble. While Odysseus is away, there is no king at all in Ithaca; he entrusts his house to Mentor, who has no share in the royal "dignity." The army is an army of knights; individual combat decides the battle, and the ordinary foot soldier plays a very minor role.

In some parts of the Homeric poems an urban *political* "market" [the *agora*] is mentioned. If Ismaros is called a *polis*, this could mean "castle," but in any case it is not the castle of an individual, but that of the Ciconians.[28] In the description of the scenes on the shield of Achilles, the elders of the wealthy and militarily powerful sibs are shown sitting in the market [*agora*] holding court; the people, as in the Germanic folkthing, stand in a circle and accompany the speeches of the parties with applause.[29] Telemachos' complaint is discussed in the market by the military notables under the direction of the herald.

The nobles, including the kings, are landed lords and ship owners who move into battle on chariots. But only those resident in the city

have a share in the power. The fact that King Laertes lives on his country estate signifies that he is in retirement. The sons of the noble sibs, as among the Germanic tribes, join as followers (*hetairoi*) in the *aventiure* of a hero—in the *Odyssey*, that of the king's son. Among the Phaeacians the nobility asserts the right to collect from the people part of the cost of hospitality gifts.[30] It is nowhere stated in the Homeric epics that all rural inhabitants are regarded as dependent peasants or servants of the urban nobility, but free peasants are not mentioned either. The treatment of the figure of Thersites, at any rate, indicates that even the common conscript, who does not go into battle in a chariot, occasionally dares to speak up against the lords—but then this is also taken as rank insolence.[31] Yet, even the king performs domestic chores, constructs his own bed, and ditches his garden. His war companions row their boat themselves. The purchased slaves, on the other hand, may hope to obtain a *kleros* [land lot] of their own;[32] the difference between the purchased slave and the "client" endowed with a lot of land, which was to be so pronounced later on in Rome, does not yet exist. Relations are patriarchal; the household economy satisfies all normal uses. The Greeks used their own ships for piracy; their participation in trade was merely passive, while the active side was still conducted by the Phoenicians.

In addition to the "market" and the town-living habits of the nobility, two other phenomena are of great importance. One is the institution of the *agon* [contest], which later was to dominate the entire conduct of life. It arose naturally from the knightly concept of honor and the military training of the youths on the exercise grounds. In organized form it appears above all in the funeral cult of war heroes (Patroklos).[33] Even in the Homeric period it already dominates the style of life of the nobility. The other important phenomenon is the completely unrestrained relationship—in spite of a certain fearful respect (*deisidaimonia*)—to the gods, whose treatment in the epics was later to be so painful to Plato [e.g., *Republic*, bk. II, 376E–385B]. This lack of religious respect of the heroic society could arise only in the wake of migrations, especially of overseas migrations, and thus in areas in which the people did not have to live with old temples and close to the ancestral graves.

While the noble cavalry of the historic patrician polis is absent from the Homeric poems, it is striking that the hoplite battle order, which arose only much later with the disciplined organization of foot soldiers in rank and file, does indeed seem to be mentioned: evidence that widely different periods left their traces in the epics.

The historical period prior to the development of the *tyrannis* knows

family-charismatic kingship, apart from Sparta and a few other examples (Cyrene), only in institutional survivals or from traditions such as we have for many cities of Hellas, Etruria, Latium, and for Rome. It was always a kingship over an individual polis, family-charismatic, equipped with religious authority, but normally (excepting Sparta and the Roman tradition) furnished only with some honorific privileges over the nobility who, in fact, were sometimes also described as "kings." The example of Cyrene shows that there, too, the king owed the source of his power, his treasure, to the middle-man trade, whether he traded himself for his own account or exacted fees for the controls he imposed and the protection he granted.[34] It was probably the rise of knightly warfare, with the attendant military independence of noble families who maintained their own chariots and followings and who themselves owned ships, that shattered the monopoly of the kings. This would be especially true for the period after the collapse of the great Oriental empires, the Egyptian as well as the Hittite [about 1200 B.C.], with which the Mycenaean kingdoms had been in contact, while other great monarchies such as the Lydian had as yet not developed; that is, after the breakdown of the trade monopolies and the forced-labor state of the Oriental kings which the Mycenaean culture reflected *en miniature*. It was probably also this collapse of the economic foundations of royal power which made possible the so-called Doric migrations [ca. 1100–900 B.C.]. This time saw the beginning of the migrations of the seafaring knighthood to the coasts of Asia Minor, where Homer does not yet report any Hellenic settlements and where at the time no strong political associations existed. The entry of the Hellenes into active participation in trade began at the same time.

7. *The Ancient Patrician City as a Coastal Settlement of Warriors*

At the beginning of known history we find the typical patrician city of Antiquity.[35] It was always a coastal city. Up to the time of Alexander and the Samnite wars in Italy [late fourth century B.C.] no polis was further removed from the sea than a day's journey. Outside the area of the polis we find only villages (κῶμαι) with unstable political associations of "tribes" (ἔθνη). A polis which was dissolved on its own initiative or by the enemy would be "dioikized" into villages. A real or fictitious act of *synoikismos*, on the other hand, was considered the origin of the city: the "settling together" of the sibs into or around a fortified castle on command of the king or by free agreement. Such

acts were also in the Middle Ages not entirely unknown: thus we have the *synoikismos* of Aquila described by Gothein, and one at the foundation of Alessandria.[96] But the fundamental nature of such acts was much more clearly defined in Antiquity than in the Middle Ages. The actual permanent living together was *not* a fundamental aspect: like the medieval noble families, those of Antiquity in part continued to reside in their country castles (as for example in Elis), or they at least owned country houses in addition to their urban seats. Decelea, for instance, was the castle of a noble clan, and many Attic villages as well as some of the Roman *tribus* were named after such castles. The territory of Teos was divided into "towers."[97] For all that, the center of gravity of the nobility's power lay in the city. The political and economic masters of the countryside, the manor lords, financiers of trade and creditors of the peasantry, all were *astoi*—i.e., "town-dwelling" noble families,[98] and the actual transplantation of the rural nobility into the cities continued apace. By the classical period the rural castles had been broken. The burial grounds (*nekropoleis*) of the noble clans had always been in the cities.

The truly fundamental element in the formation of a polis, however, was always thought to be the fraternization of the sibs into a *cult* community: the replacement of the *prytaneia* of individual families by a common *prytaneion* of the city in which the prytans took their communal meals. In Antiquity this formation of a "fraternity" did not only mean, as in the Middle Ages, that the *coniuratio* of the burghers, in becoming a *comune*, also adopts a saint for the city. The confraternity of Antiquity signified much more: the very foundation of a new local commensal and cultic community, for there was no common church, as in the Middle Ages, of which everyone was already a member before the formation of the city fraternity. To be sure, Antiquity had always known interlocal cults in addition to those of local deities. But the form of religious activity most central for everyday life was the cult of the individual clan, which in the Middle Ages did not exist, and this was always firmly closed to outsiders and thus an impediment to fraternization. Such family cults were almost as severely restricted to the members as were the cults of India, and only the absence of magical taboo-barriers made the confraternization possible. Even then the principle remained that the spirits revered by the clan would accept sacrifices only from clan members; the same held for all other associations.

Among the associations which entered into a fraternal relationship in the cultic city-association we find, significant already at a very early stage and surviving into very late periods, the phylae and phratries in which everyone had to be a member to be considered a citizen. About

the phratries we can with certitude say that they reach back into a time antedating the polis. Later they were primarily cult associations, but also exercised some other functions; in Athens, for example, they passed judgment on the military capability of the young and the related capacity for inheritance. Hence they must originally have been military associations, corresponding to the "men's house" which we have already discussed [ch. IX:2 and elsewhere]; the very term was preserved in the Doric warrior states (*andreion*) and also in Rome (*curia* derives from *coviria*) as the designation for the subdivisions of the military association which had confraternized to form the polis. The meal communities (*syssitia*) of the Spartan full citizens, the severance of men in the military age group from their families for the length of their full service liability, and the communal training of the boys in military asceticism —all these were elements of the general type of education associated with the primeval warrior associations of the tribal youths. But outside some Doric associations, this radical militaristic semi-communism of the warrior associations was nowhere developed in historical times, and even in Sparta itself it unfolded in its full harshness only during the military expansion of the Spartan *demos*, after the destruction of the nobility, for the sake of maintaining discipline and safeguarding the status equality of all warriors. In the normal phratries of other cities, by contrast, the noble families or houses (γένη, οἶκοι) alone supplied the ruling notables, as the inscriptions of the *Demotionidai* show for the old clan which had its castle in Decelea.[39] In the Draconian code of Athens [621 B.C.], for instance, this is still reflected in that the "ten best men" of the phratry —that is, the most powerful ones because of their wealth—are to decide on reconciliation or blood revenge [in the case of manslaughter].[40]

In the urban constitution of later periods the phratries were treated as subdivisions of the phylae (and in Rome: of the three old personal *tribus*) into which the ordinary Hellenic city was divided. The term *phyle* (tribe) is technically associated with the polis; the word for a non-urban "tribe" is ἔθνος, not φυλή. In the historical period the phylae had everywhere become artificial subdivisions of the polis, created for the purpose of assigning regular turns in the bearing of public burdens, in the sequence of balloting, and in the occupancy of offices, as well as for the organization of the army, and for the distribution of the yields of state enterprise, of booty and of conquered territories (thus in the allocation of land [after the prehistoric Doric conquest] on Rhodes).[41] At the same time, of course, they were also cult associations, as all—even the rationally formed—associations of early periods have always been. Artificial creations were also the typical three phylae of the Dorians, as is already indicated by the very name of the third: Pamphylae [i.e., "all

tribes"], which finds a counterpart in the Roman tradition about the *tribus* of the Luceres.[42] The origin of the phylae may frequently have been a compromise between a resident stratum of warriors and a newly entering conquering group; this may also explain the two Spartan royal families with unequal rank, which again had a counterpart in the Roman tradition of an original dual kingship. In the historical period the phylae were in all cases purely personal, rather than territorial, associations, headed by a "king of the *phyle*" (*phylobasileus*) who initially was an hereditary family-charismatic chief and later an elected official.

Members of the phylae and phratries, *tribus* and *curiae* were, as "active" or "passive" citizens, all participants in the army of the polis, but only the members of the noble clans were "active" citizens—i.e., only they shared in the offices of the city. Hence the term denoting a "citizen" is at times directly identical with the word for a member of the patrician "families." The attribution of a family to the nobility was here, as elsewhere, without doubt originally tied to the family-charismatic dignity of the district chieftaincy; with the advent of chariot warfare and castle construction, however, it seems to have become a function of castle ownership. During the period of polis monarchy, the formation of new nobility must have come about as easily as did in the early Middle Ages the rise into the circle of fief holders of any family adhering to a knightly style of life. But in historical times only a member of the patriciate (*patricius, eupatrides*) could validly communicate, as priest or official, with the gods of the polis through conducting the sacrifices or consulting the oracles (*auspicia*). As a rule the individual patrician families also had their own gods, different from those of the polis, and their own cults at their ancestral seats—signs of their pre-urban origin. On the other hand, an office priesthood existed beside the family-charismatic priesthood reserved to certain patrician families, but there was never a general priestly monopoly of communication with the gods, such as prevailed almost everywhere in Asia, for the urban magistrates had the power to perform such functions. Nor was there a priesthood that was independent from the polis, apart from the few large interlocal sanctuaries such as Delphi; priests were appointed by the city, and even the Delphic shrines were not ruled by an autonomous hierocracy. Initially they were under the authority of a neighboring polis, and after the destruction of the latter in the course of a holy war, several adjacent communes formed an amphictyony which exerted a very close control. The political and economic power of great temples —as manorial lords, owners of *ergasteria*, money lenders to private persons and, above all, to states (whose war hoards they held in deposit), and as deposit banks in general—did not change the fact that

both on the Greek mainland, and even more so in the overseas colonial settlements, the polis retained and indeed increasingly expanded its power over the wealth of the gods and the priestly benefices. The final result in Hellas was the filling of priestly offices by way of public auctions. It seems that the rule of the military nobility was decisive for this development which was completed during the rule of the *demos*. The sanctuaries, the sacred law, and magic norms of all kinds at that time became instruments of power in the hands of the nobility.

The nobility of a polis was not unconditionally closed; the acceptance of individual outside lords who had moved from their castles into the city together with their clients (as in the case of the *gens* Claudia), and mass "promotions" like that of the *gentes minores* in Rome,[43] occurred in Antiquity just as later in Venice, although this was probably more frequent in the very early period than later. Nor was the nobility a purely local, territorially limited community. Attic noblemen, such as Miltiades, held large seigneuries outside of the city territory, and everywhere, just as in the Middle Ages, interlocal connections were especially prevalent among the noble strata.

In its economic nature, the property of the nobility was predominantly seigneurial. The prestations of slaves, serfs, and clients---categories which will be discussed later---supplied the domestic needs. Even after the disappearance of the old type of bondage and of clientage, most wealth remained landed and agricultural. For this we can find a parallel in the Babylonian patriciate: at the division of the assets of the Babylonian trading house which for generations appears most frequently in the documents, that of the Egibi, urban and rural landed property, slaves, and cattle appear as the main holdings.[44] The *source* of this economic power of the typical urban nobility, however, was in Hellas as in Babylon and in the Middle Ages the direct and indirect participation in trade and shipping. This was accepted as in accord with patrician status up into a late period, and only in Rome did it come to be entirely forbidden for senators. In the ancient world, as in the Orient and in the European Middle Ages, urban residence was sought precisely for the sake of these profit opportunities. The wealth accumulated in this way was used to practice usury against the peasants who, as inhabitants of the countryside, were excluded from political power. Massive debt servitude was the result, and the best rent-producing land (in Attica: the πεδία, the lands in the plain) accumulated in the hands of the *astoi*, while the hill-sides (the seats of the Diacrii), which could not produce a rent, were everywhere held by the peasantry.[45] The seigneurial power of the urban patriciate thus originated to a large extent in urban profits. The endebted peasants either continued as sharecroppers or were pressed directly into *corvée* labor to work beside the true serfs of the old type

which had its origin in seigneurial relations. Purchased slaves began to assume some importance. Nowhere, however, not even in patrician Rome, did the free peasantry entirely disappear; this is as true of Antiquity—and perhaps even more so—as it is of the Middle Ages. The tradition about the struggles in Rome between patriciate and *plebs* clearly indicates that these conflicts were not caused by problems of a manorial social structure; but by incompatibilities of a quite different —and indeed opposite—kind.

Anyone not belonging to the urban, clan-associated, and militarily trained warriorship—and that means above all any free rural resident: *agroikos, perioikos, plebeius*—was economically at the mercy of the urban nobles. This was due to a number of factors: The exclusion from all political power, which also meant the exclusion from active participation in all judiciary activity at a time when the determination of law had not yet assumed a form strictly bound by firm rules; the necessity—which follows from the above—to give gifts or to enter into a client relationship with an urban nobleman in order to obtain a court finding in one's favor; and finally, again not unconnected, the severity of the law of debtorship. The spatial mobility of the peasantry, however, and the possibility of buying land in a new locality, apparently was relatively large during the patrician period, as is shown by the case of Hesiod's family.[46] This was in sharp contrast to later periods, to the "hoplite city," and even more so to radical Democracy. The free urban artisans and the non-patrician small merchants, by contrast, probably were in a position similar to that of the *Muntmannen* of the Middle Ages.[47] In early Rome the king seems to have had a certain tutelary power over this group, similar to the relationship between patron and client, just as did the city lord of the early Middle Ages. Occasionally we find traces of liturgical organizations of artisans: the Roman *centuriae* of military artisans, for instance, may have had this origin.[48] We do not know whether the artisans had ever been organized into guest-tribes, as was the rule in Asia and also in pre-Exile Israel; at any rate, there is no trace of a ritualistic segregation in the manner of the Indian castes.

8. *Ancient and Medieval Patrician Cities: Contrasts and Similarities*

The stereotyped number of phylae, phratries, or sibs in the organization of the ancient patrician city constitutes one obvious contrast to the patrician city of the Middle Ages. Their origin in military and religious units is reflected in this fact. The ancient city arose as a community of

warriors settling together, and this explains these divisions, just as the "hundreds" of the Germanic tribes can be explained from settlement in military groupings. It is this origin of the ancient city, as we shall see further on [cf. sec. *v*:6 below], which causes the structural differences between the patrician period here and in the Middle Ages. Other causes are, of course, to be found in the different environments. The medieval city arose in the context of large continental patrimonial realms and in opposition to their political authorities, the city of Antiquity on the sea coast and in the neighborhood of peasant and barbarian peoples; the latter had its origin in city monarchies, the former in the conflict with feudal or episcopal city lords.

In spite of these differences, whenever political conditions were similar this also found expression in similarities of the formal features of city development. We saw how the position of the city monarch in Venice, which for a time had been truly dynastic and patrimonial, was formally changed through the prohibition of appointing a coregent and ultimately through the transformation of the doge into a president of the corporation of the nobility, and thus into an office-holder. The corresponding development in Antiquity was that from the city kingship to the magistracy with a one-year tenure. In Antiquity, too, the appointment of coregents had considerable significance in the early period, which Mommsen in particular has emphasized.[49] This can be deduced from such phenomena as: The role of the Roman *interrex*;[50] the residues of an earlier practice of the appointment of successors and colleagues by the incumbent (appointment of the *dictator* by the consul; admission to candidateship and conduct of the election of a new official by the old—this was considered a precondition for a valid installment); the original restriction of the Roman community in elections to mere acclamation, and then to a choice between only those candidates proposed or (later) admitted by the magistrates. In Greece, however, the development from city monarchy to an annual magistracy under the control of the nobility differs in formal respects much more strongly from the Venetian model than does the course of events in Rome. Furthermore, the development of medieval European city constitutions outside Venice also shows important differences from the Venetian type.

The fully developed rule of the nobility everywhere replaced the Homeric council of the elders no longer fit for military service by a council of the noble families. This could be a council of the family heads, such as the patrician Senate of early Rome, the Spartan council of the γερῶχοι—i.e., of those to whom honorific gifts (of their clients) were due, and the old Attic council of prytans elected by the clans

organized in naucraries.[51] The Middle Ages knew this stage also, but not in quite so consistent a schematization, which in Antiquity was due to the religious significance of the sibs. Or else it might be a council of former officials, like the later Attic Areopagus and the Roman Senate of historical times.[52] For this latter type the Middle Ages have only modest parallels in the form of the admission of past burgomasters and councillors to the council sessions: the military and also religious character of the ancient magistracy furnished even the past incumbents with far more enduring significance than the offices of the medieval city could do. But in both periods it was always a limited number of noble families in mutual rivalry—at times, as during the rule of the Bacchiadae in Corinth,[53] only a single one—which held the power and alternated in the offices. As in all systems of domination by notables, including that of the Middle Ages, the number of people who ever held office in the patrician polis was very small. Wherever the rule of the nobility was at least *de facto* maintained, as in Rome, this remained permanently so.

Patrician rule also shows other similarities in the Middle Ages and in Antiquity. Feuds between the noble families, exile of the vanquished and their return by force of arms, wars between the knighthood of different cities (in Antiquity, e.g., the "Lelantine" war),[54] all these can be equally found in both periods. In both periods, too, the countryside was outside the law. Whenever they could, the cities of Antiquity, like those of the Middle Ages, forced other cities into clientage: the Spartan cities of the *perioikoi*,[55] later those ruled by harmosts,[56] and the numerous communities subject to Athens and Rome find their parallel in the Venetian mainland realm (the *terra ferma*) and the towns subjugated by Florence, Genoa, and other cities, and administered by their officials.

9. *Economic Character of the Ancient and Medieval Patriciate*

Economically, the urban patrician families of Antiquity and the Middle Ages were above all characterized by the fact that they were *rentiers*. In both periods noble status was determined by a knightly style of life, and not by ancestry alone. The medieval patriciate included the families of former princely servitors (*ministeriales*) together with those of free vassals and knights (especially in Italy), as well as those of free land owners who, after coming into some wealth, had assumed the knightly manner of living. In Germany and in Italy some of the patrician families retained their castles outside of the city, where they withdrew during the struggles with the craft guilds and from which

for long periods they conducted feuds with the cities which had expelled them. In Germany the best known example probably is the family of the Auers in Regensburg.[57] These knightly strata, joined together in the feudal associations, were the true *magnati* and *nobili* of the Italian terminology. The knightly families which did not possess own castles later found themselves obliged to remain in the city when the craft guilds seized power, to submit to the new government and to offer their military service against the magnates. The further development could proceed in two directions. Families not of knightly descent could gain entrance into the nobility by purchasing a noble holding—often a castle—and transferring their residence outside the city; on the other hand, noble families living in the city could take the step from merely occasional participation with their capital in trade to regular commercial operations of their own, thus abandoning their character as *rentiers*. Both movements occurred, but on the whole, the first tendency predominated since it signified an upward movement in the social hierarchy.

When cities were newly founded by political or manorial lords in the Middle Ages, it often happened that not a single knightly family was included among the settlers. Sometimes they were explicitly excluded, especially after the struggle of the craft guilds against the patriciate had begun This phenomenon is met the more frequently, the further we go East and North into the (economically speaking) "new" lands. In Sweden the foreign-born German merchants participated in the founding and the government of the new cities, as also in Novgorod and very frequently in the East in general. In these areas the "patriciate" and the mercantile stratum were really identical, at least during the early period of these cities. The great significance of this phenomenon will be discussed later [sec. *v*:6 below]. In the old cities the situation was different. But everywhere we find the tendency towards development of a *rentier* stratum which constituted the real nobility and exercised leadership in the patrician clubs. In Antiquity, a truly mercantile patriciate is also found mainly in colonial territories—e.g., in cities like Epidamnos.[58]

Thus the economic character of the patriciate was quite fluid; only its center of gravitation can be determined, and this undoubtedly was rentiership. We should strongly stress once again that the urban residence of the patriciate had its economic cause in the urban economic opportunities, and hence that in every case the economic power of the urban nobility derived from the exploitation of such sources of revenue. Neither the ancient *eupatrides* or *patricius* nor the medieval patrician was a merchant, not even in terms of the modern concept of an entrepreneur conducting business from an office. To be sure, he often participated in

mercantile enterprise, but then in the capacity of a ship owner, or as a limited partner, provider of *commenda* capital or of a "sea loan." The actual work: the voyage and the conduct of the trading operations, was left to others; the patrican himself participated only in the risks and the profits, although at times he might have taken a share also in the intellectual management of the enterprise. All important forms of business of early Antiquity and the early Middle Ages, especially the *commenda* and the "sea loan," were tailored to the existence of such financiers who invested their wealth in concrete individual undertakings, with a separate settling of accounts for each one, and usually in a great number of these to distribute the risk. This is not to deny, of course, that all imaginable transitions can be found between a patrician way of life and the personal conduct of business. The travelling trader who obtained money on *commenda* for individual ventures could transform himself into the owner of a great house operating with permanently invested limited-liability capital and employing foreign representatives to do the actual trading work. Money changing and banking operations, but also a shipping or wholesale firm, could easily be conducted for the account of a patrician who himself lived like a knight, and the transition from a capital owner who utilized momentarily unused portions of his wealth by letting them out on *commenda* to one who was continuously active as an entrepreneur was by nature quite fluid.

This fluidity is certainly a very important and characteristic aspect of urban development. But it is itself only the product of other developments. This blurring of the lines frequently came about only in the period of the craft guilds' rule, when even the nobility was forced to enroll in the guilds if it wanted to participate in the city government and when, on the other hand, the burgher remained a guild member even if he was no longer an active entrepreneur. The name *scioperati* ["idlers"] for the great merchant guilds in Italy proves this point. This development was especially typical for the large English cities, in particular for London. There the struggle for power of the economically active groups of burghers organized in the craft guilds found expression in a dispute over the basic election constituency: whether the council and the officials should be elected by the wards of the city or their representatives where the power of the land-owning urban nobility usually was strong, or by the craft guilds ("liveries"). The increasing power of the craft guilds is shown by the growing dependency of all urban citizenship rights on membership in one of the occupational associations. Edward II had early established this principle for London, and although the election of the "Common Council" according to city wards (which had been the general procedure until 1351) was later reimposed several times (1384) by force, it was permanently abandoned in favor

of election by the "crafts" in 1463.[58] While guild membership became compulsory for every burgher—even King Edward III enrolled in the Company of Linen Armourers (merchant tailors)—the importance of the really active merchants and tradesmen within the "crafts" continued to decline in favor of that of the *rentiers*. Although membership in the craft guilds was theoretically obtainable only through apprenticeship and admission, it came in practice to be acquired through inheritance and purchase, and the connection of the "crafts" with their nominal occupation shrank for all but a few (as, e.g., that of the goldsmiths) to vestigial remnants. In part the "crafts" were rent by economic and social contrasts among their members, and in part they became gentlemen associations for the sole purpose of electing the communal officials.

In reality, as we saw, the "types" always become fluid vis-à-vis each other. But this is true of all sociological phenomena and should not prevent the statement of the typical aspects. The typical patrician, at any rate, was not a professional entrepreneur in either Antiquity or the Middle Ages, but rather a *rentier* and "occasional" entrepreneur. The expression "honorable idlers" (*ehrsame Müssiggänger*) is found in the statutes of Upper Rhine cities as the official designation for members of the patrician chamber, in contrast to those of the craft guilds. In Florence, the great merchants of the *Arte di Calimala* and the bankers belonged to the "crafts" and not to the patriciate.

For the ancient world the exclusion of entrepreneurdom from the patriciate was even more a matter of course. This does not mean that the Roman senatorial nobility, for example, did not include any "capitalists" —it is not at all on this level that we find the difference. "Capitalist" *moneylenders* were both the early Roman patricians vis-à-vis the peasants, and the later Roman senatorial families vis-à-vis their political subjects —and that, as we shall see, in no mean dimensions. It was only the role of the *entrepreneur* that the status etiquette, occasionally and with varying flexibility backed up by the law, forbade to the truly patrician families of both Antiquity and the Middle Ages. The objects in which the typical patriciate of the different ages invested its wealth of course varied considerably. Nevertheless, the distinction remained the same: Whoever too noticeably crossed the line between the two forms of economic activity represented by the investment of wealth on the one hand, and by profits from capital on the other,[59] was considered a *banausos* in Antiquity and a man "not of the knightly kind" in the Middle Ages. In the later Middle Ages the old knightly families of the cities were denied equal rank by the rural nobility because they sat on the council together with the men of the craft guilds—and thus with entrepreneurs. It was not "greed for gain" as a *psychological* motive that was rejected; in practical life the Roman office nobility and the medieval

patriciate of the large coastal cities was just as possessed by the *auri sacra fames* as any other class in history. Rather, it was any *rational*, continuously organized, and in this sense specifically "bourgeois" form of acquisitive operation, any systematic economic activity, that was looked upon with disdain. The Florentine *Ordinamenti della giustizia*, passed [in 1293] to break the rule of the *nobili*, identify the families who were to be deprived of political rights as all those whose members had in the past been knights—families, that is, with a knightly style of life. In Antiquity the same criterion, that of the style of life, was used to disqualify all candidates for office who were actively engaged in a trade.[61] The consequence of the Florentine *ordinamenti*, according to Machiavelli, was that any nobleman who wanted to stay in the city had to adapt his life style to the usages of the bourgeois strata.[62]

These, then, were the primary characteristics of the patriciate; as can be seen, they belong to the category of "status" characteristics. In addition, of course, the political characteristic typical for every charismatic nobility has to be mentioned: namely, descent from a family that had once occupied certain offices and dignities, and was considered eligible for office for that very reason. This trait is found in the sherifian families of Mecca just as in the Roman nobility and in the tribunitian families of Venice. The closure of the group was of varying rigidity; it was less flexible in Venice than in Rome, where the *homo novus* was not formally excluded from the offices. Everywhere, however, when a family's eligibility for the council and for the city offices was in question, it was sought to ascertain whether a member of this family had previously sat in the council or held an office conferring council rank or, as in the Florentine *ordinamenti*, whether a knight appeared among its ancestors. In general, the principle of status closure became more rigid as the population and the importance of the monopolized offices increased.

In some of the observations in this section we have again anticipated the discussion of a later period in which the old family-charismatic nobility has entirely or in part been deprived of its special legal status and is forced to share power with the *demos* of the Greek city, the *plebs* of Rome, the *popolo* of Italy, the "liveries" of England, and the *Zünfte* of Germany, thus according equal status to these associations. This process we must now consider in greater detail.

NOTES

1. Secs. iii:2–3 appear in small print in the German edition, indicating an excursus. In his account of early Venetian history, Weber in general follows Heinrich Kretschmayr, *Geschichte von Venedig* (3 vols.; Gotha: Perthes, 1905–

1934),–Vol. I: *Bis zum Tode Enrico Dandolos*. Cf. also Bernhard Schmeidler, *Der dux und das comune Venetiarum von 1141–1229* ("Historische Studien," Vol. 35; Berlin: Ebering, 1902); Ernst Mayer, *Italienische Verfassungsgeschichte* (Leipzig: Deichert & Böhme, 1909). (W)

2. The *curia* was the local administrative council, composed of liturgically drafted officials and responsible for local tax collection; *defensor* is the late Roman designation for the highest magistrate of a city. The contrast is between these *civilian* liturgic offices and the *military* tribunate which predominated from the sixth century on. Cf. Kretschmayr, *op. cit.*, I, 38ff.

3. Doge Pietro Candiano IV (r. 959–76), husband of Waldrada of Tuscany, a niece of Emperor Otto I. Cf. Kretschmayr, *op. cit.*, I, 113ff, 436ff. (W)

4. Cf. Kretschmayr, *op. cit.*, I, 111.

5. That is, in the island settlement which in 811 had become the official residence of the doge—at a time when it was still quite inferior to some of the other mainland and lagoon cities of the duchy (*ducatus*) of Venetia. Rialto long remained the primary name of the town which only in the thirteenth century came to be generally known by the name of the territorial unit of which it was the capital. The old designation survives today in the Rialto ward, around the bridge of the same name, the old commercial quarter. Cf. Kretschmayr, *op. cit.*, I, 60, 83f.

6. Kretschmayr, *op. cit.*, I, 148.

7. Walter Lenel, *Die Entstehung der Vorherrschaft Venedigs an der Adria* (Strassburg: Trübner, 1897), 124ff. (W)

8. Chrysobullon (Golden Bull, i.e. privilege) of Alexios I, the first Comnene emperor (r. 1081–1118), of May, 1082, in which he granted Venice full freedom from taxation in her trade in the Byzantine empire in exchange for aid in his struggle against the Sicilian Normans under Robert Guiscard. Cf. Kretschmayr, *op. cit.*, I, 161ff, 168, 178f.

9. Reference to the Fourth Crusade (1202–04), which Venice deflected to an attack on Constantinople, partly in order to have a hostile emperor replaced by one willing to renew the Chrysobullon on favorable terms. After the fall of the city and the foundation of the Latin Empire (1204), the phrase *quartae et dimidiae partis totius Romanie imperii dominator* was added to the styles of the doge.

10. Enrico Dandolo, doge 1192–1205. In his oath of office, the limitations on the dogal power seem to have been spelled out in detail for the first time. Cf. Kretschmayr, *op. cit.*, I, 331, 341.

11. *Publicum placitum* or *curia ducis:* the public court meeting, at times also an acclamatory quasi-legislative meeting, which from the late ninth century on met in the ducal palace under the chairmanship of the doge. Cf. Kretschmayr, *op. cit.*, I, 191ff, 197.

12. Cf. Schmeidler, *op. cit.*, 13ff.; Kretschmayr, *op. cit.*, I, 327ff.

13. *Quaestio repetundarum:* permanent jury court (*quaestio*) instituted by the *lex Calpurnia* of 149 B.C. to try colonial and provincial governors for extortion (*de pecuniis repetundis*) and exploitation of their subjects. Pauly-Wissowa, *RE*, vol. 48 (Stuttgart, 1963), cols. 763ff.

14. Cf. Lenel, *op. cit.*, 143f.; Schmeidler, *op. cit.*, 43–48, 67ff.

14a. On the origins of these party formations and their gradual interlocal coalescence, see Robert Davidsohn, "Die Entstehung der Guelfen- und der Ghibellinen-Partei," in his *Forschungen zur Geschichte von Florenz*, IV (Berlin: Mittler, 1908), 29–66.

15. Lists detailing the contributions (army contingents, later a money tax)

due from the medieval German Estates at the accession of a German king, in support of his armed expedition to Rome (*Römerzug*) to obtain from the pope the coronation as emperor of the Holy Roman Empire.

17. *Ibid.*, 395.

18. *Ibid.*, 426.

19. Cf. below, n. 57 on the Regensburg "Auer *Wirren*".

20. King Stephen of Blois (r. 1135–54), whose claim to the throne was contested by the Plantagenets. He was succeeded by Henry II Plantagenet, the first Angevin king. (W)

21. On the *firma burgi*, cf. below, sec. *iv*:10:D; J. Hatschek, *Englische Verfassungsgeschichte*, 109ff. (W)

22. For the "companies," i.e., the guilds of individual trades or crafts such as the (merchant) companies of the drapers or fishmongers, or the (craft) companies of the coopers, cutlers or shipwrights, see S. Thrupp, *The Merchant Class of Medieval London*, *passim*.

23. "*Scivini* (*Schöffen*)" in the German text; however, Weber is obviously thinking of the 24 ward presidents, elected for long terms or until removed, the aldermen (*aldermanni* in the Latin documents) who together with the annually elected mayor and the common council formed the London city government. The *scivini* actually were subordinate officials of the London craft guilds (cf. Hegel, *Städte und Gilden*, *op. cit.*, I, 70, 78 n. 2). The number of councillors was in fact much larger than that of aldermen (for a collation of the changing council strength cf. Thrupp, *The Merchant Class of Medieval London*, 79); Weber was probably misled by Hegel's statement (*op. cit.*, 78f.) that the councillors, like the aldermen, were elected by wards.

24. See below, sec. *iii*:9.

25. On Hellas of the tribal aristocracy, cf. now M. I. Finley, *The World of Odysseus* (New York: Meridian Books, 1959).

26. *Iliad*, bk. II, 494–759.

27. *Iliad*, bk. VI, 168–17.1.

28. *Odyssey*, bk IX 40.

29. *Iliad*, bk. XVIII, 478–608, esp. 503f.

30. *Odyssey*, bk. VI, 259,293.

31. *Iliad*, bk. II, 212–77. Cf. also Finley, *The World of Odysseus*, 117ff.

32. Thus Eumaios the swineherd, Odysseus' purchased slave. Cf. *Odyssey*, bk. XIV, 61–66 and Weber, *GAzSW*, 101, n. 1.

33. *Iliad*, bk. XXIII, 257–897.

34. On the Cyrenaican silphion trade, cf. above, ch. XVI:*i*, n. 16.

35. On the early Greek city state, cf. Ehrenberg, *The Greek State*, Part I and the bibliographical essay, *ibid.*, 243–56.

36. Cf. Eberhard Gothein, *Die Culturentwicklung Süd-Italiens in Einzel-Darstellungen* (Breslau: Koebner, 1886), 162–242 for Aquila. In this case the *incasamento*—thus the Italian term, an almost literal equivalent of *synoikismos*—was compulsory; Emperor Frederick II, in an attempt to contain the Norman feudal barons of the Abruzzi mountains, ordered the villages of the Aternus valley to resettle in the new city and all *castelli* in the territory to be razed within two months. The foundation of Alessandria (near Turin, 1168) is mentioned in Gothein, *Wirtschaftsgeschichte des Schwarzwaldes und der angrenzenden Landschaften* (Strassburg: Trübner, 1892), 63.

37. On Decelea, cf. below, n. 39; on the controversy about the *pyrgoi* of Thos in Asia Minor, which may have been castle districts in the territory or militia districts for the manning of the wall towers of the town itself, see Pauly-Wissowa, RE, 2d series, V (1934), col. 55ff.

38. Cf. Weber, *GAzSW*, 116, 122, 217.

39. The *Demotionidai* formed one of the Attic phratries. A stele found near its cultic center, Decelea, was covered by inscriptions summarizing the resolutions of the association regarding admission procedures. While in the first inscription, dating from 496–495 B.C., the noble clan of the Decelean castle still played a considerable role, it was no longer mentioned in a second inscription later in the fifth century; from this it was concluded—though not without controversy—that the role of the nobility in the phratry had declined between these two points in time. Cf. art. "Demotionidai" in Pauly-Wissowa, RE, V (1905), cols. 194–202, and Weber, *GAzSW*, 136.

40. Cf. art. "Drakon," in Pauly-Wissowa, RE, V (1905), col. 1653.

41. On the land allocation on Rhodes, cf. Weber, *GAzSW*, 152.

42. Unlike the "tribes" of the Ramnes and Tities, which legend derived from Kings Romulus and Titus Tatius, the third *tribus* of the early city constitution could not be identified with one of the mythical royal names; legend instead explained it as a "naturalized" group of military allies.

43. Another mythical king, Tarquinius Priscus, was said to have enlarged the Senate—and thus the circle of noble families represented there—from 100 to 300; the new members, the *patres minorum gentium*, in later times voted only after the "fathers" of the old families. Classical writers disagreed as to whether the *gentes minores* were of patrician origin (Cicero) or were promoted plebeians (Suetonius). Cf. art. "gens" in Pauly-Wissowa, RE, VII (1912), col. 1192f.

44. On the banking house of the "Grandsons of Egibi," which existed in Babylon from the seventh to the fourth century B.C., see Fritz M. Heichelheim, *An Ancient Economic History*, II (Leiden: Sijthoff, 1964), 72ff.

45. Allusion to the party divisions of the early sixth century, which shook Attica shortly after the Solonic reforms, between the landlords of the plain (the *pediakoi*), the trading and sea-faring interests of the coast (the *parálioi*), and the radically democratic small peasantry of the Diakria hill district (the *diákrioi*). Cf. Weber, *GAzSW*, 134, 152; A. Andrewes, *The Greek Tyrants* (New York: Harper Torchbook, 1963), 102ff (on the three parties); Ehrenberg, *The Greek State*, 30f.; R. von Pöhlmann, *Griechische Geschichte und Quellenkunde*, 5th ed. (Munich: Beck, 1914), 88–97.

46. On Hesiod's family, cf. below, sec. v, n. 32.

47. In German medieval cities, small traders and artisans who stood in a special tutelary relationship to the Carolingian king, the city lord, and later to powerful patricians, owing certain services and receiving protection, assistance in the courts and other aid. Cf. Hans Planitz, *Die deutsche Stadt im Mittelalter* (Graz: Boehlau, 1954), 268f.

48. The so-called "Servian" army organization included five unarmed units, two of which comprised the military carpenters and smiths: the *centuriae fabrum tignariorum* and *fabrum aerariorum*; the others were two units of musicians and one of replacement personnel. On their position within the Roman political system and the *comitia centuriata*, see Theodor Mommsen, *Römisches Staatsrecht*, III (first ed., Leipzig: Hirzel, 1887), 281–90.

49. E.g., Mommsen, *op. cit.*, I (2nd ed., 1876), 204–212.

50. During the Roman republic, an interim official with a five-day tenure of

office who conducted affairs when for some reason both consulships were vacant. Cf. Mommsen, *op. cit.*, I, 633ff.

51. On the early Greek councils in general and the Spartan *gerousia*, cf. Ehrenberg, *The Greek State*, 59, 250: The *prytaneis* of the naucraries must be distinguished from the later prytans of the Cleisthenian council, the representatives of the ten post-reorganization phylae (cf. above, ch. XVI:*ii*, n. 16). The naucraries were a pre-Solonic institution, the smallest subdivision of the four original Ionian phylae—twelve to each tribe, and thus 48 in all. Originally, these were probably fiscal units, responsible for the maintenance of a certain number of warships, but later they became general administrative districts headed by a *prytanis*. Relatively little is known about the council formed by these district heads, on which cf. Ehrenberg, *op. cit.*, 30f.

52. Membership in the later Areopagus fell to all former *archontes*, and in the Roman Senate to all who had held curule office.

53. Ruling family of Corinth, 926(?)–657, when it was ove thrown by Kypselos, one of the early tyrants. Cf. Andrewes, *The Greek Tyrants*, 12, 43–49.

54. Seventh century B.C. war between Chalcis and Eretria, on Euboea island, over possession of the Lelantine plain.

55. "Dwellers around," the inhabitants of dependent communities which owed war services to the Spartan state, but as non-citizens enjoyed no active political rights.

56. Spartan military governors of conquered cities during the later expansionary period.

57. Early 14th century. When the Auers, who for a number of yea s had wielded power in the city (with the help of a retinue of *Muntmannen*), were expelled in 1334, the *Bürgermeister* position was for ten years rest icted to out-of-towners, quite in the manner of the Italian *podestà*. Cf. J. Langoth, *Skizze einer Entwicklungsgeschichte der freistädtischen Verfassung Regensburgs im Mittelalter* (Stadtamhof, 1866).

58. A Corinthian-Corcyrean settlement on the present-day Albanian coast, the oligarchy of which conducted trade with the interior through a "factor" on a common account. Cf. *GAzSW*, 101, 107.

59. Cf. Hegel, *Städte und Gilden*, *op. cit.*, I, 79f.; Thrupp, *The Merchant Class of Medieval London*, 73–83. Weber is probably in error with respect to the election of the Common Council by craft guilds after 1463: both Hegel and Thrupp indicate that the return to election by wards in 1384 was final. Perhaps he misinterpreted Hegel's statement (*op. cit.*, 79) that the livery companies (the upper guilds) obtained the right to participate, together with the London Common Council, in the election of mayor and sheriff (1468) and of the members of the House of Commons (1476). The year 1463 as given in the text may then be due to misreading of 1468 in the handwritten manuscript.

60. *Vermögensanlage* and *Kapitalgewinn*. On Weber's differentiation between the utilization of "wealth" (*Vermögen*) and of "capital," categories which are associated, respectively, with the concepts of "budgetary management" (*Haushalt*) and "acquisitive activity" (*Erwerb*), see *supra*, Part One, ch. II: 10–11, esp. p. 98ff.

iv

The Plebeian City

1. *The Destruction of Patrician Rule Through the Sworn Confraternity*

The manner in which the rule of the patriciate was broken shows strong "external" parallels in the Middle Ages and in Antiquity—especially if the large medieval cities are considered, and particularly those of Italy, where the development proceeded, as in the cities of Antiquity, on an essentially autonomous course, i.e. without interference from extra-urban powers.

In Italy, the next crucial stage of development after the rise of the *podestà* came with the formation of the *popolo*. Like the German craft guilds, the *Zünfte*, the Italian *popolo* was composed of economically varied elements; above all, it comprised both entrepreneurs and handicraft workers. In the struggle against the knightly families the entrepreneurs initially played the leading role; they instigated and financed the sworn confraternity of the "crafts," whereas the artisan guilds provided the necessary manpower for battle. Frequently the sworn association of the craft guilds appointed a single individual to head the movement, in order to safeguard the achievements obtained in the battle with the patriciate. Thus, after the expulsion of recalcitrant noble families in 1336, Zürich was ruled by the knight Rudolf Brun and a council composed in equal parts of representatives of the "Constabulary"—the corporation of the knights remaining in the city and the entrepreneurial "crafts" of the merchants, drapers, salt dealers, and goldsmiths—and of the minor "crafts" of small artisans; under this leadership the city was able to withstand the siege of the Imperial army.[1] In Germany the sworn confederation of the "crafts" was in most cases only temporarily an association separate from the commune. Its separate existence was ended either through the admission of "craft" representatives into the council or through the absorption of the entire citizenry, including the nobility, into the craft guilds. As a permanent organization, in the form of a city guild, the fraternity of the "crafts" was maintained only in some cities of Lower Germany and the Baltic region. Its character as a derivative

organization is shown in the composition of its governing body, which was made up of the "guild-masters" of the individual "crafts." In the fifteenth century no one could be imprisoned in Münster without the agreement of the guilds. The city guilds thus functioned as protective associations against the judicial activity of the councils. In administrative matters, too, the councils were joined, either on a permanent basis or only for important matters, by guild representatives without whom no decision was supposed to be made. In Italy, such protective associations of the citizenry against the patriciate assumed much more significant dimensions.

2. *The Revolutionary Character of the* Popolo *as a Non-Legitimate Political Association*

The Italian *popolo* was not only an economic category, but also a political one. It was a separate political community within the urban commune with its own officials, its own finances, and its own military organization. In the truest sense of the word it was a "state within the state"—the first *deliberately nonlegitimate and revolutionary* political association. The causes for this phenomenon must be sought in the fact that in Italy, much more than elsewhere, knightly families settled in the cities themselves, due to the much stronger development of economic and political means of power of the urban nobility. The consequences of this fact will engage us frequently in the following analysis.

The association of the *popolo,* which confronted these knightly families, rested on the confraternization of the occupational associations (*arti* or *paratici*).[2] The separate political community created by these associations was in the earliest cases (Milano, 1198; Lucca, 1203; Lodi, 1206; Pavia, 1208; Siena, 1210; Verona, 1227; Bologna, 1228) officially known by such names as *societas, credenza, mercadanza, comunanza,* or simply as *popolo.* The highest official of the separate commune of the *popolani* was usually called *capitano del popolo.* He was elected for a short term, usually a year, was paid a salary and, like the *podestà* of the commune, was often called in from another town, in which case he had to bring his own staff along. The *popolo* supplied him with a militia levied in most cases on the basis of city wards, or by the *arti.* Like the *podestà* of the commune, he often resided in a special "house of the

people" with a tower, the fortress of the *popolo*. The *capitano* was assisted, especially in the financial administration, by separate bodies composed of representatives (*anziani* or *priori*) of the craft guilds who were elected from the city wards for short terms of office. They claimed the right to protect the *popolani* in the courts, to contest decisions of the authorities of the commune, to address proposals to them, and often a direct role in legislation. But above all they participated in the formulation of the decisions of the *popolo* itself.

Up to the time of its full development, the *popolo* had its own statutes and its own tax system. At times it even established the principle that resolutions of the commune should be valid only if agreed to by the *popolo*, so that new laws of the commune had to be entered in both statute books. For its own decisions it enforced, wherever possible, admission into the statutes of the commune, and in a few cases the decisions of the *popolo* even obtained priority over all other statutes, including those of the commune (*abrogent statutis omnibus et semper ultima intelligantur* in Brescia).[3] The jurisdiction of the *podestà* was challenged by that of the *mercanzia* or *domus mercatorum*,[4] which asserted competency especially in all affairs of the market and the trades and thus constituted itself as a special court for the merchants and artisan producers. Beyond this, it often obtained universal significance for the *popolani*. In the fourteenth century the *podestà* of Pisa had to swear that he and his judges would not inject themselves into disputes among the city's *popolani*.

At times the *capitano* attained a broad general jurisdiction competing with that of the *podestà* and, in a few cases, even a superior appeals jurisdiction. Very frequently he obtained the right to participate in the sessions of the communal governing agency with control functions and with the power to dismiss meetings; occasionally he had the authority to convoke the citizenry of the commune, to execute the resolutions of the council if the *podestà* failed to do so, to pronounce and to remit banishment, and to supervise or to assist in the administration of the communal finances and, most important, of the property of banished citizens. In the official ranking, the *capitano* stood below the *podestà*, but in a case like that just described,[5] he had in fact become an official of the commune, a *capitaneus populi et communis*; if, in Roman terms, he was formally a *collega minor*, he was nevertheless in practice usually the more powerful of the two. Often the *capitano* also had authority over the military forces of the commune, the more so if these consisted of mercenary troops which could be maintained only from the tax payments of the rich *popolani*.

3. *The Distribution of Power Among the Status Groups of the Medieval Italian City*

Wherever the *popolo* was completely successful, the nobility was, from a purely formal point of view, left with only negative privileges. While the offices of the commune were open to the *popolani*, the offices of the *popolo* were not open to the nobility. The *popolani* enjoyed special privileges of trial procedure if they had been insulted by a *nobile*. The *capitano* and the *anziani* supervised the administration of the commune, while no similar control over the *popolo* existed. At times only the resolutions of the *popolo* concerned the entire citizenry. In many cases the nobility was explicitly excluded temporarily or permanently from any participation in the administration of the commune; the most famous is that of the Florentine *Ordinamenti della giustizia* of Giano della Bella in 1293. The *capitano*—in Florence the leader of the burgher levy of the craft guilds—was supplemented by an extraordinary, purely political official with a very short term of office: the *gonfaloniere della giustizia* (standard-bearer of justice), who was put in command of a special people's militia of one thousand men drawn by lot and subject to immediate call. He was to protect the *popolani*, to prosecute nobles and to execute sentences against them, and to supervise the observance of the *ordinamenti*. The politicized judicial system with an official spying network, abetment of anonymous accusations, an accelerated inquisitorial procedure for magnates, and much simplified methods of proof (by "notoriety") was the democratic counterpart to the Venetian trial before the Council of Ten. The materially most incisive measures against the nobility included: the exclusion from the city offices of all families adhering to a knightly style of life, the exaction of pledges for loyal conduct from the nobility and the imposition of liability for each member's behavior upon the entire patrician family, the passing of special penal laws for political offences of the *magnati*, including that of insulting a *popolano*, and the prohibition of purchasing real estate bordering on the property of a *popolano* without having obtained the permission of the latter.

The guaranty for the rule of the *popolo* was assumed by the interlocal *Parte Guelfa*, whose party statutes were treated as part of the city law. Only enrolled party members could be elected to a city office. The power instruments of the party have already been discussed. The very fact of a guaranty by a party organization which was essentially based on knightly military forces makes it reasonable to assume that the *ordinamenti* had not really destroyed the social and economic power of the patriciate. Indeed we find that within ten years after the promulgation of

these Florentine class laws, which had been adopted by numerous other Tuscan cities, the feuds between noble families flourished once again; the rule by small plutocratic groups was never interrupted at all. Even the offices of the *popolo* were nearly always filled with noblemen, for noble families could be accepted among the *popolani* by an explicit act. The exacted renunciation of the knightly style of life was only partially effective; basically it amounted to no more than a pledge of political obedience and enrollment in one of the craft guilds. The important social effect was a certain fusion of the urban *magnati* with the *popolo grasso* (the "fat people"), a term used to designate the *popolani* strata with a university education or capital wealth which were organized in the seven "upper" guilds (*arti maggiori*) of the judges and notaries, bankers, merchants of foreign cloth, merchants of Florentine woolens, silk merchants, doctors and druggists, and fur dealers. Initially all city officials had to be elected from these upper guilds in which the noblemen enrolled. Only after several additional insurrections did the fourteen "lower" guilds (*arti minori*) of the *popolo minuto*—i.e., those of the small entrepreneurs—gain a formal share in the power. The artisan strata that did not belong to these fourteen lower guilds obtained a very temporary share in the government only after the *Ciompi* revolt of 1378—in fact, they obtained an independent guild organization only then.[6] Only in a few places and temporarily did the small burghers manage, as in Perugia in 1378, to exclude by law from the council of *priores* not only the nobility, but also the *popolo grasso*. Characteristically, these lower propertyless strata of the citizenry as a rule enjoyed the support of the *nobili* in their attack against the rule of the *popolo grasso*, just as in later years the *tyrannis* was founded with the aid of the masses. Even earlier, in the thirteenth century, the nobility and these lower strata had frequently coalesced against the onslaught of the burghers. Whether such alliances came about, and how strong they were, was determined by economic factors. The interests of the small artisans could collide very sharply with those of the entrepreneurial guilds wherever the putting-out system was fully developed. In Perugia, for instance, the pace of this development was so stormy that in 1437 one individual entrepreneur put to work not only 28 *filatori* but also 176 *filatrici* [i.e., male and female spinners], as Count Broglio d'Ajano has shown.[7] The situation of the small artisans under the putting-out system was often precarious, their employment frequently discontinuous. Out-of-town workers competed for the jobs, and hiring by the day was practiced. The entrepreneurial guilds sought to regulate the conditions of the putting-out contract in as one-sided a manner as the guilds of the artisan producers

working for them which, like the *cimatori* of Perugia, prohibited the underbidding of established wage scales.[8]

These strata obviously expected nothing good from the rule of the "upper" crafts. However, they nowhere obtained permanent political power. The proletarian stratum of travelling journeymen, finally, was everywhere without any share in the city government. The participation of the "lower" crafts for the first time brought an at least relatively democratic element into the city councils, but their factual influence nevertheless remained small. The custom of appointing special commissions for the election of officials, which was common to all Italian communes, was supposed to eliminate demagogy and to establish a line of political responsibility for the election managers—men who are often anonymous and not held accountable in the modern European democratic polity. The system made possible a careful selection and orderly organization of the officiating council members and officials, but normally it was bound to issue in compromises between only the socially influential families; above all, it could never ignore the desires of the financially decisive strata. Only in times of competition for power between several families of equal strength or in periods of religious excitement could "public opinion" gain any positive influence on the composition of municipal officialdom. The Medici, for instance, gained dominance in Florence without themselves holding office, merely through utilizing their influence and a systematic manipulation of such election procedures.

The successes of the *popolo* were not achieved without violent and often long drawn-out struggle. The nobility would withdraw from the cities, to continue its feud against them from its castles. The urban armies, in turn, would break the castles; at times the cities would shatter the traditional seigneurial constitution of the countryside through legislative acts declaring the liberation of the peasantry. The means of power, which it needed for crushing the nobility, the *popolo* found in the recognized organizations of the craft guilds. The communes had utilized the "craft" organization from the very beginning for administrative purposes; they had also drafted the tradesmen, in guild-based units, for guard duty in the fortifications and increasingly also for campaign service as foot soldiers. Financially, the aid of the entrepreneurial "crafts" increasingly became indispensable with the advance of military technology. The intellectual and administrative backbone of the *popolo* was supplied by the jurists, above all by the notaries and often also by the judges, and by the other learned professions such as the physicians and druggists. These intellectual strata, which as a rule were organized

in "crafts" of their own, always belonged to the *popolo* and played a leading role similar to that of advocates and other jurists within the *tiers état* in France. The first captains of the *popolo* had in most cases previously been heads of one of the craft guilds or of a guild association. The *mercadanza* in particular, originally a non-political association of the traders and artisan producers (for in Italy, too, as Ernst Salzer has emphasized correctly, the term *mercatores* covers both groups and not merely the merchants),* normally constituted a first stage in the political organization of the *popolo;* its presiding officer, the *potestas mercatorum,* frequently became the first *capitaneus populi.*

The entire development of the *popolo* was initially oriented towards an organized protection of the interests of the *popolani* before the courts, corporations and agencies of the commune. As a rule the movement was triggered by the often far-reaching denial of legal rights to commoners. It happened not only in Germany that purveyors and craftsmen were paid with the cudgel rather than in the desired coin, and subsequently found no remedy in the courts (as is reported in a Strassburg case). Even more inciting seem to have been the personal insults and threats dealt out to the *popolani* by the militarily superior nobility, which continued to recur everywhere even a century after the formation of the separate political association of the *popolo.* The status pride of the knighthood and the natural resentment of the bourgeoisie forever made for collisions.

The development of the captaincy of the *popolo* thus began with a right of assistance and control against the authorities of the commune, similar in type to the rights of the Roman tribune of the *plebs;* from there it developed into a vetoing power, and ultimately into a coordinate office with universal competencies. The rise of the *popolo* was aided by the feuds of the patrician families, which injured the economic interests of the burghers and often provided the first occasion for the intervention of *popolani* officials. An additional favorable factor to be mentioned was the ambition of individual noblemen to utilize the *popolo* for the erection of a personal tyranny. The nobility everywhere lived in continuous apprehension of such desires, and everywhere the divisions within the ranks of the nobility gave the *popolo* the opportunity to enrol the military power of one part of the knighthood in its own service. On the purely military side, the growing importance of the infantry vis-à-vis the knightly cavalry threw its first shadows over these events. It did so in combination with the beginnings of rational military technology: In the Florentine armies of the fourteenth century we first hear of the "bombards," the forerunners of modern artillery.

4. *Ancient Parallels:* Plebs *and Tribune in Rome*

The development of the *demos* and the *plebs* in Antiquity shows many external similarities to the above development. This is especially true for Rome, where the rise of the separate political community of the *plebs*, with its own officials, is quite comparable to that of the *popolo*. The *tribuni plebis* were originally elected heads of the non-noble citizenry of the four city districts, and the aediles, in the opinion of Eduard Meyer, were the administrators of the corporate cult sanctuary which at the same time was the treasury of that group; hence they were also the treasurers of the *plebs*.[10] The *plebs* itself was constituted as a sworn brotherhood which undertook to strike down anyone obstructing its tribunes in their defense of plebeian interests—for this is what is implied in the designation of the plebeian tribune as *sacrosanctus*, as contrasted to the "legitimacy" of the officials of the entire community of Rome.[11] Analogously, the Italian *capitano del popolo* normally lacked the designation *dei gratia* which the officials with legitimate power, the *consules*, used to append to their titles.

The *tribunus plebis* thus did not possess legitimate authority of office and its identifying characteristics: the right to commune with the gods of the city, the *auspicia*, and the most significant attribute of legitimate *imperium*, the right to inflict legitimate punishment.[12] In place of the latter he had, as the head of the *plebs*, the power to execute a sort of lynch law against anyone caught obstructing his official actions: without trial and judgment, he could have such persons arrested and executed by having them thrown off the Tarpeian rock. In close parallel to the *capitano* and the *anziani*, the powers of office which the tribune later did possess developed from his right to intercede and to inhibit official actions of the magistrates against plebeians. This right of intercession—a negative power common to all Roman officials for use against coordinate or inferior authorities—was orginally the main right of the tribune. Just like the *capitano*, he developed this right into a general power of review and veto, and thus into the *de facto* highest power within the limits of the urban peace district. On campaigns, however, the tribune had no say: there, the command of the chief military officer prevailed without restrictions. This territorial limitation, which did not apply to the older authorities, is a characteristic reflection of the specifically "bourgeois" origin of the tribunate.

The political accomplishments of the *plebs* were made possible by the tribunitian veto power alone. Through it, the *plebs* obtained the right of *provocatio*, i.e., to challenge criminal verdicts [in the plebeian assembly], the mitigation of the law of debtorship, the scheduling of

court sessions on market days (in the interest of the rural population), and an equal participation in the state offices, ultimately including also the priestly offices and the council. Finally, it was through the tribunitian veto that the *plebs* managed to get its resolutions (*plebiscita*) recognized as binding for the entire community. This achievement which, as we saw, was sometimes also attained in the Italian communes, was put into force in Rome through the *lex Hortensia* at the time of the last secession of the *plebs* [287 B.C.]. Formally, of course, this signified the same curtailment of patrician power as it did in medieval Italy.

After the culmination of the older *status* struggles in this event, the tribunate moved out of the political limelight. Like the *capitano,* the tribune now became an official of the commune, and his position became one stage in the developing career sequence of municipal magistracies, an office which differed from other offices only in that election was by the *plebs* alone. The historical differentiation between plebeian and patrician was in any case becoming almost devoid of meaning in practical life as a new nobility developed, based on office-holding and wealth (*nobiles* and *equites*). In the *class* struggles, which now began, the old political rights of the *tribuni plebis* were not again powerfully reasserted until the time of the Gracchi, when they were used as instruments in the service of the political reformers and of the economic class movement of the politically disadvantaged "bourgeoisie" in its conflict with the office nobility.[13] It was the ultimate effect of this revival that the tribunitian power later became, in addition to the military *imperium,* one of the life-long official attributes of the *princeps.*[14]

These similarities between the medieval Italian and the early Roman development are very striking, especially since they appear in spite of fundamental political, social and economic differences, which will be discussed soon. It is a fact, after all, that only a limited variety of different administrative techniques is available for effecting compromises between the status groups within a city. Similarities in the forms of political administration can therefore not be interpreted as identical superstructures over identical economic foundations. These things obey their own laws.

5. *Ancient Parallels:* Demos *and Ephors in Sparta*

We may now ask whether this Roman development did not have parallels in Antiquity itself? Separate political associations like that of the *plebs* or the Italian *popolo* cannot be found elsewhere in the ancient world, as far as is known. But there are phenomena of a somewhat re-

lated character. Even in Antiquity the ephors of Sparta were viewed by some (Cicero, *de Re Publica* ii. 59; *de Legibus* iii. 16) as a parallelism of this kind. It is essential, however, to interpret this correctly.

In contrast to the "legitimate" [two Spartan] kings, the [five] ephors ("overseers") had a limited term of office of one year; like the Roman tribunes, they were elected not by the three [original Doric] clan phylae, but by the five territorial phylae of the Spartiates. The ephors convoked the citizen assembly; they had jurisdiction in civil and also in criminal matters (though perhaps not without limitations in the latter sphere), summoned even the kings before their chair, compelled officials to give an accounting of their actions, and suspended them. The administration was under their control, and together with the elected council of elders, the *gerousia*, the ephors in effect constituted the supreme political power within the Spartan territories. In the city district the kings were restricted to honorific privileges and purely personal influence; on campaigns, however, they held the full disciplinary power, which in Sparta was exceedingly severe. It was probably a phenomenon only of the late period that ephors accompanied the kings also during campaigns. It does not speak against a tribunitian quality of the ephors' power that they may have originally been appointed by the kings—perhaps, as some believe, even after the First Messenian War;[15] the same may in fact have been true for the first *tribus* heads in Rome. Nor does the more weighty fact that they lacked the typical tribunitian power of intercession—a power also possessed by the medieval *capitanei populi*—negate the assumption of a tribune-like character of the ephorate. The tradition, of course, states that the original function of these officials was to protect the citizens against the kings. The later absence of this function is to be explained from the unconditional victory of the Spartan *demos* over its opponents, and from the fact that the *demos* itself was subsequently transformed into a ruling class, originally plebeian, but later in fact oligarchic, which exercised an absolute control over the entire country. A nobility was unknown in Sparta during the historical period. The polis jealously guarded its rulership position vis-à-vis the Helots—against whom a "declaration of war" was ceremoniously pronounced each year in order to provide a religious justification for their status as outlaws—and likewise its political monopoly position vis-à-vis the Perioeci, citizens who were not members of the military association of the Spartiates.[16] But equally jealously, at least in principle, it guarded the internal social equality of the full citizens. Both principles were sustained by a spying system reminiscent of Venice, the *krypteia*.[17] According to the tradition, the Lacedaemonians were the first Greeks to have abolished the usage of a distinct costume as part of the noble style

of life, which thus must have existed previously.[18] Both these sumptuary regulations and the severe restriction of royal power almost certainly were the results of a struggle and subsequent compromise. Convincing evidence for this can be seen in the oaths mutually exchanged [once each month] between the kings and the ephors—a kind of periodically renewed constitutional contract. Some doubts [about the rational or revolutionary origin of the ephorate] are raised, however, by the fact that the ephors seem to have exercised certain religious functions. The explanation for this may be that they became "legitimate" communal officials to a much greater extent than the Roman tribunes. At any rate, the crucial features of the Spartan polis too strongly suggest a rational design to be residuals of very ancient institutions.[19]

6. *Stages and Consequences of Democratization in Greece*

A. DIFFERENTIAL VOTING RIGHTS

In the other Hellenic communities we can find no such parallels to the Roman development. However, everywhere we do find democratic movements of the non-noble citizenry against the patriciate which, in the majority of cases, led to the temporary or permanent removal of patrician domination. As in the Middle Ages, this signified neither an equalization of all citizens with respect to voting rights and eligibility for the offices or the council, nor even the admission of all free families entitled to settle in the town into the citizens' association. The freedmen, by contrast to Rome, here never did belong to it. The political equality of the free-born citizenry was vitiated by the gradation of voting rights and office eligibility, originally in terms of ground rents and armed service capabilities and later according to wealth. This gradation of rights was never completely abolished even in Athens, just as in the medieval cities the unpropertied strata nowhere permanently obtained equal status with the middle class.

The voting right in the general citizens assembly was either granted to all land owners attached to the demes[20] and enrolled in the military association of a phratry—this was the first stage of "*Democ*racy"—or also to the owners of other types of wealth. The decisive criterion was initially the capacity to equip oneself for service in the hoplite infantry, with whose emergence this upheaval was associated. The mere gradation of voting rights, as we shall see shortly, was by no means the most important instrument for preserving the preponderance of the propertied

strata. As in the Middle Ages, the formal composition of the burgher assembly could be regulated in ever so many ways and its formal competencies could be meted out ever so generously without a seriously destructive effect on the social power of the property owners.

The evolution of the *demos* produced different results in various places. The immediate, and in some cases permanent, result was the development of a Democracy externally similar to that found in many Italian communes: The wealthiest stratum of non-noble citizens, classified according to some census and mostly owners of money, slaves, *ergasteria*, ships, or trading and loan capital, gained a share in the council and the offices beside the patrician families whose position was mainly based on landed property. The mass of the small tradesmen, retailers, and people of small fortunes in general might remain excluded from the offices either legally or in practice because they could not afford the time. Or else, democratization might continue and eventually put the power into the hands of these very strata. In order that this could happen, however, means had to be found to mitigate their economic unavailability for public service—as through payments of daily allowances—and the census requirements for eligibility for office had to be reduced. But this and the *de facto* non-observance of the official stratification of the *demos* into classes based on wealth was achieved only in the fourth century, as the final form of Attic Democracy. It could come about only after the *military* importance of the hoplite army had disappeared.

The complete or partial victory of the non-noble strata had two particularly important consequences for the structure of the political association in Antiquity and for its administration: [firstly, the rise of the compulsory territorial organization and of territorial legislation; secondly, the replacement of notables in the administration by functionaries of the *demos*.].

B. THE RISE OF THE COMPULSORY TERRITORIAL ORGANIZATION AND OF TERRITORIAL LEGISLATION

We first consider the increasing transformation of the political association into a compulsory organization (*Anstalt*). One aspect of this development was the establishment of the territorial principle for political subdivisions. Just as in the Middle Ages the bulk of the citizenry was organized on the basis of local urban districts already during the rule of the patriciate, and as later at least some of the *popolo* officials were elected by city wards, so in the ancient patrician city, too, the plebeians were organized on the territorial principle, especially for the

purpose of allocating *corvées* and other public burdens. Beside the three old personal *tribus* in Rome, composed of *gentes* (sibs) and *curiae*, there appeared four purely territorial urban districts which were also called *tribus* and which after the victory of the *plebs* were joined by the [thirty-one] rural *tribus*. In Sparta four, later five, territorial phylae appeared beside the three old personal phylae. In the specifically "democratic" Greek states the victory of Democracy was identical with the passage [from a clan subdivision] to the "deme" (*demos*), the territorial district, as the subunit of the state and the basis for allocating duties and rights in the polis. We will soon have to consider the practical significance of this change. Its consequence, at any rate, was the treatment of the polis no longer as a confraternity of defence and clan associations, but as a compulsory territorial organization (*anstaltsmässige Gebietskörperschaft*).

Another factor in this development was the change which occurred in the thinking about the nature of law. The law became the law of a compulsory organization (*Anstaltsrecht*), valid for the citizens and inhabitants of the city territory as such (although, as we saw earlier, there remained residuals of the previous state of affairs). At the same time it increasingly became rationally instituted law. The irrational charismatic *ad hoc* determination of right and wrong came to be replaced by the statute. Parallel to the removal of patrician rule ran the beginnings of legislation. Initially it still had the form of charismatic legislation by an *aisymnetes*. But before long we find a continuous (and in the end unceasing) creation of new law in the *ekklesia* (assembly) and a purely secular administration of justice tied to the instituted law or, as in Rome, to the edictal instructions by the responsible magistrate. In Athens, the *demos* was eventually asked each year anew whether the existing laws should be maintained or amended. This indicates how widely accepted the proposition had become that valid law is and must be something artificially created, and that it should be based on the consensus of those to whom it is to apply. To be sure, in the period of classical Democracy —as in Athens of the fifth and fourth centuries—this conception had not yet become the prevalent one. Not every decision (*psephisma*) of the *demos* was a law (*nomos*), and not even all those which set up general norms. Decisions of the *demos* could be considered illegal, and then they might be contested by any burgher before the Attic jury court, the *heliaia*. At least at that time, the decision of the *demos* did not itself create a law. The actual enactment took the form of a legal contest, initiated upon the proposition of a new law by a citizen, as to whether the old or the newly proposed rule should be considered valid. This litigation was conducted before a special college of jurors, the

nomothetai (lawgivers); it obviously represents a rather quaint residue of the older concept of the nature of law, which disappeared only relatively late.[71] But the first decisive step toward acceptance of the notion of law as a rational creation had been taken in Athens with the abolition of the religious and aristocratic veto, the agency of which had been the Areopagus, through the law of Ephialtes [in 462 B.C.].

C. THE REPLACEMENT OF NOTABLES BY DEMOCRATIC FUNCTIONARIES

The other consequence of "democratization" to be noted is the ensuing administrative revolution. Functionaries of the *demos*, elected or chosen by lot for short terms, responsible to the assemblies and sometimes removable, or even entire subdivisions of the *demos* itself, replaced the notables ruling by virtue of family or office charisma. The new functionaries were "civil servants," but not in the modern meaning of the word. They received only moderate compensation for their expenses, or daily allowances like the jurymen, who were also drawn by lot. This, as well as the short periods of office tenure and the very frequent prohibition of reelection, precluded the development of the professional character of a modern officialdom. There was no career sequence of positions, nor a special status honor of the civil servants. Official business was discharged as an intermittent activity, which for the majority of office holders did not require their full attention, and the office revenues constituted even for men without means only an incidental, though desirable income. To be sure, the highest political positions, above all the military posts, demanded the incumbents' full working capacity; hence they could be occupied only by the well-to-do. For the financial officials in Athens, the place of our bond insurance system (*Amtskaution*) was taken by high census—i.e., wealth—requirements. In essence, these higher offices were honorary (unpaid) positions.

The real political leader created by the fully developed Democracy in Periclean Athens, the demagogue, as a rule formally occupied the leading military position. In fact, however, his power rested not upon law or office, but entirely upon personal influence and the trust of the *demos*. Thus his position was neither "legitimate" nor even "legal," even though the entire constitution of Democracy was tailored to his existence, just as the modern constitution of England is tailored to the existence of the cabinet which also does not rule by virtue of competency regulated by statute. The comparison could be extended; thus, *mutatis mutandis*, the prosecution of the demagogue because of poor leadership would correspond to the vote of no-confidence of the English Parliament, which also has never been formally instituted through legislation. The Athenian Council, whose members were drawn by lot,

now became a mere executive committee of the *demos;* it lost its judicial competence, but acquired control over the agenda of the Assembly (through the *probouleuma*) and over financial matters.[22]

In medieval cities, the seizure of power by the *popolo* had similar consequences: Numerous revisions of the urban law book, codifications of civil and trial law, a veritable flood of statutes of all kinds characterize the one side of the picture, and a spring tide of officials, of whom four to five dozen categories were sometimes to be found even in the smaller German cities, typify the other side. In addition to the auxiliary personnel of the clerks and bailiffs aiding the burgomasters, we find a host of specialized functionaries who officiated only intermittently and for whom the office revenues, mainly fees, constituted only a side-income, albeit a desirable one. Another trait common to both ancient and medieval cities, at least the large ones, was that numerous affairs which today are usually handled by the regular representative assemblies would be handed over to special boards selected through balloting or by lot. Thus in Hellenic Antiquity, legislation was organized in this manner, but also other political functions such as, in Athens, the ratification through oath of articles of confederation and the distribution of the tributes paid by the confederates. In the Middle Ages, the elections—both of officials (especially the more important ones) and of the chief legislative colleges—frequently were handled in this way. This practice was a kind of substitute for a system of representation, which, in the modern form, did not exist at the time. Such "representatives" as did exist could only represent associations, as befits a state of development in which all political rights have the character either of traditional status honors or of granted privileges. In the ancient Democracy, units so represented would be the associations entering into a cult or political community (a state), or perhaps the component parts of a confederacy; in the Middle Ages they would be the craft guilds and other corporations. Only the *special rights of associations* found "representation," not the rights of the varying "electorate" of a territorial district as in modern parliaments.

7. *Illegitimate Rulership: The Ancient* Tyrannis

Another trait common to both the ancient and the medieval city is the appearance of the city *tyrannis*, or at least of attempts to establish it. In both periods this was a locally restricted phenomenon. On the Hellenic mainland, the government in a number of large cities, among them Athens, was seized by tyrants in the seventh and sixth centuries B.C., but none of these regimes lasted more than a few generations.[23]

Here the urban liberties normally perished only after conquest by a superior military power. In the colonial areas, by contrast—in Asia Minor and especially in Sicily—the spread of the city *tyrannis* was more permanent and in part provided the definitive constitution of the city state to the time of its collapse.

The *tyrannis* was everywhere the product of the struggle of status groups. In a few cases, as in Syracuse, it seems to have been the nobility, pushed into a corner by the *demos*, which helped a tyrant to establish his rule. But on the whole the regime of the tyrants was based on sections of the middle class and on the debtors of the patricians, and their foes were the noble families, whom they exiled, whose estates they confiscated, and who conspired against them. What finds expression here is the typical class contrast of the ancient world: between an urban military patriciate as creditors and the peasantry as debtors—a contrast which existed everywhere from Israel and Mesopotamia to the Greek and Italic world. In Babylon, the countryside had almost entirely come into the possession of the patricians, whose *coloni* the peasants had become. In Israel, debt servitude was one of the subjects regulated in the "Book of the Covenant" [*Ex.* 21:1–6; *Neh.* 10:31], and all usurpers from Abimelech to Judas Maccabaeus found support in the fugitive debt slaves. The promise of Deuteronomy runs to the effect that Israel shall "lend unto many nations" [*Deut.* 15:6]; i.e., that the citizens of Jerusalem shall be the creditors and patricians and all others their debt servants and peasants. The class contrasts in Hellas and Rome were similar. Once established, the tyranny was usually supported by the small peasants, a party of the nobility which was in alliance with them, and parts of the urban middle classes. As a rule it relied on a bodyguard, and for the Greek demagogue—e.g., for Peisistratos—the grant of such a guard by the citizenry was usually just as much the first step towards the establishment of a *tyrannis* as later in medieval Italy for the *capitano del popolo*. The tyrants also employed mercenaries. Their substantive policies often attempted to smoothen class and status conflicts, no less than did those of the *aisymnetai* like Charondas and Solon.[24] Apparently the appointment of an *aisymnetes* for the reordering of the state and the law or the elevation of a *tyrannos* were often alternative solutions for the same set of problems. The social and economic policies of both the aesymnetes and the tyrants, at least on the mainland, sought to prevent the sale of peasant land to the urban nobility and the immigration of peasants into the city. In some places they attempted to restrict the purchase of slaves, the consumption of luxuries, brokerage (middlemen's) trade, and grain exports—all measures characterizing an essentially petit-bourgeois economic policy which corresponds to that of the medieval "city economy" to be discussed later [sec. *iv*: 10E below].

The tyrants perceived themselves, and were perceived everywhere, as specifically "illegitimate" rulers. This differentiated their entire position, both in its religious and its political aspects, from the old city-kingships. Quite regularly they were supporters of new emotional cults, especially of the cult of Dionysos, in contrast to the ritualistic cults of the nobility. As a rule they sought to preserve the external form of their commune's constitution, and thereby their claim to legality. At its downfall, their regime usually left the patrician stratum much weakened, and therefore under compulsion to purchase the cooperation of the commoners, which was necessary for the expulsion of the tyrant, with far-reaching concessions to the *demos*. In Athens, the middle-class democracy of Cleisthenes followed the expulsion of the Peisistratids. In some places, it is true, a merchant plutocracy succeeded the tyrants. This early type of *tyrannis* built on *economic* class conflicts had the effect, at least on the Greek mainland, of facilitating a timocratic or democratic solution to the status struggles, of which it frequently was the precursor. The successful or unsuccessful attempts to establish tyrannies in the late Hellenic period, by contrast, were outgrowths of the expansionary policy of the *demos* and had their origin in the *military* interests of that group, which will be discussed later. Victorious army leaders like Alcibiades and Lysander tried to establish tyrannies of this type.[25] On the Greek mainland such attempts remained unsuccessful until the Hellenistic period, and the military empire-formations of the *demos* there disintegrated again, for reasons to be discussed later [sec. vii below]. In Sicily, by contrast, both the early expansionist maritime policy in the Tyrrhenian Sea and the later national defense against Carthage were led by tyrants who created an interlocal military monarchy supported by mercenary armies in addition to the burgher levies and resorting to the most ruthless measures of an oriental type, such as compulsory mass naturalization of mercenaries and resettlement of the population of subjugated cities. Rome, finally, where in the early republican period various developments that might have led to a *tyrannis* had failed, ultimately fell prey to a military monarchy, in the wake of the great conquests, for internal social and economic reasons which will be discussed separately.

8. *Illegitimate Rulership: The Medieval* Signoria

In the Middle Ages, the city *tyrannis* remained largely, if not entirely, confined to Italy. The Italian *signoria*, which Eduard Meyer has likened to the ancient *tyrannis*,[26] does indeed have certain traits in common with the latter. It, too, was predominantly the creation of one

wealthy family in opposition to other members of the status group; it was the first political power in Western Europe which based its regime on a rational administration with (increasingly) *appointed* officials; it also in most cases retained certain forms of the traditional communal constitution. But beyond this, important differences have to be noted. Firstly, while we do indeed find that frequently a *signoria* developed directly out of the status struggle, very often it first appeared only after the victory of the *popolo*, and in some instances only a considerable while later. Furthermore, while the *signoria* in most cases developed directly out of the legal offices of the *popolo*, the city *tyrannis* in Hellenic Antiquity normally represented only one of the intermediate phenomena between the patrician rule and timocracy or democracy.

The formal development of the various Italian *signorie* took a number of different courses, as Ernst Salzer, in particular, has shown very clearly.[27] One group of *signorie*, an entire series, was the direct product of revolts of the *popolo* and developed out of its new offices. The *capitano del popolo*, the *podestà della mercadanza*, or also the *podestà* of the commune came to be elected by the *popolo* for increasingly longer periods or even for life. Such long-term supreme officials are found as early as the middle of the thirteenth century in Piacenza, Parma, Lodi, and Milan. By the end of that century, the rule of the Visconti in Milan was already hereditary in practice, as was that of the Scala in Verona and the Este in Modena. Parallel to the development toward tenure for life and initially *de facto*, later legal, inheritability of the office, went an expansion of the sphere of jurisdiction of the supreme official. Beginning as an "arbitral,"[28] purely political penal power, it developed into a general commission (*arbitrium generale*) to issue all kinds of orders in competition with the council and the commune, and finally into a rulership (*dominium*) with the right to govern the city *libero arbitrio*, to fill the offices, and to issue decrees which had the power of laws.

This assignment of powers had two different political sources which, however, frequently coincided in substance. One was the problem posed by party governments—above all, the constant threat to the very survival of the state, and thereby also to the economic *status quo* and especially to land ownership, which emanated from the defeated party. The installation of party captains with unlimited powers was made necessary especially by the existence of a nobility accustomed to war and by the constant fear of conspiracies. The second source is to be found in the external wars, the threat of subjugation by neighboring communes or princes. Wherever the latter factor predominated, it usually was the creation of a special military commander, the *capitano della guerra*, who

was either a foreign prince or a *condottiere*, that provided the source of the *signoria*, and not the party leadership of the *capitano del popolo*. Under such conditions, the voluntary subjection of a city under the rulership of a prince in order to secure his aid against external threats often was effected in a manner which narrowly limited the rights of the *dominus*. Within the city a power seeker normally could most easily gain support from the broad lower strata of craftsmen ordinarily excluded from active participation in the administration. In part this was so because for these groups a change did not signify any loss, while the presence of a princely court promised economic advantages, and in part because the masses everywhere are emotionally responsive to the display of personal power. As a rule, the aspirants to the *signoria* therefore made use of the "parliaments" to effect the transfer of power.[29] But occasionally, when threatened by political or economic opponents, the patrician families or the merchant class also used the instrument of a *signoria*, which initially was nowhere viewed as the permanent establishment of a monarchy. Cities such as Genoa repeatedly imposed very restrictive conditions upon powerful monarchs under whose *dominium* they committed themselves, including above all limitations upon their military power and firmly fixed money payments, and at times they even dismissed such "protectors." When the *dominus* was a foreign monarch this usually succeeded; thus Genoa at one time dismissed the king of France. But it rarely succeeded against a *signore* who had once taken up residence in the city.

9. *The Pacification of the Burghers and the Legitimation of the* Signoria

It is noteworthy that in the course of time both the power of the burghers to resist and their inclination to do so declined. The *signori* based their regime on mercenary armies and increasingly also on connections with the legitimate authorities. In Italy, except for Venice and Genoa, the hereditary *signoria* constituted the form of city government definitively legitimized by imperial and papal recognition after the subjection of Florence with the help of Spanish troops [in 1530]. The declining resistance of the burghers, however, must be explained by a number of separate factors. Here as everywhere, the very existence of a princely court created its own support in the form of growing strata in the nobility and the bourgeoisie with social and economic vested interests in its survival. The increasing refinement of wants and the slowing down of economic expansion together with a growing vulnerability to

warlike disturbances of the higher bourgeois strata's economic interests; the general decline in political aspirations of the economically active groups, associated with increasing competition and growing economic and social stability, and the consequent exclusive devotion of these groups to gainful economic activity or the peaceful enjoyment of *rentier* incomes; and finally, the general policy of the princes who furthered both these developments to their own advantage—all these were responsible for the rapid decline of interest in the political fate of the city. Both the large monarchies, like the French, and the *signorie* of single cities could everywhere count on the interest of the lower strata in the pacification of the city and in a regulation of economic conduct which professed to safeguard the "living" of the small burgher. The French cities were subjected to the rule of the crown with the help of these petit-bourgeois interests, and in Italy similar tendencies propped up the *signorie*.

The most important element, however, was an essentially political development: the pacification of the citizenry through its preoccupation with economic concerns, its declining habituation to military service and, finally, through the deliberate disarming of the urban population by the princes. It is true that this was not always their policy from the very beginning; in fact, some princes developed the first rational recruitment systems. But these soon developed into drafts of the poor only, if that was not their initial character; while this was in accord with the general type of patrimonial army formation, it was thoroughly foreign to the spirit of the republican burgher army. But the field had already to a large extent been cleared for the princes by the transition to the use of mercenary armies and to the capitalistic method of employing entrepreneurs (*condottieri*) to raise and lead the troops, changes necessitated by the increasing economic indispensability of the burghers and by the growing need for professional training in military matters. These factors had already been working toward the pacification and disarmament of the burghers during the time of the free communes. An additional element was provided by the personal and political connections of the city princes with the great dynasties, against whose power any uprising of the burghers would have had no chance of success. Ultimately, thus, it was the same series of factors, the general significance of which we have discussed before, which provided the *signoria* with the chance to develop into a hereditary patrimonial princeship: the increasing economic preoccupation of the burghers, the military disqualification of the educated strata of the bourgeoisie, and the rationalization of military technique in the direction of a professional army, combined with the development of status groups of noblemen, *rentiers*, and prebendaries

with vested economic or social interests in the existence of a princely court. Wherever these chances were utilized, the *signoria* thereby entered into the circle of legitimate powers.

The policies of the *signoria* share one tendency, of preeminent interest here, with those of the ancient *tyrannis*: the tendency to break up the political and economic monopoly position of the city in relation to the countryside. As in Antiquity, it was very often the rural population with whose aid the aspirant to power compelled the transfer of the rule—for instance, in 1328 in Padua.[30] To its own economic advantage and for political reasons, the free urban citizenry had often destroyed the manorial system of the countryside after its victory over the patriciate, freeing the peasantry and furthering the free transfer of land to the highest bidder. It was under the rule of the *popolo grasso* that massive acquisitions by the burghers of landed property from the feudal lords took place, and that in Tuscany the manorial constitution based on compulsory labor services of the peasantry was replaced by the [yield-sharing] *mezzadria* tenancy, an institution peculiarly adapted to the relations between primarily urban landowners whose only ties to the countryside consist of a *villegiatura* and their rural tenant farmers.[31] Yet, the rural population—even the free peasant landowners—remained excluded from all participation in political power. As the *mezzadria* was tailored to the economic interests of urban landowners, so the urban policy toward the countryside was adapted to the interests of the urban consumer and, after the victory of the guilds, also to those of the urban producers. The policy of the princes nowhere changed this immediately, and in some places never at all. The famous physiocratic policy of Grand Duke Leopold of Tuscany in the eighteenth century was influenced by certain natural-law concepts and was not, or at least not primarily, a policy of agrarian interests.[32] Nevertheless, the policy of the princes, which on the whole was directed to the balancing of interests and the avoidance of sharp collisions, was certainly no longer the policy of an urban citizenry using the countryside merely as a means towards its own ends.

Often, and ultimately in the majority of cases, the dominion of the city princes encompassed several cities. They did not, however, create out of these hitherto independent urban territories unitary states in the modern sense. Quite to the contrary, the individual cities tied together under the rule of a single prince frequently continued to have both the right and the occasion to communicate with each other through ambassadors. Their constitutions certainly were not standardized, nor did they become [subordinate] municipalities which fulfilled certain state functions merely by virtue of a delegation of powers from the state. A

development of this kind occurred only gradually, in conjunction with the similar transformation of the great modern patrimonial states. Representations of the Estates—such as were known in the Sicilian kingdom already in the Middle Ages, but also in other old patrimonial monarchies—were almost completely absent in the principalities which developed out of city territories. The important organizational innovations of the *signorie* are to be found in other developments, namely: (1) in the appearance of princely officials employed for indefinite periods at the side of the communal officials elected for short tenures, and (2) in the development of collegiate central agencies, above all for financial and military functions. These constituted indeed important steps toward the rationalization of administration. The establishment of a rational princely administration under the urban *signoria* was technically aided by the fact that many communes had in their own financial and military interest already created a volume of statistical records unusual for that time, and that the art of account- and record-keeping had received its technical development in the urban banking houses. A more important influence in the indubitable rationalization of administration, however, probably stemmed from the example of Venice on the one hand, and of the Sicilian kingdom on the other—an influence which probably worked more through stimulation than by way of direct adoption.

10. *Urban Autonomy, Capitalism, and Patrimonial Bureaucracy: A Summary*

The circular path of the Italian cities from a stage in which they were component parts of patrimonial or feudal structures, through a period of independence obtained by revolution with a government of local notables and then of the craft guilds, followed by the *signoria* and finally again by a position as component parts of relatively rational patrimonial associations—this cycle has no exact counterpart in the Occident. In particular, there is no counterpart for the *signoria;* at best one could find a parallel for the immediately preceding stage, that of the *capitaneus populi,* in some of the most powerful burgomasters north of the Alps. In one respect, however, the circular type of development was universal: In the Carolingian period, the cities were nothing—or almost nothing—but administrative districts, differentiated from other administrative units only by certain peculiarities of their status structure, and in the modern patrimonial state they were again very close to this

position, distinguished only by certain corporate privileges. In the intermediate period, they were everywhere to some degree "communes" with autonomous political rights and an autonomous economic policy.

The development in Antiquity was similar. Yet, neither modern capitalism nor the "state" as we know it developed on the basis of the ancient city, whereas the medieval city, though not the only significant antecedent developmental stage and certainly not itself the carrier of these developments, is inseparably linked as one of the crucial factors with the rise of both phenomena. Hence, in spite of all external similarities, we should be able to discern some very far-reaching *differences* between the ancient and the medieval city development. This problem we will turn to next.

These differences will be most easily recognized if we juxtapose the city types of both periods in their most characteristic forms. Before we approach this comparison, however, we should stress that among the medieval cities themselves there were also very significant structural differences, which so far we have dealt with only *en passant*. But for the moment we shall only recapitulate the *overall* situation of the medieval cities at the time of their greatest independence, a period in which we may hope to find their specific traits most fully developed.

At the apogee of urban autonomy the attainments of the medieval cities display an extraordinary variety of forms which can be summarized under the following headings.

A. POLITICAL AUTONOMY

The medieval urban commune gained political independence and, in some cases, conducted an expansionist foreign policy, maintaining a permanent military force, concluding alliances, conducting long wars, holding large land areas and occasionally other cities in complete subjection, and acquiring overseas colonies. With respect to overseas colonies, only two Italian maritime cities [Venice and Genoa] succeeded in the long run; domination over great land masses and international political importance was obtained for certain periods by some communes in northern and central Italy and in Switzerland, and to a far lesser degree by the Flemish and some of the North-German Hansa cities, and by very few others. But the great majority of cities never exercised territorial rule beyond the immediate rural environment and a few small towns nearby; this holds for the cities of southern Italy and Sicily, for the Spanish cities but for a short, and for the French cities but for a longer intermezzo of territorial expansion, and from the very begin-

ning for the English and German cities (with the exception of the North-German and Flemish cities already mentioned, some South-German and Swiss ones, and a number of western German cities during the short period of the [13th century] town leagues). It is true that many of these cities maintained a permanent force of town soldiers (in France until a very late period), or else, and this is the normal case, that they had a conscripted burgher militia which defended the walls and sometimes was strong enough to enforce the *Landfrieden* (territorial "peace") in confederation with other cities, to destroy the castles of robber barons and to intervene in the feuds of the country. But none of them sought to engage in international politics over long periods in the manner of the Italian and Hanseatic cities.

Most of these cities sent reprensentatives either to the Estates of the realm or of their local territory, and not infrequently, because of their financial power, they acquired the decisive voice in these bodies even if they were assigned a formally subordinate position. The most important example are the Commons of England, even though they constituted a representation not so much of urban communes as of local corporations of the various status groups. But many cities did not exercise even such rights (the details of the legal history would take us too far afield). On the Continent, the modern patrimonial bureaucratic state eventually deprived most of them of their political autonomy as well as of their military powers, except for police purposes. Only where, as in Germany, the patrimonial state developed in the form of rather small structures, did it have to permit the independent political survival of some of the city states.

A special course of development is to be noted also in England, due there to the absence of a patrimonial bureaucracy. Under the tight organization of the central administration, the individual English cities had never developed separate and individual political ambitions because they defended their interests in Parliament as a group. They had formed trade cartels, but not political town leagues as on the Continent. They constituted corporations of a privileged stratum of notables, and their good will was financially indispensable to the state. During the Tudor rule, the crown had sought to destroy their privileges, but the collapse of the Stuarts put an end to this. From that time on they remained corporations with the right to elect parliamentary representatives, and both the "Kingdom of Influence" and the noble cliques utilized the often ridiculously small and easily purchasable electoral colleges ["rotten boroughs"], which was all many of them represented, to obtain compliant parliamentary majorities.

B. AUTONOMOUS LAW CREATION

Autonomous law creation by the city, and within it again by the [old] guilds and the [later] "crafts," was a right fully exercised by the politically independent Italian cities, and at times by the Spanish, English, and a considerable part of the French and German cities although it was not always expressly granted to them by charter. To problems of urban landownership, market relations, and trade, the city courts, with burghers as lay judges (*Schöffen*), applied a uniform law specific to all burghers of the given city. The law itself might be based on custom or autonomous legislation, or on imitation, adoption, or imposition in the founding charter of another city's legal system. City courts increasingly excluded from the trial procedure such irrational and magical means of evidence as duels, ordeals, and clan oaths, in favor of rational procedures of presenting evidence. This development, however, should not be thought of as running a straight course: at times the adherence to a special trial procedure in the city courts signified the conservation of older legal forms in the face of rational innovations by the royal courts, as in England (absence of the jury), or the preservation of medieval law against the penetration of Roman law, as on the Continent. In the latter case the legal institutions adaptable to capitalism had their origin precisely in the urban law systems (it being in the cities that early capitalist interests had some autonomy), and not in the Roman (or Germanic) "law of the land" (*Landrecht*).

The city governments, for their part, sought to establish the rule that the guilds and "crafts" could not legislate [for their own courts] without the magistrates' consent, or they at least tried to limit such legislation to the guilds' assigned area of jurisdiction. For all cities which had to reckon with a political or manorial city lord—and this means, for all outside of Italy—both the extent of urban autonomy and the distribution of legislative power between the council and the craft guilds was forever unstable and a question of power.

The developing patrimonial bureaucratic state everywhere increasingly curtailed the autonomy of the cities. In England the Tudors were the first systematically to assert the principle that the cities as well as the "crafts" were corporately organized state institutions for definite purposes, with rights which could not exceed the privileges outlined in the charter, and with legislative powers binding only citizens who were members of the corporation. Any offense against these restrictions was used as an opportunity to have the charters cashiered in a *quo warranto* action (a fate which London experienced as late as under James II). In this view, as we saw, the city was not a "territorial body"

but a privileged association of the local status groups (*ständischer Verband*), in the administration of which the Privy Council continuously interfered. In France, the cities were in the course of the sixteenth century deprived of all judicial powers, except for police matters, and for all financially important acts permission of the state authorities came to be required. In Central Europe, the autonomy of the cities under the authority of the territorial princes was as a rule completely destroyed.

C. AUTOCEPHALY

Few cities other than those of Italy achieved full autocephaly: i.e., none but their own judicial and administrative agencies. Non-Italian cities often obtained it only for the lower [non-capital] jurisdiction, normally with the reservation of appeal to the royal or supreme territorial court. Wherever the passing of judgment was in the hands of lay judges (*Schöffen*) taken from the citizenry, the identity of the judicial overlord was a matter primarily of fiscal interest, and the cities often did not see any need to appropriate or purchase the formal jurisdiction. What mattered to them was that the city be a separate judicial district, with lay judges chosen from their midst. At least for the lower jurisdiction, and partially also for the capital jurisdiction, this right was obtained in relatively early times. Independent election of the lay judges or co-optation by the officiating panel without interference from the lord was achieved by most cities. Also important was the attainment of the privilege that a burgher be responsible only to the court of his city.

The development of the urban administrative agency, the Council, we cannot investigate here. The existence of such a body, provided with far-reaching administrative powers, was the identifying mark of every city commune in western and northern Europe at the height of the Middle Ages. The manner of its composition varied endlessly. It was determined to a great extent by the actual power position of the various groups: the patrician families (the owners of land rents and monetary wealth, the financiers and occasional merchants), the bourgeois merchants, often enrolled in the "crafts" (either long-distance traders or large retailers and putting-out entrepreneurs for industrial products), and, finally, the purely artisan "crafts" properly so called. The balance of *economic* power between the burghers and the political or manorial lord of the city, on the other hand, determined the degree to which the latter continued to participate in the nominations to the council, and thus to what extent the city remained partially heterocephalous. The directly relevant factor was the lord's need for money, for this made possible the purchase of his urban rights; the obverse of this, of

course, was the financial strength of the cities. However, the financial needs of the city lords and the financial power of the city were not alone decisive [for their relative strength] if the city lords possessed *political* means of power. In France the royal government—which under Philip Augustus [r. 1180–1223] had still been allied with the cities—and to a small extent also other feudal lords obtained already in the thirteenth century through their mounting money requirements the right, in the form of *pariage* contracts, to participate in the filling of administrative positions, control rights over the conduct of office of the urban magistrates, especially in the field of fiscal administration, which was of particular interest to the king, and the right of confirming the elected consuls in their offices.[38] By the fifteenth century the royal *prévôt* presided over the burgher assembly. In the age of Richelieu and Louis XIV, finally, the offices of the city were completely in the hands of the royal *intendant*, and the financial troubles of the state led to the filling of both city and state offices by sale.

The patrimonial-bureaucratic state transformed the administrative agencies of the city into corporate representations of the privileged status groups whose jurisdiction applied only to the circle of their corporate interests, but without significance for the functions of state administration. The English state, which had to retain the autocephaly of the city corporations because they were electoral bodies for Parliament, simply by-passed the city when it wished to have local associations execute those functions which our municipalities fulfill nowadays and made the parish—to which not only the privileged corporation members, but all qualified inhabitants belonged—or some other newly created association the executor of these tasks. Most of the time, however, the patrimonial bureaucracy simply transformed the urban magistrates into agencies of the sovereign alongside all others.

D. TAXING AUTONOMY

Next, we consider the problem of the city's taxation power over its burghers, and its freedom from taxation and other charges by outside powers. The former they obtained to very varied extent; the control rights of the city lord were often preserved to some degree, although at times they were completely abolished. In England the cities never possessed full taxing autonomy and always needed the consent of the crown for all new taxes. Full freedom from rent (*Zins*) and tax obligations toward the outside was rarely achieved. Cities not politically autonomous obtained this freedom only when they could farm the tax obligation, paying off the city lord either once and for all or, more

frequently, through periodical lump sums, and could then take the collection of the royal taxes under their own management (*firma burgi* in England). The elimination of obligations to the outside everywhere succeeded most completely with respect to personal duties deriving from the former personal subjection of burghers to judicial or manorial lords.

While after its victory the typical patrimonial-bureaucratic state differentiated the city from the countryside for taxation purposes, seeking to hit production and consumption equally through a specifically urban tax, the excise, it at the same time deprived the cities almost entirely of their autonomous taxing power. In England the imposition of taxes on the cities as corporate bodies had little significance, since most of the new administrative tasks fell on other types of communities. In France the crown appropriated one half of the urban excise (*octroi*) from Mazarin's ministership on, all city financial operations and the internal taxation having been brought under state control already earlier. In Central Europe the urban agencies were in this respect, too, transformed into almost pure state organs.

E. MARKET RIGHTS AND AUTONOMOUS URBAN ECONOMIC POLICY

The right to hold markets; autonomous trade and craft regulation and monopolistic powers of exclusion. — The market was part of every medieval city, and the supervision over the market had everywhere in considerable measure been taken out of the hands of the city lord by the council. In later periods, the regulation of trade and production was concentrated either in the hands of the municipal authorities or in those of the craft associations, depending upon the local power structure; the city lord continued to be largely excluded.

The urban policy of economic regulation comprised [a wide range of activities and motivations].[84] Quality control over production was exercised partly in the interest of enhancing the reputation—and thus the export interests—of the trades, and partly in the interest of the urban consumers. Price control was basically exercised in the interest of the consumers. Another goal was the protection of the "living" of the small burghers, pursued by means of restrictions imposed upon the number of apprentices and journeymen, and at times also upon the number of masters; with the narrowing of subsistence opportunities, the monopolization of master positions for native sons, especially for masters' sons, intensified. Wherever the craft guilds directly controlled economic regulation, they attempted to counteract the development of capitalistic dependency on outsiders and large entrepreneurs by prohibiting the putting-out system, imposing controls on capital loans,

regulating and organizing the supply of raw materials and, at times, also the sale of the finished products. Above all else, however, the city sought to prevent competition from the countryside under its domination; hence it sought to suppress the establishment of rural industrial enterprises and to force the peasantry (in the interest of the urban producers) to purchase its requirements in the city and (in the interest of the urban consumers) to sell its output on the market of the city and only there. Also in the interest of the consumers (and occasionally in that of industrial users of raw materials), it tried to prevent "forestalling" of wares outside the urban market. Finally, in the interest of its merchant population, the city sought to impose "staple" and brokerage monopolies for goods passing through its own territory, while at the same time trying to gain free-trade privileges abroad.

These core points of the economic policy of the so-called "city economy" (*Stadtwirtschaftspolitik*), varying according to the manifold compromise possibilities of conflicting interests, can in their principal features be found almost everywhere. The direction taken by the policy of any particular city was determined not only by the internal power relationship of the interested parties, but also by the range of economic opportunities open to them. The expansion of this range in the first period of settlement initiated policies directed toward a widening of the market; its constriction after the end of the Middle Ages was accompanied by tendencies toward monopolization. But beyond these generalities each city had interests of its own which collided with those of competitors; especially among the long-distance trade cities of the South, a life-and-death struggle prevailed.

The patrimonial-bureaucratic state did not at all intend a basic break with the policies of the "city economy" stage of development after the subjugation of the cities. Quite to the contrary: In the interest of its revenues, the state was as much concerned with the economic prosperity of the cities and their industries and with the maintenance of population size through the preservation of urban "livings" as it was, in the interest of a mercantilist trade policy, with the stimulation of foreign trade; the measures for the latter it could copy, at least in part, from the urban long-distance trade policies. The patrimonial state sought to balance the conflicting interests of the cities and other groups, and in particular attempted to reconcile the petit-bourgeois approach of protecting the "living" with policies friendly to capitalist stirrings. Almost up to the eve of the French Revolution, it violated the principles of the traditional economic policy only where the local monopolies and privileges of the burghers obstructed its own, ever more capitalistically oriented, policy of monopolies and privileges. It is quite true that in

individual instances even this could lead to a very drastic disruption of the burghers' economic privileges, but only in exceptional local cases did it indicate a deliberate rupture with the traditional approach. Nevertheless, the autonomy of urban economic policy and regulation was lost, and indirectly this could, of course, have considerable significance.

Yet more decisive was the inability of the city to bring military-political means of power into the service of its interests, such as the patrimonial-bureaucratic prince could apply. Even the new economic opportunities opened by the policies of the patrimonial state could only rarely be exploited by the cities as public bodies, as they could be—and were—exploited by the princes themselves. It lies in the nature of the case that these opportunities were open only to individuals, above all to socially privileged individuals; thus we find that in the typical, monopolistically privileged, domestic and overseas undertakings of English and French patrimonialism, relatively many members of the landed nobility and of the higher officialdom participated beside the kings themselves, but relatively very few burgher elements. Occasionally, it is true, certain cities—such as Frankfurt—participated in spite of such obstacles for city account in speculative foreign undertakings, at times on a very large scale. But in most cases this turned out to be very much to their disadvantage, since a single failure was bound to hit them much more severely than it would a large political unit.

The economic decline of numerous cities, especially after the sixteenth century, can only in part be explained by a shift in the trade routes (it also occurred at precisely the same time in England), and also only in part by the establishment of large home industries based on non-urban labor. To the greatest part it must be explained by other, more general conditions. Foremost among these is the fact that the traditional forms of enterprise integrated in the "city economy" no longer were the ones which could generate the really great profits, and, further, that both the politically oriented and the commercial and industrial capitalist undertakings simply no longer found a useful support in policies of the "city economy" type, just as had happened earlier in the case of feudal military technology. Even where these undertakings were formally located in the city, they could no longer be sustained by an entrepreneurdom tied locally to the individual burgher association. The new capitalist undertakings settled in the new locations suitable for them, and for help in the defense of his interests—insofar as he required any at all—the entrepreneur now appealed to powers other than a local burgher association. Just as in England the Dissenters, who played so important a role in the capitalistic development, remained outside of the ruling city corporation in consequence of the Test Acts,[85]

so the great modern commercial and industrial cities of England arose entirely outside of the precincts—and thus of the monopoly-power spheres—of the old privileged corporations. It is for this reason that they frequently displayed a completely archaic judicial structure: The old manorial courts, the "court baron" and "court leet," existed in Liverpool [into the seventeenth century] and in Manchester up until the modern reform, the manorial lords having merely been bought out as lords of the court.[36]

F. ATTITUDE TOWARD NON-CITIZEN STRATA

The specific political and economic characteristics of the medieval city also determined its attitude to non-citizen strata, an attitude which shows very different features in different cities. They all shared, to begin with a common element, the economic contrast to the specifically non-urban political and feudal-manorial structures, which can be summarized in the antithesis: market versus *oikos*. This antithesis should not be thought of simply as an economic "struggle" between political or manorial lords and the city. This did occur, of course, wherever the city, in the interest of expanding its power, admitted politically or manorially dependent persons against the wish of their masters inside the walls or, even worse, as non-resident members into the burgher association. The latter expedient was soon made impossible, at least in the Nordic cities, by princely leagues or royal prohibition. But the *economic* development of the city as such was nowhere contested as a matter of principle; the objections arose rather against the city's *political* independence, and in specific cases—which were not rare—over economic issues because particular economic interests of the feudal nobility clashed with the commercial policies and monopolistic tendencies of the cities. The feudal military interests, the kings in the forefront, of course viewed with the highest misgivings the development of autonomous fortresses within their political territory. The German kings in general, except for very short periods, never abandoned such misgivings. The French and English kings, by contrast, were at times quite friendly toward the cities, partly for political reasons associated with their struggle against the barons, partly because of the importance of urban financial power.

Neither did the tendency of the urban market economy to dissolve manorial and, indirectly, feudal structures—which indeed asserted itself with varying degrees of success—necessarily assume the form of a "struggle" of the cities against other interests. Quite to the contrary: over broad areas there were strong common interests. Both political and manorial lords were extremely interested in the monetary revenues

which they might be able to obtain from their peasant subjects, and it was the city which provided the latter with a local market for their products and hence with the possibility of paying their dues in money rather than in services or products, or else the city provided the lord with the opportunity to turn his in-kind income into money instead of consuming it himself, through sale either on the local market or abroad via the increasingly capitalistic long-distance trade. The political and manorial lords made energetic use of these possibilities, either by demanding money rents from their peasants, or by utilizing the market-stimulated self-interest of the peasants in higher production through the creation of larger farming units which in turn could deliver a higher share of the output as marketable rents-in-kind. Also, the more strongly local and long-distance trade developed, the more money revenues could the feudal nobility derive from the exceedingly large variety of tributes levied on this traffic; western Germany provides a good example even in the Middle Ages.[87]

For all these reasons, the foundation of cities was from the viewpoint of the founders primarily a business undertaking, the creation of opportunities for money revenues. Economic interests of this kind motivated the innumerable "city"-foundations by the nobility in the East, especially in Poland, even at the time of the Jewish persecutions—often fail-starts whose citizenry, frequently numbering only a few hundreds, at times was still in the nineteenth century up to ninety per cent Jewish. This specifically medieval and North European type of city foundation as a "business" undertaking constitutes, as we shall see, a direct antithesis to the military fortress-town foundations represented by the ancient polis. The conversion of almost all personal and material claims of the manorial and judicial lords into rent claims, and the resulting (in part fully *de jure*, in part merely *de facto*, yet far-reaching) economic freedom of the peasantry—which did not come forth wherever the city development was weak—was the consequence of the fact that the lordly political and manorial revenues in the territories of intensive city development could increasingly be fed from the market sale of peasant products or of peasant deliveries in kind, and beyond this from sources of the market economy, all of which replaced the direct exploitation of personal service obligations of the subjects or the allocation of delivery obligations for household wants in the manner of the ancient *oikos* economy. Both the lord and, to a lesser degree, his dependents now increasingly supplied their requirements through the money economy. Another important element in this transformation of the landlord-peasant relationship was the buying out of the rural nobility by the urban burghers, who then converted the estates to rational forms of economic operation. This process, however, met with barriers

wherever the feudal associations required eligibility to hold a fief (*Lehensfähigkeit*) for the ownership of "noble" land, a condition which the urban patriciate could satisfy almost nowhere north of the Alps.

The existence of a "money economy" itself, at any rate, did not create a clash of economic interests between the political or manorial lords and the cities; to some extent, as we have seen, it even created a community of interests. A purely economic collision arose only where the lords, in order to increase their incomes, sought to enter non-agricultural market production on their own, an attempt which naturally could be made only where a suitable labor force was available. Wherever this occurred, the struggle of the cities against such industrial production activities of the rural lords did indeed break out, frequently flaring up with particular intensity only during the patrimonial-bureaucratic period of modern history. In the Middle Ages, by contrast, this was hardly an important issue, and the factual dissolution of the old manorial association and of peasant bondage frequently proceeded without any struggle at all as the consequence of the advance of the money economy. This was the case in England. Elsewhere, to be sure, the cities directly and deliberately furthered this development; this as we saw, is what happened in the Florentine power sphere.

The patrimonial-bureaucratic state sought to harmonize the contrasting interests of the nobility and the cities. However, since it wanted to use the nobility as officers and civil servants, it prohibited the purchase of noble estates by non-nobles, including the urban citizenry.

G. THE CITY AND THE CHURCH

On this last issue the ecclesiastic, and especially the monastic seigneuries were during the Middle Ages much more on a collision course with the cities than the secular lords. In general the clerics were, beside the Jews, the major specifically alien body within the city, especially after the separation of state and church in the Investiture Struggle. For their estates, as church property, they claimed far-reaching freedom from the public burdens and also "immunity," i.e., exemption from the spheres of jurisdiction of all officials, including the urban magistrates. As an Estate, the clerics themselves did not share in the military and other personal obligations of the burghers. At the same time, these burden-free properties, and thereby also the number of persons exempted from the jurisdiction of the urban authorities, continuously increased through the gifts of pious burghers. Moreover, in their lay brothers the monasteries had a labor force free of the obligation to support families, which therefore could easily underbid any non-monastic competition if, as was quite frequent, they were used in commercial industrial produc-

tion for the cloister's account. Also, the cloisters and religious foundations, like the *waqf* of medieval Islam, had on a very considerable scale brought into their possession the permanent sources of money rent in the Middle Ages: market halls, stalls of all kinds, shambles, mills and the like, which thereby were not only withdrawn from the urban tax roll but also exempted from the economic regulation of the city; on top of this, they frequently even claimed monopoly rights for these installations. Even in military respects the immunity of the walled cloisters could be dangerous to the city. Finally, the ecclesiastic court, enjoined to uphold the prohibition of usury, was everywhere a threat to bourgeois enterprise. Against the accumulation of landed property in *mortmain* the citizenry sought to protect itself through prohibitions, just as the princes and the nobility did through the "amortization laws."

On the other hand, however, a part of the urban trades found important profit opportunities in the religious festivals, especially if the city had a sanctuary which was the goal of pilgrimages and where indulgences were granted. And the religious endowments, insofar as they were open to the burghers, provided places of maintenance for the aged and for spinster daughters. For this reason the relations between the clergy and monasteries and the citizenry were by the end of the Middle Ages by no means so completely unfriendly, in spite of all collisions, that this element alone would suffice to provide an "economic explanation" of the Reformation. The ecclesiastic and monastic institutions were in fact not at all as inviolable for the city commune as the Canon Law would have had it. It has been pointed out quite correctly that in Germany the religious endowments and monasteries had lost their most interested protector against the laity when the power of the kings atrophied after the Investiture Struggle, and that the *avouerie*,[38] which they had thrown off, was very easily revived (even if in somewhat changed form) if they attempted to engage strongly in economic activities. In many cases the city council managed to subject them to a tutelary power very similar to that of the old *avoué* by pressuring them under the most diverse pretexts and titles to accept "curators" and "attorneys," who then conducted the administration of the ecclesiastic properties in accordance with the interests of the burghers.

The position relative to the burgher association of the clerics as a status group varied greatly. In some cases the clergy simply remained outside the city corporation, but even where this was not the case, it formed an uncomfortable and unassimilable alien body with its ineradicable status privileges. Within its territories the Reformation put an end to this state of things, but the cities, which shortly after were subjugated by the patrimonial-bureaucratic state, were no longer in a position to derive a benefit from this solution.

In this last respect the development in Antiquity had taken an entirely different course. The further back we go in time, the more the economic position of the temples resembles that of the churches, and especially of the monasteries, in the early Middle Ages, the peculiarities of which could be observed with particular clarity in the Venetian colonies [cf. above, sec. iii:2]. But the direction of the further development was not, as in the Middle Ages, towards an increasing separation of state and church and a growing independence of the ecclesiastic dominions; instead, it took precisely the opposite course. The urban patrician families appropriated the priestly positions as sources of fee revenues and power, and the rule of the *demos* turned them altogether into state offices, transforming them into prebends which ordinarily were sold at auction. Democracy thus destroyed the political influence of the priests and transferred the economic administration of the sanctuaries to the commune. The great temples of Apollo at Delphi and of Athena at Athens were the treasure houses of the Hellenic state and deposit banks for the slaves;[38] some of them also remained large landowners. But an economic competition of the temples with the bourgeois crafts did not appear in the ancient cities. A secularization of the sanctuaries' holdings did not and could not occur in the ancient world, but in substance (if not always in form) the "secularization" of the trades that once had been concentrated in the temples was carried out incomparably more radically in Antiquity than in the Middle Ages. The absence of monasteries, and of an autonomous interlocal church organization in general, was the essential reason for this difference.

Conflicts of the urban citizenry with the seigneurial powers were as widespread in Antiquity as they were in the Middle Ages and at the beginning of the modern period. The ancient city, too, had a peasant policy and an agrarian policy which destroyed feudalism. But the [spatial] dimensions of these policies were so much larger in Antiquity, and their bearing on the internal development of the cities so heterogeneous as compared to the Middle Ages, that here the difference between the two periods becomes very clear. This difference we shall now have to discuss in the general context.

NOTES

1. In Brun's reform, the urban nobility and the upper "crafts" were united in the corporation of the "Constabulary" (*Konstaffel*), which in case of war provided the mounted force. The *Konstaffel* had 13 representatives on the council, as had the 13 minor "crafts" of the small artisans. Cf. A. Largiadèr, *Geschichte von Stadt und Landschaft Zürich* (2 vols.; Zürich: Rentsch 1945), I, 133f.

2. *Paratici*: the "paraders;" a synonym for *arti*, the "crafts," perhaps deriving

from the practice of guild processions. Cf. *Dizionario Enciclopedico Italiano*, IX (1958), 40.

3. "They [i.e., the resolutions of the *popolo*] should nullify all statutes and should always be consi red last." From a Brescia statute instructing the *podestà*, ca. 1250; "Statuti Bresciani del secolo XIII," in *Historiae Patriae Monumenta*, XVI² (Torino, 1876), 1584⁰⁸.

4. *Mercanzia* was the term used in Florence, *domus mercatorum* or its Italian equivalent, *casa dei mercanti*, in Verona for the "merchants court". Cf. A. Doren, *Italienische Wirtschaftsgeschichte* (Jena: G. Fischer, 1934), 412ff.

5. The description seems to be based on the captaincy of Ghiberto di Gente in Parma, 1253. Cf. Ernst Salzer, *Über die Anfänge der Signorie in Oberitalien* ("Historische Studien," vol. 14; Berlin: Ebering, 1900), 150–157.

6. The *ciompi* were the dependent artisans of the Florentine crafts in general, and more narrowly the unskilled laborers of the *Arte della Lana*, the guild of the woolens trades. In the uprising of July, 1378 the lower artisan strata obtained the formation of three new *arti* to represent their interests: two for the skilled laborers of the woolens industry and some other trades, and one for the *ciompi* proper. The new guilds were to be given a one-third share in the government, but as that "long hot summer" continued with further unrest, the new guilds of the skilled workers joined with the entrepreneurial guilds to crush the *ciompi* after a second uprising one month later; their *arte* was abolished and the men reincorporated into the *Lana*. The other two new guilds survived, with a share in the city regime, until 1384 when they, too, were abolished and the members were forced to rejoin their original associations. For an early description of this "first proletarian revolution," see Machiavelli's *Florentine Histories*, bk. III; cf. also A. Doren, *Das Florentiner Zunftwesen vom 14. bis zum 16. Jahrhundert* (Stuttgart: Cotta, 1908), 221–236, and for the events culminating in the revolt, Gene A. Brucker, *Florentine Politics and Society 1343–1378* (Princeton: Princeton University Press, 1962), chs. VII–VIII.

7. Conte Romolo Broglio d'Ajano, "Lotte sociali a Perugia nel secolo XIV," *Vierteljahrschrift für Social- und Wirtschaftsgeschichte*, VIII (1910), 337–349. This case p. 334, the power seizure by the *arti minori* in 1378, p. 347.

8. Broglio d'Ajano, *op. cit.*, 340f. The *cimatori* were the shearers of cloth.

9. Salzer, *Über die Anfänge der Signorie*, *op. cit.*, 97, fn. 3.

10. Eduard Meyer, *Kleine Schriften* (first ed.; Halle: Niemeyer, 1910), I, 373. Both the tribunes and the aediles were officials of the *plebs*, in contrast to the "curule" magistrates—the consuls and praetors—who were officials of the entire community.

11. The *potestas sacrosancta* of the tribune is contrasted to the *potestas legitima* of the communal magistrate by Mommsen, *Römisches Staatsrecht*, II (3rd ed., 1877), 276f.; at least in name, religion provided the tribune with a surrogate for the inviolability based on law of the "legitimate" magistrates. The actual surrogate, of course, was the violent self-help of the plebeians.

12. *Auspicium imperiumque*, or the "authority to conduct, as the representative of the community, the business of the latter with the gods and with mankind," were the two aspects of *full* powers of communal office according to Mommsen. As representatives of only part of this community, the plebeian tribunes had only part of these powers. Cf. Mommsen, *Römisches Staatsrecht*, I, 73; II, 269ff., 272.

13. I.e., from the latter part of the second century B.C. on. Tiberius Sempronius Gracchus was plebeian tribune in 133 B.C., and his brother Gaius in 123 B.C. For Weber's reading of the Gracchian period, see *GAzSW*, 238ff., 253.

14. Augustus and later *principes* assumed the tribunitian powers (although not the tribunate itself) for the entire length of their reign; other offices of the republican period, such as the consulship, they held only intermittently and for short periods. Cf. Mommsen, *Römisches Staatsrecht*, II, 84 and fn. 4.

15. Second half of the eighth century B.C. The war ended with the Spartan conquest of the Messenian plain, which to the largest part was turned into Helotic land.

16. According to Plutarch (*Lycurgus*, ch. 28), the ephors each year declared war upon the Helots "so that their being murdered [by the *krypteia*—see the next note] should not violate sacred law;" the story is now generally thought to be apocryphal. On the respective status of the Helots, Spartan state slaves assigned to work the land of individual warriors, and the Perioeci, political subjects with a certain amount of autonomy, cf. Ehrenberg, *The Greek State*, 29, 36f.

17. Plutarch (*loc. cit.*) relates that the ephors periodically sent into the countryside armed groups of the most agile youths who would hide in the daytime and roam the roads at night, killing any Helots they met; this was known as the *krypteia* (secret service). This story was at one time interpreted as referring to a special police force for the suppression of the Helots, but nowadays seems to be generally discounted; the *krypteia*, which other ancient sources also mention, is now thought to have been a special hardening and initiation period in the education of Spartan youth—see art. "Krypteia" in Pauly-Wissowa, *RE*, XI (1922), cols 2031–32. Weber's identification of the institution with a "spying system" perhaps derives from the misreading of a passage in Eduard Meyer, *Geschichte des Altertums* (Stuttgart: Cotta, 1893), II, 563 (III, 518 in the post-war 3rd edition, Basel: Schwabe, 1954), where the suggestive name is mentioned almost in the same breath with a comparison of Venice and Sparta for their general police state qualities.

18. Thucydides, *History of the Peloponnesian War*, bk. I, ch. 6.

19. Weber here takes sides in a dispute of his day, connected with the problem of the Lycurgan constitution of Sparta, about the early or late, legitimate or revolutionary origin of the ephorate. In particular, the entire section seems to be a point by point argument with Szanto's art. "Ephoroi" in Pauly-Wissowa, *RE*, V (1905), cols. 2860–64, and against the position taken by Eduard Meyer in "Lykurgos von Sparta," *Forschungen zur alten Geschichte* (Halle: Niemeyer, 1892), I, 244–261. A similar emphasis on the revolutionary (but not on the altogether rationally instituted) nature of the historical ephorate, in part backed with the same arguments, is defended by Victor Meyer, "Spartiaten und Lakedamonier," *Hermes*, LIX (1924) 35ff. (now reprinted in *Polis und Imperium*, Zurich: Artemis, 1965) and *id.*, *Neugründer des Staates* (München: Beck, 1925), 44ff.

20. I.e., to the rural and urban territorial districts, the Attic *demoi*. Ehrenberg calls them "urban and country boroughs" (*The Greek State*, 31).

21. On the difference between *psephismata* and *nomoi*, and on the role of the *nomothetai*, cf. Ehrenberg, *The Greek State*, 56f. and the bibliography, 250; for the *heliaia*, cf. *ibid.*, 72.

22. On the relationship between the Athenian Council of Five Hundred (*boule*) and the Assembly (*ekklesia*), cf. A.H.M. Jones, *Athenian Democracy*, 105–122. A *probouleuma* or "pre-consultation" in the *boule* was required in most cases before a matter could be decided in the Ecclesia.

23. For a brief analysis of the Greek *tyrannis*, see now A. Andrewes, *The Greek Tyrants* (New York: Harper Torchbooks, 1963).

24. Charondas of Katanê (Catania) on Sicily, of uncertain date, seventh or

sixth century B.C.; his codification for Katanē was widely used in later city foundations. Solon of Athens, ca. 638–559 B.C.; on his reforms and their background, especially the economic aspects, cf. A. French, *The Growth of the Athenian Economy* (London: Routledge & Kegan Paul, 1964), 10–29; also Andrewes, *op. cit.*, ch. VII.

25. The opposing commanders of the Athenian and Spartan armies during the final phase of the Peloponnesian war, which ended with Lysander's victory at Aigospotamoi (405 B.C.) and his seizure of Athens (404 B.C.). Alcibiades, after a checkered career alternately in Athens and in the service of her enemies had himself created commander with unlimited powers (*strategos autokrator*) in 407 B.C., but was deposed and exiled in the same year after losing a battle to Lysander. The latter, militarily more successful, used his position as Spartan sea commander (*nauarchos*) to build a personal power base in the conquered cities, but ultimately failed to translate this into permanent rule in his home state where he was deposed in 403 B.C.

26. Eduard Meyer, *Geschichte des Altertums*, II, 613 (in the postwar re-issue: III, 566 fn. 1).

27. Salzer, *Die Anfänge der Signorie*, *op. cit.*, *passim*. The four main offices serving as springboards for the establishment of a *signoria*—those of the *podestà* of the commune, the captain of the *popolo*, the closely related *podestà* of the merchant court, and the military commander (*capitano della guerra*)—are taken up one by one *ibid.*, 26ff.

28. I.e., a judicial power unrestricted by the city statutes and not requiring the collaboration of the regular authorities normally needed (*sine illis de curia et collegio*), which, however, was limited to certain types of incidents, usually political ones, such as a rebellion. Cf. Salzer, *op. cit.*, 76 (for the *podestà*) and 171 (for the *capitano del popolo*).

29. The *parlamentum*, *contio*, or *arengum* was the general assembly of the citizenry (direct democracy), not—as the name might suggest—a "city parliament" of the modern type. The counterpart of the latter would be the "representative" assembly of the late medieval city council.

30. Submission of Padua to Can grande della Scala, *signore* of Verona. This surrender, after a struggle of almost two decades, was effected against the resistant parties within the city by Marsilio de Carrara, head of the Padovan "signorial" family, with the help of the peasants from the *contado*. Cf. Robert Davidsohn, "Beiträge zur Geschichte des Reiches und Oberitaliens," *Mitteilungen des Instituts für österreichische Geschichtsforschung*, XXXVII (1917), 402; now also J. K. Hyde, *Padua in the Age of Dante* (Manchester University Press, 1966), 280 and *passim*.

31. On the *mezzadria* tenure in Tuscany, a *métayage* (crop-sharing) form of land holding, cf. Robert Davidsohn, *Geschichte von Florenz*, I (Berlin: Mittler, 1896), 777ff.

32. The Habsburg successor of the Medici, Grand Duke Leopold I of Tuscany (r. 1765–1790), the later Emperor Leopold II (r. 1790–1792). Like his brother, Emperor Joseph II, he was much influenced by physiocratic doctrines, in the spirit of which he effected major reforms in the Grand Duchy. Cf. Hermann Büchi, *Finanzen und Finanzpolitik Toskanas im Zeitalter der Aufklärung (1737–1790) im Rahmen der Wirtschaftspolitik* ("Historische Studien," vol. 124; Berlin: Ebering, 1915).

33. Rights of *pariage*, or condominion, which were contracted voluntarily or under duress with many cities, monasteries or small city lords, in exchange for promises of protection or abatement of tax claims. The financial weakness of the

French crown became, in combination with military strength, an instrumental factor for obtaining such rights when translated into onerous tax burdens on which the cities defaulted, thus providing the king with a pretext for asserting control claims. Already Philip II Augustus during the long wars with the Angevins, but especially Louis IX (r. 1226–1270) greatly extended the royal domain through *par age* contracts. Cf. Robert Holtzmann, *Französische Verfassungsgeschichte* (Munich: Oldenbourg, 1910), 280ff.; art. "Cosignieurie" in *Grande Encyclopédie*, XII, 1129f.

34. For a less compressed summary of these policies, cf. A. B. Hibbert, "The Economic Policies of Towns," in *Cambridge Economic History of Europe*, III (Cambridge, 1963), 157–229.

35. The "Corporation Act" of 1661 and the "Test Act" of 1672 required all members of corporations and other officials, within a stated period after election or appointment, to receive Communion according to the rites of the Church of England and to sign a declaration against transubstantiation.

36. Liverpool had purchased all remaining manorial rights in 1672, and shortly thereafter began a vigorous economic development, whereas the Manchester "court leet"—the governing body of the town—remained the property of a baronial family until 1845, when the municipality bought itself off for the tidy sum of £200,000. Cf. J. Hatschek, *Englische Verfassungsgeschichte*, 700f.; arts. "Liverpool" and "Manchester" in *Encyclopedia Britannica*.

37. E.g., the fantastic Rhine river tolls of the thirteenth century: the *furiosa Teutonicorum insania*.

38. In early medieval Europe, the *Vogt* or *avoué* (i.e., "advocate") was the secular legal officer of a church or monastery, appointed by the crown and rewarded with a benefice out of the church patrimony. Outside of the towns, the office was, with the waning of royal power, increasingly appropriated by the nobility, both functions and rewards substantially expanding at the expense of the churches. On the development of the *avouerie*, see Marc Bloch, *Feudal Society*, trans. L. A. Manyon (Chicago: University of Chicago Press, 1961), 404ff.

V

Ancient and Medieval Democracy[1]

The special position of the medieval city in the history of political development does not, in the last analysis, derive from the essentially economic contrasts between the urban burghers and the non-urban strata and their economic life styles. The crucial element was, rather, the general position of the city within the total framework of the

medieval political and status associations. It is this aspect which differentiates the typical medieval city most sharply from the ancient city, but it is also with respect to this criterion that we can distinguish within the medieval period two types, albeit with somewhat fluid transitional forms, which nevertheless in their purest examples are very distinctly different: A southern European type, found especially in Italy and southern France, which in spite of all differences is much closer to the ancient polis than the other type, that of northern France, Germany, and England, which again in spite of a great variety of forms represents a unity with respect to the criterion now under consideration. We therefore have once again to turn to a comparison of the medieval city type with that of Antiquity and, wherever suitable, with those of other periods, in order to get a coherent picture of the basic causes for these differences.

The knightly patriciate of the southern European cities owned castles and estates outside the cities just as did that of Antiquity, for which we have several times already cited the example of Miltiades' [estates in the Chersonese]. The possessions and castles of the [Genoese] Grimaldi are found all along the coast line of Provence. Towards the North such conditions become much rarer, and in the typical central or northern European city of later times they were entirely absent. On the other hand, the medieval city also knew almost nothing of such phenomena as a populace which, like the Attic *demos*, expected and received municipal gratuities and pensions based entirely on the political power of the state [i.e., on the tributes exacted abroad and similar revenues]. Direct distribution of the economic yield of municipal properties, similar to the distribution of the profit from the Laureion mines[2] to the burghers of Athens, did, however, exist in medieval cities as it does in modern communities.

Origin of the Ancient Lower Class: Debtors and Slaves

The contrast between the lowest strata [of Antiquity and those of the Middle Ages] is very sharp. The ancient city experienced as the chief danger arising from economic differentiation, which all parties therefore sought to combat with varying means, the emergence of a class of full citizens, descendants of families with full citizenship rights, who were economically ruined, in debt, without property, no longer capable of equipping themselves for service in the army, and who hoped for a revolution or a tyranny from which they could demand a redistribution of land, a cancellation of debts, or support out of public

means: grain distributions, free admission to festivities, dramatic performances and circus fights, or direct doles from public funds to make possible their attendance at such performances. It is true that such strata were not entirely unknown in the Middle Ages; they could be found also in more recent times in the South of the United States, where the slave-holding plutocracy was confronted by the unpropertied "poor white trash." In the Middle Ages the debt-ridden *déclassé* strata of the nobility, for instance in Venice, were as much an object of concern as in Rome at the time of Catilina. But on the whole this problem played a very small role in the Middle Ages, above all in the democratic cities. It certainly was not the starting point for class struggles, as it typically was in Antiquity. For the class struggles of early Antiquity took place between the urban patriciate as *creditors* and the peasants as *debtors* or as dispossessed debt slaves. The *civis proletarius*, the "descendant"—namely, of a full citizen—was the typical *déclassé*.[3] In the later period this role fell to debt-ridden *Junkers*, like Catilina, who confronted the propertied strata and became the leaders of the radical revolutionary parties. The interests of the negatively privileged strata of the ancient polis were essentially *debtor* interests. But also *consumer* interests. Those interests, on the other hand, which in the Middle Ages constitute the pivot of city politics during the democratic period, the *producer* interests of the artisans, increasingly recede into the background in later Antiquity, although the early period of the rise of ancient Democracy had also been characterized by artisan-type policies concerned with a "fair living." The fully developed Democracy of the Hellenic cities, but also the fully developed rule of *honoratiores* in Rome, take into account little more than trading and consumer interests, at least as far as the urban population is concerned. The export prohibitions for grain, which the ancient polis had in common with the medieval city and the mercantilist state, did not suffice in Antiquity; hence the economic policy of that period was dominated by direct public provision for grain supplies. The grain gifts of friendly princes provided the main impetus in Athens for a revision of the citizenship rolls in order to exclude those not entitled to a share in the distribution.[4] Crop failures in the grain areas of the Pontus forced Athens to remit the tribute of the confederates, which shows to what extent economic capacity was ruled by the price of bread. Direct grain purchases by the polis are also found in ancient Greece, but grain tributes imposed on the provinces on a huge scale for free distribution to the urban citizenry appear only in the late republican period in Rome.

In the Middle Ages, the typical needy person was a poor artisan, a craftsman without work. In Antiquity, he was a "proletarian," a

former landowner who was politically *déclassé* because he no longer owned any real estate. Antiquity, too, knew an "unemployment" problem for its artisans; as the typical remedy it used the great public construction projects, such as those executed by Pericles.

The mass employment of slave labor in the trades affected their social position in Antiquity. To be sure, slavery was a permanent feature also in a number of medieval cities. In the Mediterranean maritime cities a real slave trade existed even to the very end of the Middle Ages and, on the other end of the continuum, as continental a city as Moscow, prior to the abolition of serfdom [1861], showed most of the characteristics of a large Oriental city of the time, say, of Diocletian: it was a place where rents derived from the ownership of land and souls, as well as office revenues, were consumed. But in the typical city of the medieval Occident, slave labor played a rapidly diminishing economic role, and ultimately none at all. Nowhere would the powerful craft guilds have tolerated the development of an artisan stratum of slaves, paying a "body-rent" to their master, as competitors of the free crafts. This is precisely what happened in Antiquity. There, any accumulation of wealth invariably signified an accumulation of slaves, and every war produced huge numbers of captives who swamped the slave markets.

In part these slaves were utilized for *consumption* purposes, i.e., in the personal service of the owners. The possession of slaves was one of the basic prerequisites for a conduct of life appropriate to the social standing of a full citizen in Antiquity. In the hoplite period, a time of chronic warfare, he could dispense with slave labor as little as the knight of the Middle Ages could do without that of the peasants. A man who had to live without any slaves was definitely a "proletarian" (in the ancient meaning of the word). The eminent families of the Roman nobility "consumed" the services of great numbers of slaves, who were engaged in the conduct of the great households in a very detailed functional division of labor and also produced a considerable part of the household needs in the manner of the *oikos* economy. Food and clothing for the slaves, however, were to the largest part obtained in the money economy. In Athens the household as a rule supplied itself entirely through the money economy, and this was even more true for the Hellenistic East. However, of Pericles [i.e., in the fifth century B.C.] it was still thought noteworthy to stress that he, for the sake of his popularity with the artisans, attempted to supply his needs whenever possible by purchase in the market rather than within the economy of his household.

At the same time commercial *production* in the ancient city was also to a considerable part in the hands of slaves. The *ergasteria* we

have discussed earlier; beside them appear independently established unfree artisans and small merchants. It should be obvious that the side-by-side employment of slaves and free citizens, such as we find in the mixed piecework groups laboring at the construction of the Erechtheion,[5] must have had a socially degrading effect on the evaluation of work, and that the economic competition of the slaves must also have been noticeable. For all that, the fullest expansion of the exploitation of slaves in ancient Greece fell precisely in the periods of Democracy.

2. *Constituencies of the City: Ancient Territorial Units versus Medieval Craft Associations*

This proximity of slave labor and free labor apparently also nipped in the bud any possibility of a development of craft guilds in Antiquity. It may be assumed, even though it cannot be definitively proven, that in the early days of the polis there existed beginnings of occupational associations. To all appearances these were organizations of the militarily important old war crafts, such as the *centuriae fabrum* in Rome and the *demiourgoi* in Athens at the time of the status struggles. But these beginnings of political organization disappeared without leaving a trace precisely during the democratic period, and, given the social structure of the crafts at that time, it could hardly have been otherwise. The ancient small burgher could be a member of a mystery congregation (as in Greece) or a *collegium* (as later in Rome) together with slaves,[6] but he could not join with them in an association which, like the craft guilds of the Middle Ages, claimed political rights.

The medieval *popolo*, in contrast to the patriciate, was organized on the craft guild principle. But precisely during the rule of the *demos* in the classical period of Antiquity, all traces of craft organizations are absent, in spite of the incipient development noted for an earlier period. The ancient "democratic" city was organized, instead, by "demes" (*demoi*) or "tribes" (*tribus*), that is, according to territorial and in fact (formally) primarily rural districts. This is a characteristic which, in turn, was entirely absent in the medieval city. To be sure, the subdivision of the *interior* of the city into wards was common not only to the cities of Antiquity and the Middle Ages, but to the Oriental and Far Eastern city as well. But the exclusive founding of all political organization on territorial communities and, above all, the extension of this principle to the entire *countryside* under the political rule of the city, so that formally the *village* became a direct subdivision of the *city*—this phenomenon was unknown in the Middle Ages and also in the cities

of all other areas. The "deme" divisions essentially coincided with village districts, historically formed or created *ad hoc*, and—like villages—the "demes" were equipped with a commons and with local authorities. The historical uniqueness of this type of *city*-constitution, which prevailed especially during the democratic period of the ancient polis, simply cannot be stressed too strongly.

By contrast, craft organizations as constituencies of the city are found in Antiquity only in the early period, and then only alongside other status corporations. They were used primarily for election purposes: so, in Rome, the *centuriae* of the *fabri* [craftsmen] alongside the *centuriae* of the *equites* [knights] in the old military class organization, and perhaps in early Athens—though this is entirely conjectural—the *demiourgoi* of a pre-Solonic compromise among the status groups.[1] The origins of such organizations could have been voluntary associations, as was certainly true for the very old *collegium mercatorum*, with its professional god Mercurius, which was taken into account in the political constitution of Rome. Or again, they could have their source in liturgical associations formed for military purposes, for the ancient city did, after all, originally rely for the satisfaction of public requirements on the involuntary services of the burghers.

Individual phenomena of a "city guild" type are indeed found in Antiquity. The cult association of the dancers of Apollo in Miletus, for instance, had an official status of a city-governmental kind (although its specific powers are not known), as is shown by the fact that the name of its president supplied the eponymic designation for the year. In one respect it finds its closest parallel in the city guilds of the medieval North, in another in the craft guilds of the magical dancers among American Indian tribes, of the magicians (Brahmans) in India, and of the Levites in Israel. But this cult association should not be pictured as a guest tribe of professional ecstatics. In historical times it probably was a club of *honoratiores* qualified to participate in the Apollo processions; its nearest medieval correspondence would thus be the *Richerzeche* of Cologne, with the difference that the ruling political burgher association is, in a manner typical of Antiquity (but not of the Middle Ages), identified with a separate cult community. If in late Antiquity, in Lydia, colleges of craftsmen are again found with *hereditary* wardens, which seem to have taken the place of the [political-tribal units, the] phylae, then we can almost certainly say that they must have had their origin in old craft-specialized guest tribes and thus represent a development more reminiscent of India than of the Occident. In the Occident an occupational organization of craftsmen first reappeared in the late Roman and early medieval *officia* and *artificia* of the manorial handi-

crafts. Later, during the transition to the Middle Ages, we find associations of urban handicraft workers producing for the market but personally tied to a master to whom they owed a "body rent"; these associations, however, which seem only to have served for the collection of the dues, may have had their origin in liturgical organizations formed by the lords. Alongside these groupings, which disappeared in time, we find those voluntary unions of *free* artisans—perhaps just as old as the former—which were organized for the purpose of monopolizing economic opportunities, and which later were to play the decisive role in the movement of the bourgeoisie against the patrician houses.

Nothing at all similar is found in the classic Democracy of Antiquity. Liturgical craft guilds, which may have existed in the early period of city development (even though not even traces of such units can be documented with any assurance apart from those Roman military and electoral associations), reappear only in the liturgical monarchies of late Antiquity. Free and voluntary unions were active in all possible spheres of life especially during the period of classical Democracy, but, as far as can be seen, they nowhere obtained or aspired to the character of craft guilds. Hence they are of no concern in the present context. If they had anywhere sought for the economic character of craft guilds, they would have had to disregard the distinction between free and unfree members, just as the medieval city later did, in spite of the existence of great masses of unfree artisans. But this would have required the renunciation of all *political* aspirations, which in turn would have produced important disadvantages in the economic sphere, the nature of which we shall soon discuss. The ancient Democracy was a "guild" of the *free* burghers only, and this determined its political functioning in all respects. Free craft guilds or similar unions therefore first began to form, as far as is known, precisely at the time when the political role of the ancient polis had definitely come to an end. But the idea of suppressing, expelling, or in some other way effectively limiting the number of the unfree and the free but not fully enfranchised craft workers (freedmen, metics) was one which ancient Democracy could no longer even consider since it was so obviously impracticable. The beginnings of such policies, which in a very typical way show themselves during the period of the status struggles and especially during the rule of the *aisymnetai* and *tyrannoi*, later vanish entirely precisely after the victory of Democracy. The extent to which the slaves of private masters were employed side-by-side with free citizens and metics on the public construction projects and in the production of state supplies during the very period when the rule of the *demos* was absolute seems to show that these operations could not have been con-

ducted without them—although it probably also shows that their owners were unwilling to forego the profits obtainable from their utilization on the public projects and had the power to prevent their exclusion. At least on the public projects the slaves would otherwise certainly not have been used. The productive capacities of the free trades operated by full citizens thus were not sufficient for major state needs.

The great structural difference between the fully developed ancient and medieval city, during the period of the rule of the *demos* here and of the *popolo* there, is manifested in this [neglect of artisan producer interests]. In the ancient city of early Democracy, dominated by the hoplite army, the town-dwelling craftsman—i.e., a man not settled on a "citizen's parcel" (*kleros*) and not economically capable of self-equipment for military service—played a politically negligible role. In the Middle Ages the city was led by the *popolo grasso*, the *grande bourgeoisie* of the large entrepreneurs, *and* by the small capitalists, the tradesmen of the *popolo minuto*. But within the ancient citizenry these strata had no—or at least no significant—power. If ancient capitalism was *politically* oriented, so was ancient Democracy. In the case of ancient capitalism, the interests were directed toward state supply contracts, state construction and armament, state loans (a political factor in Rome as early as the Punic wars), state expansion and booty in the form of slaves, land, tributes, and privileges in the subject cities with respect to the purchase of land, the lending of money on land, trade and deliveries. The political orientation of ancient Democracy was determined by the peasantry as long as it provided the core of the hoplite armies, whose interest was in the military acquisition of land for settlement purposes, and by the urban *petite bourgeoisie* with its interest in the direct and indirect revenues obtainable from dependent communes: the state building programs, the allowances paid for attending theater performances and *heliaia* court sessions, the grain and other distributions offered by the state at the expense of the subjugated peoples. Restrictive craft guild policies in the medieval manner would never have been permitted, in view of their consumer interests in cheap supplies of craft products, by the landowning strata which made up the bulk of the hoplite army at the time of its triumph in the compromises between the status groups under Cleisthenes in Athens and the *decemviri* in Rome.[8] And the later sovereign *demos* in Hellas, which stood under the influence of more specifically urban interests, no longer showed any interest in such policies and probably, as we have noted, also was no longer in a position to enact them.

The political aims and means of ancient Democracy thus were fundamentally different from those of the medieval *bourgeoisie*. This

also finds expression in the difference, mentioned several times already, between the political subdivisions of cities in the two periods.

In the Middle Ages the patrician houses did not vanish outright, but instead were often forced to enroll in the craft guilds, the new constituencies of the citizenry. This signified that they could be outvoted within these units by the middle classes and had thus formally lost part of their influence. Often, of course, the effect of such measures was to drive the craft guilds onto a path which turned them into plutocratic corporations of *rentiers*, such as the London "liveries." Nevertheless, such developments always signified an increase in the power of a specifically *urban* stratum either directly participating in commerce and the trades or indirectly interested in it: of the *bourgeoisie* in the modern sense.

In Antiquity, on the other hand, the old *personal* patrician family associations (the *gentes*, phylae and phratries) were replaced or joined by [*territorial*] subdivisions of the city state, the *demoi* and *tribus*, and these bodies or their representatives assumed all political power. This had two consequences. Firstly, it signified the dissipation of the influence of the patrician families, for their holdings, as is natural for land obtained through mortgage lending and debt foreclosure, were typically dispersed all over the territory and could now no longer be brought to exert concentrated political weight in a single constituency, but were reduced to diffuse effect on the individual *demoi* where the component parcels happened to be situated. There, in the "deme," the holding was now registered and taxed; this signified a far greater curtailment of the political power of large holdings than would today the incorporation of the manorial districts (*Gutsbezirke*) in eastern Germany into the rural communes.[9] Furthermore, and most importantly, the division of the entire city territory into *demoi* signified that henceforth all council positions and offices would be filled with representatives of these units, as happened in Hellas, or at least that the voting bodies would be organized according to *tribus*, as happened in Rome with the thirty-one rural and four urban *tribus* in the *comitia tributa*.[10] At least according to the original intention, this was to secure the dominance and the rule over the city not of town-dwelling, but of rural strata. Thus the revolutionary reorganization was *not* to signify a rise to political power of the urban, economically active burgherdom, as in the case of the medieval *popolo*, but the exact opposite: the political rise of the peasantry. This is to say: while in the Middle Ages the carrier of "democracy" was from the very beginning the stratum of the urban tradesmen, in the Cleisthenian period of Antiquity it was the peasantry.

3. *Excursus on Athenian* versus *Roman Constituencies*

Only in Rome, however, was this of factual importance also in the long run. For in Athens membership in a "deme" was a permanent and hereditary quality, independent of residency, landownership and occupation; one was born into it just like one was born into the phratry and the clan. The descendants of a member of the Paianian "deme"—such as, e.g., those of Demosthenes—remained for all centuries legally attached to this district, were taxed by it and drawn by lot for its offices, regardless of whether they retained any connections at all to the district through residence or landownership. This, of course, deprived the *demoi* of their character of local peasant associations as soon as a few generations of migration to the city had gone by. All kinds of urban tradespeople would by that time count as members of a rural *demos*. In fact the *demoi* became purely personal subdivisions of the citizenry, just like the phylae. As a result the burghers of Athens, who could always be present in the popular assembly, the *ekklesia*, were favored not only on this score but also increasingly came to constitute the majority within the formally rural *demoi* as the city grew.

The development in Rome was different, even though at one time a similar principle seems to have applied to the four old urban *tribus*. However, each of the later rural *tribus* comprised only those citizens who actually owned land there at any given time. With the abandonment of this property and the purchase of new property elsewhere, one changed one's *tribus*. The *gens* Claudia, for instance, in later times no longer belonged to the *tribus* which it had given its name. Just as in Athens—and actually much more so, because of the so much larger territorial expanse—this arrangement favored those *tribus* members who could attend the *comitia*, and that means those who lived in Rome. In contrast to Athens, however, such benefits accrued only to people who held land in the rural *tribus*, and then only if their properties were of such size that they could afford to live in the city while leaving the actual farming of their lands to others—in other words, the beneficiaries were landowning *rentiers*. Great and small *rentier* landlords thus dominated the Roman *comitia* after the victory of the *plebs*. The superior strength of the town-dwelling landed nobility in Rome and of the urban *demagogos* in Athens helped to perpetuate this difference between the two cities.

The *plebs* of Rome was not a *popolo*, a union of the craft guilds of artisans and traders, but rather a status association of the rural landowners capable of serving in full armour, of whom the town-dwellers alone as a rule dominated politics. The plebeians originally were not at

all smallholders in the modern sense, and even less a peasantry in the medieval sense, but rather the landowning stratum of the countryside which was economically capable of full military service: if socially not a "gentry," then at least a "yeomanry" with middle-class character in regard to size of landholdings and style of life at the time of the rise of the *plebs*. In other words: a stratum of "agrarian burghers."

In the course of expansion of the Roman state, the influence of the city-dwelling agrarian *rentiers* increased. By contrast, the entire urban artisan population remained organized in the four urban *tribus*, and therefore without political influence. The Roman office nobility always preserved this organizational principle, and even the Gracchian reformers were far from wanting to change it in favor of a "Democracy" of the Hellenic type. This "agrarian" character of the Roman army made possible the continued domination of the great city-dwelling senatorial families. Whereas Attic Democracy appointed its executive Council, the *boule*, by lot, and destroyed the veto power of the Areopagus, the old council composed of former officials and corresponding to the Senate, in Rome the Senate was retained as the directing agency of the city and no attempt was ever made to change this. The command of the troops always fell to officers from the urban noble families during the great expansion period. The Gracchian reform party of the late republican period, like all typical ancient social-reform movements, was above all interested in safeguarding the military capacity of the polity; it sought to check the proletarianization of the rural landowners through the land purchases of large landholders, and to strengthen their number; in order to maintain thereby the strength of the self-equipping burgher army. It, too, was thus by origin a rural party—in fact, so much so that the Gracchi, in order to obtain anything at all along these lines, felt constrained to seek an ally against the office nobility in the "knights" (*equites*),[11] the capitalist stratum interested in farming the state revenues and in state supply contracts which, because of its commercial activities, was excluded from participation in the offices.[12]

4. *Economic Policies and Military Interests*

It has been asserted, probably correctly, that the Periclean construction policy served also to provide employment for the Athenian artisans.[13] Since the building programs were financed from the tributes paid to the hegemonial city by the confederates, it was these who were the ultimate source of such earning opportunities. However, the benefits by no means accrued only to craftsmen with full citizenship, for the inscrip-

tions show that metics and slaves also found employment at these projects. The real "unemployment benefits" of the lower strata during the Periclean period were, rather, sailor's wages and booty—above all, booty from sea wars. This is the reason why the *demos* was always so easily won for war. These *déclassé* burghers were economically dispensable and had nothing to lose. But an employment and output policy oriented around independent craft producers never appeared as a significant element in the entire ancient democratic development.

If the economic policy of the ancient city is thus seen to be pursuing primarily the interests of urban consumers, then this can certainly also be said of the medieval city. But the measures taken were much more drastic in Antiquity, obviously because it seemed impossible to leave the provisioning with grain of cities such as Athens and Rome in the hands of private commerce. Occasionally we find also in Antiquity measures favoring the production of some especially important export goods, but these were never mainly directed at the artisan branches of production. And nowhere were the politics of an ancient city dominated by such producer interests. The interests with a decisive influence on the policies of the old maritime cities were, rather, in the early period those of the town-dwelling seigneurial and knightly patriciate, which is found everywhere, in sea trade and piracy whence it derived its wealth, and later, in the early period of Democracy, those of the rural hoplite proprietors, a stratum which in this form is found only in Mediterranean Antiquity. Still later the urban policies were determined by the interests of the owners of money and slaves, on the one hand, and by those of the urban *petit-bourgeois* strata on the other, both of which had a stake, though differing in kind, in state contracts and in military spoils, either as large or small entrepreneurs, or as receivers of state handouts, or again as warriors and sailors.

In these respects the medieval city democracies behaved in a fundamentally different manner. The causes for this difference were present and effective already at the founding of the medieval cities; they were connected both with geographic circumstances and with military factors based on general cultural developments. The ancient Mediterranean cities were not confronted at the time of their emergence by *non*-urban political and military power structures of any significance and, most importantly, of a high technical level; in fact, the cities themselves were at that time the bearers of the most highly developed military techniques. This was true for the knightly *phalanx* of the patrician clan city, and even more so later for the city of the disciplined hoplite formations. Wherever the situation was in this military respect similar in the Middle Ages, as in the case of the early medieval southern European maritime

cities and of the Italian city republics of the urban nobility, the development also shows relatively far-reaching similarities to that of Antiquity. In the early medieval city state of southern Europe, the aristocratic structure of urban organization was predetermined by the aristocratic character of military technique. Especially the maritime cities, but also those relatively poor inland cities—such as Bern—which held possession of large subject territories ruled by the urban *rentier* patriciate, displayed the fewest tendencies toward democratic development.

The industrial inland cities, by contrast, and in particular the cities of continental northern Europe, found themselves confronted in the Middle Ages by the military and administrative organization of the kings and their castle-seated knightly vassals distributed all over the wide inland terrain. To a high percentage, which increases toward the North and the interior, these cities were dependent from the moment of their foundation on concessions from the political and seigneurial power-holders integrated into the feudal military and office structure. Increasingly as time went on, they were given "city" status not because of any political or military interests of a local defense association, but for purely *economic* motives of the founder alone who, as the wielder of power, expected for himself revenues from tolls and other traffic charges and from taxes. The establishment of a city became for the lords primarily an economic undertaking, a business proposition rather than a military measure—or at least, wherever military aspects had played any role, they tended to recede more and more into the background. The urban autonomy of varying extent, which was the specific characteristic of the medieval Occidental city, developed only because and insofar as the non-urban power-holders did not yet possess a trained apparatus of officials able to meet the need for an urban administration even to the limited extent required by their *own* interest in the economic development of the city. This was the only element which *everywhere* was decisive. The early medieval princely administration and courts did not have the specialized knowledge, continuity, and training in rational objectiveness which would have given it the capacity to order and direct the affairs of urban craft and commercial interests—affairs that were so far removed from the social habits and time-consuming preoccupations of the knightly personnel of these bodies. The interest of the power-holders in the early period was only in money revenues. If the burghers managed to satisfy these interests, all probabilities were in favor of the non-urban power-holders refraining from interference with the burghers' affairs. This was especially true since such interference might have harmed the attractiveness of one's own city foundation in the competition with those of other power-holders, and thus one's own revenues. The competi-

tion between the non-urban powers, in particular the conflict of the central power with the great vassals and the hierocratic power of the church, came to the aid of the cities, especially since an alliance of any one of the contending powers with the money power of the burghers could provide it with a decisive advantage. Hence, the more unitary the organization of the larger political association, the less was the development of urban political autonomy. For all feudal powers without exception, beginning with the kings, viewed the development of the cities with utter distrust. Only the lack of a bureaucratic apparatus and their money requirements forced the French kings from Philip Augustus on, and the English kings after Edward II, to seek support in the cities, just as the same factors had earlier induced the German kings to seek support from the bishops and the wealth of the church. After the onset of the Investiture Struggle, which deprived the German kings of this support, we find also in Germany short periods during which the Salic kings courted the cities. But as soon as their political and financial resources permitted the royal or provincial patrimonial powers to develop the necessary administrative apparatus, they tried to destroy the autonomy of the cities again.

The historical interlude of urban autonomy was thus in medieval city development caused by entirely different conditions than in Antiquity. The typical ancient city, its ruling strata, its capitalism, its democratic interests—all these were politically and militarily oriented, and the more so, the more their specifically ancient aspects come to the fore. The downfall of the patriciate and the transition to Democracy were caused by a change in military technique. It was the self-equipped disciplined hoplite army which carried the struggle against the nobility, ousting it militarily and then also politically. Its success was of varying dimensions. At times it led to the complete destruction of the nobility, as in Sparta. Or it led to the formal removal of status differences, to satisfaction of the demand for rational and more easily accessible justice, safeguards for the legal status of persons, and elimination of the rigors in the debt law, while *de facto*—if in changed form—the preeminence of the nobility was preserved: as in Rome. Or again, it led to the incorporation of the nobility into the *demoi* and to a timocratic government of the city state: as in Cleisthenian Athens. In most cases some of the authoritarian institutions of the patrician state were preserved as long as the influence of the rural hoplite elements was predominant. Great variety prevailed also in the intensity of militarization of institutions. The Spartan hoplite community treated all land belonging to the warriors and the unfree population living on it as communal property, and granted each warrior who had established his military qualification

the claim to a land rent. No other polis went quite that far, but restrictions on the alienability of the warrior lots (*kleroi*), the inherited land of members of the city guild, seem to have been fairly widespread and survived in rudiments into the later period. However, even this practice was probably never universal and was later eliminated everywhere. All other land was encumbered only by the inheritance rights of the sons[14] and otherwise freely alienable. In Sparta, land accumulation, although forbidden in the hands of the male Spartiates, was admissible in those of their women, and this ultimately transformed the economic basis of the warrior association of the perhaps 8,000 original full citizens, the *homoioi* ("equals"), so much that finally only a few hundred could afford the full military training and the membership fee for the *syssitia*, on which full citizenship rested. In Athens, development took the opposite course: here the enactment of free transferability of land in combination with the "deme" constitution furthered the breaking up of the land into small lots, which corresponded to the requirements of the expanding market-gardening culture. In Rome the free transferability of land, which existed from the time of the Twelve Tables, had again different consequences in that it led to the destruction of the village-type of rural settlement.[15] In Hellas, hoplite democracy waned in all those areas where military strength came to be based primarily on naval power—as in Athens definitively after the defeat at the hand of the Boeotians at Koroneia in 447 B.C.[16] From that time on, the former rigorous military training was neglected, the remainders of the old authoritarian institutions were abolished, and both policies and institutions of the city came under the full domination of the *town*-dwelling *demos*.

Such transformations based on purely military factors were unknown in the medieval city. The victory of the *popolo* rested primarily on economic foundations. And the specifically medieval city type, the artisan inland city, was altogether economically oriented. The feudal powers of the Middle Ages were not by origin city-kings and city nobles. Unlike the nobility of Antiquity, they were not interested in putting into their service specific instruments of military technique offered only by the city. For, apart from the maritime cities with their war fleets, the cities of the Middle Ages were not as such the bearers of specific military power instruments. Quite to the contrary: Whereas in Antiquity the hoplite army and its training, and thus military interests, increasingly came to constitute the pivot of all urban organization, in the Middle Ages most burgher privileges began with the limitation of the burgher's military duties to garrison service. The economic interests of the medieval townsmen lay in peaceful gain through commerce and the trades, and this was most pronouncedly so for the lower strata of the urban citizenry,

as is shown especially by the contrast between the policies of the *popolo minuto* and those of the upper strata in Italy. The political situation of the medieval townsman determined his path, which was that of a *homo oeconomicus*, whereas in Antiquity the polis preserved during its heyday its character as the technically most advanced military association: The ancient townsman was a *homo politicus*.

In the northern European cities, as we have seen, the *ministeriales* and knights as a status group were often directly excluded from the city. The non-knightly landowners were either mere city subjects or, at times, passive guest-burghers under the protection of the city; sometimes they were guild-organized gardeners and vintners, but they were almost never politically or socially significant. As a general rule, and increasingly so over time, the countryside was a mere object of the economic policy of medieval cities without a voice of its own. The typical medieval city was nowhere in a position even to entertain the notion of a policy of colonizing expansion.[17]

5. *Serfs, Clients and Freedmen: Their Political and Economic Role*

Here we reach a very important point: the comparison of the status structure of the ancient and the medieval city. In addition to the slaves, which we have already discussed, the ancient polis knew a number of *status* strata which in the Middle Ages are either found only in the early period or not at all, or which appear only outside of the city. Among these we count: 1. the serfs; 2. the debt slaves and debt servants; 3. the clients; 4. the freedmen. The first three groups in general belong to the period prior to the hoplite democracy and later are found only in remnants of rapidly diminishing importance. The freedmen (emancipated slaves), by contrast, play an increasingly important role precisely in the later period.

1. THE SERFS. In historical times, patrimonial serfdom (*Hörigkeit*) appears in the area of the ancient polis primarily in conquered territories. In the early feudal period of city development, however, it must have been very widely diffused. Like the position of serfs throughout the world, which has always been similar in certain fundamental aspects while widely varying in the details, that of the ancient serf was in principle not different from that of his medieval counterpart. Everywhere the serf was in the main exploited economically. Serfdom was most completely preserved in the Hellenic area wherever the polis or-

ganization was not completely carried through, as in [southern] Italy, and also in cities which were constituted so rigorously as warrior organizations that the serfs were considered the possession of the state rather than that of individual masters. Outside these areas, serfdom disappeared almost everywhere during the period of hoplite democracy. It revived during the Hellenistic period in the western areas of the Orient, which at that time were being organized in the polis form. Large territories, which retained their tribal constitution, were assigned to the individual cities whose burghers formed a Greek (or Hellenized) garrison in the interest of the post-Alexandrian territorial kings. However, initially this bondage of the non-Hellenic rural population (the ἔθνη, or "tribes") was purely political and hence quite different from the patrimonial dependency of the early epoch; it no longer belongs to the description of the autonomous cities.[18]

2. DEBT SERVANTS[19] played a very significant role as labor power in Antiquity. They were economically "declassed" burghers, whose situation provided *the* specifically social issue in the early status struggles between the urban patriciate and the rural hoplites. Various compromises to resolve the problems of these downgraded peasant strata were worked out in the aisymnetic codifications of the Greeks,[20] in the Roman Twelve Tables, in the laws on seizure of persons for unpaid debts,[21] and in the policies of the tyrants. The solutions varied greatly. The debt servants did not come from serf strata, but were free landowners who with their families and lands had been sentenced to permanent enslavement or to private debt bondage, or who had voluntarily entered into debt bondage in order to avoid enslavement. They were put to economic use, frequently as farmers on their own land for the account of the creditor. The peril posed by such strata can be seen from the fact that the Twelve Tables prescribed that enslaved debtors could not be held in the country but had to be sold abroad ["*trans Tiberim*"].

3. THE CLIENTS[22] must be distinguished both from debt servants and serfs. In contrast to the latter, they were not despised as men under the power of others, but rather formed the followership of a patron; this relationship was one of mutual "fidelity," such that it put a legal suit between patron and client under a religious taboo. The contrast to debt bondage is shown by the fact that the economic exploitation of the client relationship by a patron was considered an offence against decency. The clients were personal and political, but not economic, means of power of the patron. Their relationship to the lord was regulated by the *fides*, the observance of which was guarded not by a judge but by a moral code, and the violation of which had sacral consequences (the violator became an *infamis*). Clientage stemmed from the time of

knightly warfare and the rule of the nobility, and the clients originally were the attendants of the lord who followed him into battle, were obligated to render gifts and support in case of need, perhaps occasionally also labor services, and were provided with a parcel of land and represented before the courts by him. They were not the lord's servants, but what the Middle Ages would have called his *ministeriales*, with the difference, however, that they were not men of a knightly style and with knightly rank, but small people with peasant holdings—a stratum of plebeian war-fief holders.

The client thus was a person who had no share in the land holdings and the local communities, and therefore in the military association, and who had entered (in Rome through the *applicatio*) into a tutelary relation with the head (*pater*) of a patrician family or with the king and in turn was assigned (the technical term in Rome was *adtribuere*) military equipment and land by this patron. In most cases this relationship was inherited from his ancestors. This was the old meaning of clientage. And just as in the Middle Ages the rule of the nobility gave rise to the *Muntmannen*, so in Antiquity under equivalent circumstances the small peasantry found itself induced to enter clientage in great masses, if only to secure representation before the courts by a nobleman. In Rome this was probably the source of the freer forms of clientage of the later period. But the old clientage, at least in Rome, put the client entirely in the hand of the patron. As late as 134 B.C. Scipio, as commander of an army, could still summon his clients to military service.[23] In the period of the Civil Wars this role [of a private military following] was taken over by the *coloni* (small leaseholders) of the great landowners.

In Rome the clients had a vote in the military assembly, and according to tradition (Livy) they constituted an important support for the patricians. The institution of clientage was probably never legally and formally abolished. But the triumph of hoplite technology eliminated its former military significance also in Rome, and in later times clientage survives only as an institution securing the patron a certain social influence. Hellenic Democracy, by contrast, completely destroyed clientage. The medieval city knew the institution only in the form of the tutelary power (*Muntwaltschaft*) of a full citizen over a guest citizen who applies for his protection. This clientage for representation in the courts vanished along with patrician domination.

4. THE FREEDMEN, finally, were a numerically significant stratum which played a role of considerable importance in the ancient city. They were in the main exploited economically. In the [Greek] inscription material carefully examined by Italian investigators, about one

half of the manumitted were women.[24] In those cases manumission is likely to have usually served the purpose of making possible a valid marriage, and thus probably was obtained through purchase by the bridegroom *in spe*. Beyond this we find in the inscriptions an especially large number of freedmen who had been house servants, and thus owed their freedom to personal favor. The seemingly large proportion of such individuals is probably deceptive, since for precisely this category of freedmen the chance of being mentioned in the inscriptions was naturally much greater than for other groups. On the other hand it seems quite plausible to assume, with Galderini,[25] that the number of emancipations of household slaves was increasing during periods of political and economic decline and decreasing during periods of economic prosperity: The constriction of profit opportunities would lead the master to reduce the size of his household and at the same time to shift the risk of hard times onto the slave, who now would be forced to maintain himself in addition to paying off his manumission price to the master. The agricultural writers[26] mention manumission as a bonus for good service on the estate. Furthermore, a master may often have manumitted a household slave instead of utilizing him in his service because, as Strack has pointed out, he could thus rid himself of the legal, even if only limited, liability for his actions.[27]

However, other slave strata must have been at least equally important [as a source for the class of freedmen]. The slave permitted by his master to conduct an independent business enterprise in return for the payment of fees was in the best position to accumulate money toward the purchase of his freedom, just as this was true in the case of the Russian serf [similarly released from direct service]. For the master, at any rate, the services and fees which the freedman had to contract for certainly played the crucial role in the decision to grant manumission. The freedman and his descendants remained in a patrimonial relationship to the family of the former owner, which was dissolved only by the passage of several generations. He not only owed the master the contracted services and fees—which were often quite steep—but his inheritable property was, at his death, as in the case of the unfree of the Middle Ages, to a considerable extent at the mercy of the patron. In addition he was under the obligation of *pietas*, i.e., bound to the most varied forms of personal obedience which enhanced the social position of the master and directly increased his political power. The consequence was that during the rule of the *demos*, for instance in Athens, the freedmen were completely excluded from the citizenship rights and counted among the metics. But in Rome, where the power of the office nobility was never really broken, the freedmen were considered citizens,

though on the insistence of the *plebs* they were restricted to the four urban *tribus*—a demand which the office nobility granted out of fear that the freedmen might otherwise constitute the basis for attempts to create a *tyrannis*. At least to the mind of the ancients such an attempt was made when the *censor* Appius Claudius undertook [in 308 B.C.] to give the freedmen an equal vote with the rest of the citizens by distributing them through all the *tribus*. But this characteristic undertaking we cannot interpret, as does Eduard Meyer,* as an attempt to create a "Periclean" demagogy, for the rule of Pericles rested not on freedmen—in Athens excluded from all citizenship rights precisely by Democracy—but on the interests of the guild of *full* citizens in the *political* expansion of the city. The freedmen, by contrast, were *homines oeconomici*—a stratum of peaceable businessmen who were much closer to the economic *bourgeoisie* of the Middle Ages and modern times than any full citizen of an ancient Democracy. Hence the question in Rome was, rather, whether a "people's captaincy" of the medieval type was to be set up with their help, and the rejection of Appius Claudius' attempt signified that, as before, the peasant army and the normally dominant urban office nobility were to remain the decisive factors.

Let us dwell a little more on the situation of the freedmen, who were, in a certain way, the most "modern" of the ancient social strata, the one which most closely approximated a *bourgeoisie*. Nowhere did the freedmen gain access to the city offices and the priesthood, nowhere did they enjoy full *connubium*, and nowhere did they obtain participation in the military exercises (membership in the *gymnasion*)—even though in cases of extreme need they were called to arms—and in the administration of justice. In Rome they could not become "knights," and almost everywhere they were disadvantaged *vis-à-vis* the fully free citizens in some aspects of trial procedure. Their special legal situation had the economic consequence that they were excluded not only from the citizenship emoluments granted by the state or otherwise based on political status, but also from the acquisition of land and hence from the possession of mortgages. Revenues from *land* rent thus remained the characteristic monopoly of full citizens precisely under Democracy. In Rome, where the freedmen did have citizenship, but of an inferior type, their exclusion from the census status of an *eques* (knight) signified that they could not participate (at least as entrepreneurs on own account) in the great tax farms and the state contracts which were monopolized by that status group. They thus confronted [the *grande bourgeoisie* of] the *equites* as some kind of plebeian *bourgeoisie*. The exclusion from landownership and the tax farming enterprises in effect meant that the freedmen found themselves barred from the typically

ancient, politically oriented type of capitalism, and by the same token pushed onto the path of a relatively modern, bourgeois manner of gaining a livelihood. Accordingly we find them to be the most important bearers of those forms of economic activity which display "modern" features. As a group, the freedmen can be best likened to our petty-capitalist middle classes (which at times may accumulate considerable wealth), in strong contrast to the typical Hellenic *demos* of full citizens who monopolized the politically conditioned *rentier* incomes: state pensions, *per diem* attendance fees, mortgage interest and land rents. The work training of slavery in combination with the possibility of purchasing one's freedom was a powerful spur for the acquisitive urge of the unfree in Antiquity, just as more recently in Russia. The interests of the ancient *demos*, by contrast, were military and political. As a stratum with purely economic interests, the freedmen provided an ideal public for the cult of Augustus as the "Bringer of the Peace." The dignity of the *Augustales*, which was created by the first Princeps, played somewhat the same role as in our time the title of "Purveyor to His Majesty the King."[29]

In the Middle Ages a separate status group of the freedmen is found only in the early, pre-urban period. Within the cities the stratum of serfs, whose inheritance reverted partly or entirely to their masters, was held within narrow limits already in the earliest period of city development through the principle that "*Stadtluft macht frei*,"[30] and also through the city privileges of the emperors which forbade the lords to enforce their claims on the inheritance of townsmen. Under the domination of the craft guilds urban serfs disappeared altogether. While for the ancient city, which was essentially a military association, a constitution based on guild organizations would have been inconceivable because it would have had to comprise free-born together with manumitted and unfree artisans, the medieval craft guild constitution was based precisely on the rejection of extra-urban status differences.

6. *The Polis as a Warrior Guild* versus *the Medieval Commercial Inland City*

The ancient polis, we might summarize, from the time of the creation of the disciplined hoplite formations, was a *guild of warriors*. Wherever a city wished to carry out an active land-based foreign policy it had to follow the example of the Spartiates on a greater or lesser scale—namely, to turn burghers into a trained hoplite army. Argos and Thebes, during the period of their expansion, also created contingents of

warrior *virtuosi*, units which in the Theban case [of the "Sacred Bar of Boeotia] were additionally strengthened by ties of personal friendship.[31] Cities which possessed no such troops but had to rely on the army of burgher hoplites, like Athens, were on land restricted to defensive strategy. But everywhere the burgher hoplites formed the predominant class of full citizens after the downfall of the patricians. Neither in medieval Europe nor anywhere else can an analogous stratum be found.

If Sparta was a permanent military camp, this was to some extent also true of most other Greek cities. During the early period of the hoplite polis, the cities therefore developed an increasing closure toward the outside, which contrasted to the far-reaching freedom of movement prevailing in Hesiod's days [probably late eighth century B.C.],[32] and frequently they also imposed restrictions on the transferability of the warrior lots. This institution, however, decayed very early in most cities and then became altogether superfluous as paid mercenaries or, in the maritime cities, naval service gained in importance. Yet, even then military service remained ultimately decisive for [participation in] political rule in the city, which retained its character as a militaristic guild. In Athens it was precisely the radical Democracy which supported an expansion policy—fantastic in the light of the small active population—that extended as far abroad as Egypt and Sicily. Internally, the polis as a militaristic association was absolutely sovereign. In every respect the citizenry dealt with the individual just as it chose. Inept economic conduct, especially squandering of the inherited warrior lot (the *bona paterna avitaque* of the Roman disemancipation formula),[33] adultery, poor education of the son, mistreatment of the parents, disrespect for the gods (*asebeia*), insolent violence (*hybris*)—in short, any kind of behaviour which might endanger the military and political morals and discipline or provoke the wrath of the gods to the disadvantage of the polis, was sternly punished, in spite of the famous assurance in Pericles' funeral oration (as reported by Thucydides): that in Athens every man was permitted to live as he wished.[34] In Rome similar transgressions led to the intervention of the *censor*. As a matter of principle, thus, there certainly was no freedom of personal conduct, and wherever it did exist *de facto*, it was purchased, as in Athens, at the price of diminished efficiency of the burgher militia. Economically, too, the Hellenic city had complete disposal over the property of the individual: if it ran into debt, the city could still in the Hellenistic period pawn the property and even the person of the burgher to the municipal creditors.

The burgher remained primarily a soldier. In addition to a water well, market (*agora*), town hall (*archeion*) and theatre, a true city

needed—according to Pausanias—also a [military exercise ground, the] *gymnasion.*[35] It was nowhere lacking. In the market and the *gymnasion* the citizen spent the largest part of his time. In classical Athens the claims upon his time by the *ekklesia,* jury court service, council service and service in the state offices in rotation, and above all by service in the military campaigns—summer after summer for many decades—were of proportions which no other differentiated culture in history has ever experienced before or after.

All accumulations of burgher wealth of any significance were subject to the claims of the polis of Democracy. The liturgical duties of the "trierarchy," which involved the outfitting, provisioning and commanding of war-ships, and of the "hierarchy," which consisted of setting up the great festivals and theater performances, the forced loans in emergency situations, the Attic institution of *antidosis*[36]—all these subjected bourgeois accumulation of wealth to great instability. The absolute arbitrariness of justice administered by the people's courts—civil trials in front of hundreds of jurymen untrained in the law—imperilled the safeguards of the formal law so much that it is the mere continued existence of wealth which is to be marvelled at, rather than the violent reversals of fortunes which occurred after every political mishap. The latter were the more threatening to the wealthy since one of the most important property components, their slave holdings, would in such cases usually shrink due to massive escapes.[37] At the same time, the polis democracy was in need of the capitalists for its supply and construction contracts and for the farming of its tax collection. But a purely national class of capitalists, such as Rome had in the equestrian order, the Hellenic cities never developed. The individual city states were too small to offer sufficient chances of gain, and most cities, in contrast to Rome, sought to stimulate competition among contractors and tax farmers by admitting and attracting foreign applicants.

Landed property, slaves (usually in rather modest numbers) who paid a tribute to the owner or were rented out as laborers (Nikias),[38] ownership of ships, and capital participation in trade—these were the typical investment forms of burgher wealth. Citizens of the hegemonial cities also had opportunities for investment in foreign mortgages and landed property. Such investments in land abroad were possible only where the local land monopoly of the ruling burgher guilds had been broken. The acquisition of foreign land by the polis, which was then leased to Athenians or assigned to Attic cleruchs, and admission of the Athenians to land ownership in the subject cities, consequently, were among the essential aims of the Athenian policy of maritime rule. Hence, under Democracy, too, land and human possessions were de-

cisive for the economic situation of the burgher. War, which could overthrow all these property relations, was chronic, and, in contrast to the chivalrous conduct of war in the patrician period, it was now pursued with extraordinary ruthlessness. Almost every victorious battle was followed by the mass slaughter of the prisoners, and almost every conquest of a city ended with the killing or enslavement of the entire population. Each victory brought a sudden increase in the supply of slaves. A *demos* of this type could not possibly be oriented towards pacific economic acquisition based on rational and continuous economic activity.

In this respect the medieval urban citizenry behaved in a thoroughly different way even during the first period of development. The medieval phenomena most closely related to those described above are found in the maritime cities, in Venice and, above all, in Genoa, whose wealth depended on their colonial power overseas. But even in these instances we are dealing primarily with plantation and manorial properties on the one hand, and with trading privileges and craft settlements on the other, but not—as in Antiquity—with cleruchies, revenues from military pay, or doles distributed to the mass of the citizens out of tributes exacted abroad. The industrial inland city of the Middle Ages, finally, is altogether alien to the ancient type. It is true, of course, that after the victory of the *popolo* the entrepreneurial stratum of the upper guilds was often extraordinarily war-minded. But the decisive motivations here were the elimination of bothersome competitors, the domination of the trade routes or their liberation from tolls, and the gaining of trade monopolies and staple rights. It is also true that the medieval city, too, knew large-scale redistributions of the land holdings, both in the wake of foreign victories and of internal upheavals resulting in a change of the ruling party in the city. Especially in Italy: Landed properties of the vanquished party would be leased or purchased outright from the state agency administering enemy holdings by the momentarily victorious party, and each subjugation of a foreign commune would be utilized to increase the opportunities for land purchases by the victorious citizenry. But the radicalism of these ownership changes cannot be compared to the immense property revolutions which, even into the late period of the ancient city, accompanied each internal revolution and each victorious foreign or civil war. And above all, land acquisition itself no longer stood in the foreground of the economic interests driving for political expansion.

Under the domination of the craft guilds, the medieval city was a structure oriented immeasurably much more than any city of Antiquity —at least during the epoch of the independent polis—towards acquisition through rational economic activity. Only the demise of city auton-

omy in the Hellenistic and late Roman period can be said to have reduced this difference somewhat, in that it destroyed the chances of creating economic opportunities for the burghers by means of an urban military policy. To be sure, in the Middle Ages, too, cities could at times be bearers of technological advance in land warfare—such as Florence, in whose army artillery was first employed. Even the [twelfth century] burgher levies of the Lombards against Frederick I represented an important innovation in military technique. But on the whole, the knightly armies remained at least equal to the city armies, and on the average—especially in the flatlands[30]—they were definitely superior. Military strength might be a support for the economic activities of the city burghers, but in landlocked areas it could not serve as the foundation for these endeavors. Since the seat of the most potent military powers lay outside the cities, the medieval burgher was forced to rely for the pursuit of his economic interests on rational economic means.

7. *Ancient City States and Impediments to Empire Formation*

Four great power formations were created by the ancient polis: the Sicilian empire of Dionysios, the Attic Confederacy, the Carthaginian and the Roman-Italic empire. The Peloponnesian and Boeotian confederacies we can ignore since their status as great powers was ephemeral. Each of these four formations rested on a different base. The empire of Dionysios was a pure military monarchy based on a mercenary army and only in a subsidiary manner on the burgher levy. It is thus not typical and of no specific interest for us. The Attic Confederacy was a creation of Democracy, and thus of a burgher guild. This fact inevitably brought about a policy of exclusive rights for citizens and caused the complete subordination of the allied democratic burgher guilds of the confederate cities to that of the hegemonial city. Since the level of the membership tributes of the confederacy had not been fixed in advance by agreement, but was determined unilaterally in Athens—even if not by the *demos* itself, but by an elected commission that negotiated in an adversary procedure—and since, further, all lawsuits of the confederates were tried before the Athenian courts, the small citizens guild of the capital became the unrestricted ruler of the wide empire. This was especially true once the contributions of own ships and manpower contingents by the confederates had come to be replaced, with only a few exceptions, by monetary contributions, and the entire naval service had thereby become the preserve of the citizenry

of the hegemonial polis.[40] A single decisive dest uction of the fleet of this *demos* thereafter was bound to b ing about the collapse of its rule over the confederacy.

The great-power position of the city of Ca thage rested on mercena y armies, while the polis itself was ruled in a strictly plutoc atic pattern by great patrician houses who combined, in the typical ancient manner, gains from trade and naval warfare with large land holdings, which here consisted of plantations operated capitalistically with slave labor. (It was only in connection with the expansiona y policy that the city went over to the minting of coins.) The relationship of the army leaders, to whose persons and fates the armies and their chances fo booty were tied, with the patrician houses of the city could never be without those tensions which down to [the Imperial general] Wallenstein [in the Thirty Years War] have always prevailed between the leaders of privately recruited armies and those who hire them. This persistent mistrust weakened the military operations, so that the tactical superiority of the professional mercenary army could not be permanently maintained against the Italic burgher levies once there, too, a permanent single commander was put in charge and the military skills of the cor rals and soldiers had risen to the level of the mercenary army.

The suspicions of the Carthaginian plutoc acy and the Spartan epho s against the victorious field commander finds a correspondence in the behavior of the Attic *demos* and the use it made of the institution of ost acism. The fear of the ruling strata that in the case of the development of a military monarchy they would have to sha e the state of servitude of the subjugated foreign peoples paralyzed the expansion power of the ancient polis. Furthermore, all ancient hoplite communities shared the disinclination, based on the self-inte est of powerful, economically profitable political monopolies, to open the citizens association by relaxing the restrictions on membership and merging their burgher rights with those of a number of other individual polis communities into a universal citizenship of an empire. All incipient developments toward inter-city community formation and citizenship rights could never quite overcome this basic tendency. For upon the citizen's membership in the individual military burgher-guild depended all his rights, his prestige and ideological pride in being a burgher, as well as his economic opportunities. The rigid mutual exclusiveness of the cult communities was a further powerful check on any unitary state formation. That these developments could be overcome is shown by the Boeotian League, which developed a common Boeotian citizenship, common officials, a legislative assembly made up of representatives of the individual citizenries, a common coinage and a common army, while retaining the

autonomy of the individual cities. However, this was an almost completely isolated case within the Hellenic world. The Peloponnesian League signified nothing similar, and the relationships in all other confederacies were shaped along precisely the opposite lines.[41] It was a very special set of social conditions that permitted the Roman commune to conduct a policy which, in this respect, diverged considerably from the standard type of Antiquity.

In Rome, incomparably much more than in any other ancient polis, a stratum of *honoratiores* of strongly feudal stamp remained and, with only temporary challenges, time and again reconstituted itself as the bearer of rulership. This found a very clear reflection also in the development of the institutions. The victory of the *plebs* had not brought about a "deme" constitution in the Hellenic sense. While formally it gave domination to the peasants living in the *tribus*, in fact the rule fell into the hands of those owners of rural land rents who were permanently resident in the city and therefore could continuously participate in its political life. They alone were economically "dispensable" and thus capable of filling political offices. In the Senate, as the assembly of the high officials, they were the core of the developing office nobility. In addition, feudal and semi-feudal dependency relations retained unusual strength and significance. Clientage as an institution, although increasingly deprived of its former military character, played an important role in Rome down into the very late period. Furthermore, as we have seen, the freedmen remained substantively under almost slavery-like jurisdictional authority of their former owners: Caesar could have one of his freedmen executed without provoking any objections. The Roman office nobility ever more pronouncedly, as time went on, came to be a stratum which, in terms of the size of its landed possessions, would find a weak analogy only in the early Greek interlocal nobility, in such figures as Miltiades, who at the time were decried as "tyrants." The age of Cato Maior [second century B.C.] still reckoned with estates of moderate dimensions, although they were far larger than the estate which Alcibiades inherited or the rural estates assumed to be of normal size by Xenophon.[42] But undoubtedly the individual noble families were already at that time cumulating in their hands great numbers of such holdings; beyond this, they participated directly in such commercial undertakings as their status position permitted, while through their slaves and freedmen they were indirectly also partners in business affairs of all kinds everywhere in the world which were not in accord with their status. None of the Hellenic noble strata could even distantly approach the economic and social level of the Roman patriciate of the late republic. On the expanding estates of the Roman nobility an ever growing number of small tenant-farmers

(*coloni*) was settled, outfitted by the lord and closely supervised in their economic management, who after each crisis found themselves more deeply in debt until their position on the land and of complete dependency on the lord had *de facto* become hereditary. In the Civil Wars they were levied by the party leaders to provide military support—just as the clients of the army leader had been called up in the Numantian war [a century earlier].

But it was not only individual persons who stood in client relationship in great numbers. The victorious field commander took allied cities and countries under his personal protection, and this patronage remained in his family. Thus the Claudians held Sparta and Pergamon in clientage, and other families had other cities under their patronage, receiving their ambassadors and representing their wishes in the Senate. Nowhere else in the world has political patronage of this kind been consolidated in the hands of individual, formally private families. Long before the monarchy, private rulership powers existed here such as are ordinarily possessed only by monarchs.

Democracy was never able to breach this power of the office nobility based on all kinds of clientage relationships. Rome never reached the point where an attempt to crush the power of the noble houses in the Attic manner could be thought of—namely, by incorporation of the clans into territorial units like the "demes" and elevation of these units into constituencies of the political association. Nor was any attempt ever made to constitute, as in Attic Democracy after the destruction of the power of the Areopagus, a committee of the *demos* as the administrative agency and a college of jurors, drawn by lot from the entire citizenry, as the judicial authority. In Rome the Senate—the institution which as representation of the office nobility most closely corresponded to the Areopagus—kept control over the administration firmly in its hands. As a permanent body it was at an advantage vis-à-vis the annually changing elective officials, and even the victorious military monarchy did not immediately attempt to thrust these patrician houses aside, but only disarmed them and restricted them to the administration of pacified provinces.

The patrimonial structure of the Roman ruling stratum found expression also in the manner of conduct of official business. Initially the office staff was probably provided by the officials themselves. In the civilian administration the appointment of the subalterns was later largely taken out of their hands, but the military commander must to a considerable extent have been aided in the execution of his duties by his clients and freedmen as well as by a free following of personal and political friends from allied patrician houses, for on campaigns it was

considered permissible to delegate official duties to personal appointees. The *princeps* of the early period of military monarchy also conducted his administration to a large part with the help of his freedmen, who at that time indeed reached the apex of their power. Later this was subject to increasing restrictions. But especially under the rule of the Claudians, who had always had a large clientele, the employment of dependents reached such proportions that one Claudian emperor could threaten the Senate with the plan also formally to put the entire administration into the hands of his personal subjects. Just like the patriciate of the late republic, the *princeps* found the fulcrum of his economic power in his manorial land holdings, which especially under Nero grew to huge dimensions, and in such territories as Egypt which, even if they were not legally his personal domains (as has been maintained), were in fact administered in a patrimonial fashion. These patrimonial and feudal traits of the Roman republic and its administrative establishment of *honoratiores*, which still exerted their effect in such late periods, were a characteristic with an almost unbroken tradition from far back when, to be sure, they were confined to much smaller dimensions. This was the source of important differences between Rome and the Hellenic world.

Typical differences appear also in the style of life. In Hellas, as we saw, the nobleman began in the time of chariot warfare to exercise in the ring. The *agon* (contest), a product of the individual knightly combat and the glorification of knightly heroism, was the source of the most important traits of Hellenic education. The Middle Ages had their tournaments, but in spite of similarities—such as that in both cases chariots and horses occupy the foreground—the very significant difference remains that in Hellas certain official festivities were always celebrated only in this form, as *agones*. The advance of hoplite military techniques merely caused the content of the *agon* to expand. now all disciplines which were drilled in the *gymnasion*—spear combat, wrestling, fist-fighting, and above all foot racing—assumed this form and were thereby made socially acceptable. The ritual chants in honor of the gods were supplemented by *agones* in poetry. To be sure, the aristocrat shone through the quality of his possessions: the horses and chariots which he sent into the race. Nevertheless, at least formally, the plebeian disciplines had to be acknowledged as of equal rank. The *agon* came to be organized with prizes, umpires and rules of the game, and permeated all spheres of life. Beside the Homeric epics, it developed into the most important national bond of the Hellenic world as against that of the "barbarians." Already the earliest appearances of Greeks on works of the plastic arts seem to show nakedness—the absence of all clothing

except arms—as a trait specific to them. From Sparta, the place of the most intensive military training, this spread over the entire Greek world; even the loincloth fell away.

No other community on earth ever developed an institution like the *agon* to such importance, to the point where it dominated all interests, the practice of the arts and of conversation up to the Platonic "dialectical" contests. To the final days of the Byzantine Empire, circus parties were the form in which the masses organized their disagreements and the carriers of revolutions in Constantinople and Alexandria.

The Italic peoples never knew this institution, at least not in the form which it had taken in the classic period of Hellas. In Etruria, the city nobility of the *Lucumones*[42] ruled over despised plebeians and had paid athletes perform at its festivals. In Rome, too, the ruling nobility rejected such "mingling-with-the-masses": its prestige feelings would never have suffered the utter lack of distance and solemnity involved in the naked gymnastics sessions of those "*Graeculi*," as little as it would ever have stooped to the Greeks' cultic chant-and-dance, their Dionysian orgiastic cults, or the *abalienatio mentis* of ecstasy. In Roman political life the rhetoric and give-and-take of the *agora* and *ekklesia* played as little a role as the competitions of the *gymnasion*. Speech-making came up only later, and then mostly in the Senate, where it was completely different in character from the rhetorical art of the Attic popular leaders. Tradition and experience of the Elders, the former officeholders above all, determined politics. Old age, rather than youth, set the tone of social forms and the character of dignity. Rational deliberations, rather than the rhetorically stirred lust for booty of the *demos* or the emotional excitement of the young warriors, tipped the balance in Roman politics. Rome remained under the direction of the experience, the deliberation, and the feudal power of the *honoratiores*.

NOTES

1. This subtitle does not appear in the separate 1921 publication of the "City," which was divided into only four sections; the text here simply continued.

2. Silver mines in southeastern Attica which belonged to the state. The distribution of the revenues was discontinued in 483 B.C., when Themistocles persuaded the *demos* to apply them to the building of the fleet. Cf. Ehrenberg, *The Greek State*, 85; *GAzSW*, 18.

3. In explaining the proletarian as one who is only a "descendant" (*proles*)—but not one of the inheritors—of a full citizen, Weber deliberately reverses the usual "etymology" of the term, current already among the Ancients, which explains the *proletarius* as one who *has* nothing to offer to the state but his *proles*

or descendants. Cf. also *GAzSW*, 194, 215. In a recent appraisal of Weber's contribution to historiography, a German classical historian called this an "ingenious interpretation . . . [which] historical science has neglected very much to its own detriment." See Alfred Heuss, "Max We rs Bedeutung für die Geschichte," *Historische Zeitschrift*, vol. 201 (1965), 552.

4. In 444 B.C. a large shipment of grain from the Libyan king Psammetichos induced a rash of prosecutions under a Periclean law of 451 B.C. which had excluded from citizenship all burghers with a foreign-born mother. According to Plutarch (*Pericles*, ch. 37) about 5,000 were denied citizenship status and sold into slavery at this occasion, while 14,040 inhabitants we e confi med as citizens entitled to the emoluments of the grain distribution. Other grain gifts seem to have caused similar incidents. Cf. Ed. Meyer, *Geschichte des Altertums*, IV/1 (5th ed.; Basel: Schwabe, 1954),665.

5. A construction lag in the building of this temple on the Acropolis brought the appointment of an investigatory commission in 409 B.C. to eport on progress, fragments of whose report (together with expense accounts for the project) are extant on a marble slab. In this rare document, which among other things also gives wage rates, full citizens a e shown working even unde the foremanship of slaves. For Weber's view on the problem of slavery in Hellas in gene al (and a further discussion of this document), cf. *GAzSW*, 139–146; fo mo e recent discussions in English, see A.H.M. Jones, *Athenian Democracy*, 10–20 and ch. IV, *passim*, and Victor Ehrenberg, *The People of Aristophanes: A Sociology of Old Attic Comedy* (New York: Schocken Books, 1962), ch. VII.

6. "Mystery congregations" in Hellas: for instance, the orgiastic cults of Demeter and Dionysos; on the participation of slaves see, e.g., Ehrenberg, *The People of Aristophanes, op. cit.*, 174, 189f. The Roman *collegia* were cult and funeral societies, sometimes purely social clubs, of the *petite bourgeoisie;* see art. "Collegium" in Pauly-Wissowa, *RE*, IV (1901), cols. 380–480, esp. 385ff.

7. The *centuriae* ("hundreds"), originally merely a my units, were the voting units of the Roman people assembled in its military array (*comitia centuriata*). Betides the five *centuriae* of non-combattants (*fabri*, musicians and reserve) and the sixteen units of the mounted force, it consisted of 172 *centuriae* of f t soldie s in five "classes" determined on the basis of wealth. The unequal manpower strength of the individual units worked to the disadvantage of the poorer classes. The possible derivation of the *centuriae fabrum* from olde *collegia* of these trades was suggested by Mommsen, *Römisches Staatsrecht*, III, 287, but disputed by other historians (cf. Kornemann in Pauly-Wissowa, *RE*, IV (1901), 442). A pre-Solonic creation of a status g oup of *demiourgoi* is ascribed to the mythical hero Theseus by Plutarch (*Theseus*, ch. 25), but the historicity of its existence is doubtful; on this, see also *GAzSW*, 107, 116f., 122f.

8. The *decemviri legibus scribendis*, the perhaps legendary two colleges of ten who w ote the code of the Twelve Tables, ca. 450 B.C.

9. In Prussia (and some other German states), large individual o several contiguous landed estates were in Weber's day often exempted from the territorial administrative organizations at the lowest level (the rural communes o *Gemeinden*) and formed separate "estate districts" in which the *Junker* owner, o one of their numbe , took over the public-law functions of the communes. The *Gutsbezirke* survived the 1918 revolution and were not abolished until 1927, when they still numbe ed some 12,000.

10. The assembly of the Roman people in the tribal array (*comitia tributa*), younger than the assembly in the military array (*comitia centuriata*), was originally used fo the electioo of lesser officials, and increasingly also for legislative

functions. On the division of functions between the different assemblies, see Mommsen, *Römisches Staatsrecht*, III, 300–368; G. W. Botsford, *The Roman Assemblies* (New York: Macmillan, 1909), chs. X–XIV.

11. The standard translation "knight" for the Latin *eques* is somewhat unfortunate because of the inappropriate feudal associations of the English term; the *equites* were the upper commercial classes who derived their name and their political, economic and social prerogatives from the fact that they were wealthy enough to do their military service on horseback.

12. In one of the measures taken to gain the support of the commercial middle class, Gaius Gracchus restricted the jury roll for the extortion court (*quaestio repetundarum*, for which see above, sec. iii:3, n. 13), from which fifty lay judges were chosen in each trial, to the *equites*. This measure was rescinded in the Sullan reform, when the bench again reverted to the senatorial nobility.

13. See, e.g., Plutarch, *Pericles*, chs. 13–14, where the trades that were to benefit are enumerated; cf. also the discussion in French, *The Growth of the Athenian Economy*, 153ff., where this passage is quoted.

14. "*Erbanwartschaften der Sippen*" in the text. However, elsewhere Weber unambiguously states that there were no reversion or subsidiary inheritance rights of the sib with respect to purchased land, while there probably was a limitation on testamentary disposal in favor of the sons (cf. *GAzSW*, 128–133, also 11of. on the *kleros*); hence we assume this to be a misreading of "*der Söhne*."

15. As Weber says elsewhere, the village was destroyed in favor of dispersed settlement "of, *sit venia verbo*, an 'Americanistic' character" on individual homesteads (*GAzSW*, 203). The thesis of an original village-type settlement structure seems to be a polemical assertion based on Weber's early studies of the Roman rural constitution. Cf. *GAzSW*, 195f. 222f. 229f., where this is spelled out in greater detail.

16. One factor in this correlation of maritime power with the rise of the property-less urban strata, which Weber stresses elsewhere, is the fact that naval service, in contrast to service in the hoplite army, "presupposes only negligible expenditures on self-equipment" of the citizen; see *GAzSW*, 40.

17. Weber is thinking of the type of "colonization" characteristic of Antiquity: the foundation of "daughter-cities" through the settlement of groups of citizens on a foreign shore. *Medieval* colonization and colonizing city foundation, especially in the Slavic territories of eastern Germany, in general was the work of the landowning nobility and of the knightly orders.

18. On the polis foundations of the Seleucid empire, and their relationship to the "tribal" territories, see also *GAzSW*, 160ff.; Ehrenberg, *The Greek State*, ch. III:3, *passim*.

19. *Schuldknechte*. Weber apparently uses this term both for the full debt slave and the *nexus* who was working off a debt. On the *nexum* (debt bondage) contract, cf. "Soc. of Law," above, ch. VIII:ii, n. 33; also *GAzSW*, 192, 210, 220.

20. E.g., the Solonic debt cancellation and repurchase of citizens sold abroad, discussed in *GAzSW* 117f., 133ff.; cf. also French, *The Growth of the Athenian Economy*, 10–18.

21. E.g., the Roman *lex Poetelia* of 326 B.C., mentioned above, "Soc. of Law," ch. VIII:ii, n. 38.

22. On the Roman *clientes*, cf. *GAzSW*, 202–209.

23. The younger Scipio Africanus, in the campaign against Numantia in Spain; see also *GAzSW*, 206.

24. Amedeo Giuseppe Calderini, *La manomissione e la condizione dei liberti in Grecia* (Milano, Ulrico Hoepli Ed., 1908), 200ff.

25. Calderini, *op. cit.*, 49 and *passim*.

26. The Roman *scriptores rei rusticae*, writers of manuals on estate management: Cato Major of the mid-second century B.C. Varro, a contemporary of Cicero and Caesar; Columella of the early empire; and Palladius of the fourth century A.D. Weber made a close study of these authors for his early work, *Die römische Agrargeschichte in ihrer Bedeutung für das Staats- und Privatrecht* (Stuttgart: Enke, 1891). The above statement is probably derived from Columella's *de re rustica*, bk. I, ch. viii.

27. Max L. Strack, "Die Freigelassenen in ihrer Bedeutung für die Gesellschaft der Alten," *Historische Zeitschrift*, vol. 112 (1914), 1–28, esp. 26. For a discussion in English of the slave-owner's legal liabilities, see W. W. Buckland, *The Roman Law of Slavery. The Condition of the Slave in Private Law from Augustus to Justinian* (Cambridge: The University Press, 1908).

28. Ed. Meyer, *Geschichte des Altertums*, I (Stuttgart, 1910), 204, 332f.

29. Appointment to the board of the *seviri Augustales* was a dignity of the provincial municipalities which was primarily conferred upon well-to-do freedmen, upon application and against payment of a "fee for the honor" (*summa pro honore*). In addition to enriching the treasury, the incumbents had to arrange and finance games; their compensation was the title and a ring-side seat in the local circus. The archetypal *Augustalis* was Trimalchio, the vainglorious *nouveau riche* so savagely depicted in Petron's *Satyricon*. Mommsen called the institution "a fictitious municipality . . . in which nothing was real but the expense and the pomp;" it was created to give these strata a semblance of participation in the municipal offices from which they were otherwise excluded. Cf. Mommsen, *Römisches Staatsrecht*, III, 452–457; art. "Augustales" in Pauly-Wissowa, *RE*, II (1896), 2350ff.

30. Cf. above, sec. ii:1, n. 3.

31. The ἱερὸς λόχος of 300 warriors, a famous elite unit and the permanent garrison of the Theban acropolis, is said to have been made up of pairs of lovers —a fact which is thought to have contributed to their bravery; see Plutarch, *Pelopidas*, ch. 18ff.

32. Hesiod relates that his father had migrated from Asia Minor to Boeotia and settled there as a small landowner (*Works and Days*, 633–40); this is often taken as evidence for the free transferability of land and freedom of personal movement in an early period. See also *GAzSW*, 110.

33. The "paternal and ancestral goods;" the formula used in a trial to have an adult put under tutelage apparently mentions squandering of these as one of the causes for this action. Cf. *GAzSW*, 198.

34. Thucydides, *Peloponnesian War*, bk. II, ch. 37.

35. Pausanias, *Description of Greece*, bk. X, ch. 4:1.

36. The curious Athenian procedure for protesting a tax assessment or the imposition of a litur ical duty. On a day especially set for this purpose, the prospective taxpayer or *trierarchos* had the right to indicate another citizen who, in his opinion, was more liable or financially more capable of bearing the burden in question. The latter then had the choice either to accept the burden or to exchange his entire wealth against that of the protesting citizen, who then became liable himself, or, finally, to put the matter up to a court to decide—in which case both parties could seize each other's wealth until the matter had been settled. Cf. art. "Antidosis" in Pauly-Wissowa, *RE*, I (1894), 2396–2398.

37. According to Thucydides (*Pelop. War*, bk. VII, ch. 27), 20,000 Athen-

ian slaves, "to the largest part artisans," escaped after the Spartan occupation of Decelea in 413 B.C. Modern authorities disagree as to whether or not this number must be spread over the entire nine-year occupation; cf. Ehrenberg, *The People of Aristophanes*, 185f., French, *The Growth of the Athenian Economy*, 138f.

38. Rich Athenian statesman and army leader during the middle phase of the Peloponnesian war; he is said to have owned 1,000 slaves: *GAzSW*, 137, 178; Plutarch, *Nikias*, ch. 4; Xenophon, *Vectigalia*, IV. 14–15.

39. I.e., in contrast to mountainous areas, as in Switzerland, where burgher and peasant armies first achieved some success against the knightly cavalry (e.g., defeat of the Habsburgs by the Swiss cantons at Morgarten, Sempach and Näfels in 1315, 1386 and 1388). Cf. also *GAzSW*, 259, n. 3.

40. On the economic aspects and the tributary arrangements of the first Attic (or Delian –after its early headquarters) Confederacy, 478–404 B.C., see French, *The Growth of the Athenian Economy*, 82–106 and the literature cited 186f.

41. For an analysis of the various Hellenic leagues and confederacies, cf. Ehrenberg, *The Greek State*, 112–131. This author, incidentally, denies the existence of a federal citizenship in the Boeotian League (*ibid.*, 123).

42. Alcibiades (born ca. 450 B.C.), who was in his day considered a very well-off young man, inherited an estate estimated at roughly 75 acres (*GAzSW*, 137), about half the size of the estates discussed by Cato (*GAzSW*, 210). Both Xenophon (ca. 430–360 B.C.) and the elder Cato (234–149 B.C.) left treatises on estate-management. About the former, however, Weber observes (*GAzSW*, 148) that he understood no more of agriculture "than a retired Prussian officer who settles down on a *Rittergut*," a comparison not intended to be complimentary.

43. Latinized Etruscan designation for kings or local barons; of uncertain meaning (art. "Lucumo," Pauly-Wissowa, *RE*, XIII (1927), 1706). Their athletes were, "in the opinion of specialists, by their very physiognomies identified as professionals who . . . performed against payment before the lords as a viewing public" (*GAzSW*, 125).

Appendices

APPENDIX I

TYPES OF SOCIAL ACTION AND GROUPS

The terminology of the second, and older, part of *Wirtschaft und Gesellschaft* is that published in the 1913 essay on "Some Categories of Interpretive Sociology" (*Logos*, IV, reprinted in *GAzW*). In the older manuscript, "social action" is *Gemeinschaftshandeln*, whereas in the newer Part One it is *soziales Handeln*; in the older Part Two, *Gemeinschaft* is a general term for "social group." The following is a translation of the definitions of *Gemeinschaftshandeln*, *Gesellschaftshandeln* (rationally regulated action), *Vergesellschaftung* (association), *Zweckverein* (voluntary association), *Gelegenheitsvergesellschaftung* (*ad hoc* agreement or association), *Massenhandeln* (collective behavior), *Einverständnishandeln* (consensual action), *Anstalt* (compulsory association or institution), and *Verband* (organization) from the *Logos* essay. The page numbers after the excerpts refer to the reprint in *GAzW*.

We shall speak of *Gemeinschaftshandeln* (social action) when human action is *meaningfully* related to the behavior of other persons. Social action does not occur when two cyclists, for example, collide unintentionally; however, it does occur when they try to avoid the collision or sock one another afterwards or negotiate to settle the matter peacefully. Social action is not the only type that is pertinent for causal explanation. However, it is the primary object of interpretive sociology. An important (but not indispensable) component of social action is its meaningful orientation to the *expectation* that others will act in a certain way, and to the presumable chances of success for one's own action resulting therefrom. Action can be understood rather clearly—and this is an important type of explanation—when there is an objective chance (i.e., more or less probability as expressed in a "judgment of objective possibility") that these expectations are indeed well-founded. . . . In particular,

instrumentally rational action is oriented toward such expectations. In principle, it appears at first sight irrelevant whether a person's action is guided by the expectation that certain natural events will occur, with or without his purposive intervention, or that human beings will act in a certain way. But if a person acts subjectively rational, his expectations in relation to the behavior of others may also be based on the assumption that he can expect a subjectively meaningful behavior on their part. In other words, he may believe that he can, with different degrees of probability, predict their behavior from certain meaningful relationships. Specifically, his expectation may be subjectively based on an "understanding" with another actor (or others); he then believes that he has reason to expect compliance with the "agreement," according to the meaning which he himself attributes to it. This imparts to social action a specific quality, because it enlarges the realm of expectations within which the actor thinks he can orient his own actions rationally. However, the possible (subjective) meaning of social action is not exhausted by the orientation toward the presumable action of others. In the limiting case, action may be oriented to the "value" of an act (as a matter of duty, for example); then it is oriented not toward expectations but values. Similarly, expectations need not refer to actions but may also concern feeling states (for example, giving pleasure to a person). Empirically fluid is the transition from the ideal type of a meaningful relationship between one's own action and that of others to the case in which another person is merely an object (for example, an infant). For us, behavior that is oriented toward meaningful action is only the rational limiting case.

Always, however, "social action" (*Gemeinschaftshandeln*) is for us an individual's behavior, either historically observable or theoretically possible or likely, in relation to the actual or anticipated potential behavior of other individuals. . . . (*pp. 441–442*).

Social action is *Gesellschaftshandeln* (rationally regulated action) insofar as it is (1) meaningfully oriented toward rules which have been (2) established rationally with a view toward the expected behavior of the "associates" (*Vergesellschaftete*), and insofar as (3) the meaningful orientation is indeed instrumentally rational on the part of the actor. Very tentatively, established rules (in the purely empirical sense envisaged here) may be defined as follows: they are either (a) onesided demands of some persons toward others; in the rational limiting case, they are explicit orders; or (b) a mutual declaration to the effect that a certain kind of action will be undertaken or is to be expected; in the limiting case, this involves an explicit agreement. . . . (*pp. 442–443*).

The rational ideal type of *Vergesellschaftung* (association or con-

sociation) is for us the "voluntary association" (*Zweckverein*): a kind of *Gesellschaftshandeln* in which all participants have rationally agreed to the statute that defines the purposes and means of the association. . . . (*p.* 447).

An agreed-upon rational action (*Vergesellschaftung*) does not always result in the establishment of a voluntary association, which, according to our definition, must have (1) general rules and (2) a staff of its own. Agreed-upon rational action may be *ad hoc*: *Gelegenheitsvergesellschaftung*. For example, it may involve merely the quick execution of a revenge killing. In this case all characteristics of voluntary association are missing, with the exception of a rational plan (*Ordnung*), which is for us the decisive criterion. A convenient example for the progression from *Gelegenheitsvergesellschaftung* to the *Zweckverein* [from rational *ad hoc* agreement or association to continuous association] is the industrial cartel: It ranges from the simple, one-time agreement of various competitors not to lower their prices below a certain level to the "syndicate" with its huge assets, a sales organization of its own, and a complex organizational structure. . . . (*p.* 450).

All analogies with the "organism" and other similar biological concepts are condemned to sterility. In addition, it is by no means *only* social action (*Gemeinschaftshandeln*) which makes it appear "as if" action was determined by a consensual order; rather, such an effect can be produced equally and even more drastically by the various forms of "homogeneous" and "collective" behavior (*Massenhandeln*) which are not part of social action.

For "social action," in our terminology, involves the purposive (*sinnhafte*) orientation of the action of individuals to that of others. Hence, it is not sufficient that several persons behave in like manner; nor does every kind of interaction, including pure imitation, constitute social action. No matter how homogeneous the behavior of members of a "race" may be in some way, a "racial community" exists for us only if the actions of the members are purposively related to one another; in the most elementary case, we require that the members segregate themselves from the "racially alien" environment because other members also do it (regardless of the exact manner and the degree of segregation). When a large number of pedestrians react to a shower by opening their umbrellas, we do not deal with social action but with "homogeneous mass behavior." The same is true of behavior provoked by the mere "influence" of others, for example, in the case of a panic or when a mass of pedestrians succumbs to "mass suggestion" in a sudden crowding. In such cases in which the behavior of individuals is influenced by the mere fact that others behave in a certain way, we

shall speak of "mass-conditioned" or collective behavior (*massenbedingtes Sichverhalten*). For it cannot be doubted that the mere fact of the spontaneously acting mass, even if it is geographically separate and related only by the press, can influence the behavior of all individuals. It is not our present task to analyze these phenomena; rather, this is the subject matter of mass psychology. . . . (*pp. 454–455*).

Herrschaft (domination) does not mean that a superior elementary force asserts itself in one way or another; it refers to a meaningful interrelationship between those giving orders and those obeying, to the effect that the expectations toward which action is oriented on both sides can be reckoned upon. . . . (*p. 456*).

"Consensus" (*Einverständnis*) exists when expectations as to the behavior of others are realistic because of the objective probability that the others will accept these expectations as "valid" for themselves, even though no explicit agreement was made. The reasons for such behavior on the part of the others are irrelevant for the concept. Social action that rests on such likely consensus will be called "consensual action" (*Einverständnishandeln*).

Of course, the actual degree of consensus—in the sense of calculable probabilities—must not be confused with the subjective reliance of an individual that others will treat his expectations as valid. In the same way, the empirical validity of an agreed-upon order must not be confused with the subjective expectation that others will abide by its intended meaning. In both cases, however, a relationship of intelligible adequate causation obtains between average objective validity (as understood in terms of "objective possibility") and average subjective expectation.

In any given case, a person's action may only approximate a consensus or only pretend to one, just as it can happen with an explicit agreement. This will affect the degree and unambiguousness of the empirical validity of the consensus. Persons linked together through a consensus may deliberately violate it, just as "associates" may disregard their agreement. As the thief (in the example used earlier) orients his action to the legal order by concealment, so a disobedient person may "agree" on the facts of power by resorting to subterfuge. Hence, consensus must not be taken for "satisfaction" of those adhering to it. Fear of dire consequences may bring about "adaptation" to the normal meaning of oppressive rule; it may also lead to a personally undesirable but formally "free" agreement. Of course, persistent dissatisfaction endangers the stability of a coercive regime, but it does not invalidate the consensus as long as the powerholder can objectively count on the (adequate) execution of his commands. . . . (*pp. 457–458*).

Not every social action falls into the category of consensual action; it does so only if, in the average, it is indeed oriented toward the probability that a consensus exists. Racial segregation qualifies as an example if a person can take it more or less for granted that the participants will typically treat it as *obligatory;* otherwise, it would be an instance of mass behavior or simply of social action without consensus. . . . Of course, not every external "acting together" of several persons is social action or even consensual action. Collaboration is by no means essential for the concept of consensual action. For example, it is absent in all cases in which a person orients himself to the action of unknown others. . . . (*pp. 458–459*).

The transition from consensual action to agreed-upon rational action is fluid—after all, the latter merely constitutes the special case of regulated action. The consensual behavior of streetcar passengers who take the side of another passenger in an argument with the conductor turns into agreed-upon rational action if they subsequently decide on a joint complaint. Even more so, "association" (*Vergesellschaftung*) occurs whenever an arrangement is made in a purpose-rational manner, even though its extent and meaning may vary greatly. Thus, an association (or consociation) comes into being as soon as a newspaper (with a publisher, editor, staff and subscribers) is founded for members of a racial group who have segregated themselves consensually but without formal agreement; now the previously amorphous consensual action is *directed* with different degrees of effectiveness. The same happens when an "academy" in the manner of the *Crusca* [in Tuscany] and "schools" teaching grammatical rules are created for a language group, or when an apparatus with rational rules and a staff is established for a *Herrschaft.* Conversely, almost every association tends to create consensual action beyond the realm of its rational purposes (this will be called "consensual action determined by association"). Every bowling club creates conventions, that is, social action oriented toward consensus, which transcends the *Vergesellschaftung.* . . . (*pp. 460–461*).

By no means is it permissible to identify social action, consensus and association with the idea of being for or against one another. For us, consensus is not identical with exclusiveness toward others, nor, of course, is amorphous social action. It depends upon the individual case whether consensual action is "open" to others or whether and to what degree it is "closed" because the participants make joining impossible through a mere consensus or an agreement (*Vergesellschaftung*). A language group or a market are (vaguely) delimited in one way or another. As a rule, not every living person can be considered an actual or potential participant in the expectations of the consensus, but only an indeter-

minate number of persons. However, the members of a language group are usually not interested in excluding others from the consensus (although, of course, they may want to exclude them in a given conversation), and market interests often desire the "expansion" of the market. But it happens that a language (if it is sacred, secret or peculiar to a status group) or a market are "closed" monopolistically through consensus or association (*Vergesellschaftung*). On the other hand, even if there is normally a closure through association, as in the affairs of a political community, the powers-that-be may be interested in considerable openness (for immigrants). . . . (*pp.* 462–463).

"Compulsory associations" or "institutions" (*Anstalten*) are groups in which 1) membership depends on objective criteria regardless of the declared will of those included (in contrast to the "voluntary association"), and 2). rationally established rules and an enforcement apparatus codetermine individual action (in contrast to amorphous consensual groupings which lack a rationally established order). Thus, not every group into which a person is born or in which he is raised is an *Anstalt;* witness the language community or the household, both of which do without such rational rules. However, proper examples are that structure of the political community which is called "state" and the religious structure which is technically a "church."

Rationally regulated action is related to consensual action as the compulsory association is to the "organization" (*Verband*). "Organized action" is oriented toward consensus (not toward rational rules), that is, it is consensual action under which 1) membership is attributed consensually, without the participants' rational agreement, 2) an effective consensual order is imposed by certain persons (powerholders), in spite of the absence of rationally established rules, 3) these persons or others are prepared to use physical or psychic coercion against those who violate the consensus. . . . (*p.* 466).

APPENDIX II

PARLIAMENT AND GOVERNMENT IN A RECONSTRUCTED GERMANY

(*A Contribution to the Political Critique of Officialdom and Party Politics*)

Preface

This political treatise is a revision and enlargement of articles published in the *Frankfurter Zeitung* during the summer of 1917.[1] The essay does not provide any new information for constitutional experts, and it does not claim the protective authority of any science. A choice among ultimate commitments cannot be made with the tools of science. The arguments presented here cannot influence those for whom the historical tasks of the German nation do not rank above all issues of constitutional form, or who view these tasks in a radically different manner. Our arguments have certain presuppositions, from which they are directed against those who consider even the present times suitable for discrediting parliament in favor of other political powers. Unfortunately, such critique has been going on now for forty years among fairly large circles of literati inside and outside the university, continuing during the war. Very often it has been undertaken in the most arrogant and extravagant form, with disdainful venom and without any willingness to understand the preconditions of effective parliaments. It is true that the political achievements of the German parliaments are not beyond critique. But what is true of the *Reichstag* is also true of other political institutions, which those literati have always treated with great consideration and often adulation. If such dilettantes make a cheap sport out of attacking parliamentarism, it appears quite proper to scrutinize

their political acumen for once without much consideration for their feelings. It would be enjoyable to have an earnest joust with fair-minded opponents—no doubt, there are some—, but it would be contrary to German uprightness to show respect for circles from the midst of which the author and many others have time and again been labelled "demagogue," "un-German" or "foreign agent." No doubt, most of the literati in question were gullible, but this exactly is perhaps the most shameful aspect of such excesses.

It has been said that now is not the time to deal with domestic issues, because we are busy with more important things. "We?"—Who? That must mean those who stayed home. And what is it that should keep them so busy? Inveighing against the enemies? Wars are not won that way. The soldiers at the front don't make speeches against the enemies, and such railing, which increases with the distance from the trenches, is unworthy of a proud nation. Or should we make speeches and pass resolutions about what "we" must annex before "we" can conclude peace? On this particular score the following should be said on principle: If the army, which fights the German battles, would take the position that "whatever *we* have won with our blood must remain under German control," *we* who stayed home would have the right to say: "Consider that politically this might not be prudent." However, if the army insisted, *we* would have to be silent. But if "we" have no scruples to poison the soldiers' pride in their achievements by calling out to them, as it has happened time and again: "If such and such a war goal, which we conceived, is not reached, you will have bled in vain"—then this appears to me simply intolerable from a purely human point of view, and nothing but harmful to the will to hold out. Instead, it would be better to keep repeating just one thing: that Germany fights for her life against an army in which Africans, Ghurkas and all kinds of other barbarians from the most forsaken corners of the world stand poised at the frontiers ready to devastate our country. That happens to be true, that everybody can understand, and that would have preserved unity. Instead the literati are busying themselves with fabricating various "ideas," for which the soldiers are supposed to shed their blood and die. I do not believe that these vain doings have made it any easier for our soldiers to fulfill their difficult duties; they certainly have harmed greatly the possibilities of a sober political discussion.

It seems to me that *our* primary task at home consists in *making it possible* for the returning soldiers to rebuild that Germany which they have saved—with the ballot in their hands and through their elected representatives. Hence we must remove the obstacles posed by present conditions, so that the soldiers can begin reconstruction right after the

war instead of having to get involved in sterile controversies. No sophistry can conjure away the fact that [equal] suffrage and parliamentary government are the only means for this purpose. Insincere and outrageous is the complaint that a reform was being considered "without asking the soldiers"—when in fact only the reform would give them the opportunity to participate decisively in political affairs.

It is said further that every critique of our form of government would provide ammunition to the enemies. For twenty years this argument has been used to shut us up, until it was too late. What can we now lose abroad by such a critique? The enemies can congratulate themselves if the old evils should persist. Especially now, when the great war has reached the stage at which diplomacy begins to move again, it is high time to do everything that will prevent a repetition of the old mistakes. For the time being the prospects are unfortunately very limited. But the enemies know, or will come to know, that German Democracy cannot conclude a bad peace if it is to have any future.

He whose ultimate beliefs put *every* form of authoritarian government above *all* of the nation's political interests may openly do so. He cannot be argued with. However, we do not want to hear the nonsensical talk about the contrast between the "West European" and the "German" ideas of the state. We are dealing here with simple questions of [constitutional] techniques for formulating national policies. For a mass state, there are only a limited number of alternatives. For a rational politician the form of government appropriate at any given time is a technical question which depends upon the political tasks of the nation. It is merely a regrettable lack of faith in Germany's potentialities when it is asserted that the German spirit would be jeopardized if we shared useful techniques and institutions of government with other peoples. Moreover, parliamentarism has been neither alien to German history, nor have any of the contrasting systems been peculiar to Germany alone. Compelling circumstances will see to it that a German state with parliamentary government will be different from any other. It would not be sober politics, but politics in the literati-style, if this issue were turned into an object of national vanity. We do not know today whether an effective parliamentary reconstruction will take place in Germany. It may be thwarted by the Right or forfeited by the Left. This latter, too, is possible. The vital interests of the nation stand, of course, above democracy and parliamentarism. But if parliament were to fail and the old system were to return, this would indeed have far-reaching consequences. Even then one could be grateful to fate for being a German. But one would have to abandon forever any great

hopes for Germany's future, *irrespective* of the kind of peace we would have.

The author, who voted Conservative almost three decades ago and later voted Democratic, who then was given space in the [arch-conservative] *Kreuzzeitung* and now writes for liberal papers, is neither an active politician nor will he be one. For caution's sake, it may be added that he does not have connections of any kind with any German statesman. He has good reason to believe that no party, not even the Left, will identify with what he has to say; this applies in particular to what is personally most important to him (sec. *iv*, below), and this happens to be a matter about which the parties do *not* have divergent opinions. The author adheres to his political views because the events of the last decades convinced him long ago that every German policy, irrespective of its goals, is condemned to failure in view of the given constitutional setup and the nature of our political machinery, and that this will remain so if conditions do not change. Moreover, he considers it most unlikely that there will always be military leaders who can extricate the nation from political catastrophe through military deeds, at the price of tremendous sacrifices in blood.

In themselves, technical changes in the form of government do not make a nation vigorous or happy or valuable. They can only remove technical obstacles and thus are merely means for a given end. Perhaps it is regrettable that such bourgeois and prosaic matters, which we shall discuss here with deliberate self-limitation and exclusion of all of the great *substantive* cultural issues facing us, can be important at all. But this is the way things are. It has been proven in great as in little things: by the political developments of the recent decades, but also, very recently, by the utter failure of political leadership on the part of an exceptionally capable and decent bureaucrat [Georg Michaelis]—this was a kind of test for the analysis presented shortly before the event in the articles republished here.[2] Whoever is not convinced by these events will not be satisfied by any proof. If a politician changes the form of government, he takes into account the generations to come. But this little piece of occasional writing is merely intended to contribute to the debate of contemporary issues.

The long delay of publication in this form, which like-minded friends suggested to me, has been due to other preoccupations and then, since November, to the usual technical difficulties of going into print.

i

Bismarck's Legacy

The present condition of our parliamentary life is a legacy of Prince Bismarck's long domination and of the nation's attitude toward him since the last decade of his chancellorship. This attitude has no parallel in the reaction of any other great people toward a statesman of such stature. Nowhere else in the world has even the most unrestrained adulation of a politician made a proud nation sacrifice its substantive convictions so completely. On the other hand, policy differences with a statesman of such magnitude have rarely triggered such a great deal of hatred as erupted at the time on the extreme left and in the [Catholic] Center party. What were the reasons?

As often before, epochal events such as those of 1866 and 1870 have had their greatest impact upon the generation for which the victorious wars were an indelible experience of its youth, but which had no clear comprehension of the serious domestic tensions accompanying them. It was not until this generation grew up that Bismarck became a legend. The generation of political literati which entered public life from about 1878 on split in two unequal segments. The larger group admired not the greatness of Bismarck's sophisticated and commanding intellect, but exclusively the admixture of violence and cunning, the seeming or actual brutality of his political approach. The other group reacted with feeble resentment. This second variety disappeared quickly after his death, but the first has since been cultivated all the more. For a long time now, this dominant attitude has shaped not only the historical mythology of Conservative politicians, but also of genuinely enthusiastic literati and, of course, of those intellectual plebeians who by imitating Bismarck's gestures seek to legitimate themselves as partaking of his spirit. We know that Bismarck had the greatest contempt for this quite influential group, even though he was not averse to taking political advantage of these courtiers, just as he did of Mr. Busch and his ilk.[3] At the margin of a memorandum which we would call Pan-German (*alldeutsch*) today he once wrote: "Windy in content and puerile in form." This referred to a manuscript which he had requested as a specimen from a man who differed from today's representatives of this type by having served the nation courageously, not just by mouthing words. What

Bismarck thought about his Conservative peers he put down in his memoirs.

Bismarck had plenty of reason for thinking lowly of his peers. For what happened to him when he was forced out of office in 1890? In fairness, he could not expect sympathy from the Center party, to which he had tried to link the assassin Kullmann;* from the Social Democrats, whom he had hunted with the [local] banishment paragraph of the anti-socialist legislation; from the Progressives (*Freisinnige*), whom he had stigmatized as "enemies of the *Reich*." But what did the others do who had loudly applauded these actions? Conservative lackeys occupied the chairs of Prussian ministers and sat in the Federal offices. What did they do? They sat it out. "Just a new superior"—that was the end of the matter. Conservative politicians sat on the presidential chairs of the parliaments in the Empire and in Prussia. What words of sympathy did they find for the departing creator of the *Reich*? They did not utter one word. Which of the big parties constituting his following demanded any account of the reasons for his dismissal? They did not bestir themselves, they simply turned to the new sun. This event has no parallel in the annals of any proud people. But the contempt which it deserves can only be heightened by that enthusiasm for Bismarck on which the same parties later took a hereditary lease. For half a century the Prussian Conservatives have failed to show any "character" in their commitment to great political goals or any other ideals, such as men like Stahl and Gerlach and the members of the old Christian-Social movement, in their own way, did possess.* Only when their financial interests, their monopoly of office benefices, their office patronage or—and this is the same thing—their electoral privileges were at stake, did their governmental voting machine ruthlessly go into gear, even against the king. Then the whole sorry apparatus of "Christian," "monarchic" and "national" phraseology was set in motion—the same phrase-making that those gentlemen now condemn as "cant" on the part of the Anglo-Saxon politicians. When several years after Bismarck's dismissal their material interests were affected, especially by tariff issues, then, and only then, did they remember Bismarck as their man, and only since that time have they pretended quite seriously to be the guardians of his tradition. There are good reasons for assuming that Bismarck had only disdain for these manipulations. This is proven by private statements. Who can blame him for it? However, the shame about that caricature of political maturity provided by the nation in 1890 must not blur our recognition of the fact that in this undignified behavior of his partisans Bismarck tragically reaped his own harvest; for he had wanted—and deliberately accomplished—the political impotence of parliament and of the party leaders.

No statesman who took power without parliamentary responsibility ever had such a co-operative parliamentary ally with so many political talents as Bismarck had [in the National Liberals] between 1867 and 1878. It is quite possible to disagree with the political views of the National-Liberal leaders of that time. Of course, one cannot compare them to Bismarck with regard to diplomatic skill and intellectual energy; next to him, they appear at best as average, but this is true also of all other German politicians and of most foreign ones. At best, a genius appears once in several centuries. But we could thank fate if our government were now, and in the future, in the hands of politicians of their caliber. It is indeed one of the most barefaced distortions of the truth if political literati make the nation believe that up until now the German parliament has not managed to produce great political talents. It is outrageous that the present subservient fashion denies the status of representatives of the "German *Geist*" to such parliamentary leaders as Bennigsen, Stauffenberg and Völk or such democrats as the Prussian patriot Waldeck;* after all, the "German spirit" was at least as strong in the St. Paul's Church [in Frankfurt in 1848] as it has been in the bureaucracy, and certainly more so than in the inkpots of these gentlemen.

These men of the *Reichstag*'s prime period had one great advantage: They knew their own limitations and recognized both their past errors and Bismarck's tremendous intellectual superiority. Nowhere else did he have more passionate personal admirers than in their circles, even in those of the later [left-wing liberal] Secessionists. One fact in particular speaks for their personal stature: They were completely free of resentment against Bismarck's superiority. He who has know them must fully absolve all major figures among them from this charge. To all informed about the course of events, Bismarck's suspicion that these men ever thought of toppling him must appear to border on paranoia. Time and again I heard from their leaders that they would consider caesarism—government by a genius—the best political organization for Germany, if there would always be a new Bismarck. That was their sincere conviction. Of course, they had vigorously crossed swords with him in the past. For this very reason they also knew his limitations, and they were not ready to make any unmanly intellectual sacrifices. It is true that they tended to compromise with him to the point of self-denial in order to avoid a rupture; indeed, they went much further than tactical considerations towards the voters, who threatened to repudiate them on this score, would have permitted. The National-Liberal leaders shied away from a fight for greater parliamentary rights not only because they foresaw the Center party as its beneficiary, but also because they realized that such a conflict would paralyze for a long time Bismarck's

policies as well as the work of parliament. "Nothing succeeds any longer"—this was the familiar complaint in the eighties. The ultimate intent of these leaders, often expressed in their inner circle, was the salvaging, during the rule of this grandiose figure, of those institutions upon which depended the continuity of the Empire's leadership after adjustment to politicians of more usual qualifications.[d] Among these institutions they counted parliament—a parliament capable of actively participating in government and of attracting great political talents; they also wanted strong parties.

These National-Liberal leaders knew that the achievement of this goal did not depend on them alone. Frequently I heard it said from their midst during Bismarck's great turn-about of 1878: "No great political skills are necessary to destroy or to cripple a party which is in our precarious position. But if this happens, another big party interested in rational co-operation cannot be created in its stead; it would be necessary for the government to appeal to interest groups and to resort to the system of petty political patronage, and even then the most serious political disruptions would occur." As we have said above, one can differ on some of the policies of this party, but it was through its initiative that the position of the Imperial Chancellor was created in the constitution (Bennigsen's motion), the civil code was unified on a national basis (Lasker's motion), the *Reichsbank* was established (Bamberger's motion); indeed, we owe to this party most of the great *Reich* institutions, which are still proving their worth. After the fact, it is easy to criticize its tactics, which always had to consider its difficult position vis-à-vis Bismarck. One can explain its decline, among other factors, by pointing to the natural difficulties of a party of such purely political orientation, but burdened by the adherence to obsolete economic dogmas on the economic and welfare issues of the time—yet, in all these respects the conservative parties do not fare any better. The National-Liberal party's ideas about constitutional reform clashed with Bismarck's goals after 1866 not because of any shortsightedness, as has often been alleged, but because of "unitary" ideals—quite in Treitschke's sense—, ideals which we have abandoned in the meantime, in part for non-political reasons.[e] At any rate, the later developments have *completely vindicated* the basic political premises of the National-Liberals.

The National-Liberals could not fulfill their chosen political tasks and disintegrated, ultimately not because of any substantive reasons, but because Bismarck did not tolerate any autonomous power—neither within the ministries nor within parliament. It is true that he offered ministries to various parliamentary leaders, but all of them found out that from the beginning he had shrewdly made preparations which

would enable him to topple his new colleague at any moment by discrediting him on purely personal grounds. In the last analysis, this and nothing else motivated Bennigsen to decline such an offer [in 1877]. Bismarck's domestic politics aimed exclusively at preventing the consolidation of any strong and independent party. His primary means were the military budget and the anti-socialist legislation [of 1878–1890]; in addition, he manipulated quite deliberately and skillfully the clash of economic interests over tariff policies.

In military matters, the basic position of the National-Liberal politicians was, to my knowledge, the following. They were willing to keep the authorized strength of the army as large as it appeared necessary, and for this very reason they considered it a merely *technical* question. In this way, the old issues of the Prussian Constitutional Conflict [of 1862–1866] would be buried and at least this source of demagogic excitement would be eliminated for the benefit of the *Reich*.[9] The simple ascertainment of authorized strength in annual appropriation bills was all that was needed. None of these leaders ever doubted that in this fashion the necessary enlargement of the army would proceed without domestic and international turmoil and repercussions; in particular, the military would be able to ask for far higher appropriations in a much less dramatic manner than if this technical problem were to be mixed up with the domestic power interests of the bureaucracy, with the result that every seventh year the military questions would explode into a political sensation with catastrophic consequences for national stability and into a wild election campaign under the slogan: "Imperial Army versus Parliamentary Army." This was a highly deceptive slogan, for the army would not have been any more of a parliamentary institution with a one-year than with a seven-year appropriation. The more so since the seven-year appropriation remained largely fictional in any case. In 1887 the *Reichstag* was dissolved solely over the issue of whether the authorized military strength, on which all *bürgerliche* parties agreed, should be determined every three or every seven years; the three-year appropriation was declared to be "an assault on privileges of the Crown." But three years later, in 1890, a new bill on authorized military strength was presented to parliament, Windthorst, [the Center party leader],[10] did not fail to rebuke his opponents for this inconsistency, scornfully but with full justification. In this manner, the old and buried military issues of the Prussian Constitutional Conflict were transplanted to the federal level, and the role of the army became subject to party politics. One must not fail to recognize that precisely this was Bismarck's intention: in that demagogic slogan he saw a means of making the Emperor, who had lived through the Constitutional Conflict, suspect the

Reichstag and the liberal parties of hostility to the army, and at the same time of discrediting the National Liberals with their own voters as traitors of parliamentary budgetary rights, since they had accepted the seven-year appropriation (*Septennat*). Exactly the same can be said of the anti-socialist legislation. The National Liberals were willing to meet Bismarck more than half-way, and even the Progressives were amenable to provisions which would make a *general* criminal offense out of what they called "excitation to class hatred." But Bismarck wanted emergency legislation as such. During the public furor over the second attempt at the Emperor's life [in 1878] Bismarck dissolved the *Reichstag* without making any attempt to compose his differences with it, simply because he saw an opportunity to destroy the only powerful party of the time.[11]

Bismarck succeeded. And the consequences? Instead of having to compromise with a *parliamentary* party which was very close to him in spite of all opposition and which had co-ope ated with him since the founding of the *Reich*, Bismarck became permanently dependent upon the [Catholic] Center party, which hated him until the end of his life and which had a power base *outside* of parliament impregnable to his attack. When he later made his famous speech on the passing of the nation's youth (*Völkerfrühling*), Windthorst replied sarcastically, but again correctly, that he himself had destroyed the great party that had supported him in the past. When the National Liberals made specific proposals to safeguard the *Reichstag*'s right to raise revenues, Bismarck rejected this as leading to "parliamentary rule," but he was eventually forced to concede the same thing to the Center party in the worst possible form—in the "pay-off"-paragraph of the so-called Franckenstein clause, to which in Prussia the even worse *lex* Huene was added (which later on was eliminated again only with great difficulties).[12] Moreover, Bismarck had to swallow [as part of the price for these revenues] the major defeat of the state's authority in the struggle against the Catholic church, the *Kulturkampf*, which he had fought with completely unsuitable means and for which he denied responsibility in vain and with little honesty. On the other hand, in his anti-socialist laws he offered the most splendid election issue to the Social Democrats. To be turned into demagoguery, and very bad demagoguery at that, was also the fate of the Imperial welfare legislation in Bismarck's hands, however valuable this legislation may be thought in itself. He rejected protective labor legislation, which after all was indispensable to the preservation of the nation's population resources, as interference with the rights of the master—in part with incredibly trivial arguments. For the same reason he used the provisions of the anti-socialist legislation to have

the police destroy the trade unions, the only possible bearers of a down-to-earth interest representation of the working class. Thus he drove their members into the most extreme radicalism of pure party politics. On the other hand, Bismarck, in imitation of certain American practices, believed that he could create a positive attitude toward the state, and political gratitude, by granting welfare benefits out of public funds or compulsory private funds. A grave political error: every policy that ever banked on political gratitude has failed. In politics, too, the Biblical saying applies to the doing of good works: "They have forfeited their wages." We got benefits for the sick, the disabled, the veterans and the aged. This was certainly desirable. But we did not get the guarantees necessary for *preserving* physical and mental health, and for enabling those *sound in body and mind* to defend their interests soberly and with self-respect; in other words, precisely the *politically relevant* part of the working population was left out.

As in the *Kulturkampf*, Bismarck here overrode all major psychological considerations. Above all, in the treatment of the unions one point was overlooked that even today some politicians have not yet understood: A state that wants to base the spirit of its mass army on honor and solidarity must not forget that in everyday life and in the economic struggles of the workers the sentiments of honor and solidarity are the only decisive moral forces for the education of the masses, and that for this reason these sentiments must be given free rein. This and nothing else is the political meaning of "social democracy" in an age which, inevitably, will still remain capitalist for a long time. We are even today suffering from the consequences of this policy. Bismarck had created a political atmosphere about himself which in 1890 left him only the alternatives of unconditional surrender to Windthorst or of a *coup d'état*, if he was to remain in office. Thus it was no accident that the nation reacted with complete indifference to his resignation.

In view of the usual uncritical and, above all, unmanly glorification of Bismarck, it seemed high time to call attention, for a change, to this side of the matter. For the most influential part of the popular Bismarck literature has been written for the Christmas table of the philistine who prefers that completely nonpolitical kind of hero worship which has become so common with us. The Bismarck literature of this type caters to such sentimentality and presumes to serve its hero by veiling his limitations and by maligning his opponents. But in this manner one cannot educate the nation to develop habits of independent political thinking. It does not diminish Bismarck's giant stature to be fair toward his opponents and to point without embellishment to the consequences of his misanthropy; nor to point to the fact that since 1878 the nation

has been unaccustomed to sharing, through its elected representatives, in the determination of its political affairs. Such participation, after all, is the precondition for developing political judgment.

What then was Bismarck's legacy, as far as we are here interested in it? He left behind him a nation *without any political sophistication,* far below the level which in this regard it had reached twenty years before [i.e., in 1870]. Above all, he left behind him a nation *without any political will of its own,* accustomed to the idea that the great statesman at the helm would make the necessary political decisions. Furthermore, he left behind him a nation accustomed to fatalistic sufferance of all decisions made in the name of "monarchic government," because he had misused monarchic sentiments as a cover for his power interests in the struggle of the parties; a nation unprepared to look critically at the qualification of those who settled down in his empty chair and with astonishing lack of embarrassment took the reigns of government into their own hands. On this score by far the gravest damage was done. The great statesman did *not* leave behind any political tradition. He neither attracted nor even suffered independent political minds, not to speak of strong political personalities. On top of all this, it was the nation's misfortune that he harbored not only intense mistrust toward all even vaguely possible successors, but that he also had a son who indeed exceedingly mediocre political talents he overestimated to an astonishing degree.[13] A *completely powerless parliament* was the purely negative result of his tremendous prestige. It is well-known that after he had left office and personally suffered the consequence of this very condition, he accused himself of having made a mistake. However, this powerlessness of parliament also meant that its intellectual level was greatly depressed. The naive moralizing legend of our unpolitical literati reverses the causal relationship and maintains that parliament remained deservedly powerless *because* of the low level of parlimentary life. But simple facts and considerations reveal the actual state of affairs, which in any case is obvious to every soberly reflecting person. The level of parliament depends on whether it does not merely discuss great issues but decisively influences them; in other words, its quality depends on whether what happens there matters, or whether parliament is nothing but the unwillingly tolerated rubber stamp of a ruling bureaucracy.

ii

Bureaucracy and Political Leadership

1. *Bureaucracy and Politics*

In a modern state the actual ruler is necessarily and unavoidably the bureaucracy, since power is exercised neither through parliamentary speeches nor monarchical enunciations but through the routines of administration. This is true of both the military and civilian officialdom. Even the modern higher-ranking officer fights battles from the "office." Just as the so-called progress toward capitalism has been the unequivocal criterion for the modernization of the economy since medieval times, so the progress toward bureaucratic officialdom—characterized by formal employment, salary, pension, promotion, specialized training and functional division of labor, well-defined areas of jurisdiction, documentary procedures, hierarchical sub- and super-ordination—has been the equally unambiguous yardstick for the modernization of the state, whether monarchic or democratic; at least if the state is not a small canton with rotating administration, but comprises masses of people. The democratic state no less than the absolute state eliminates administration by feudal, patrimonial, patrician or other notables holding office in honorary or hereditary fashion, in favor of employed civil servants. It is they who decide on all our everyday needs and problems. In this regard the military power-holder, the officer, does not differ from the civilian official. The modern mass army, too, is a bureaucratic army, and the officer is a special type of official, distinct from the knight, the *condottiere,* the chieftain, or the Homeric hero. Military effectiveness rests on bureaucratic discipline. The advance of bureaucratism in municipal administration differs little from the general development; it is the more rapid, the larger the community is, or the more it loses local autonomy to technical and economic associations. In the Church the most important outcome [of the Vatican Council] of 1870 was not the much-discussed dogma of infallibility, but the universal episcopate [of the pope] which created the ecclesiastic bureaucracy (*Kaplanokratie*) and turned the bishop and the parish priest, in contrast to the Middle Ages, into mere officials of the central power, the Roman *Curia.* The same bureaucratic trend prevails in the big private enterprises of our time, the more so, the larger

they are. Private salaried employees grow statistically faster than the workers.

It is simply ridiculous if our literati believe that non-manual work in the private office is in the least different from that in a government office. Both are basically identical. Sociologically speaking, the modern state is an "enterprise" (*Betrieb*) just like a factory: This exactly is its historical peculiarity. Here as there the authority relations have the same roots. The relative independence of the artisan, the producer under the putting-out system, the free seigneurial peasant, the travelling associate in a *commenda* relationship, the knight and vassal rested on their ownership of the tools, supplies, finances and weapons with which they fulfilled their economic, political and military functions and maintained themselves. In contrast, the hierarchical dependence of the wage worker, the administrative and technical employee, the assistant in the academic institute *as well as* that of the civil servant and the soldier is due to the fact that in their case the means indispensable for the enterprise and for making a living are in the hands of the entrepreneur or the political ruler. The majority of the Russian soldiers, for example, did not want to continue the war [in 1917]. But they had no choice, for both the means of destruction and of maintenance were controlled by persons who used them to force the soldiers into the trenches, just as the capitalist owner of the means of production forces the workers into the factories and the mines. This all-important economic fact: the "separation" of the worker from the material means of production, destruction, administration, academic research, and finance in general is the common basis of the modern state, in its political, cultural and military sphere, and of the private capitalist economy. In both cases the disposition over these means is in the hands of that power whom the *bureaucratic apparatus* (of judges, officials, officers, supervisors, clerks and non-commissioned officers) directly obeys or to whom it is available in case of need. This apparatus is nowadays equally typical of all those organizations; its existence and function are inseparably cause and effect of this concentration of the means of operation—in fact, the apparatus is its very form. Increasing public ownership in the economic sphere today unavoidably means increasing bureaucratization.

The "progress" toward the bureaucratic state, adjudicating and administering according to rationally established law and regulation, is nowadays very closely related to the modern capitalist development. The modern capitalist enterprise rests primarily on *calculation* and presupposes a legal and administrative system, whose functioning can be rationally predicted, at least in principle, by virtue of its fixed general norms, just like the expected performance of a machine. The modern

capitalist enterprise cannot accept what is popularly called "*kadi*-justice": adjudication according to the judge's sense of equity in a given case or according to the other irrational means of law-finding that existed everywhere in the past and still exist in the Orient. The modern enterprise also finds incompatible the theocratic or patrimonial governments of Asia and of our own past, whose administrations operated in a patriarchal manner according to their own discretion and, for the rest, according to inviolably sacred but irrational tradition. The fact that *kadi*-justice and the corresponding administration are so often venal, precisely because of their irrational character, permitted the development, and often the exuberant prosperity, of the capitalism of traders and government purveyors and of all the pre-rational types known for four thousand years, especially the capitalism of the adventurer and booty-seeker, who lived from politics, war and administration. However, the specific features of modern capitalism, in contrast to these ancient forms of capitalist acquisition, the strictly rational organization of work embedded in rational technology, nowhere developed in such irrationally constructed states, and could never have arisen within them because these modern organizations, with their fixed capital and precise calculations, are much too vulnerable to irrationalities of law and administration. They could arise only in such circumstances as: 1) In England, where the development of the law was practically in the hands of the lawyers who, in the service of their capitalist clients, invented suitable forms for the transaction of business, and from whose midst the judges were recruited who were strictly bound to precedent, that means, to calculable schemes; or 2) where the judge, as in the bureaucratic state with its rational laws, is more or less an automaton of paragraphs: the legal documents, together with the costs and fees, are dropped in at the top with the expectation that the judgment will emerge at the bottom together with more or less sound arguments—an apparatus, that is, whose functioning is by and large *calculable* or predictable.[34]

2. *The Realities of Party Politics and the Fallacy of the Corporate State*

Within the political parties bureaucratization progresses in the same fashion as in the economy and public administration.

The existence of the parties is not recognized by any constitution or, at least in Germany, by any law, although they are today the most important political vehicles for those ruled by bureaucracy—the citizens. Parties are inherently voluntary organizations based on ever renewed re-

cruitment, no matter how many means they may employ to attach their clientele permanently. This distinguishes them from all organizations with a definite membership established by law or contract. Today the goal of the parties is always vote-getting in an election for political positions or a voting body. A hard core of interested members is directed by a leader or a group of notables; this core differs greatly in the degree of its hierarchical organization, yet is nowadays often bureaucratized; it finances the party with the support of rich sponsors, economic interests, office seekers, or dues-paying members. Most of the time several of these sources are utilized. The hard core also defines program and tactics and selects the candidates. Even in mass parties with very democratic constitutions, the voters and most of the rank and file members do not (or do only formally) participate in the drafting of the program and the selection of the candidates, for by their very nature such parties develop a salaried officialdom. The voters exert influence only to the extent that programs and candidates are adapted and selected according to their chances of receiving electoral support.

No moralizing complaint about the nature of campaigning and the inevitable control of minorities over programs and candidates can eliminate parties as such, or change their structure and methods more than superficially. The conditions for establishing an active party core (like those for establishing trade unions, for example) and the "rules of war" on the electoral battlefield can be regulated by law, as was done several times in the United States. But it is impossible to eliminate the struggle of the parties itself if an active parliamentary representation is to exist. However, some literati time and again entertain the confused notion that this is possible or ought to be done. In varying degrees of awareness, this notion underlies the many proposals to displace the parliaments based on universal (equal or graduated) suffrage by electoral bodies of an occupational nature, or to put them next to one another, with the corporate occupational groups serving at the same time as electoral assemblies for parliament. To begin with, this is an untenable proposition at a time when formal occupational identification—which in an electoral law would have to rely on external criteria—reveals next to nothing about economic and social function, when every technological discovery, every economic shift and every new field changes these functions and hence the meaning of formally identical jobs as well as the numerical relationships. Of course, this idea is also unsuitable for its avowed purpose. Even were it possible to represent all voters through occupational bodies such as chambers of commerce and agriculture, and to constitute the parliament from these bodies, the consequences would obviously be the following:

1) Beside these organizations fastened together with legal cramp-irons there would continue to exist the voluntary interest groups, just as the *Bund der Landwirte* (Farmers' League) and the various employers' associations parallel the chambers of commerce and agriculture. Further, the political parties, also based on free recruitment, would not think of disappearing, but would merely adjust their tactics to the new condition. This change would not be for the better: The influencing of elections in these corporate occupational organizations through financial backers and through the exploitation of capitalist dependencies would continue at least as uncontrolled as before.

2) The solution of the substantive tasks of these occupational organizations would be drawn into the whirl of political power and party struggles now that the composition of these organizations influences the parliamentary elections and job patronage; thus these organizations would be crowded with party representatives instead of competent experts.

3) Parliament would become a mere market place for compromises between purely economic interests, without any political orientation to overall interests. For the bureaucracy this would increase the opportunity and the temptation to play off opposed economic interests and to expand the system of log-rolling with job and contract patronage in order to preserve its own power. Any public control over the administration would be vitiated, since the decisive moves and compromises of the interested groups would be made behind the closed doors of the non-public associations and would be even less controllable than before. In parliament the shrewd businessman, not the political leader, would reap advantage from this situation; a "representative" body of this kind would be the least proper place imaginable for the solution of political problems according to truly political criteria. All of this is clear to those who understand these matters. It is also obvious to them that such arrangements would fail to diminish capitalist influences in the parties and parliament, or even to eliminate, or at least to clean up, the party machinery. The opposite would happen. The fact that the parties operate on the principle of free recruitment hinders their regulation by the state; this is not understood by those literati would would like to recognize only organizations established by public law, not the ones which establish themselves on the battlefield of today's social order.

In modern states political parties may be based primarily on two different principles. They may be essentially *organizations for job patronage,* as they have been in the United States since the end of the great differences about the interpretation of the Constitution. In this case they are merely interested in putting their leader into the top position so that he can turn over state offices to his following, the regular

and the campaign staffs of the party. Since the parties do not have substantive principles, they compete against one another by writing those demands into their programs from which they expect the greatest impact. This type of party is so distinct in the United States because of the absence of a parliamentary system; the popularly elected President of the Union controls—together with the Senators—the patronage of the vast number of federal jobs. Despite the resulting corruption this system was popular since it prevented the rise of a bureaucratic caste. It was technically feasible, as long as even the worst management by dilettanti could be tolerated in view of the limitless abundance of economic opportunities. The increasing necessity of replacing the untrained party protégé and sometime-official with the technically trained career official diminishes progressively the parties' benefices and results inescapably in a bureaucracy of the European kind.

The second type of party is primarily ideological (*Weltanschauungspartei*) and intended to accomplish the realization of *substantive* political ideals. In relatively pure form this type was represented in Germany by the Catholic Center party of the eighteen-seventies and the Social Democrats before they became bureaucratized. In general, parties combine both types: They have substantive goals which are set by tradition, hence modifiable only by degrees, but they also want to control job patronage. First of all, they want to put their leaders into the major *political* offices. If they are successful in the electoral struggle, the leaders and functionaries can provide their following with secure state jobs during the party's dominance. This is the rule in parliamentary states; therefore, the ideological parties, too, followed this path. In nonparliamentary states [such as Imperial Germany] the parties do not control the patronage of the top offices, but the most influential parties can usually pressure the dominant bureaucracy into conceding nonpolitical jobs to their protégés, next to the regular candidates recommended through their own connections with officials; hence, these parties can exercise "subaltern"-patronage.

In the course of the rationalization of campaign techniques during the last decades, all parties have moved towards bureaucratic organization. The individual parties have reached different stages of this development, but at least in mass states the general direction is clear. Joseph Chamberlain's "caucus" in England, the rise of the "machine," as it is significantly called, in the United States, and the growing importance of party officialdom everywhere, including Germany, are all stages of this process; in Germany it proceeds fastest in the Social Democratic party —quite naturally, since it is the most democratic party. For the Center party the clerical apparatus (*Kaplanokratie*) functions as party bureau-

cracy, and for the Conservative party in Prussia, since Puttkamer's ministry [1881–88], the county and local governmental apparatus of the *Landrat* and the *Amtsvorsteher,* irrespective of how openly or covertly it has been done. The power of the parties rests primarily on the organizational effectiveness of these bureaucracies. The mutual hostility of the party machines much more than programmatic differences accounts for the difficulties of merging parties. The fact that the *Reichstag* deputies Eugen Richter and Heinrich Rickert each retained his own local organization in the Progressive party foreshadowed its eventual split.[15]

3. *Bureaucratization and the Naiveté of the Literati*

Of course, there are many differences between the various kinds of bureaucracy: between the civilian and the military administration, between state and party, between community, church, bank, cartel, producers' co-operative, factory, and interest group (such as employers' associations or the *Bund der Landwirte*). The degree to which unpaid notables and interest groups participate also varies greatly. Neither the party boss nor the board members of a joint stock company are bureaucrats. Under the various forms of so-called "self-government," notables or elected representatives of the governed or the taxpayers may as a corporate group or as individual organs be conjoined with, or superor subordinated to, the bureaucracy and have co-determining, supervisory, advisory and sometimes executive functions. The last phenomenon occurs particularly in the municipal administrations. However, we are here not interested in these institutions, although they are not without practical significance. (Thus, we do not discuss here numerous institutions of which we can be proud in Germany and some of which are indeed exemplary. But it is a horrendous error of the literati if they fancy that the governing of a large state is basically the same as the self-government of any medium-sized city. Politics means conflict.) In our context it is decisive that in the administration of *mass associations* the trained career officials always form the core of the apparatus; their discipline is the absolute precondition of success. This is increasingly so, the larger the association is, the more complicated its tasks are, and above all, the more its existence depends on power—whether it involves a power struggle on the market, in the electoral arena or on the battlefield. This is especially true of the political parties. Doomed is the system of local party administration by notables, which still exists in France—whose parliamentary *misère* is due to the absence of bureaucratized parties—and partly in Germany. In the Middle Ages administration by

local notables dominated all kinds of associations, and it still prevails in small and medium-sized communities, but nowadays "respected citizens," "leading men of science," or whatever their label, can be used merely as advertisement, not as executors of the decisive everyday routines. For the same reason, various decorative dignitaries appear on the boards of joint-stock companies, princes of the Church are displayed at the Catholic conventions, real and pseudo-aristocrats at the meetings of the Farmers' League (*Bund der Landwirte*), and deserving historians, biologists and similar experts who usually are unsophisticated in political matters are drawn into the agitation of the Pan-German champions of war-gains and electoral privileges. Increasingly the real work in all organizations is done by the salaried employees and by functionaries of all kinds. Everything else has become window-dressing.

Just as the Italians and after them the English masterly developed the modern capitalist forms of economic organization, so the Byzantines, later the Italians, then the territorial states of the absolutist age, the French revolutionary centralization and finally, surpassing all of them, the Germans perfected the rational, functional and specialized bureaucratic organization of all forms of domination from factory to army and public administration. For the time being the Germans have been outdone only in the techniques of party organization, especially by the Americans. The present world war means the world-wide triumph of this form of life, which was advancing at any rate. Already before the war, the universities, polytechnical and business colleges, trade schools, military academies and specialized schools of all conceivable kinds (even for journalists.) reverberated with urgent demands propelled by the schools' recruitment interests and the graduates' mania for benefices: The professional examination was to be the precondition for all well-paying and, above all, secure positions in public and private bureaucracies; the diploma was to be the basis of all claims for social prestige (of *connubium* and social *commercium* with the circles that consider themselves "society"); the socially proper, guaranteed "salary" [rather than the "wage"], followed by a pension, was to be the form of compensation; finally, salary increases and promotion were to be dependent on seniority. The effects can be seen inside and outside of governmental institutions, but we are here only interested in the consequences for political life. It is this sober fact of universal bureaucratization that is behind the so-called "German ideas of 1914," behind what the literati euphemistically call the "socialism of the future," behind the slogans of "organized society," "cooperative economy," and all similar contemporary phrases. Even if they aim at the opposite, they always promote the rise of bureaucracy. It is true that bureaucracy is by far not the only modern

form of organization, just as the factory is by far not the only type of commercial enterprise, but both determine the character of the present age and of the foreseeable future. The future belongs to bureaucratization, and it is evident that in this regard the literati pursue their calling —to provide a salvo of applause to the up-and-coming powers—just as they did in the age of laissez-faire, both times with the same naiveté.

Bureaucracy is distinguished from other historical agencies of the modern rational order of life in that it is far more persistent and "escape-proof." History shows that wherever bureaucracy gained the upper hand, as in China, Egypt and, to a lesser extent, in the later Roman empire and Byzantium, it did not disappear again unless in the course of the total collapse of the supporting culture. Yet these were still, relatively speaking, highly irrational forms of bureaucracy: "Patrimonial bureaucracies." In contrast to these older forms, modern bureaucracy has one characteristic which makes its "escape-proof" nature much more definite: rational specialization and training. The Chinese mandarin was not a specialist but a "gentleman" with a literary and humanistic education. The Egyptian, Late-Roman or Byzantine official was much more of a bureaucrat in our sense of the word. But compared to the modern tasks, his were infinitely simple and limited; his attitude was in part tradition-bound, in part patriarchally, that means, irrationally oriented. Like the businessman of the past, he was a pure empiricist. The modern official receives a professional training which unavoidably increases in correspondence with the rational technology of modern life. All bureaucracies in the world proceed on this path. Our superiority on this score was due to the fact that before the war other bureaucracies had not gone as far. The old American patronage official, for example, was a campaign "expert" with the pertinent "know-how," but he was by no means an expertly trained official. Not democracy as such, as our literati allege, but lack of professional training was the source of corruption, which is as alien to the university-trained civil service now emerging as it is to the modern English bureaucracy, which increasingly replaces self-government through notables ("gentlemen"). Wherever the modern specialized official comes to predominate, his power proves practically indestructible since the whole organization of even the most elementary want satisfaction has been tailored to his mode of operation. A progressive elimination of private capitalism is theoretically conceivable, although it is surely not so easy as imagined in the dreams of some literati who do not know what it is all about; its elimination will certainly not be a consequence of this war. But let us assume that some time in the future it will be done away with. What would be the practical result? The destruction of the steel frame of modern industrial

work? No! The abolition of private capitalism would simply mean that also the *top management* of the nationalized or socialized enterprises would become bureaucratic. Are the daily working conditions of the salaried employees and the workers in the state-owned Prussian mines and railroads really perceptibly different from those in big business enterprises? It is true that there is even less freedom, since every power struggle with a state bureaucracy is hopeless and since there is no appeal to an agency which as a matter of principle would be interested in limiting the employer's power, such as there is in the case of a private enterprise. *That* would be the whole difference.

State bureaucracy would rule *alone* if private capitalism were eliminated. The private and public bureaucracies, which now work next to, and potentially against, each other and hence check one another to a degree, would be merged into a single hierarchy. This would be similar to the situation in ancient Egypt, but it would occur in a much more rational—and hence unbreakable—form.

An inanimate machine is mind objectified. Only this provides it with the power to force men into its service and to dominate their everyday working life as completely as is actually the case in the factory. Objectified intelligence is also that animated machine, the bureaucratic organization, with its specialization of trained skills, its division of jurisdiction, its rules and hierarchical relations of authority. Together with the inanimate machine it is busy fabricating the shell of bondage which men will perhaps be forced to inhabit some day, as powerless as the fellahs of ancient Egypt. This might happen *if* a technically superior administration *were to be the ultimate and sole value* in the ordering of their affairs, and that means: a rational bureaucratic administration, with the corresponding welfare benefits, for this bureaucracy can accomplish much better than any other structure of domination. This shell of bondage, which our unsuspecting literati praise so much, might perhaps be reinforced by fettering every individual to his job (notice the beginnings in the system of fringe benefits), to his class (through the increasing rigidity of the property distribution), and maybe to his occupation (through liturgic methods of satisfying state requirements, and that means: through burdening occupational associations with state functions). It would be made all the more indestructible if in the social sphere a status order were then to be imposed upon the ruled, linked to the bureaucracy and in truth subordinate to it, as in the forced-labor states of the past. An "organic" social stratification, similar to the Oriental-Egyptian type, would then arise, but in contrast to the latter it would be as austerely rational as a machine. Who would want to deny that such a potentiality lies in the womb of the future? In fact, this has

often been said before, and the very muddled anticipation of it also throws its shadow upon the productions of our literati. Let us assume for the moment that this possibility were our "inescapable" fate: Who would then not smile about the fear of our literati that the political and social development might bring us *too much* "individualism" or "democracy" or other such-like things, and about their anticipation that "true freedom" will light up only when the present "anarchy" of economic production and the "party machinations" of our parliaments will be abolished in favor of social "order" and "organic stratification"—that means, in favor of the pacifism of social impotence under the tutelage of the only really inescapable power: the bureaucracy in state and economy.

4. *The Political Limitations of Bureaucracy*[16]

Given the basic fact of the irresistible advance of bureaucratization, the question about the future forms of political organization can only be asked in the following way:

1. How can one possibly save *any remnants* of "individualist" freedom in any sense? After all, it is a gross self-deception to believe that without the achievements of the age of the Rights of Man any one of us, including the most conservative, can go on living his life. But this question shall not concern us here, for there is another one:

2. In view of the growing indispensability of the state bureaucracy and its corresponding increase in power, how can there be any guarantee that any powers will remain which can check and effectively control the tremendous influence of this stratum? How will democracy even in this limited sense be *at all possible*? However, this too is not the only question with which we are concerned here.

3. A third question, and the most important of all, is raised by a consideration of the inherent limitations of bureaucracy proper. It can easily be seen that its effectiveness has definite limitations in the public and governmental realm as well as in the private economy. The "directing mind," the "moving spirit"—that of the entrepreneur here and of the politician there—differs in substance from the civil-service mentality of the official. It is true that the entrepreneur, too, works in an office, just like the army leader, who is formally not different from other officers. If the president of a large enterprise is a salaried employee of a joint stock corporation, then he is *legally* an official like many others. In political life the same is true of the head of a political agency. The governing minister is *formally* a salaried official with pension rights. The fact

that according to all constitutions he can be dismissed or resign at any time differentiates his position from that of most, but not all other officials. Far more striking is the fact that he, and he alone, does not ne to prove formal specialized training. This indicates that the meaning of his position distinguishes him, after all, from other officials, as it does the entrepreneur and the corporation president in the private economy. Actually, it is more accurate to say that he is *supposed* to be something different. And so it is indeed. If a man in a leading position is an "official" in the spirit of his performance, no matter how qualified—a man, that is, who works dutifully and honorably according to rules and instruction—, then he is as useless at the helm of a private enterprise as of a government. Unfortunately, our own government has proven this point.

The difference is rooted only in part in the kind of performance expected. Independent decision-making and imaginative organizational capabilities in matters of detail are usually also demanded of the bureaucrat, and very often expected even in larger matters. The idea that the bureaucrat is absorbed in subaltern routine and that only the "director" performs the interesting, intellectually demanding tasks is a preconceived notion of the literati and only possible in a country that has no insight into the manner in which its affairs and the work of its officialdom are conducted. The difference lies, rather, in the kind of *responsibility*, and this does indeed determine the different demands addressed to both kinds of positions. An official who receives a directive which he considers wrong can and is supposed to object to it. If his superior insists on its execution, it is his duty and even his honor to carry it out as if it corresponded to his innermost conviction, and to demonstrate in this fashion that his sense of duty stands above his personal preference. It does not matter whether the imperative mandate originates from an "agency," a "corporate body" or an "assembly." This is the ethos of *office*. A political leader acting in this way would deserve contempt. He will often be compelled to make compromises, that means, to sacrifice the less important to the more important. If he does not succeed in demanding of his master, be he a monarch or the people: "You either give me now the authorization I want from you, or I will resign," he is a miserable *Klebe* [one who sticks to his post]—as Bismarck called this type—and not a leader. "To be above parties"—in truth, to remain outside the realm of the struggle for power—is the official's role, while this struggle for personal power, and the resulting personal responsibility, is the lifeblood of the politician as well as of the entrepreneur.

Since the resignation of Prince Bismarck Germany has been governed by "bureaucrats," a result of his elimination of all political talent. Germany continued to maintain a military and civilian bureaucracy

superior to all others in the world in terms of integrity, education, conscientiousness and intelligence. The military and, by and large, also the domestic performance during the war has proven what can be achieved with these means. But what about the *direction* of German [domestic and foreign] policy during recent decades? The most benign thing said about it was that "the victories of the German armies made up for its defeats." We will be silent about the sacrifices involved and ask instead about the reasons for these failures.

Abroad it is fancied that German "autocracy" is at fault. Inside Germany, thanks to the childish historical fantasies of our literati, it is frequently assumed, by contrast, that a conspiracy of international "democracy" brought about the unnatural world coalition against us. Abroad the hypocritical phrase of the "liberation" of the Germans from autocracy is employed. At home the vested interests—we shall get to know them—manipulate the equally hypocritical slogan of the necessity to protect the "German spirit" from contamination by "democracy," or they look for other scapegoats.

It has become customary, for instance, to criticize German diplomacy, probably unjustifiably. It appears likely that on the average it was about as good as that of other countries. A confusion is involved here. What was lacking was the *direction* of the state by a *politician*—not by a political genius, to be expected only once every few centuries, not even by a great political talent, but simply by a politician.

5. *The Limited Role of the Monarch*

This brings us straight to the discussion of those two powers which alone can be controlling and directing forces in the modern constitutional state, next to the all-encompassing officialdom: to the *monarch* and the *parliament*.

The position of the German dynasties will emerge unscathed from the war unless there is a great deal of imprudence and nothing is learnt from the mistakes of the past. Whoever has had an opportunity to get together with German Social Democrats could almost always get them to admit, after an intensive discussion, that "in itself" the constitutional monarchy was the suitable form of government for Germany in view of her special international situation. This was so long before August 4, 1914, and I do not speak here of "revisionists," parliamentary deputies, or trade unionists, but of regular party functionaries, in part very radical ones. One need only look for a moment at Russia in order to

understand that the transition to parliamentary monarchy, as the liberal politicians desired it, would have preserved the dynasty, destroyed the naked rule of the bureaucracy, and in the final result would have strengthened the country as much as it is now weakened by the present republic of literati, irrespective of its leaders' idealism.[17] In England it is well understood that the strength of British parliamentarism is related to the fact that the highest position in the state is occupied once and for all. We can discuss here neither the reasons for the importance of the mere existence of a monarch nor the question of whether only a monarch can play this role. For Germany at least we must reckon with the position of the monarch. We cannot be eager for an age of wars between pretenders and an era of counter-revolutions; for that our international position is too tenuous.

However, in the modern state the monarch can never and nowhere be a counterforce against the pervasive power of the bureaucrats. He cannot supervise the administration, for it is a professionally trained apparatus and the modern monarch is never an expert, with the possible exception of military matters. Above all, the monarch is never a *politician* with training obtained within the machinery of the parties or of diplomacy. Not only his education, but especially his constitutional position works against this. He does not gain his crown through a party contest, and the struggle for power is not his natural milieu, as it is for the politician. He does not personally experience the harsh realities of party life by descending into the political arena, but rather is removed from them through his privilege. There are born politicians, but they are rare. The monarch who is not one of them becomes a threat to his own and to the state's interests if he attempts to govern by himself, as did the Tsar, or to exert influence with political means—through "demagogy" in the broadest sense of the word—in speech and writing, for the sake of propagating his ideas or projecting his personality. He then endangers not only his crown—that would be his personal affair—but the survival of the state. However, this temptation—nay, necessity—arises inevitably for a modern monarch if he is confronted only by bureaucrats, that means, if parliament is powerless, as has been the case in Germany for decades. Even from a purely instrumental viewpoint this has severe drawbacks. If there is no powerful parliament, the monarch is today dependent upon the reports of officials for the supervision of the work of other officials. This is a vicious circle. The continuous war of the various ministries against one another, as was typical of Russia and also to some extent of Germany up to the present, is the natural consequence of such allegedly "monarchic" governments without a *political* leader. This conflict of "satraps" involves most of the time not

only differences of opinion, but personal rivalries; the clashes between the ministries serve their chiefs as vehicles in the competition for the ministerial positions. If these are treated merely as bureaucratic benefices, court intrigues, not substantive reasons or qualities of political leadership, determine incumbency. Everybody knows that personal power struggles are common in parliamentary states. The error lies in the assumption that monarchies are different in this regard. In truth, they have an additional problem. The monarch believes that he himself rules, whereas in fact behind this screen the bureaucracy enjoys the privilege of operating without controls and without being accountable to anybody. Flatterers surround the monarch with the romantic halo of power because he can replace the governing minister according to his discretion. However, monarchs like Edward VII of England and Leopold II of Belgium, who certainly were not outstanding personalities, wielded much greater power although *and because* they ruled in strictly parliamentary fashion and never played a conspicuous public role, or at least never appeared in public in other than parliamentary trappings. It is pure ignorance if such monarchs are treated as "shadow kings" in the phraseology of the literati, and it is stupidity if they turn the philistine gossip about their morals into a political yardstick. History will judge differently, even if their policies should ultimately fail—as so many great projects have come to naught. One of these two monarchs was even forced to change his court officials according to the parliamentary power constellation, but he brought together a world coalition; the other ruled only a small state, but he assembled a huge colonial empire (at least in comparison to our colonial fragments). Whoever wants to *lead* in politics, whether he be monarch or minister, must know how to play the modern instruments of power. The parliamentary system eliminates only the politically *incompetent* monarch—for the country's benefit. Is this a "night-watchman state"[18] that managed to attach to itself, despite its very small population, the best parts of all continents? How philistine is this hackneyed phrase that betrays so much of the resentment of the *Untertan*.

Let us now turn to parliament.

6. *Weak and Strong Parliaments, Negative and Positive Politics*

Modern parliaments are primarily representative bodies of those ruled with bureaucratic means. After all, a certain minimum of consent on the part of the ruled, at least of the socially important strata, is a pre-

condition of the durability of every, even the best organized, domination. Parliaments are today the means of manifesting this minimum consent. For certain actions of the public powers, enactment after previous deliberation in parliament is obligatory; this includes especially the budget. The control over the raising of revenues—the budget right—is the decisive power instrument of parliament, as it has been ever since the corporate privileges of the estates came into being. However, as long as a parliament can support the complaints of the citizens against the administration only by rejecting appropriations and other legislation or by introducing unenforcable motions, it is excluded from positive participation in the *direction* of political affairs. Then it can only engage in "negative politics," that means, it will confront the administrative chiefs as if it were a hostile power; as such it will be given only the indispensable minimum of information and will be considered a mere drag-chain, an assembly of impotent fault-finders and know-it-alls. In turn, the bureaucracy will then easily appear to parliament and its voters as a caste of careerists and henchmen who subject the people to their annoying and largely superfluous activities.

Things are different when parliament has accomplished the following: Either, that the administrative heads must be recruited from its midst—the *parliamentary system* proper—, or that they need the express confidence of its majority for holding office or must at least resign upon losing its confidence—the *parliamentary selection* of the leaders; that they must account for their actions exhaustively to parliament, subject to verification by that body or its committees—*parliamentary accountability* of the leaders; further, that they must run the administration according to the guidelines approved by parliament—*parliamentary control* of the administration. Then the leaders of the dominant parties have a positive share in government, and parliament becomes a factor of positive politics, beside the monarch who now governs no longer by virtue of his formal crown rights—at least not exclusively—, but by virtue of his personal influence, an influence which remains great in any case, but varies according to how prudent he is and how sure of his aims. This is what is meant by the *Volksstaat* [state of the people], irrespective of whether the term is appropriate or not; by contrast, a parliament of the ruled which can only resort to negative politics vis-à-vis a dominant bureaucracy represents a version of the *Obrigkeitsstaat* [state of the authorities]. We are here interested in the *concrete* consequences of the position of parliament.

Whether we hate or love parliamentary politics—we cannot eliminate it. At most, parliament can be made politically powerless, as Bismarck did with the *Reichstag*. In addition to the general consequences

of "negative politics," the weakness of parliament has other results [which can be better understood if we first recall the role of a strong parliament]: Every conflict in parliament involves not only a struggle over substantive issues but also a struggle for personal power. Wherever parliament is so strong that, as a rule, the monarch entrusts the government to the spokesman of a clear-cut majority, the power struggle of the parties will be a contest for this highest executive position. The fight is then carried by men who have great political power instincts and highly developed qualities of political leadership, and hence the chance to take over the top positions; for the survival of the party outside parliament, and the countless ideal, and partly very material, interests bound up with it require that capable leaders get to the top. Only under such conditions can men with political temperament and talent be motivated to subject themselves to this kind of selection through competition.

Matters are completely different if under the label of "monarchic government" the appointment to the top positions is the outcome of bureaucratic advancement or accidental court acquaintance, and if a powerless parliament must submit to such a government formation. In this case, too, personal ambitions, apart from substantive issues, naturally play a role, but in very different, subaltern forms, and in directions such as have been pursued in Germany since 1890. Besides representing the local economic interests of influential voters, petty subaltern job patronage becomes the major concern of the parties. The clash between Chancellor Bülow and the Center party [in 1906] was not due to politial differences, but essentially to the Chancellor's attempt to repudiate the party's patronage rights which even today still shape the personnel composition of some central agencies of the *Reich*. The Center party is not alone in this respect. The conservative parties continue their office monopoly in Prussia and try to scare the monarch with the spectre of "Revolution" whenever these benefices appear in danger. The parties which are permanently excluded endeavor to compensate themselves by running the municipal administrations and the public health insurance funds, and pursue in parliament, as the Social Democrats used to do, policies hostile to the government or alienated from the state. This is quite natural, for *every* party strives for *power*, that means, for a share in the administration and hence in the filling of offices. As far as the latter is concerned, our ruling strata are not to be outdone by any others, but they cannot be held *accountable* since job hunting and patronage occur behind the scenes and involve the subordinate positions which are not responsible for the personnel composition of the civil service. Our bureaucracy, in turn, benefits from this state of affairs by

being free from personal supervision; the only price it pays to the dominant parties are "tips" in the form of those small-time benefices. This is the natural result of the fact that the party (or party coalition) which actually provides the majority for or against the government is not itself officially called upon to fill the top political position.

On the other hand, this system permits qualified bureaucrats who nevertheless have no trace of statesman-like talent to maintain themselves in leading political positions until some intrigue forces them out in favor of similar personages. Thus, we have no less party patronage than any other country, but we have it in dishonestly veiled form and in a manner which always favors certain partisan views acceptable at court. However, this partiality is by far not the worst aspect of the matter. It would be politically tolerable if it afforded at least an opportunity for recruiting, from these court parties, leaders capable of guiding the nation. However, this is not the case. It would be possible only in a parliamentary system, or at least in one which makes the top positions available to parliamentary patronage. Here we encounter a purely formal obstacle embedded in the constitution.

7. *The Constitutional Weaknesses of the* Reichstag *and the Problem of Leadership*

Article 9 of the *Reich* constitution [of 1871] reads that "nobody can be simultaneously a member of the *Bundesrat* and of the *Reichstag*." Hence, whereas in parliamentary systems it is considered absolutely necessary that the leaders of the government are members of parliament, this is legally precluded in Germany. The Imperial chancellor, a minister representing his state in the *Bundesrat*, or an Imperial secretary of state, can be a member of a state parliament—for example, of the Prussian diet—and can there influence or even lead his party, but he cannot sit in the *Reichstag*. This stipulation was simply a mechanical imitation of the exclusion of the British peers from the House of Commons (and probably carried over from the Prussian constitution). Hence, it was an act of thoughtlessness; it must now be removed. This will not in itself be tantamount to the introduction of the parliamentary system or of parliamentary patronage, but it will create the opportunity for a politically competent deputy to hold at the same time a major position in the Imperial government. It is hard to see why a deputy who proves suitable for a top position should be forced to abandon his political base before he can assume his post.

If Bennigsen had entered the government at the time [1877/78] and had left the *Reichstag*, Bismarck would have turned an important political leader into an administrative official without parliamentary support, and the [National Liberal] party would have been taken over by its left wing or it would have disintegrated—and this perhaps was Bismarck's intent. Today the [National Liberal] deputy Schiffer has lost his influence in the party by joining the government and thus has surrendered it to its big business wing.[19] In this manner, the parties are "beheaded," but instead of effective politicians the government gets officials without professional training in a bureaucratic career and without a parliamentarian's influence. This results in the cheapest conceivable form of "buying off" the parties. Parliament becomes a stepping-stone for the career of talented would-be secretaries of state: This typically bureaucratic idea is championed by political and legal literati who consider the problem of German parliamentarism thus solved in a specifically "German" manner! These same circles sneer at job hunting, which appears to them as an exclusively "Western European" and "democratic" phenomenon. They will never understand that parliamentary leaders seek office not for the sake of salary and rank, but of *power* and the attending *responsibility*, and that these leaders can succeed only if they have a parliamentary following; these circles will also never comprehend that there is a difference between making parliament a recruiting ground for leaders or for bureaucratic careerists. For decades the same groups have ridiculed the German parliaments and their parties for seeing in the government something of a natural enemy. But they are not in the least disturbed by the fact that because of the limitation—directed exclusively against the *Reichstag*—of Article 9, *Bundesrat* and *Reichstag* are treated by the law as hostile powers which can relate to one another only through declarations from the latter's rostrum and the former's conference table. It should be left to the conscientious consideration of a statesman, of the government empowering him, *and* of his voters, whether he can combine with his office a parliamentary mandate, party leadership or, at any rate, participation in a party, and whether the instructions according to which he votes in the *Bundesrat* are compatible with his own convictions for which he stands in the *Reichstag*.[20] The man who is responsible for instructing the "presiding" [i.e., the Prussian] vote in the *Bundesrat*—the Imperial chancellor and Prussian foreign minister—should be free to exert his influence as a party member in the *Reichstag*, in addition to presiding over the *Bundesrat* under the supervision of the representatives of the other states. Nowadays, of course, it is considered "noble" if a statesman stays aloof from the parties. Count Posadowsky even believed that he owed it to

his *earlier* office [secretary of the interior from 1897 until 1907] to remain unaffiliated with any party, that means, to misuse the *Reichstag* in the role of an ineffective academic rhetorician. Why ineffective? Because of the way in which parliament conducts its business.

The speeches of the deputies are today no longer personal professions, still less attempts to win over opponents. They are official statements addressed to the country ("through the window"). After representatives of all parties have spoken once or twice in turn, the *Reichstag* debate is closed. The speeches are submitted beforehand to a party caucus, or at least agreed upon in all essentials. The caucus also determines who will speak for the party. The parties have experts for every issue, just like the bureaucracy. It is true that besides their worker-bees they have drones who are useful for rhetorical fireworks, if used cautiously. By and large, however, those who do the work also have the influence. Their work is done behind the scenes, in the meetings of the committees and the caucuses and especially in the private offices of the most active deputies. For instance, Eugen Richter's position was impregnable, even though he was very unpopular in his own [Progressive] party, because of his great working capacity and his unexcelled knowledge of the budget. He may have been the last deputy who could check up on the war minister's use of every penny, down to the last canteen. Despite their annoyance, officials of the War Department have several times expressed their admiration to me about Richter's grasp of these matters. Presently Matthias Erzberger's position in the Center party rests on his tremendous, bee-like industry, without which the influence of this politician, whose political talent is quite limited, would scarcely be understandable.[21]

However, industry qualifies a man neither for leadership in government nor in a party—two things which are by no means as different as our romantic literati believe. To my knowledge, all German parties had in the past men with the talent of political leadership: von Bennigsen, von Miquel, von Stauffenberg, Völk and others among the National Liberals, von Mallinckrodt and Windhorst in the Center party, von Bethusy-Huc, von Minnigerode, von Manteuffel among the Conservatives, von Saucken-Tarputschen among the Progressives, and von Vollmar among the Social Democrats. They all passed away or left parliament, like Bennigsen in the eighteen-eighties, because they could not enter the government as party leaders. If deputies do become ministers, like von Miquel and Möller, they must abandon their earlier political commitments in order to fit into the purely bureaucratic ministries. (At the time Möller said that he was in the *unpleasant* position of having made his private views known in his earlier speeches as a deputy!)

However, there are a great many *born leaders* left in Germany. But where are they? The answer is now easy. As an illustration, I refer to a man whose political views and attitudes toward social reform are radically opposed to mine: Does anybody believe that the present director of Krupp, formerly a civil servant and active in East-German colonization politics, was destined to manage Germany's largest industrial enterprise rather than to run a key ministry or a powerful parliamentary party?[22] Why then does he do the one and would presumably, under the present conditions, refuse the other? To make more money? I assume instead another very simple reason: Namely, that in face of the powerlessness of parliament and the resulting bureaucratic character of the ministerial positions a man with a strong power drive and the qualities that go with it would have to be a fool to venture into this miserable web of mutual resentment and on this slippery floor of court intrigue, as long as his talents and energies can apply themselves in fields such as the giant industrial enterprises, cartels, banks and wholesale firms. People of his type prefer to finance All-German newspapers and to open them to the scribbles of the literati. Stripped of all phraseology, our so-called monarchic government amounts to nothing but this process of *negative selection* which diverts all major talents to the service of capitalist interests. For only in the realm of private capitalism is there today anything approaching a selection of men with leadership talents. Why? Because *Gemütlichkeit*—in this case: the rhetoric of the literati---comes to an end as soon as economic interests involving millions and billions of Marks and tens and hundreds of thousands of workers are affected.[23] And why is there no such selection in government? Because one of the worst legacies of Bismarck's rule has been the fact that he considered it necessary to seek cover for his caesarist regime behind the *legitimacy* of the monarch. His successors, who were no Caesars but sober bureaucrats, imitated him faithfully. The politically uneducated nation took Bismarck's rhetoric at its face value, and the literati provided the usual applause. This stands to reason because they examine the future officials and consider themselves officials and fathers of officials. Their resentment is directed against everybody who seeks and gains power without legitimizing himself through a diploma. Since Bismarck had dishabituated it from worrying about public affairs, and foreign policy in particular, the nation permitted itself to be talked into accepting something as "monarchic government" which in truth amounted to the unchecked rule of the bureaucracy. Under such a system qualities of political leadership have never been born and brought to fruition anywhere in the world. Our civil service does indeed include men with leadership qualities; we certainly would not want to deny this here.

However, the conventions and internal peculiarities of the bureaucratic hierarchy severely impede the career opportunities precisely of such talents, and the whole nature of modern officialdom is most unfavorable to the development of *political* autonomy (which must be distinguished from the inner freedom of the private individual). The essence of politics—as we will have to emphasize time and again—is *struggle*, the recruitment of *allies* and of a *voluntary* following; to get training in this difficult art is impossible under the career system of the *Obrigkeitsstaat*. It is well-known that Bismarck's school was the Frankfurt Federal Diet.[34] In the army, training is directed toward combat, and this can produce military leaders. However, for the modern politician the proper palaestra is the parliament and the party contests before the general public; neither competition for bureaucratic advancement nor anything else will provide an adequate substitute. Of course, this is true only of a parliament and a party whose leader can take over the government.

Why in the world should men with leadership qualities be attracted by a party which at best can change a few budget items in accordance with the voters' interests and provide a few minor benefices to the protégés of its higshots? What opportunities can it offer to potential leaders? The tendency towards merely negative politics of our parliament is reflected today in the most minute details of the agenda and conventions of the *Reichstag* and the parties. I know of quite a few cases in which young political talents were simply suppressed by the old guard of deserving local notables and party bigwheels. This happens in every guild, and it is quite natural in a powerless parliament restricted to negative politics, since in an institution of this kind the guild instincts will predominate. A party oriented toward sharing governmental power and responsibility could never afford this; every member would know that the survival of the party and of all the interests which bind him to it depends upon its subordination to qualified leaders. Nowhere in the world, not even in England, can the parliamentary body as such govern and determine policies. The broad mass of deputies functions only as a following for the leader or the few leaders who form the government, and it blindly follows them *as long as* they are successful. *This is the way it should be.* Political action is always determined by the "principle of small numbers," that means, the superior political maneuverability of small leading groups. In mass states, this caesarist element is ineradicable.

However, this element alone guarantees that *responsibility* toward the public, which would evaporate within an assembly governing at large, rests upon clearly identifiable persons. This is especially true of a democracy proper. Officials elected directly by the people have proven

themselves in two situations: First, in the local cantons, in which the members of a stable population know one another personally and where elections can be determined by a person's reputation in the neighborhood community. The second case, which holds true only with considerable reservations, is the election to the highest political office in a mass state. It is rarely the most outstanding man, but usually at least a suitable political leader who obtains supreme power in this way. However, for the mass of officials in the middle ranks, especially those who need a specialized training, popular election as a rule fails completely, and for understandable reasons. In the United States the judges appointed by the President towered above those elected by the people in terms of capability and integrity. The man who appointed them was, after all, responsible for the official's qualification, and the ruling party suffered later if gross abuses occurred. In the United States, equal suffrage has resulted time and again in the election, as lord mayor, of a popular trustee who was largely free to create his own municipal administration. The English parliamentary system equally tends toward the development of such caesarist features. The prime minister gains an increasingly dominant position toward parliament, out of which he has come.

Just like every other human organization, the selection of political leaders through the parties has its weaknesses, but upon these the German literati have dilated *ad nauseam* during the last decades. Of course, the parliamentary system, too, expects of the individual that he subordinate himself to a man whom he can often accept only as the "smaller evil." But the *Obrigkeitsstaat* gives him no choice at all and imposes upon him bureaucrats instead of leaders, which certainly makes for a bit of a difference. Moreover, plutocracy flourishes in Germany as much as in other countries, if only in somewhat different forms. The literati depict the great capitalist powers in the darkest colors and, it should be noted, without any encumbering knowledge. There are some solid reasons behind the fact that these very powers, which know their own interests far better than those armchair theorists, range themselves unanimously on the side of the bureaucratic *Obrigkeitsstaat* and against democracy and parliamentarism; this is especially true of heavy industry, the most ruthless of these capitalist powers, but these reasons remain beyond the ken of the literary philistines. In their moralizing fashion, they score the fact that the party leaders are moved by the will to power and their following by selfish interest in office-holding—as if the bureaucratic aspirants were not equally career- and salary-minded, but rather inspired by the most selfless motives. The role of demagogy in the power struggle is demonstrated to everybody by the current (January

1918) newspaper campaign about who should be the German foreign minister, a campaign encouraged from certain official quarters.[25] This proves that an allegedly monarchic government facilitates the most pernicious misuse of the press in the pursuit of office and of interdepartmental rivalries. This state of affairs could not be aggravated in any parliamentary system with powerful parties.

The motives of party members are no more merely idealist than are the usual philistine interests of bureaucratic competitors in promotion and benefices. Here as there, personal interests are usually at stake (and this will not change in the vaunted state of corporate solidarity, which the literati envision). It is of crucial importance, however, that these universal human frailties at least do not prevent the selection of capable leaders. But in a party this is possible only if the leaders know that in case of victory they will have the powers and the responsibilities of government. Only then is this selection *possible*, but it is not assured even then. For only a *working*, not a merely speech-making parliament can provide the ground for the growth and selective ascent of genuine leaders, not merely demagogic talents. A working parliament, however, is one which supervises the administration by continuously sharing its work. Before the war this was not possible in Germany, but afterward it must be possible, or we will have the old *misère*. This is our next topic.

iii

The Right of Parliamentary Inquiry and the Recruitment of Political Leaders

The whole structure of the German parliament has been oriented toward *negative politics*: critique and complaint, the deliberation, modification and passing of governmental bills. All parliamentary conventions correspond to this condition. Because of the lack of public interest, we unfortunately do not have any political analyses of the actual operations of the *Reichstag*, as they exist for foreign parliaments; we only have solid legal studies of the rules of procedure. However, if you talk to a deputy about any desiderata of parliamentary organization, you are immediately confronted with numerous conventions which exist only

for the comforts, vanities, wants and prejudices of tired parliamentary dignitaries and impede any political effectiveness of parliament. In this way even the simple task of continuous parliamentary supervision over the bureaucracy is handicapped. Is this supervision superfluous?

Our officialdom has been brilliant wherever it had to prove its sense of duty, its impartiality and mastery of organizational problems in the face of official, clearly formulated tasks of a specialized nature. The present writer, who comes from a civil-service family, would be the last to let this tradition be sullied. But here we are concerned with political, not bureaucratic achievements, and the facts themselves provoke the recognition which nobody can truthfully deny: That bureaucracy failed *completely* whenever it was expected to deal with *political* problems. This is no accident; rather, it would be astonishing if capabilities inherently so alien to one another would emerge within the same political structure. As we have pointed out, it is not the civil servant's task to enter the political arena fighting for his own convictions, and in this sense to engage in the political struggle. On the contrary, his pride lies in maintaining impartiality, hence in disregarding his own inclinations and opinions, in order to adhere conscientiously and meaningfully to general rule as well as special directive, even and particularly if they do not correspond to his own political attitudes. But the heads of the bureaucracy must continuously solve political problems—problems of *Machtpolitik* as well as of *Kulturpolitik*. Parliament's first task is the supervision of these policy-makers. However, not only the tasks assigned to the top ranks of the bureaucracy but also every single technicality on the lower administrative levels may become politically important and its solution may depend on political criteria. Politicians must be the countervailing force against bureaucratic domination. This, however, is resisted by the power interests of the administrative policy-makers, who want to have maximum freedom from supervision and to establish a monopoly on cabinet posts.

1. *Effective Supervision and the Power Basis of Bureaucracy*

Effective supervision over the officialdom depends upon certain preconditions.

Apart from being rooted in the administrative division of labor, the power of all bureaucrats rests upon *knowledge* of two kinds: First, technical know-how in the widest sense of the word, acquired through

specialized training. Whether this kind of knowledge is also represented in parliament or whether deputies can privately consult specialists in a given case, is incidental and a private matter. There is no substitute for the systematic cross-examination (under oath) of experts before a parliamentary commission in the presence of the respective departmental officials. This alone guarantees public supervision and a thorough inquiry. Today, the *Reichstag* simply lacks the right to proceed in this fashion: the constitution *condemns it to amateurish ignorance.*

However, expertise alone does not explain the power of the bureaucracy. In addition, the bureaucrat has *official information,* which is only available through administrative channels and which provides him with the facts on which he can base his actions. Only he who can get access to these facts independently of the officials' good will can effectively supervise the administration. According to the circumstances, the appropriate means are the inspection of documents, on-the-spot inquiry and, in extreme cases, the official's cross-examination under oath before a parliamentary commission. This right, too, is withheld from the *Reichstag,* which has deliberately been made incapable of gaining the necessary information. Hence, in addition to dilettantism, the *Reichstag* has been sentenced to *ignorance*—plainly not for technical reasons, but exclusively because the bureaucracy's supreme power instrument is the transformation of official information into classified material by means of the notorious concept of the "service secret." In the last analysis, this is merely a means of protecting the administration against supervision. While lower ranks of the bureaucratic hierarchy are supervised and criticized by the higher echelons, all controls, whether technical or political, over these policy-making echelons have failed completely. The manner in which administrative chiefs answer questions and critiques in the *Reichstag* is often disgraceful for a self-confident people; it has been possible only because parliament cannot avail itself, through the "right of investigation" (*Enqueterecht*), of the facts and technical viewpoints, knowledge of which alone would permit steady co-operation with and influence upon the administration. This must be changed first. Of course, the *Reichstag* committees are not supposed to immerse themselves in comprehensive studies and to publish fat volumes—this will not happen anyway because the *Reichstag* is too busy with other things. The parliamentary right of inquiry should be an auxiliary means and, for the rest, a whip, the mere existence of which will force the administrative chiefs to account for their actions in such a way as to make its use unnecessary. The best accomplishments of the British parliament have been due to the judicious use of this right. The integrity of British officialdom and the public's high level of political

sophistication are largely founded on it; it has often been emphasized that the best indicator for political maturity lies in the manner in which the committee proceedings are followed by the British press and its readers. This maturity is reflected not in votes of no-confidence, indictments of ministers and similar spectacles of French-Italian *unorganized* parliamentarism, but in the fact that the nation keeps itself informed about the conduct of its affairs by the bureaucracy, and continuously supervises it. Only the committees of a powerful parliament can be the vehicle for exercising this wholesome pedagogic influence. Ultimately, the bureaucracy can only gain by such a development. The public's relationship to the bureaucracy has rarely shown such want of comprehension as in Germany, at least in comparison with countries that have parliamentary traditions. This is not astonishing. In our country, the problems with which the officials must deal are nowhere visible. Their achievements can never be understood and appreciated and the sterile complaints about "Saint Bureaucratius"—instead of positive critique—cannot be overcome so long as the present condition of uncontrolled bureaucratic domination persists. Moreover, the power of officialdom would not be weakened wherever it has its proper place. In departmental affairs, the permanent under-secretary (*Geheimrat*) who has specialized in a given field has the edge over his minister, even the minister who has been a career official; this is true for England just as for Germany. That is quite appropriate, for nowadays specialized training is an indispensable precondition for the knowledge of the technical means necessary to the achievement of political goals. But policy-making is not a technical affair, and hence not the business of the professional civil servant.

2. *Parliament as a Proving-Ground for Political Leaders*

The continuous supervision which would be introduced by the seemingly unspectacular right of parliamentary inquiry is the basic precondition for all further reforms aiming at an increase of parliament's share in government. This change is also the indispensable presupposition for turning parliament into a recruiting ground of political leaders. German literary fashion likes to discredit parliaments as arenas for "mere speech-making." Similarly, though with far more wit, Carlyle had thundered against the British parliament three generations ago, and yet it became the decisive agent of British world power. Today political (and military) leaders no longer wield the sword but resort to quite prosaic sound waves and ink drops: written and spoken *words*. What

matters is that intelligence and knowledge, strong will and sober experience determine these words, whether they be commands or campaign speeches, diplomatic notes or official statements in parliament. However, ignorant demagogy or routinized impotence—or both—prevail in a parliament which can only criticize without getting access to the facts and whose leaders are never put into a situation in which they must prove their mettle. It is part of that sorry story of political immaturity, which a wholly unpolitical era produced in our country, that the German philistine looks at political institutions such as the British parliament with eyes blinded by his own environment; he believes that he can smugly look down at them from the heights of his own political impotence and he fails to consider that the British parliament became, after all, the proving ground for those political leaders who managed to bring a quarter of mankind under the rule of a minute but politically prudent minority. The main point is that to a significant degree this subordination has been voluntary. Where are the comparable achievements of the much-praised German *Obrigkeitsstaat*? The political preparation for such achievements is, of course, not acquired by making ostentatious and decorative speeches before parliament, but only through steady and strenuous work in a parliamentary career. None of the outstanding English leaders rose to pre-eminence without experience in the committees and, often, in various government agencies. Only such intensive training, through which the politician must pass in the committees of a powerful *working* parliament, turns such an assembly into a recruiting ground not for mere demagogues but for positively participating politicians. Until today the British parliament has been unparalleled in this respect (as nobody can honestly deny). Only such co-operation between civil servants and politicians can guarantee the continuous supervision of the administration and, with it, the political education of leaders and led. Publicity of administration, enforced by effective parliamentary oversight, must be demanded as a precondition for any fruitful parliamentary work and political education. We, too, have begun to embark on this road.

3. *The Importance of Parliamentary Committees in War and Peace*

The wartime exigencies, which have done away with quite a few conservative slogans, have brought into being the Main Committee (*Hauptausschuss*) of the *Reichstag*,[26] its operations still leave much to be desired, but it is at least a step toward an effective parliament. Its insufficiency from a political viewpoint has been due to the pernicious

and unorganized *form* in which publicity was given to very sensitive problems; the discussions occurred among too large a circle of deputies, and for that reason they were bound to be emotional. It was simply dangerous mischief that hundreds of persons knew about confidential military and diplomatic matters (witness the issue of submarine warfare); as a result, such information was handed on privately or found its way into the press, inaccurately or in the form of sensational allusion. Current deliberations of foreign and military policy belong before a small circle of trusted representatives of the parties. Since politics is always made by a small number of persons, the parties, too, must be organized for the vital political issues not in the manner of guilds, but in that of a following. Their spokesmen must be "leaders," that means, they must have unlimited authority for making important decisions (or they must be able to get this authority within a few hours from committees that can be called together at any time). For its designated single purpose, the Committee of Seven of the *Reichstag* was a step that seemingly led in this direction.[27] The vanity of the administrative chiefs was taken into account by calling this body "provisional" and by attempting not to treat the parliamentarians as representatives of their parties—an attempt that would have destroyed the Committee's political significance and fortunately failed. There were good technical reasons for bringing these seven party representatives together with government representatives, but instead of the seven plenipotentiaries of the *Bundesrat* it would have been better to draw upon just three or four delegates of the larger non-Prussian states and, for the rest, to call in the four or five top military men or their deputies. At any rate, only a small group of men who are obliged to be discreet can prepare political decisions in very tense political situations. Under the wartime conditions it was perhaps appropriate to establish such a mixed committee uniting the representatives of the government with those of *all* major parties. In peacetime, an arrangement that would draw in party representatives on a similar basis might be equally useful for the deliberation of sensitive political issues, especially in foreign politics. For the rest, however, this system has a limited utility; it is neither a substitute for genuine parliamentary reform nor a means for the creation of coordinated governmental policies. If these policies are to be supported by several parties, consensus could be established in discretionary meetings between the government leaders and representatives of the parliamentary *majority*. A committee in which Independent Socialists and Conservatives sit together cannot possibly fulfill this function of formulating a political will. Any expectations along these lines would be politically unrealistic, since such structures cannot facilitate the pursuit of consistent policies.

By contrast, for the peacetime supervision of the bureaucracy specialized mixed committees, following upon the *Hauptausschuss*, might well prove suitable, provided the public is kept informed and effective procedures are designed that can preserve uniformity in the face of the specialized subject matter dealt with in the various subcommittees which would draw upon representatives from the *Bundesrat* and the ministries. The possible political effectiveness of such an arrangement will, of course, depend completely upon the future role of the *Reichstag* and the structure of its parties. If things remain as they are, if the mechanical obstacle of Article 9 of the constitution is retained and parliament continues to be limited to "negative politics"—and the bureaucracy obviously aims at this perpetuation—, then the parties will probably impose petty mandates on their representatives in the committees; they will certainly not grant them policy-making powers; moreover, each will go its own way pursuing petty emoluments for its protégés. The whole arrangement would then become a useless and time-consuming annoyance to the administration, not a means of political training and of fruitful co-operation. The positive result would in that case at best be something similar to the proportional patronage practiced in some Swiss Cantons: the individual parties peacefully divide their influence over the administration, and this lessens conflict among them. (However, it is very doubtful whether even this relatively negative result can be obtained in a mass state that is confronted with major political tasks. To my knowledge, the Swiss have divergent opinions about the positive effects of this practice, and these must of course be evaluated very differently in a large state.) Uncertain as these idyllic perspectives are, he who values most the elimination of party conflict will be pleased about them, and the bureaucracy will expect from such a practice the perpetuation of its power by continuing the system of petty payoffs. If, in addition, bureaucratic positions were to be divided proportionally among the various parties acceptable at court, it would be even easier to produce "happy faces all around." However, such a peaceful redistribution of benefices in the Prussian interior administration is most unlikely, given the monopoly of the Conservative party on the posts of *Landräte*, *Regierungs-* and *Oberpräsidenten*. Moreover, in purely political terms, not much more would come out of it than benefices for party bureaucrats, rather than political power and responsibility for party leaders. This would certainly not be a suitable means for raising the political level of parliament. It would be a completely open question whether in this manner the public supervision of the administration and the requisite public maturity could be increased.

At any rate, even the simplest administrative matters cannot be

adequately discussed in such a bureaucratized committee unless its right to procure the necessary technical and administrative information at any time is fully guaranteed. The bureaucracy's status interests, or more bluntly, its vanities and its desire to perpetuate the absence of controls, are the sole obstacles in the path of this demand—which, moreover, does not even imply the introduction of parliamentary government, but merely one of its technical preconditions.

The only substantively relevant objection which constitutional experts usually raise against the right of inquiry is that the *Reichstag* is completely autonomous with regard to its agenda, and hence the given majority might one-sidedly refuse an investigation or influence it in such a fashion as to make unwelcome findings impossible. Without any doubt, this discretion (Article 27 of the *Reich* constitution), which was adopted uncritically from English theory, is not suitable here. The right of inquiry must be guaranteed by new legislation; in particular, it must be established unconditionally as a *minority* right—let us say, in the form that one hundred deputies must be able to demand an inquiry, and such a minority must of course also have the right to be represented in committees, to ask questions and to write dissenting opinions. To begin with, this is necessary in order to provide the countervailing power of publicity against any abusive parliamentary majority and its well-known dangers, a counterweight that does not exist in other states and up to now has been effective in England only by virtue of the mutual party courtesy. However, other guarantees will also be required. As long as the industries compete with one another, especially those of different countries, it will be imperative to protect their technological secrets against tendentious publicity. The same protection must be extended to military technology, and also to pending questions of foreign policy, which prior to their ultimate decision should be discussed only before a small group. It is an error of some, particularly of Russian, literati that foreign affairs—such as the conclusion of a peace between warring nations—can be successfully conducted by outdoing one another in the public pronouncement of general "principles," instead of resorting to sober deliberations of the best possible compromise between the inevitably antagonistic national interests that lurk behind these alleged "principles."[28] At this very moment the facts make a mockery out of this notion. Certainly the means by which the faults of *our* past must be remedied are very different from these amateurish ideas of political literati. The opinion widely held in democratic circles that *public* diplomacy is a panacea—and always works for peace—is in this very generalized form a misconception. It has a certain appropriateness for final and thoroughly considered positions, but not—as long as there are competing states—for the process of deliberation; the same holds

true, of course, for competing industries. In direct contrast to the utility of public scrutiny in the realm of public administration, at the stage of foreign policy deliberations such publicity can most severely disturb the rationality and soberness of decision-making and hence even endanger or prevent peace. The events of the present war have demonstrated this very clearly. However, we shall discuss foreign politics in a separate section [cf. sec. *iv*, below].

4. *Domestic Crises and the Lack of Parliamentary Leadership*

At this point we would merely like to add some observations on the manner in which nowadays the lack of parliamentary leadership shows up in domestic crises. The events of Erzberger's [peace] move in July [1917] and of the two subsequent crises were instructive on this score.[29] All three occasions have clearly shown the consequences of a situation in which 1) government and parliament confront one another as divided organs, the latter being a "mere" representation of the ruled and therefore oriented toward "negative politics," 2) the parties are guild-like bodies since political leaders cannot find their vocation in parliament and hence no place in the parties, 3) the executive is in the hands of bureaucrats who are neither party leaders nor continuously in touch with them, but instead stand "above" the parties—to use the conventional status-conscious phraseology—and hence cannot lead them. When a strong parliamentary majority insisted on a positive decision by the government, the system failed at once. The puzzled government had to let the reins drag because it had no foothold in the party organizations. The *Reichstag* presented a spectacle of complete anarchy because the (so-called) party leaders had never held executive positions and were also at the time not considered future heads of government. The parties were confronted with a completely novel task to which neither their organization nor their personnel could measure up—the formation of a government. Of course, they were totally unable to succeed on this score, nor did they really try, for none of them, from the extreme right to the extreme left, had a man who was a recognized leader; the same held for the bureaucracy.

For forty years all parties have operated on the assumption that the *Reichstag* merely has the function of "negative politics." The "will to impotency," to which Bismarck had condemned them, was shockingly obvious [in July 1917]. They did not even participate in the selection of the new leadership; the vanity of the bureaucracy would not even tolerate that much at this critical moment, although the most simple pru-

dence would have prescribed it. Instead of putting to the parties the captious question whom they would like to propose as candidates or, more practically, how they looked upon the various possible candidates, the bureaucracy did not budge from its prestige-ridden view that the formation of the government did not concern the *Reichstag*. Forces outside of parliament [in particular, General Ludendorff] intervened and set up the new government, which in turn did not submit to the *Reichstag* a definite proposal with a categorical demand for a clear Yes or No answer. As everyone remembers, the new chancellor [Dr. Georg Michaelis] was forced into making several contradictory statements about the most important point [the Peace Resolution of the majority parties] and had to accept supervision by the Committee of Seven on a point of foreign affairs [the German response to the Papal peace note of August 1917] simply because he did not have parliament's *confidence*. It goes without saying that this unpleasant spectacle, which was bound to impair Germany's prestige, reinforced the literati's comforting conviction that parliamentarism was "impossible" in Germany; they kept talking of parliament's "failure." Actually, something very different failed: the bureaucracy's attempt at manipulating parliament, the very system that for decades had been at work, with the applause of the literati, to prevent parliament from making any positive political contributions, all in the interest of bureaucratic independence. The situation would have been completely different in any other mode of government in which responsibility rested squarely, or at least significantly, upon the shoulders of the party leaders; this would have offered an opportunity for political talents to help shape the country's fortunes from inside parliament. Then the parties could not have permitted themselves such a petty-bourgeois and guild-like organization as the one now prevailing in the *Reichstag*. They would have been compelled to subordinate themselves to leaders instead of to diligent civil-service types, such as prevailed especially in the Center Party, who would lose their nerve at the crucial moment. In such a crisis the leaders would have been obliged to form a coalition, which would have proposed to the monarch a constructive program and the men capable of carrying it out. However, under the given circumstances nothing but purely negative politics were possible.

[Michaelis,] the new chancellor selected from outside parliament [in July 1917], was confronted with a chaotic situation that soon resulted in the old condition. True enough, a number of very capable parliamentarians moved into high government office, but because of Article 9 of the Constitution they lost influence in their own parties, which thus were beheaded and became disoriented.[30] The same happened in the crises of August and October [1917]. Again the government failed completely because the men in charge clung tenaciously to the view that

they should not maintain continuous contact with the party leaders and not even hold preliminary talks with representatives of those parties whose backing they desired or hoped for. The mere fact that the new chancellor appointed in November [1917, Count Hertling], got in touch with the majority parties before taking office, and the further fact that all purely political ministries were now taken over by experienced parliamentary deputies, made it possible at long last to run the machinery of domestic politics with reasonable ease, although Article 9, Sentence 2, continued to show its harmful effects.[81] The January [1918] crisis proved even to the most benighted mind that parliament is *not* the source of our domestic troubles; rather, they have two sources: (1) the abandonment of Bismarck's strict principle that the generals conduct the war according to *military* rationale but that the head of the government concludes peace according to *political* considerations (of which strategic desiderata are only one factor); (2) even more importantly, the fact that some subaltern courtiers found it compatible with an allegedly "monarchic" government to leak policy deliberations to the press to benefit certain political parties.[82]

Our conditions can teach everyone that rule by career officials is not tantamount to the absence of party rule. A *Landrat* must be a Conservative in Prussia, and since 1878—when the eleven most fruitful years of German parliamentary work ended—our pseudo-parliamentarism has rested on the partisan axiom that every government and its representatives must be "conservative," with only a few concessions to the patronage of the Prussian bourgeoisie and of the Center party. This and nothing else is meant by the "impartiality" of the bureaucracy. This state of affairs has not been changed by the lesson which the war taught in all other countries: that all parties sharing in the government become "patriotic." The partisan interests of the conservative bureaucracy and of its allied interest groups dominate the government. We are now confronted with the inescapable consequences of this "cant," and we will continue to face them in peacetime. Not parliament alone but the whole governmental system will have to pay for it.

5. *Parliamentary Professionalism and the Vested Interests*

The decisive question about the future of Germany's political order must be: How can parliament be made fit to govern? Every other way of putting the question is simply wrong, and everything else is secondary.

It must be clearly understood that parliamentary reform depends not merely on these seemingly trivial yet practically important extensions

of parliamentary jurisdiction and on the removal of the mechanical obstacle presented by Article 9, as well as on certain significant changes in the procedures and the present conventions of the *Reichstag;* it depends above all on the development of a suitable corps of professional parliamentarians.

The professional parliamentary deputy is a man for whom the *Reichstag* mandate is not a part-time job but his major vocation; for this reason he needs an efficient office with the requisite personnel and access to information. We may love or hate this figure—he is technically indispensable, and therefore we have him already. However, even the most influential pros are [in Germany] a rather subaltern species, operating behind the scenes, because of the subordinate position of parliament and the limited career opportunities. The professional politician may live merely *from* politics and its hustle and bustle, or he may live *for* politics. Only in the latter case can he become a politician of great calibre. Of course, he will succeed the more easily, the more he is financially independent and hence available—not an entrepreneur but a *rentier*. Among those dependent upon a job only the lawyers can easily take leave and are suited to be professional politicians. An exclusive dominance of lawyers would certainly be undesirable, but it is a foolish tendency of our literati to denigrate the uses of legal training for political leadership. In an age ruled by jurists the great lawyer is the only one who, in contrast to the legally trained civil servant, has been taught to fight for, and effectively represent, a given cause; we would wish that the public pronouncements of our government showed more of the lawyer's skill in the best sense of the word. However, only if parliament can offer opportunities for political leadership will any kind of independent person, not just gifted and capable lawyers, want to live for politics. Otherwise, only salaried party functionaries and representatives of interest groups will want to do so.

The resentment of the typical party functionary against genuine political leaders strongly affects the attitude of some parties toward the introduction of parliamentary government and hence the recruitment of leaders in parliament. This tendency is, of course, very compatible with the like-minded interests of the civil service, for the professional deputy is a thorn in the side of the administrative chiefs, if only as an inconvenient supervisor and pretender to some share in the exercise of power. This is certainly aggravated when he emerges as a possible competitor for the top positions in government (a threat not posed by the representatives of special interests). In this manner we can also explain the bureaucracy's struggle to preserve parliament's ignorance, since only skilled professional parliamentarians who have passed through the school

of intensive committee work can produce from their midst responsible leaders, rather than mere demagogues and dilettantes. Parliament must be completely reorganized in order to produce such leaders and to guarantee their effectiveness; in their own way, the British parliament and its parties have long been successful in this regard. It is true that the British conventions cannot simply be taken over, but the basic structure can very well be adapted. We are not concerned here with the details of the changes required in the *Reichstag* procedures and conventions; they will become apparent as soon as the parties are forced to pursue responsible politics. However, we should turn to one more serious impediment to parliamentary government which is rooted in the German party system, a difficulty which has been discussed often, but usually in a distorted fashion.

There is no doubt that parliamentary government functions most smoothly in a two-party system such as existed in England until a short while ago (even though its disruption had been apparent for some time). However, such a system is not indispensable, and in all countries, including England, pressures for the formation of party coalitions are building up. More important is another difficulty: Parliamentary government is feasible only when the largest parties are *in principle* willing to take over the responsibilities of government. In Germany this was by no means the case. The biggest party, Social Democracy, was unwilling to enter any coalition under any conditions, since it believed in certain evolutionary theories and stuck to pseudo-revolutionary conventions inherited from the period of the anti-socialist legislation [1878–90]—for example, it refused to send members to ceremonial functions at Court. Even when it could have taken over the government in one of the smaller principalities by virtue of a temporary majority, it refused to do so. However, much more important than those theoretically inspired anxieties has been the real worry that it would be repudiated by its own class-conscious members if it joined a government inevitably limited by the conditions of a society and economy that would remain capitalist for the foreseeable future. This situation motivated the leaders to keep the party for decades in a kind of political ghetto, in order to avoid any kind of contaminating contact with the workings of a bourgeois state. Despite appearances, they do this even now. Syndicalism—the unpolitical and anti-political heroic ethos of brotherhood—is on the increase, and the leaders fear a rupture of class solidarity which would later damage labor's effectiveness in its economic struggles. Moreover, the leaders cannot rest assured that the bureaucracy's traditional attitudes will not come to the fore again after the war. Our future will depend to a large extent on the party's stand in the years ahead: whether its will to gain

governmental power will prevail or whether the unpolitical ethos of proletarian brotherhood and syndicalism, which surely will proliferate after the war, will gain the upper hand.

For somewhat different reasons, the second largest German party, the [Catholic] Center, has up to now been skeptical of parliamentarism. A certain elective affinity between its own authoritarian mentality and the *Obrigkeitsstaat* has worked in favor of the bureaucracy's interests. But another factor is more relevant. Since the Center party is a natural minority party, it is afraid that under a parliamentary regime it will also be a parliamentary minority and that its power position and ability to represent its present clientele would be endangered. Its power rests primarily on extra-parliamentary means: the clergy's control over the political attitudes of the believers. Within the *Reichstag* the system of negative politics provided the party with an opportunity to serve the material interests of its members. After the party had accomplished at least those clerical objectives that can be permanently maintained in Germany, it changed from an ideological party more and more into a vehicle of patronage for Catholic candidates for office and other Catholic interests which have felt themselves discriminated against ever since the era of the *Kulturkampf* [1871–80's]—whether this feeling is still justified is irrelevant here. Today its power rests largely on this function. Its control over the balance of power in the parliaments enabled the party to promote the private interests of its protégés. The bureaucracy could acquiesce and still save its face, because this patronage was "unofficial." However, the vested interests in the party are not only concerned lest parliamentarization and democratization diminish their opportunities in periods in which the Center would be part of the minority, they also fear something else. Under the present system the Center has been able to avoid that *responsibility* which would have fallen upon it if its leader had sat in the government, and this responsibility would not always have been convenient. Even if today the Center party commands a number of political talents, among the officials promoted by it are such incompetent ones as no responsible governing party would be likely to appoint. Such men can advance *only* if their sponsors cannot be held responsible for them. If the party were part of the government, it would have to recruit more capable candidates.

Unofficial patronage, then, is the worst form of parliamentary patronage—one that favors mediocrity, since nobody can be held responsible. It is a consequence of our *rule by conservative civil servants*, a rule whose perpetuation rests on this system of handouts (*Trinkgeldersystem*). It is no wonder that the Conservative party and the big business wing of the National Liberal party feel quite comfortable under these condi-

tions. For, after all, patronage under this system is not in the hands of politicians and parties, which might be held responsible by the public, but works through private channels ranging from the very important fraternity connections to the cruder or finer forms of capitalist "recommendations." Big business, which the foolish ignorance of our ideologists suspects of being allied with horrid parliamentarism, knows full well why it supports as one man the retention of an unsupervised bureaucracy.

This is the state of affairs which is heatedly and bitterly defended with literary slogans about the "corrupt" and "un-German" character of open party patronage. In truth, it is not the "German spirit," but powerful material interests in benefices, joined to the capitalist exploitations of "connections," which are pitted against handing patronage over to parliament. There can be no doubt that only the presence of absolutely compelling political circumstances will change anything at all in this respect. Parliamentary government will not arrive on its own. Nothing is more certain than that the most powerful groups work against it. True enough, all the parties mentioned have ideologists and sober politicians in addition to those subaltern office-seekers and routinized parliamentarians, but the latter have the upper hand. If the system of petty patronage were to be extended to other parties, the general trend would merely be reinforced.

Lastly, the beneficiaries of the status quo, and those naive literati who unsuspectingly mouth their phraseology, like to point triumphantly to the *federal* character of the German constitution in order to demonstrate conclusively the impossibility of parliamentary government on purely formal grounds. Let us first turn to the *legal* aspect of this problem, within the confines of our written constitution: from this we can see how incredible such an assertion really is. According to Article 18 of the Constitution, the emperor appoints and dismisses the chancellor and all imperial officials *on his own*, without interference from the *Bundesrat* [the Federal Council, a representation of the governments of the individual states]; only to him do they owe obedience, within the limits of the Federal laws. As long as this is the case, any constitutional objection on "Federal" grounds is baseless. Under the Constitution nobody can prevent the emperor from handing the *Reich* government over to the leader or the leaders of the parliamentary majority and from sending them into the *Bundesrat*; or from dismissing them if a clear *Reichstag* majority votes against them; or merely from consulting the parties in the formation of the government. No majority in the *Bundesrat* is entitled to topple the chancellor or merely to insist on his giving an account of his policies, as the undisputed interpretation of Article 17, Paragraph 2 requires him to do before the *Reichstag*. Recently it has

been proposed that the chancellor be made accountable not only to the *Reichstag* but also to the *Bundesrat;* this proposal deserves to be examined for its political feasibility (and to be discussed later on), but it would be a constitutional innovation no less than the elimination of Article 9, Paragraph 2, which we have proposed above. We must deal later with the fact that the real problems of parliamentary government, and of the Empire's constitution in general, are rooted not so much in the constitutional rights of the other members of the federation as in the relationship of those states to the hegemonial Prussian state. However, before we do this, we should examine the manner in which the present system has functioned in the field of foreign policy. It is here that government by bureaucrats reveals the inherent limits of its effectiveness as well as the terrible price we had to pay for tolerating it.

iv

Bureaucracy and Foreign Policy

1. *The Government's Failure to Curb Harmful Monarchic Pronouncements*

In Germany the *interior* administration is dominated by a specifically bureaucratic concept of administrative secrecy, the "service secret" (*Dienstgeheimnis*). It is astonishing to note the difference in the realm of *foreign* policy: there some of the most diverse steps were taken with dramatic publicity—and a publicity, at that, of a very peculiar sort.

For more than a decade, from the Krüger telegram to the Morocco crisis,[22] we had to live with the fact that purely private statements by the monarch on foreign policy matters were made public by sedulous court officials or news services, either with the toleration or even with the participation of the government. We are dealing here with events which have been of the utmost importance in shaping our global policies, and especially in consolidating the global coalition against us. Let us be clear that we are concerned here not with the question of whether the monarch's statements were correct and justified, but solely with the behavior of the officials. This writer, who certainly is convinced of the utility of monarchic institutions in large states, would refrain from any underhanded polemics against the monarch as much as from the pseudo-

monarchic adulation or the sentimental subaltern phraseology of the vested interests and the philistines. However, a monarch who makes personal but public statements of a sometimes extremely aggressive nature must be prepared to put up with an equally aggressive public critique. For we must face the fact that this method of conducting our policies through the *publication* of monarchic pronouncements was tolerated time and again. If this method was a grave political error (as we believe it was), then the toleration of the several repetitions of this procedure proves, insofar as the monarch was personally responsible for it, the necessity of his being forced to accept advice *only* from the political leadership, and of excluding all other groups—courtiers, military or whatever—from meddling in politically important matters. However, if concrete guarantees for such a procedure are not forthcoming, an utterly frank critique of the monarch himself would become a political duty. Certainly, such a public critique of the monarch would be politically undesirable. It is age-old political wisdom, not an old-fashioned outlook, which seeks to protect the monarch from being dragged demagogically before the public, as has happened repeatedly in Germany, by providing ritual formalities and conditions for his public appearances and thus making it possible to keep him personally out of the public disputes of party politics. Precisely because of this he can intervene much more effectively in times of national crisis. It should be clear, then, that we do not discuss here possible blunders on the part of the monarch, but rather the very different fact that the government used his public appearances or the publication of his views as a diplomatic means—at least in one case despite his personal doubts,[34] and that the government leaders suffered the publication of the monarch's views by non-responsible agencies, over their heads, without resigning immediately. Of course, the monarch is free to take any political position that he cares to take. But it must be up to the politically responsible leaders to decide whether, or in what substantive or formal manner, his views should be *made public*, and to assess their presumable impact. Hence, the chancellor must be asked for his advice before any major political utterance by the monarch can reach the public, and his advice must be accepted as long as he is in office. He and his colleagues default on their duties if they remain in office after this rule has been breached even once. Behind all the talk that "the nation does not want a shadow king," and similar phrases, these men hide nothing but their desire to hang on to their offices, if they fail to resign. This has nothing to do directly with the issue of parliamentary government; it is simply a question of political integrity. On this score our government has failed time and again in the most miserable manner. These failings are due to our faulty political

structure, whic puts men with a bureaucratic mentality into positions of political leadership. The issue of parliamentary government becomes highly significant only because under the given conditions there is no other instrumentality for effecting and guaranteeing the necessary changes. In order to avoid any misconstruction of our position, we should add that in almost all cases the monarch's statements were not only subjectively understandable, but sometimes also politically warranted—insofar as one could judge matters at the time. Moreover, in some cases it would probably have been helpful to convey his strong personal reactions through *diplomatic* channels to the governments concerned. But what was politically irresponsible was the *publication* of such statements, and here responsibility fell upon the political leadership for tolerating or instigating it. In Germany it seems to have been forgotten that it makes a tremendous difference whether a *politician* (the prime minister or even the president of a republic) issues a statement, no matter how harsh it may be, or whether he makes public a personal statement by the *monarch* and then "assumes responsibility" for it by a dramatic but cheap gesture. A public utterance of the monarch cannot, in effect, be criticized freely in the country; hence, it actually covers the statesman who misuses it for this purpose against a straightforward critique of his *own* actions. Abroad, however, there are no such restraints, and critique centers on the monarch. A politician can and should resign if conditions change and new policies become necessary against which he has committed himself, but the monarch is supposed to stay, and this implies that his words will stay with him. Once he has publicly committed himself, he cannot take them back even if he tries to do so in a new situation. Passions and sentiments of honor are aroused, for now it is a national point of honor to support the monarch—and ignorant literati such as the Pan-Germans (and their publishers) do a flourishing business. At home and abroad, the monarch's words are taken as binding, and the political fronts become frozen. This has indeed been the pattern in all these cases. Let us take a cool look at a few of them in order to see how the political mistake was made.

First the Krüger telegram. The indignation over the Jameson raid was justified and shared all over the world, even in England. It is quite possible that insistent diplomatic representations in London (which might have referred to the monarch's strong reaction) could have elicited formal statements by the British cabinet which it could perhaps not easily have disregarded afterwards. In addition, a general agreement about the African interests of both sides might have become more likely; Cecil Rhodes, for one, was quite amenable to it,[35] and it was necessary if we wanted to have a free hand in the Orient and keep Italy in the

alliance. But the publication of the telegram had, of course, the effect of a slap in the face, which precluded any reasoned talks.[36] Now the issue became a matter of national honor, and rational political interests were pushed aside. Hence, when later—before, during and after the Boer War—attempts were made to come to an understanding about Africa or the overall relations between England and Germany, the public in both countries, whose sentiments of national honor had now been aroused, did not really welcome these attempts even though both sides could have achieved their material goals through diplomatic understandings. The result of these approaches was to make Germany appear as the dupe after the Boer War. After all, in 1895 we simply did not have sufficient military resources to back any protest effectively. Let us silently pass over the shameful end, the refusal to receive the exiled president: for the main point was that the Boers could not be helped in spite of the monarch's words. Hence General Botha could declare in the South African parliament in 1914 that it had been Germany's behavior which has led to the loss of the Boers' independence.

There was much astonishment in Germany when Japan declared war on her in August 1914 and China followed suit in August 1917. The former step is always explained with the well-known 1895 intervention in connection with Port Arthur,[37] the latter with American pressures, and in both cases opportunism is also charged. No matter how true this is, another important factor must be added. It was, after all, the German monarch who, in word and picture, had publicly warned of the "Yellow Peril" and had called for the "preservation of the most sacred goods" [of the European nations]: Does anyone among us really believe that educated Chinese and Japanese have forgotten that?[38] In international politics racial problems belong to the most difficult ones since they are complicated by the interest clashes between the white nations. One can only approve of the monarch's endeavor to form an opinion on this score. But what German interest could possibly be served by making his views public in the way it was done? Was this reconcilable with any German interest in the Far East? What power resources stood behind such pronouncements? Whose interests were they bound to serve in the end? Moreover, which political aims were served by publishing the Emperor's speeches at the time of Count Waldersee's mission, or his naval addresses, which perhaps might have been quite fitting in a circle of officers?[39] The result of the German China policies contrasted embarrassingly and, we must add, by no means accidentally with such rhetoric, and this proved highly damaging to our prestige. Again, we shall leave out a shameful episode, the treatment of the "expiatory mission" [of Prince Chun in 1901, to apologize for the assassination of

minister von Ketteler during the Boxer Rebellion] and the discussions, again in public, which surrounded it. It is simply impossible to imagine the concrete political ends that Chancellor Bülow might have wanted to further when he tolerated such political Romanticism, which needlessly offended the Chinese sense of honor. If he was clear-headed enough to perceive the political uselessness and harm of all these events and yet felt that he had to consider conditions requiring their toleration, he should have resigned in the monarch's interest no less than that of the nation.

Grave doubts have been expressed whether the publication of the Emperor's speech in Damascus [before Saladin's grave, on November 8, 1898] was helpful in our relations with Russia. Our sympathies for Islamic culture and our political interests in the territorial integrity of Turkey were well-known abroad and not in need of such noisy ostentation. However, quite apart from the political constellation prevailing at the time, it would have been better to avoid the impressions created by this public move. Here, too, it is easy to see whose designs were bound to benefit from it.

If in this instance positive doubts are still possible, matters are perfectly clear with regard to the public address which the Emperor made in Tangier at the beginning of the Morocco crisis. Even neutral parties approved of Germany's stand, but it was again a serious mistake to use the monarch for a public move. We do not yet know what offers France made after [her foreign minister] Delcassé fell, but so much was clear then: Either Germany would have to be serious about going to war for the sake of Moroccan independence or the affair would have to be settled promptly in a manner that took account of each side's interests and sense of honor, with France offering some compensations. This might have had far-reaching consequences for our relationship with France. Why was it not done? The monarch's word, it was said, had engaged the nation's honor in favour of the Sultan of Morocco, and therefore we could not now leave him "in the lurch." However, the government did not really intend to go to war. The upshot of it all was the debacle of Algeçiras, followed by the "Panther" episode and finally the abandonment of Morocco; at the same time, the endless tension kindled eagerness for war in France and thus facilitated the English policy of encirclement. This development was paralleled by the impression that Germany would always yield in spite of the Emperor's words. All of this happened without providing any political compensations for Germany.

The aims of German foreign policy, especially overseas, were exceedingly limited if compared to those of other nations, and its results

were outright meager. However, it produced tensions and sheer noise like that of no other country, and time and again these wholly useless and damaging sensations were created by publishing statements of the Emperor. This method proved detrimental to us not only in hostile or neutral countries. After the Algeçiras conference the Emperor felt the need to express his thanks to Count Goluchowski, and instead of using regular channels the well-known telegram was *published*. The addressee's downfall was prompt and embarrassing for us: It demonstrated too late that no government will permit its leading statesmen to be *publicly* given a "good grade" by another government—not even by that of a closeally.[40]

On the domestic scene, the same mistakes were made. Did the so-called "Penitentiary Speech," which William made in a moment of anger [in 1898], really belong before the public, where it appeared as a political program? What is one to think of the fact that the bureaucracy felt now obliged to dream up a corresponding paragraph for inclusion in the proposed anti-strike bill, merely because William had spoken of stiff prison sentences for strikers? Only the portentous events of 1914 and the present [Easter 1917] promise of equal suffrage [in Prussia] have been able to counteract the impact of this pointless publication upon self-respecting workers. Was it in the dynastic interest? Or what other politically acceptable aims could the publication have had?

However, we want to limit ourselves here to the realm of foreign policy and hence would like to ask the pertinent question: At all these occasions, where were those *Reichstag* parties which could have made the decisive difference for the government's policy, but which later preferred to reproach Chancellor von Bethmann Hollweg for the failures of a policy that turned "the whole world into our enemies," or which accused him of hiding behind the monarch? What did they do in all those cases? *They took advantage of the attacks by the extreme left in order to denounce its "anti-monarchic" attitude!* We must state emphatically that they raised *public* objections only when it was too late. Even then they did this only to the extent that their vested interests were not involved. We shall not go into any details about the highly publicized events of 1908 [the "Daily Telegraph" Affair]; however, we should remind ourselves that the Conservative party, in contrast to the indubitably impressive remonstrance of its leaders before the monarch, later openly abandoned Prince Bülow and, as usual, remembered its pseudo-monarchism when its own *material* interests were affected. By the way, the monarch himself may have been quite astonished to find this chancellor, who at least once advised him on a spectacular personal intervention against his own objections,[41] suddenly turn against him under

the pressure of an excited public opinion. And what, finally, did our literati do in all these incidents? ***Publicly they applauded*** or kept on jabbering about how Germans do not happen to like a monarchy of the English type—just as the right-wing press is still doing. Flattering the most dreary philistine instincts, they attributed the failures to the diplomats and did not bother to ask once how these could work under such conditions. We could also speak of their ***private*** talk—but that would be a long story, and one not very honorable for those agitators who inveigh so bravely against the majority for demanding a "starvation peace."[42]

In all these cases, the behavior of our government was irresponsible; it has no parallels in any other large state. A ***public*** confrontation was permissible only if the government had been willing to go all the way, and without delay. But we did not really intend to take up arms for the Boers or against the "Mongols" or for the Sultan of Morocco; moreover, in the two former cases we had no business, and not enough power, to think of armed intervention. Yet the leaders of the government permitted a situation to arise in which the monarch was made to engage himself publicly, and this vitiated any rational agreement with England about our South African interests, and with France about the North African interests. Our position appeared first to be a matter of honor, and then was abandoned nevertheless. The inescapable result was a series of diplomatic defeats that were acutely embarrassing to every German and brought lasting detriment to our interests. Here was the root of the very dangerous impression that Germany would always retreat after much blustering, and it appears that this belief was one of the factors determining English policy in late July 1914. The unnatural world coalition against us has been largely due to these incredible blunders, which still affect us. The present humbug abroad about German "autocracy" is just that: swindle—but it is by no means politically irrelevant that it can occur. Who enabled our enemies, who themselves believe in it as little as in other fairy tales about Germany, to promote this swindle successfully? Who brought the tremendous and politically so effective hatred of the whole world upon the head of exactly this monarch, whose attitude was several times notoriously decisive in preserving the peace even at moments when war might have been more opportune for us from the viewpoint of *Realpolitik*? Who has made it possible for the masses abroad to believe seriously that Germany desires to be "liberated" and that this suppressed yearning will eventually find an outlet if only the war can be sufficiently prolonged? Who made possible the unheard-of absurdity of the present situation? As long as repetition is possible, the nation must not forget that it was

the conservative bureaucracy which was responsible for this state of affairs: in decisive moments it put bureaucrats into the top positions of government which instead should have been manned by *politicians*—men experienced in weighing the effects of public statements, men with the politician's sense of responsibility, not the bureaucrat's sense of duty and subordination that is proper in its place but pernicious in political respects.

Here the abyss that separates the two can be seen most clearly. The civil servant must sacrifice his convictions to the demands of obedience; the politician must publicly reject the responsibility for political actions that run counter to his convictions and must sacrifice his office to them. But in Germany this has never happened. The worst aspect of the matter has not yet been discussed: It is reliably known that almost all of the men who were in charge of our policies in that disastrous decade have time and again privately repudiated grave declarations for which they accepted formal responsibility. If one asked with amazement why a statesman remained in office if he was powerless to prevent the publication of a questionable statement, the usual answer was that "somebody else would have been found" to authorize it. This may very well be true, but then it also indicates the decisive fault of the system. Would somebody else have also been found if the head of government would have had to take the responsibility as the trustee of a powerful parliament?

2. *Parliamentary and Legal Safeguards*

At this decisive point we can see the importance of a parliament to which the bureaucracy is truly answerable. There is simply no substitute for it. Or is there? This question must be answered by all who are still convinced that they have a right to rail against parliamentarism. At the very same point it becomes perfectly obvious that the civil servant's sense of responsibility and that of the politician are appropriate each in its sphere—and nowhere else. For we deal here not with incompetent and inexperienced civil servants and diplomats but in part with outstanding ones, yet they did not have political "guts," something that is quite different from private integrity. However, they did not lack it accidentally, but rather because the political structure of the state had no use for it. What is one to say about a state of affairs—unknown to any other major power—in which the monarch's personal cabinet, courtiers or news agencies publicize events that are of utmost importance for international politics, with the result of getting our foreign policy bogged down and messed up for decades; a state of affairs, moreover, in which

the head of government shrugs his shoulders about these incidents and tolerates them after making some spuriously noble gestures. All that in a state, for whose *domestic* administration the "service secret" is (in the power interests of the agency chiefs) the crown jewel of civil service duty! It is obvious that this apparent contradiction can be explained solely by the bureaucrats' interest in unsupervised office-holding. What is one to say of a system which leaves politicians in office who condone major mistakes against their better convictions? And finally, how is one to take the fact that, in spite of the obviousness of it all, there are still literati who do not hesitate to claim that a state which functions thus in the most important political respects has "brilliantly proven" itself? True enough, the performance of the officials and civil servants was brilliant in their own sphere. However, in the politician's realm the bureaucracy has not only failed for decades, but has also shifted onto the monarch the odium of its own politically disoriented behavior in order to hide behind him. In this manner it helped bring about a world-wide constellation against us, in the wake of which the monarch could have lost his crown and Germany her whole political future if it had not been for the magnificent performance of our army. In the interest of the nation and of the monarchy, every constitutional alternative that prevents such occurrences is better than this state of affairs. *Hence, the current state must come to an end whatever the cost may be.* It is beyond doubt (and can easily be proven) that there are no partisan differences of opinion about these gravely detrimental developments. However, the right-wing politicians either did not have enough political character or had too many personal interests to voice opinions *publicly* which they stated *privately* with extreme bluntness. For the same reasons, they were unwilling to draw any concrete conclusions. But without substantive guarantees no decisive change can occur. This has been demonstrated by the fact that the court circles responsible for these publications proved absolutely incorrigible. The introduction of such safeguards is politically much more important than all other political issues, including those of parliamentary and suffrage reform. For us, parliamentarization is primarily the indispensable *means* for establishing such concrete safeguards. For it cannot be doubted that *only* a strong parliament and the actual parliamentary accountability of the government can provide a guarantee against the recurrence of such events.

However, after letting things run their course for decades, it will take years before a really effective parliamentary leadership can be created. What can be done in the meantime, as long as this reform has not been carried through or come to fruition?

One thing stands to reason: Everywhere, and particularly in a democracy, the big decisions in foreign policy are made by a small

number of persons. At present, the United States and Russia are the best examples, and no literary phraseology can change the facts. Every attempt at doing so would weaken the burden of responsibility, while the point is precisely to increase it. Hence the imperial prerogatives of Article 11 of the constitution, which in actuality are exercisable under the chancellor's responsibility, will remain unchanged. However, legal blocks must immediately be erected against the dangerous mischief which unaccountable and unknown courtiers or journalists have been able to perpetrate by publishing personal statements of the monarch on foreign policy. A special law must threaten with severe penalties, including criminal ones in case of deliberate abuse, anyone who will bring monarchic opinions before the domestic or foreign public without clearing them in advance with the proper authorities. In line with his constitutional obligations, the chancellor must take *prior* responsibility for their publication. *This is what matters.* It is empty rhetoric when the chancellor later reacts to protests in parliament with the assurance that he was taking responsibility for the publication. Even if this is done, an utterance by the monarch cannot be frankly criticized without endangering his political prestige. Most of all, however, such an excuse is not only pointless but politically a lie if the chancellor was not consulted in advance and merely went along. If he was indeed not asked beforehand, his statement merely indicates that, in spite of this publication, he does not feel like being pensioned off and prefers instead to hang on to his office. In addition to punishing those guilty of leaking the monarch's utterances, it must be constitutionally possible to "indict" the chancellor for approving or tolerating such leaks; such an "indictment," which should preferably occur before a parliamentary committee, would have the purpose of dismissing him or of declaring him permanently unfit for political office. Such a legal provision will exert the necessary pressure on the chancellor to proceed with the greatest caution.

Every monarchic pronouncement should be approved by the chancellor only after extensive deliberation with experienced men. Therefore, it would be desirable if an advisory body could comment about the suitability of *publication* (for this is the only issue). If a parliamentary committee is not desired, another body might serve the same purpose.

Up to now the Committee for Foreign Affairs of the *Bundesrat*, which is composed of representatives from the non-Prussian kingdoms [Saxony, Württemberg and Bavaria], was a kind of bad constitutional joke, merely decorative, without formal powers and real influence. For the chancellor is not required to present to it an account of his policies; in fact, he is explicitly exempted from this duty by Article 11. He need not go beyond passively accepting an expression of opinion. He is being polite if he presents [to this body] a formal *exposé*, such as is custom-

arily submitted in parliament for the instruction of the public. This at least seems to have been the actual practice, even though in this more intimate circle policies could very well have been discussed on their merits. During the war the Committee seems to have slightly increased its importance, and this too would not be accidental. It could very well be assigned such an advisory function before the publication of a monarchic statement with important foreign policy implications. It would be even better if the Committee could be transformed into an Imperial Crown Council which, together with the responsible department chiefs and some elder statesmen, could discuss important foreign policy alternatives *prior* to the decision and, if possible, in the monarch's presence. In the absence of a collegiate body of this kind on the *Reich* level, the Prussian Crown Council now frequently exercises this function not only in Prussian matters, but also in politically important matters concerning the *Reich* as a whole (and hence also the non-Prussian member states). Formally this activity can be only advisory, since the constitutional responsibility of the chancellor can be abridged as little as the constitutional role of the emperor in representing the *Reich* to the outside. Of course, any such proposal is discredited from the beginning if—as the bureaucracy is unfortunately prone to do—attempts are made to use it for the exclusion or weakening of the influence of parliament. However, it might be useful to impose by statute an explicit duty on the chancellor's part to give a full explanation of his policies before the *Bundesrat*. A problem might be posed by the relationship between this advisory body and the special parliamentary committees, especially if deputies would also sit in the Committee. More on that later.

Irrespective of whether this proposal will be realized, *never again* must such situations as those described earlier be tolerated. Therefore we must state unambiguously that the highly insincere pseudo-monarchic legend with which these events were defended was a fabrication of the Conservative party on the basis of Bismarck's demagogy. Purely domestic party interests hid behind this legend, just as they do now behind the war-time *Fronde*. This interest-ridden legend served many purposes: to preserve official positions—from the *Landrat* to the minister—as Conservative benefices, to use the state bureaucracy as the electoral machine of the Conservative party, therefore to perpetuate the Prussian suffrage privileges [i.e., the three-class suffrage] and to discredit and weaken the *Reichstag*, which in spite of all is still the best of the German parliaments. When today, after the political consequences have become clear, demands are raised for strengthening parliament as an organ of administrative supervision and of recruiting capable leaders, we know in advance the slogan which the beneficiaries of uncontrolled bureaucracy hold ready: "The monarchy is in danger."

But the future of the monarchy will be in doubt if these self-interested sycophants continue to have the monarch's ear. It must be the dynasties' own affair to cope with the fright caused by the spectre of democracy —not ours.

V

Parliamentary Government and Democratization

1. *Equal Suffrage and Parliamentarism*

We are concerned here not with the issue of democratization in the social sphere, but only with that of democratic—that is, equal—suffrage in its relation to parliamentarism. We also will not discuss whether at the time [1871] it had been constitutionally advisable for the German *Reich* to introduce equal suffrage under Bismarck's heavy pressure. Rather, we take equal suffrage for granted, as a fact that cannot be undone without grave repercussions. We merely want to inquire into the relationship between parliamentarization and democratic suffrage.

Parliamentarization and democratization are not necessarily interdependent, but often opposed to one another. Recently the belief has often been encountered that they are even necessarily opposed. Genuine parliamentarism, it is argued, is possible only in a two-party system, and then only if the parties are dominated by aristocratic notables. In England the old parliamentarism was indeed, as befits its feudal origin, not really "democratic" in the Continental sense, even after the Reform Bill and up until the [present] war. A look at the suffrage system alone will make this clear. The property and income requirements and the effective rights of plural voting had, after all, such an extent that, if they were transposed to Germany, they would probably admit only half of the present Social Democrats and also considerably fewer deputies of the Center party into the *Reichstag*. (However, in Germany there is no equivalent to the role of the Irish in the English parliament.) Until Chamberlain's caucus system, the two parties were clearly dominated by clubs of *honoratiores*. If the demand "One man, one vote," which was first raised by the Levellers in Cromwell's army, were now really to be satisfied, together with the demand for the (initially limited) women

suffrage, the character of the English parliament will certainly change significantly. The two-party system, already weakened by the Irish, will disintegrate further with the advance of the Socialists, and the bureaucratization of the parties will continue. —The well-known Spanish two-party system, based on the party notables' tacit agreement to use the vote for a periodic alternation in the tenure of the office aspirants, appears at the moment to be succumbing to the first attempt at serious elections. — But will such changes eliminate parliamentarism? The existence and formal power position of the parliaments are not threatened by democratic suffrage. This is demonstrated by France and other countries with equal suffrage, where the governments are ordinarily recruited from parliament and rely on parliamentary majorities. Of course, the spirit of the French parliament is very different from the English one. However, France is not a country suitable for a study of the *typical* consequences of democracy for parliamentarism. The strongly petty-bourgeois, and especially small *rentier*, character of its stable population creates conditions for a particular mode of rule by party notables and for a peculiar influence of *haute finance*, such as do not exist in predominantly industrial states. The French party structure is inconceivable in such states, but so is the historical two-party system of England.

Two-party systems are impossible in industrialized states, if only because of the split of the modern economic strata into bourgeoisie and proletariat and because of the meaning of socialism as a mass gospel. This creates, as it were, a "denominational" barrier, especially in Germany. Furthermore, the organization of German Catholicism as a party for the protection of a minority, a result of the denominational distribution, will hardly be eliminated, even though the Center party owes its present number of deputies merely to the given arrangement of electoral districts. At least four, and probably five, large parties will therefore permanently coexist in Germany; coalition governments will continue to be necessary and the power of a prudently operating monarchy will remain significant.

2. *The Impact of Democratization on Party Organization and Leadership*

However, the rule of notables within the parties is untenable everywhere outside of isolated agrarian areas with patriarchal landed estates because modern mass propaganda makes electoral success dependent upon the rationalization of the party enterprise: the party bureaucrat,

party discipline, party funds, the party press and party advertising. The parties are more and more tightly organized. They endeavor to commit even adolescents as a following. The clerical apparatus does this automatically for the Center party, the social environment for the Conservatives. Other parties have their own youth organizations, such as the "National-Liberal Youth" and the youth groups of the Social Democrats. Likewise the parties make use of all economic interests. They organize producers' and consumers' cooperatives and trade unions, and put trusted members as officials into the party positions thus created. They establish schools, sometimes backed by very substantial funds, for public speaking and for the training of agitators, editors and administrative employees. A voluminous party literature comes into being; it is financed by the same funds, contributed by interest groups, and used for the purchase of newspapers, the establishment of advertising offices and similar enterprises. The party budgets increase rapidly, for the election costs and the number of the necessary paid agitators rise. It is no longer possible to conquer a hotly contested larger district without spending at least 20,000 Marks. (At the present time politically interested businessmen invest their war profits on a vast scale in so-called patriotic newspapers of all kinds, in preparation for the first postwar elections.) The party apparatus increases in importance, and correspondingly the weight of the *honoratiores* declines.

Matters are still in flux. The organization of the bourgeois parties, which differs greatly in the degree of internal coordination, as has been noted before, presents roughly the following picture: The local activities are usually conducted "extra-occupationally" by *honoratiores*, and only in the big cities by officials. Newspaper editors or lawyers head the bureaus in medium-sized communities. Only larger districts have salaried secretaries who travel about. Local and regional associations cooperate in very different degrees in the selection of candidates and the choice of electoral slogans. The participation of the regional associations is determined particularly by the need for electoral coalitions and for run-off agreements. The leaders of the local organizations recruit the permanent members through efforts of greatly varying degrees, among which public meetings play a major role. The members' activities are very limited; often they do no more than pay their dues, subscribe to the party paper, attend more or less regularly the meetings at which party speakers appear, and volunteer a moderate amount of work at election time. In return, they obtain at least formal participation in the election of the local party executive and the stewards (*Vertrauensmänner*) and, depending upon the size of the locality, also a direct or indirect voice in the selection of the delegates to the party conventions. As a rule, how-

ever, all candidates are designated by the core of permanent leaders and bureaucrats; mostly they are also drawn from among them, supplemented by a few notables who are useful and deserving by virtue of their well-known name, their personal social influence or their readiness to make financial contributions. Thus, the participation of the rank and file is limited to assistance and voting during the elections, which take place at relatively long intervals, and to the discussion of resolutions, the outcome of which is always largely controlled by the leaders. A complete replacement of the local leaders and district officials is rare and almost always the result of an internal revolt, which most of the time involves personality issues. The common voter, who does not belong to any organization and is wooed by the parties, is completely inactive; the parties take notice of him mostly during the elections, otherwise only through propaganda directed at him.

The organization of the Social Democratic party, which has often been described, is much tighter [than that of the bourgeois parties] and also comprises a larger percentage of the available voters; within democratic forms it is strictly disciplined and centralized. The parties of the Right used to be more loosely organized and relied more on local notables, but now they are supplemented by the Farmers' League (*Bund der Landwirte*) with its closely-knit mass organization. In the Center party centralism and authoritarian leadership are formally most highly developed; however, the clergy's power has its limits in all non-ecclesiastic matters, as events have proven repeatedly.

The present stage of development has definitely done away with the old state of affairs, when elections used to take place on the basis of ideas and slogans which were formulated by ideologists and then propagated and discussed in the press and in public meetings; when candidates were proposed by *ad hoc* committees and, if elected, joined together to form parties that remained flexible in their composition; when, finally, these parliamentary groups constituted the leadership of like-minded persons all over the country—above all, the leadership which formulated the issues for the next elections. Now, by contrast, the party *official* is emerging everywhere, although at a varying pace, as the dynamic element of party tactics. Along with him, organized fund raising becomes important. The perpetual financial difficulties require regular dues, which naturally play the biggest role in class-based mass organizations such as the Social Democratic party; however, they also time and again reinvigorate the position of the party patron, which used to be predominant. Even in the Social Democratic party it was never completely absent. In the Center party a single patron, Mr. August Thyssen, now successfully claims a social rank at least equiva-

lent to that of an archbishop. Among the bourgeois parties, financial backers are moderately important as revenue sources on the left, but much more so on the right. In the nature of things, their role is most important in the middle-of-the-road parties such as the National Liberals and the old Free Conservatives, so that the present moderate strength of these bourgeois parties comes closest to being an approximate measure for the importance of money as such, that means, of funds provided by individual patrons, in elections based on equal suffrage. But even in the case of these parties one could not say that it is the support from financial backers, even if it is indispensable for them, which produces the vote. They exist, rather, by virtue of a peculiar mixed marriage of the financial powers with that broad stratum of the literati, including in particular the academic and non-academic teachers, which is emotionally attached to reminiscences of the Bismarck era. Compared to the number of their votes, a disproportionately large part of the bourgeois press appeals to them as subscribers; in watered-down form, its line is imitated by the completely opportunistic advertising press, since this happens to be convenient to government and business circles.

Here as everywhere bureaucratization and rational budgeting are concomitants of democratization, however strongly the German parties differ in their internal social structure. This necessitates much more continuous and strenuous electioneering than was ever known to the old parties of *honoratiores*. The number of election speeches that a candidate must deliver today, preferably in every little hamlet of his district, is ever increasing, as is the number of his local visits and reports, and also the demand by the party press for information services and ready-made copy and for advertising of every kind. The same can be said about the severity and ruthlessness of the methods of political combat. This has often been deplored and blamed upon the parties as one of their peculiarities. However, not only the party organizations resort to these measures, but just as much the power-holding governmental apparatus. Bismarck's press, which was financed out of the so-called "Guelph Fund," topped everything else, especially since 1878, with regard to unscrupulousness of means and want of good tone. The attempts have not ceased to create a local press that would be completely dependent on the dominant governmental apparatus. The existence and quality of these combat methods thus has nothing to do with the degree of parliamentarization nor with the kind of suffrage gradation; rather, these methods result purely from the *mass* elections, irrespective of whether the electoral bodies are the recruiting ground for the politically responsible leaders or whether they can only pursue negative policies of interest representation and petty patronage, as in Germany.[43] In the

latter case, the party struggle takes on particularly subaltern forms because it is motivated by purely material and personal interests. It is possible and necessary to fight with the means of criminal law against political attacks upon the personal honor and the private life of an opponent and against the unscrupulous spreading of sensational falsehoods. However, the essence of the political struggle as such cannot be changed as long as there are elected bodies that decide about material interests. Least of all can it be changed by reducing the importance and the level of parliament. So much must simply be accepted as a fact. Every kind of esthetic or moralizing disdain is completely sterile with regard to the issue of domestic political reform. The political question is merely: What are the consequences of this progressive democratization of the means and organizational forms of political combat for the structure of the political enterprise inside and outside of parliament? The developments just described are intimately related to the conduct of parliamentary affairs that we discussed earlier.

Inside and outside of parliament a characteristic figure is required: the *professional* politician, a man who at least ideally, but in most cases materially, regards party politics as the content of his life. [To repeat once more:] This figure, whether we love it or hate it, is in its present form the unavoidable product of the rationalization and specialization of partisan activities on the basis of mass election. Here again it does not make a difference what degree of political influence and responsibility devolves upon the parties by virtue of the advance of parliamentarism.

There are two kinds of professional politicians [as we have seen]: Those who live materially "off" the party and political activities; under American conditions these are the big and small political "entrepreneurs," the bosses, and under German conditions the political "workers," the salaried party officials. Secondly, there are those who live "for" politics, having independent means and being propelled by their convictions; politics becomes the center of their lives, as was true, among the Social Democrats, of Paul Singer, who at the same time was a party financier in the grand style.[44] It should be clear here that we do not deny the "idealism" of party officialdom. At least on the Left large numbers of irreproachable political personalities are found among the functionaries, such as one might have a hard time finding in other strata. However, although idealism is far from being a function of a person's financial situation, living "for" politics is cheaper for the well-to-do party member. Precisely this element—persons who are economically independent of those above and below them—is most desirable for party life and hopefully will not completely vanish, especially not from the radical parties. Of course, the party enterprise proper can nowadays not

be operated by them alone—the bulk of the work outside of parliament will always be carried by the party bureaucrats. However, because of their very preoccupation with the operation of the enterprise, these officials are by no means always the most suitable candidates for parliament. The Social Democrats are the only major exception. In most bourgeois parties, however, the party secretary, who is tied down by his office, does not make the best candidate. Within parliament a predominance of the party officialdom, no matter how desirable and useful its representation is, would not have a favorable effect. But such a predominance exists not even within the most bureaucratized party, the Social Democrats. In fact, party officialdom presents the relatively smallest danger of bringing about a domination by the "bureaucratic spirit" to the disadvantage of real leaders. This danger emanates much more from the compulsion to take account of interest organizations for the sake of vote-getting; this leads to the infiltration of their employees into the list of party candidates, a phenomenon that would increase considerably if a proportional election system, requiring the voting for lists, were to be adopted.[48] A parliament composed of such employees would be politically sterile. It is true, however, that the spirit of the employees of organizations such as the parties themselves and the trade unions is essentially different, due to their training in struggling with the public, from the spirit of the civil servant who works peacefully in the midst of filing-cabinets. Especially in the radical parties, and above all in the Social Democratic party, the danger posed by the bureaucratic spirit would be relatively smallest, since the vehemence of political combat counteracts the tendencies (not negligible even there) toward ossification into a stratum of benefice-holders. Yet even in these parties only a fraction of the genuine leaders were party bureaucrats.

In all democratized parliaments and parties the present demands upon the political enterprise result in elevating one profession to a particularly prominent role as a recruiting base for parliamentarians: the lawyers. Besides the knowledge of the law and, more importantly, the preparation for fighting an opponent which this profession affords in contrast to the office-holding of the employed jurists, a purely material element is decisive: the possession of a private office—today an absolute necessity for the professional politician. While every other free entrepreneur is prevented, because of the work load in his own enterprise, from meeting the increasing demands of regular political activity and would have to give up his occupation in order to become a political pro, it is relatively easy for the lawyer to switch, given the technical and psychological basis of his activities. The "lawyers' dominance" in a parliamentary democracy, which is so often and so wrongly deplored, is

only facilitated by the way in which even today the German parliaments fail to offer their members adequate offices, information services and clerical personnel.[48] However, we do not want to discuss here the technical aspects of the parliamentary enterprise. Rather, we will ask in which direction the party *leadership* develops under the pressure of democratization and of the growing importance of professional politicians, party officials and employees of interest groups, and which repercussions this has for parliamentary life.

3. *Democratization and Demagoguery*

The popular view of the German literati quickly disposes of the question about the effect of democratization: The *demagogue* will rise to the top, and the successful demagogue is he who is most unscrupulous in his wooing of the masses. An idealization of the realities of life would be useless self-deception. The assertion about the increasing importance of the demagogue has often been correct in this negative sense, and it is indeed correct if properly understood. In the negative sense it is true of democracy to about the same extent as, for the impact of monarchy, the remark that some decades ago a well-known general made to an autocratic monarch: "Your Majesty will soon be exclusively surrounded by scoundrels." A matter-of-fact consideration of democratic leadership selection will always include a comparison with other organizations and their systems of selection. A glance at the personnel affairs of bureaucratic organizations, including the best officers' corps, suffices to make clear the following: A genuine acknowledgment by subordinates that a superior "deserves" his position is not the rule but the exception, especially in the case of new superiors who have advanced fast. Profound skepticism about the wisdom of appointments, both with regard to the motives of those making them as with respect to the means employed by those who have been particularly fortunate in obtaining their positions, dominates the attitudes of the great majority of serious insiders—quite irrespective of all petty gossip. But this mostly silent critique is not noticed by the public, which thus has no inkling of it. Countless experiences, which everybody can make all about him, teach that the quality which best guarantees promotion is a measure of pliancy toward the apparatus, the degree of the subordinate's "convenience" for his superior. The selection is, on the average, certainly not one of born leaders.

The same skepticism of the insiders prevails in quite a few cases with regard to academic appointments, although public control should be able to profit itself here in view of the public character of the accom-

plishments, something that generally is not true in the case of officials. However, the politician and, above all, the party leader who is rising to public power is exposed to public scrutiny through the criticism of opponents and competitors and can be certain that, in the struggle against him, the motives and means of his ascendancy will be ruthlessly publicized. Sober observation should therefore show that the selection within the party demagogy proceeds, by and large, by no means according to less useful criteria than does the selection behind the closed doors of bureaucracy. Contrary examples are provided only by new countries such as the United States, but for the Germanic states in Europe a denial of this observation would be plainly insupportable. Moreover, if even a completely incompetent chief of staff [Helmuth von Moltke] at the beginning of the World War is not supposed to be an argument against the monarchy's ability to recruit leaders, then it is also inadmissible to hold their blunders in recruitment against the democracies.

However, we do not want to pursue further these politically sterile comparisons and recriminations. The decisive point is that for the tasks of national leadership only such men are prepared who have been selected in the course of the political struggle, since the essence of all politics is struggle. It simply happens to be a fact that such preparation is, on the average, accomplished better by the much-maligned "craft of demagoguery" than by the clerk's office, which in turn provides an infinitely superior training for efficient administration. Of course, political demagoguery can lead to striking misuses. It can happen that a mere rhetorician without superior intellect and political character gains a strong power position. But this description would not even apply to an August Bebel,[47] for he had character, although he lacked a superior mind. The period of his persecution [in the eighteen-seventies] and the accident that he was one of the earliest [Social Democratic] leaders, but also that personal quality brought him the unreserved trust of the masses, which intellectually far superior party members could not rival. Eugen Richter, Ernst Lieber, Matthias Erzberger—they all belong to a similar type.[48] They were successful "demagogues," in contrast to far superior intellects and temperaments who could not gain power in their parties despite their rhetorical triumphs before the masses. That is no accident—yet it is not a consequence of democratization; rather, it results from the constraints that impose "negative politics."

Democratization and demagogy belong together, but—let us repeat this—independently of the kind of constitution, insofar as the masses can no longer be treated as purely passive objects of administration, that is, insofar as their attitudes have some active import. After all, the road to demagogy has also been chosen, in their own manner, by the

modern monarchies. They use speeches, telegrams and propaganda devices of all kinds for the promotion of their prestige; nobody can claim that this kind of political propaganda has proved less dangerous for the national interest than the most passionate demagogy [of party leaders] at election times. Quite to the contrary. In the midst of the war we now encounter even the phenomenon that an admiral engages in demagogy. The jurisdictional struggles between the former chancellor [Bethmann-Hollweg] and Admiral von Tirpitz were brought before the public in a wild campaign by the latter's followers (and with his toleration, as was correctly emphasized in the *Reichstag*); domestic interests joined the fray on the admiral's side, so that a military and diplomatic issue that could be resolved only with the most thorough knowledge of the facts [i.e., the issue of unrestrained submarine warfare] became the object of an unparalleled demagoguery among the masses, which in *this* case were indeed "uncritical," that is, without any means of judgment. Hence nobody can claim that "demagoguery" is a characteristic of a constitutionally democratic polity. The revolting battles of the satraps and intrigues of candidates for a ministry in January 1918 also were carried into the press and public meetings. These demagogic activities had some impact. In Germany we have *demagoguery* and the pressure of the rabble *without democracy*, or rather *because of the absence* of an orderly democracy.

However, we want to discuss here only the actual import of demagogy for the structure of political leadership; thus we want to raise the question of the relationship between democracy and parliamentarism.

4. *Plebiscitary Leadership and Parliamentary Control*

Active mass democratization means that the political leader is no longer proclaimed a candidate because he has proved himself in a circle of *honoratiores*, then becoming a leader because of his parliamentary accomplishments, but that he gains the trust and the faith of the masses in him and his power with the means of mass demagogy. In substance, this means a shift toward the *caesarist* mode of selection. Indeed, every democracy tends in this direction. After all, the specifically caesarist technique is the plebiscite. It is not an ordinary vote or election, but a profession of faith in the calling of him who demands these acclamations. The caesarist leader rises either in a military fashion, as a military dictator like Napoleon I, who had his position affirmed through a plebiscite; or he rises in the bourgeois fashion: through plebiscitary affirma-

tion, acquiesced in by the army, of a claim to power on the part of a non-military politician, such as Napoleon III. Both avenues are as antagonistic to the parliamentary principle as they are (of course) to the legitimism of the hereditary monarchy. Every kind of direct popular election of the supreme ruler and, beyond that, every kind of political power that rests on the confidence of the masses and not of parliament —this includes also the position of a popular military hero like Hindenburg—lies on the road to these "pure" forms of caesarist acclamation. In particular, this is true of the position of the President of the United States, whose superiority over parliament derives from his (formally) democratic nomination and election. The hopes that a caesarist figure like Bismarck attached to universal suffrage and the manner of his anti-parliamentary demagogy also point in the same direction, although they were adapted, in formulation and phraseology, to the given legitimist conditions of his ministerial position. The circumstances of Bismarck's departure from office demonstrate the manner in which hereditary legitimism reacts against these caesarist powers. Every parliamentary democracy eagerly seeks to eliminate, as dangerous to parliament's power, the plebiscitary methods of leadership selection. A notable instance is found in the present French constitution and the French election law, which abolished list voting [in 1889] because of the Boulangist danger. However, French parliamentary democracy paid with that lack of authority of the supreme powers among the masses that is typical of France and so characteristically different from the position of the President of the United States. By contrast, in democratized hereditary monarchies the caesarist-plebiscitary element is always much attenuated, hut it is not absent. As a matter of fact, the position of the present British Prime Minister [Lloyd George] is based not at all on the confidence of parliament and its parties, but on that of the masses in the country and of the army in the field. Parliament acquiesces (with considerable inner reluctance).

Thus, the contrast between the plebiscitary and the parliamentary selection of leaders is quite real. However, the *existence* of parliament is not useless for that matter. Vis-à-vis the factually caesarist representative of the masses it safeguards in England 1) the continuity and 2) the supervision of his power position, 3) the preservation of civil rights, 4) a suitable political proving ground of the politicians wooing the confidence of the masses, and 5) the peaceful elimination of the caesarist dictator once he has lost the trust of the masses. However, since the great political decisions, even and especially in a democracy, are unavoidably made hy few men, mass democracy has bought its successes since Pericles' times with major concessions to the caesarist principle of selecting leaders. In the large American municipalities, for example,

corruption has been checked only by plebiscitary municipal dictators, whom the trust of the masses gave the right of establishing their own administrative agencies. And wherever democratic mass parties found themselves confronted with great tasks, they were obliged to submit more or less unconditionally to leaders who held the confidence of the masses.

We have just illustrated, with the British example, the importance that under this circumstance parliament retains in a mass democracy. However, there are not only subjectively sincere "socialists," but also subjectively sincere "democrats" who hate the parliamentary enterprise so much that they advocate "socialism without parliament" or "democracy without parliament." Of course, nobody can "refute" overwhelmingly powerful antipathies. But it is necessary to clarify what would be their practical consequence in a state with our monarchic constitution. What then would be a democracy without any parliamentarism in the German political order with its authoritarian bureaucracy? Such a merely *passive democratization* would be a wholly pure form of *uncontrolled bureaucratic domination*, so familiar to us, which would call itself a "monarchic regiment." Or, if we relate this democratization to the economic reconstruction that these "socialists" hope for, it would be a modern rational counterpart of the ancient liturgical state. Interest groups legitimized and (allegedly) controlled by the state bureaucracy would be actively the agents of corporate self-administration, and passively they would be the carriers of the public burdens. The civil servants would then be supervised by these profit-oriented associations, but neither by the monarch who would be quite incapable of doing it, nor by the citizen who would lack all representation.

Let us take a closer look at this vision of the future. Such passive democratization would not, for the foreseeable future, lead to the elimination of the private entrepreneur, even if there would be far-reaching nationalization; rather, it would involve a syndicalization of big and small capitalists, small propertyless producers and wage earners, through which the economic opportunities of each category would somehow be regulated and—this is the crucial matter—be monopolistically guaranteed. This would be socialism in about the same manner in which the ancient Egyptian "New Kingdom" was socialist. It would be democracy only if provisions were made for giving the will of the masses decisive influence on the management of this syndicalized economy. It is inconceivable how this could be done without a representation safeguarding the power of the masses and continuously controlling the syndicates: that is, without a democratized parliament that would be able to intervene in the substantive and personnel affairs of this administration. Without a popular representation of the present type an

economy of such industry associations can be expected to evolve a guild policy of protecting everybody's livelihood, and thus to move toward a stationary economy and the elimination of any interest in economic rationalization. For everywhere the concern with a corporate *guarantee* of a livelihood has been decisive for economic groups that dispose of no or little capital as soon as they were monopolistically organized. He who wants to consider this an ideal of a "democratic" or "socialist" future is welcome to do so. But it takes the very shallow dilettantism of the literati to mistake such a cartellization of profit and wage interests for the ideal, so frequently propagated nowadays, according to which the production of goods be adapted in the future to needs and not, as at present, to profit interest—a confusion that arises time and again. For to realize this last ideal it would obviously be necessary to proceed not from a cartellization and monopolization of profit interests, but from the exact opposite: the organization of consumer interests. The economic organization of the future would have to be established not in the manner of state-controlled compulsory producer cartels, guilds and trade unions, but in the manner of a huge, state-controlled and compulsory consumer cooperative; the latter, in turn, would regulate production according to demand, as some consumer cooperatives already do (through production of their own). Again, it cannot be imaged how the "democratic" interests—those of the mass of the consumers—can be protected in any way other than through a parliament that also can control national production continuously.

But this is enough about such pipe dreams. The complete abolition of the parliaments has not yet been demanded seriously by any democrat, no matter how much he is opposed to their present form. Probably every democrat would like to retain them as the agency for enforcing the *public control of administration*, for determining the *budget* and finally for deliberating and passing *laws*—functions for which parliaments are indeed irreplaceable in all democracies. The opposition, insofar as it is sincerely democratic and not, as is usually the case, a dishonest screen for bureaucratic power interests, desires essentially two things: 1) that laws should be made not through parliamentary decision but through compulsory popular vote; 2) that the parliamentary *system* should not exist, that means, the parliaments should not be the recruiting grounds for the national leaders and parliamentary confidence should not be decisive for their tenure in office. As is well known, this is the established rule in the American democracy; partly it derives from the direct popular election of the head of state and of other officials, and partly from the so-called principle of the "separation of powers." However, American democracy teaches the lesson, with sufficient clarity, that the elimination of parliamentarism

in this manner provides no more of a guarantee for impartial and incorruptible administration than does the parliamentary system itself; the exact opposite is the case. It is true that, by and large, the popular election of the head of state has not worked out badly. The number of really unsuitable presidents has at least not been larger during the last decades than that of unfit monarchs in the hereditary monarchies. However, with the principle of popular election of civil servants the Americans themselves are satisfied only to a very limited extent. If applied generally, this principle eliminates not only what technically distinguishes the bureaucratic machinery: bureaucratic discipline, but it also fails to provide any guarantee for the quality of the officials in a large state. It puts the selection of candidates into the hands of invisible cliques which, by comparison with parliamentary parties and their leaders, are highly irresponsible toward the public. The candidates are presented to the voters who themselves have no capacity for technical judgment. This is a most unsuitable form of filling administrative positions that require specialized technical training. It is precisely with regard to the most recent and advanced administrative functions, hut also with regard to judgeships, that the trained officials appointed by the elected head of state in the United States are technically, and insofar as corruption is concerned, incomparably superior. After all, the selection of trained civil servants and that of political leaders are two different things. — By contrast, the mistrust against the powerless *and therefore* corrupt parliaments of the individual American states has led to an expansion of direct popular legislation.

The *plebiscite*, as a means of election as well as of legislation, has inherent technical limitations, since it only answers "Yes" or "No." Nowhere in mass states does it take over the most important function of parliament, that of determining the budget. In such cases the plebiscite would also obstruct most seriously the passing of all bills that result from a compromise between conflicting interests, for the most diverse reasons can lead to a "No" if there is no means of accommodating opposed interests through negotiation. The referendum does not know the *compromise*, upon which the majority of all laws is based in every mass state with strong regional, social, religious and other cleavages. It is hard to imagine how in a mass state with severe class tensions tax laws other than progressive income taxation, property confiscations and "nationalizations" can be adopted through popular vote. These difficulties might perhaps not impress a socialist. However, we know of no example when a state apparatus exposed to the pressures of a referendum has effectively enforced such often nominally exorbitant and partly confiscatory property taxes; this is as true of the United States as it is of the Swiss Cantons, in which the conditions are very favorable since

the population, by virtue of old tradition, thinks in terms of substantive issues and is well schooled in political matters. Moreover, the plebiscitary principles weaken the autonomous role of the party leader and the responsibility of the civil servants. A disavowal of the leading officials through a plebiscite which rejects their proposals does not and cannot enforce their resignation, as does a vote of noconfidence in parliamentary states, for the negative vote does not identify its reasons and does not oblige the negatively voting mass, as it does a parliamentary majority voting against a government, to replace the disavowed officials with its own responsible leaders.

Finally, the more the direct management of economic enterprises by the state bureaucracy were to grow, the more awkward would be the lack of an independent control organ that would have the power, as the parliaments do, to demand publicly information from the all-powerful officials and to call them to account. The specific means of purely plebiscitary democracy: direct popular elections and referenda, and even more so the instrument of the recall, are completely unsuitable in the mass state for the selection of trained officials and for the critique of their performance. Since the importance of interested money is not negligible for the parties' campaigns even in parliamentary elections, its power and the impetus of the demagogic apparatus supported by it would increase all the more immensely if in a mass state popular elections and referenda were to prevail completely.

It is, of course, true that compulsory voting and the referendum are the radical opposite of the situation so often deplored, namely, that the citizen in the parliamentary state fulfills no other political function than putting a ballot, provided ready-made by the parties, into a box every few years. It has been questioned whether this is really a means of political education: Without any doubt, it is that only under the conditions, discussed earlier, of public scrutiny and control of the administration which accustoms the citizens to the continuous observation of the administration of their affairs. However, the compulsory referendum may call the citizen to the ballot box dozens of times within a few months in order to decide about laws; the compulsory election imposes upon him the voting for long lists of candidates who are completely unknown to him and whose *technical* qualifications for office he cannot judge. It is true that the absence of technical qualifications (which the monarch himself does not have either) is in itself no argument against the democratic selection of the officials. It is certainly not necessary to be a shoemaker in order to know whether a shoe fits. However, not only the danger of growing apathy, but also of erroneous identification of those responsible for abuses is extremely great if specialized officials are popularly elected, whereas in a parliamentary system

the voter makes the leaders of the party which appointed the officials responsible for their performance. And insofar as technically complicated laws are concerned, the referendum can all too easily put the result in the hands of hidden, but skillfully manipulating interests. In this respect, the conditions in European countries, with their highly developed trained officialdom, are essentially different from those in the United States, where the referendum is considered the only corrective against the corruption of the inevitably subaltern legislatures.

These arguments are not directed against the use of the referendum as *ultima ratio* in suitable cases, even though the conditions in mass states differ from those of Switzerland [where this method is applied]. But the plebiscite does not make powerful parliaments superfluous in large states. As an organ of public control of the officials and of really "public" administration, as a means for the elimination of unfit top officials, as a locus for establishing the budget and for reaching compromises among parties, parliament remains indispensable in the electoral democracies. In hereditary monarchies it is all the more indispensable, since the monarch cannot just go along with popularly elected officials nor, if he appoints the officials, take sides, lest his specific domestic function be compromised: to make possible a conflictless solution in cases when the political mood and the balance of power are not clear. Apart from being a check upon "caesarist" leaders, parliamentary power is necessary in hereditary monarchies because there may be long periods in which no one appears to hold the confidence of the masses to a fairly general degree. Everywhere the problem of succession has been the Achilles heel of purely caesarist domination. The rise, neutralization and elimination of a caesarist leader occur most easily without the danger of a domestic catastrophe when the effective co-domination of powerful representative bodies preserves the political continuity and the constitutional guarantees of civil order.

The point that really offends the democrats who are hostile to parliament is apparently the largely voluntaristic character of the partisan pursuit of politics and hence also of the parliamentary parties. As we have seen, "active" and "passive" political participants indeed stand at opposite poles under this system. The political enterprise is an *enterprise of interested persons.* (We do not mean those materially interested persons who influence politics in every form of state, but those politically interested men who strive for political power and responsibility in order to realize certain political ideas.) This very pursuit of interests, then, is the essential part of the matter. For it is not the politically passive "mass" that produces the leader from its midst, but the political leader recruits his following and wins the mass through "demagogy." This is true even under the most democratic form of state. Therefore, the

opposite question is much more pertinent: Do the parties in a fully developed mass democracy permit at all the rise of men with leadership capacities? Can they at all absorb new ideas? For they succumb to bureaucratization quite as does the state apparatus. The founding of new parties, with the necessary organizational apparatus and newspapers, requires today such an investment of funds and labor, and is so difficult in view of the entrenched power of the existing press, that it is practically almost out of the question. (Only the plutocracy of the war profiteers has under the very special conditions of the war succeeded on this score [with the establishment of the Fatherland Party].)

The existing parties are stereotyped. Their bureaucratic positions provide the "maintenance" of the incumbents. Their store of ideas has largely been fixated in propaganda literature and the party press. The material interests of the publishers and authors resist the devaluation of this body of literature through the transformation of ideas. The professional politician, finally, who must live "off" the party, least of all wants to see his intellectual equipment of ideas and slogans outmoded. Hence, the reception of new ideas proceeds relatively fast only there, where parties completely devoid of principles and devoted only to office patronage, as in the United States, add to their "platforms" whichever "planks" they think will gain them the most votes.

The rise of new leaders appears even more difficult. For a long time the same leaders have been seen at the helm of German parties; these leaders in most cases deserve personally highest regard, but just as often they do not excel either intellectually or in strength of political temperament. We have already mentioned the typical guild resentment against new men—this is in the nature of things. On this score, too, conditions are partly different in parties as the American ones. There it is the rulers of the parties, the bosses, who have a very stable position. They only want power, not honor or responsibility. For the sake of preserving their own power they do not expose themselves to the vagaries of a candidacy, which would lead to a public discussion of their political practices and thus could compromise the chances of the party. They therefore frequently present, even if reluctantly, "new men" as candidates. They don't mind that as long as these candidates are "reliable" in their sense. They do nominate them unwillingly, but perforce, if these men have such a vote-getting power, by virtue of their "newness," hence by virtue of some spectacular achievement, that their candidacy appears necessary in the interest of electoral victory. These practices, which have come into being under the conditions of direct election, are not at all transferable to Germany and are scarcely desirable here. Just as little transferable are the French and Italian conditions, the consequence of the party structure in these countries, under which a fairly

limited number of political personalities considered suitable for a ministerial post (*ministrable*), occasionally supplemented by new men, rotate in the leading positions in ever different combinations.

The English conditions are very different. Men with political temperament and leadership qualifications have there appeared and risen in sufficient numbers within the parliamentary career line (which we cannot describe here) and also within the parties, which are strictly organized through the caucus system. On the one hand, the parliamentary career offers very good opportunities to men with political ambition and the will to power and responsibility; on the other, the parties are forced by the "caesarist" feature of mass democracy to submit to men with political temperament and talent as soon as these prove that they can win the confidence of the masses. The chance for a potential leader to get to the top is a function, as it turns out time and again, of the parties' power chances. Neither the parties' caesarist character and mass demagogy nor their bureaucratization and stereotyped public image are in themselves a rigid barrier for the rise of leaders. Especially the well-organized parties that really want to exercise state power must *subordinate* themselves to those who hold the confidence of the masses, if they are men with leadership abilities; in contrast, the loose following in the French parliament is, as is well known, the real home of pure parliamentary intrigues. In turn, however, the solid party organization and, above all, the necessity for the leader to train and prove himself through conventionally prescribed participation in parliamentary committee work, guarantees fairly well that these caesarist trustees of the masses respect the established constitutional arrangements and that they are selected not purely emotionally, that means, merely according to "demagogic" qualities in the negative sense of the word. Particularly under the contemporary conditions of selection, a strong parliament and responsible parliamentary parties, hence their function as a recruiting and proving ground of mass leaders as statesmen, are basic conditions for maintaining continuous and consistent policies.

5. *The Outlook for Effective Leadership in Postwar Germany*

The political danger of mass democracy for the polity lies first of all in the possibility that emotional elements will predominate in politics. The "mass" as such (irrespective of the social strata which it comprises in any given case) thinks only in short-run terms. For it is, as every experience teaches, always exposed to direct, purely emotional and ir-

rational influence. (It has this in common, incidentally, with the modern "self-governing" monarchy, which produces the same phenomena.) A cool and clear mind—and successful politics, especially democratic politics depends, after all, on that—prevails in responsible decision-making the more, 1) the smaller the number of decision-makers is, and 2) the clearer the responsibilities are to each of them and to those whom they lead. The superiority of the American Senate over the House of Representatives, for example, is largely a function of the smaller number of senators; the best political achievements of the English parliament are products of unequivocal responsibility. Wherever such unambiguous responsibility defaults, the party system fails like any other kind of domination. From the viewpoint of the national interest the political utility of solidly organized interest groups rests on the same basis. Completely irrational, from the same viewpoint, is the unorganized "mass"—the democracy of the streets! It is strongest in countries with either a powerless or a politically discredited parliament, that means, above all, in countries without *rationally organized parties*. In Germany, apart from the absence of the Latin coffee-house culture and the presence of a calmer temperament, organizations such as the trade unions, but also the Social Democratic party, constitute a very important counterbalance against the direct and irrational mob rule typical of purely plebiscitary peoples. From the Hamburg cholera epidemic [of 1892] to the present time it has been necessary to appeal repeatedly to these organizations for help whenever the state apparatus proved inadequate. That must not be forgotten once the times of hardship are over.

In Germany, too, the difficult first postwar years will be a severe test for the discipline of the masses. There can be no doubt that the trade unions, in particular, will face unprecedented difficulties. For the up-and-coming young workers, who now earn ten times as much as in peacetime and enjoy a temporary license that will never recur, are being dishabituated from any sense of solidarity and any capacity to adapt to, and be useful for, the organized economic struggle. A "syndicalism of immaturity" will flare up once this youth is confronted with the normalcy of peacetime. It is certain that we will encounter plenty of purely emotional "radicalism" of this kind. In the population centers attempts at a syndicalist putsch are quite possible, just as is a mighty groundswell, in view of the serious economic situation, of the political mood represented by the Liebknecht group. We must ask whether the masses will *persist* in the sterile negativism toward the state that must be anticipated. That is a question of nerves. The outcome will depend, first of all, on whether the proud saying: "The appeal to fear finds no response in German hearts," *will prove itself on the thrones*. Moreover,

the outcome will depend on whether such explosions trigger again the familiar fear of the propertied, that means, whether the emotional effect of the blind fury of the masses will activate the equally emotional and senseless cowardice of the bourgeoisie, just as the beneficiaries of uncontrolled bureaucracy hope.

Against putsch, sabotage and similar politically sterile outbreaks, which occur in all countries—even though less frequently here as elsewhere—every government, including the most democratic and the most socialist, would have to proclaim martial law if it does not want to risk the consequences that now appear in Russia. No further word is needed on this score. *But:* The proud traditions of peoples which are politically mature and free from cowardice have always proved themselves in such situations in that they kept their nerve and a cool head, crushed force with force, but then tried to resolve soberly the tensions that had led to the outbreak—above all, in that they immediately restored the *guarantees of civil liberties* and in general did not let such events interfere with the manner of their political decision-making. In Germany, however, one can be quite assured that the beneficiaries of the old order and of uncontrolled bureaucracy will exploit every outbreak of syndicalist putschism, no matter how insignificant, in order to scare our philistine bourgeoisie which, unfortunately, still has pretty weak nerves. Among the most shameful experiences during the tenure of Chancellor Michaelis we must note that *speculation on the cowardice* of the bourgeoisie which expressed itself in the attempt to exploit in a sensational fashion, and for purely partisan purposes, the behavior of a few dozen pacifist fanatics, without regard for the effect upon our enemies—and also upon our allies. After the war similar intrigues will be repeated on a larger scale. By its reaction the German nation will then demonstrate whether it has attained political maturity. We would have to despair of our political future if these machinations were to succeed; unfortunately, some experiences make this appear a possibility.

In Germany the democratization of the parties on the left and the right is a fact that cannot be undone—on the right it takes the form of an unscrupulous demagogy that has a counterpart not even in France. However, the democratization of the suffrage is a compelling demand of the hour, which can no longer be postponed, especially in the German hegemonial state [Prussia]. Apart from all other considerations, reasons of state require, (1) since the equal suffrage is today the only way of ending the suffrage struggles, that their sterile perpetuation, which has led to such profound bitterness, must be eliminated from the political scene *before* the soldiers return from the field for the reconstruction of the state; (2) that it must be viewed as politically unaccept-

able to put the returning soldiers at an electoral disadvantage vis-à-vis those strata which maintained, or even increased, their social position, property and customers during the time when they at the front laid down their lives for those who stayed home. Of course, the obstruction of this political necessity is possible, but this would have terrible consequences. *Never again* would the nation be as solidary in the face of an external threat as it was in August 1914. We would be condemned to remain a small and conservative country, perhaps with a fairly good public administration in purely technical respects, but at any rate a provincial people without the opportunity of counting in the arena of world politics—and also without any *moral* right to it.[49]

NOTES

1. Unless otherwise indicated, the notes and the emendations in the text are by the English editors, as are the subheadings within secs. *i–v*, which merely intend to give the reader a better orientation.

From Max Weber, *Gesammelte politische Schriften*, ed. Johannes Winckelmann (2d ed.; Tübingen: Mohr, 1958), 294–394. The essays were first published together in the series "Die innere Politik," edited by Siegmund Hellmann (München and Leipzig: Duncker & Humblot, 1918). In certain passages Weber drew on Part Two of *Wirtschaft und Gesellschaft*, which was unpublished at the time. Hence, the reader will find certain repetitions in Weber's exposition of rule by notables and by bureaucrats, but at the same time he can observe the linkage between Weber's political views and his scholarly perception of secular changes. Yet as Weber himself points out in the preface, he does not claim scientific authority for his political views. Furthermore, the reader should keep in mind that the essay originated in newspaper articles which repeated the main points with propagandistic persistence. Weber's "Politics as a Vocation," which is his best known political essay in the United States, in turn takes up some of the themes of his wartime writings. It is truly the sum of his political perspective, but in its brevity it is even more of an occasional piece than the earlier political writings and hence in need of more extensive and concrete elaborations such as the present essay.

In recent years Weber's politics have been given considerable attention. The following selection is useful as background reading for his political writings; it also contains many references to other pertinent literature: Arnold Bergsträsser, "Max Webers Antrittsvorlesung in zeitgeschichtlicher Perspektive," *Vierteljahrshefte für Zeitgeschichte*, vol. 5, 1957, 209–19; Golo Mann, "Max Weber als Politiker," *Neue Rundschau*, vol. 75, 1964, 380–400; Wolfgang Mommsen, *Max Weber und die deutsche Politik, 1890–1920* (Tübingen: Mohr, 1959); *id.*, "Max Weber's Political Sociology and His Philosophy of World History," *International Social Science Journal*, vol. 7, 1965, 23–45; for an expanded version, see "Universalgeschichtliches und politisches Denken bei Max Weber," *Historische Zeitschrift*, vol. 201, 1965, 557–612; Guenther Roth, "Political Critiques of Max Weber: Some Implications for Political Sociology," *American Sociological Review*, vol. 30, 1965, 213–223; Gustav Schmidt, *Deutscher Historismus und der Übergang zur parlamentarischen Demokratie* ("Historische Studien," vol.

398; Lübeck: Matthiesen, 1964); Gerhard Schulz, "Geschichtliche Theorie und politisches Denken bei Max Weber," *Vierteljahrshefte für Zeitgeschichte*, vol. 12, 1964, 325–350.

2. Sections *i* to *iii* had originally been published in the *Frankfurter Zeitung* of May 27, June 5/6 and June 24, 1917 under the title "German Parliamentarianism in Past and Future". Cf. the bibliography in Eduard Baumgarten, ed., *Max Weber—Werk und Person* (Tübingen: Mohr, 1964), 71 ff; also Winckelmann's introduction to GPS, 2d ed., XXXV. On the fall of Chancellor Bethmann-Hollweg on July 14, 1917 and the short rule of Chancellor Michaelis (until October 30, 1917), see below, notes 27 and 29.

3. Moritz Busch (1821–1899) was Bismarck's principal press agent and official eulogist. His memoirs, *Bismarck: Some Secret Pages of his History* (London: Macmillan, 1898), were first published in England because of anticipated libel problems in Germany.

4. After the initial measures of Bismarck's struggle to control the Catholic church (the so-called *Kulturkampf*, 1872–1887, which was strongly supported by the liberal parties), an attempt on his life was made by a certain Kullmann, an unemployed Catholic cooper, at Bad Kissingen in July 1874. As again in 1878, when the Social Democrats were saddled with the responsibility for the Hödel and Nobiling attempts on the old Emperor's life, Bismarck immediately tried to turn this incident to political advantage in his conflict with the Center party. "You may renounce this murderer as much as you want," he exclaimed (very much alive) in the next budget debate, "but he hangs tightly on to your coattails; it is you whom he calls his party." See Karl Bachem, *Vorgeschichte, Geschichte und Politik der deutschen Zentrumspartei*, III (Köln: Bachem, 1927), 219f.

5. Friedrich Julius Stahl (1802–1861) and Ludwig von Gerlach (1795–1877), both advisers of the romantic Prussian king Frederick William IV, were leaders of Protestant agrarian conservatism in mid-century Prussia. Stahl, one of the most effective spokesmen of the Divine Right of kings after the 1848 revolution, was influential in shaping the Prussian constitution of 1850 along conservative lines. Gerlach, a co-founder of the *Kreuzzeitung*, opposed Bismarck to the end, to the point of sitting with the Center delegates in the post-1870 *Reichstag*. On the older Christian-Social movement in general, see W. O. Shanahan, *German Protestants Face the Social Question: The Conservative Phase, 1815-1871* (Notre Dame: University of Notre Dame Press, 1954).

6. Rudolf von Bennigsen (1824–1902), Joseph Völk (1819–1882) and Franz August Freiherr Schenk von Stauffenberg (1834–1901) were leaders of the National-Liberal party. Bennigsen headed the party from 1866 to 1898; he refused a seat in the government in 1877 and retired from the *Reichstag* from 1883 to 1887, because he felt he could no longer cooperate with Bismarck. The right-wing Völk left the party in the first dispute over tariff legislation in 1878; the South-German Stauffenberg was one of the leaders of the left-wing *Sezession* in 1881. Benedikt Franz Leo Waldeck (1802–1870) was the leader of the democratic left in the Prussian National Assembly of 1848 and again in the Prussian diet during the Constitutional Conflict, 1861–1869.

7. Weber's father, Max Weber Sr., played a significant role in the Berlin National-Liberal party of the Bismarckian era as a city magistrate, deputy in the Prussian Diet and some-time deputy in the *Reichstag*. Bennigsen, Miquel, and other leaders of the party were frequent guests in his house, and "already the half-grown sons were permitted . . . to overhear the political disputes and absorb whatever they could understand" (Marianne Weber, *Max Weber* [Tübingen:

Mohr, 1926], 42). Although Weber was only 14 years old in 1878, the interests of the early-maturing boy ranged far into political matters (cf. the letters of the 14- and 15-year old reprinted in Baumgarten, *Max Weber, op. cit.*, 6–13); hence these and the following statements may indeed be based on his own memories from that period.

8. Bismarck established the *Reich* as a federation of the ruling dynasties which were represented in the *Bundesrat* (Federal Council); they formally controlled all legislation and "governed" through its president, the chancellor who was appointed by the emperor and who normally was also prime minister of Prussia. The *Reichstag* was the only "unitary" institution, i.e. one representing the German people as a whole, but it had only deliberative and budgetary powers and no control over the federal government. Many state functions—churches, education, the railroads, the post office, in the case of Bavaria even the army—remained under the jurisdiction of the individual states. The central institutions which did exist were dominated by Prussia.

9. On the background of the Prussian Constitutional Conflict, which brought Bismarck to power, see Eugene N. Anderson, *The Social and Political Conflict in Prussia: 1858–1864* (Lincoln: The University of Nebraska Press, 1954).

10. Ludwig Windthorst (1812–1891), a former Hanoverian minister of justice, was the leader of the Catholic Center party and as such Bismarck's major parliamentary antagonist, although sometimes a cooperating one, during the latter's entire incumbency.

11. On Bismarck and the anti-socialist legislation, see Guenther Roth, *The Social Democrats in Imperial Germany* (Totowa, N.J.: The Bedminster Press, 1963), ch. III; Vernon L. Lidtke, *The Outlawed Party: Social Democracy in Germany, 1878–1890* (Princeton: Princeton University Press, 1966).

12. When Bismarck, in 1879, wanted to raise the customs tariffs in order to make the *Reich* less dependent upon the financial contributions of the member states, the particularist (but protectionist) Center party, whose votes he needed, insisted that any excess of the new revenues above 130 million marks be transferred to the states; if the *Reich* wanted any share of such sums, the question would again be thrown into parliament, which voted the annual matricular contributions. Georg von und zu Franckenstein (1825–1890), a prominent Bavarian member of the party, was the author of this clause. In Prussia it was complemented by the Huene bill (1885–1893), the work of the Center deputy and Silesian landowner Karl Huene Baron von Hoiningen (1837–1900), which required that the Prussian state pass on all but 15 million marks of the windfall Franckenstein monies to the counties and municipalities "in order to eliminate a stimulus for unhealthy expenditures of the Prussian state budget." Cf. Ernst Rudolf Huber, *Deutsche Verfassungsgeschichte seit 1789*, III (Stuttgart: Kohlhammer, 1963), 951; Bachem, *Zentrumspartei, op. cit.*, III, 394ff.

13. Herbert von Bismarck (1849–1904) was his father's secretary of state for foreign affairs from 1886 to the latter's fall in 1890.

14. The idea that Roman law promoted capitalism is part of the nursery school lore of the amateurish literati: Every student must know that all characteristic legal institutes of modern capitalism (from the share, the bond, the modern mortgage, the bill of exchange and all kinds of transaction forms to the capitalist forms of association in industry, mining and commerce) were completely unknown to Roman law and are of medieval, in part of Germanic origin. Moreover, Roman law never got a foothold in England, where modern capitalism originated. The reception of Roman law became possible in Germany because

of the absence of the great national guilds of lawyers, which in England resisted this development, and because of the bureaucratization of law and administration. Early modern capitalism did not *originate* in the bureaucratic model states where bureaucracy was a product of the state's rationalism. Advanced capitalism, too, was at first not limited to these countries, in fact, not even primarily located in them; it arose where the judges were recruited from the ranks of the lawyers. Today, however, capitalism and bureaucracy have found one another and belong intimately together. (Weber's footnote.)

15. On the *Sezessi n* and its merger with the Progressive party, see above, Pa t Two, ch. XIV, n. 9. On the organization in general of the German parties during the Empire, see Thomas Nipperdey, *Die Organizati n der deutschen Parteien v r 1918* (Düsseldorf: Droste, 1961).

16. Compare also Weber's comment at the 1909 convention of the *Verein für Sozialpolitik* in Vienna, in which he confronted the older generati n of membe s who had exalted the superiority of bureaucracy vis-à-vis "Manchesterism", reprinted in *GA SS*, 412ff.

17. Since it has been alleged from Russian quarters that Mr. Kerenski has made use of this passage from the *Frankfurter Zeitung* in public meetings to show the need for his offensive as a proof of "strength," let me here explicitly address this gravedigger of Russia's young freedom: An offensive can be launched nly by someone who disposes of the necessary resou ces—for example, enough artillery to hold down the opposing infantry in its trenches, and enough means of transportation and supplies to let the own soldiers in their trenches feel their dependence on him for food. The "weakness" of the so-called "Social-Revolutionary" government of Mr. Ke enski, however, lay in its lack of creditworthiness, as has been explained elsewhere [cf. "Russlands Übergang zur Scheindemokratie," in *Die Hilfe*, April 26, 1917, eprinted in *GPS*, 192–210], and in the necessity, in order to gain the *domestic* c edits required for the maintenance of its power, to deny its own idealism, to conclude an alliance with the bourgeois imperialist Entente, and thus to sacrifice hundreds of thousands of its own countrymen as mercenaries for alien inte ests. I believe that I was unfortunately right with this prediction, as with others that I made elsewhere on Russia's expected stance. (I see no reason to modify this passage, which was written many months ago.) (Weber's footnote.)

18. *Nachtwächterstaat* was the epithet commonly applied to the liberal state with its minimization of functi ns by the critics of the laissez-faire doctrine. The reference, of course, is to "Manchesterist" England.

19. Eugen Schiffer (1860–1954) a National-Liberal deputy, was made undersecretary of state at the Imperial treasury in 1917.

20. It is amusing that in the [ultra-conservative] *Kreu zeitung* of all places an anonymous writer derives the incompatibility of the two positions fr m the formalist legal consideration that parliamentary deputies are supposed to vote according to their convictions, but *Bundesrat* members according to instructions. It does not put off the *Kreuzzeitung* that numerous *Landräte*, who since Puttkamer's times have been responsible for "representing the political line of the government," sit in the Prussian diet; nor is it disturbed by Imperial secretaries of state who, as deputies in the Prussian diet, would be expected to criticize the instructions they have received, as *Bundesrat* members, from the government which is responsible to this diet. If a party leader, who is als a member of the *Bundesrat*, cannot get the instructions that correspond to his convictions, he must resign. In fact, that should be done by *every* statesman [who cannot get the necessary mandate]. More n that below. (Weber's footnote.)

21. Matthias Erzberger (1875–1921) was the most prominent Center party member of the war period. A leader of the democratic left wing, he played a key role in the process of parliamentarization and in the early post-war government; he was assassinated by nationalist fanatics in 1921. Cf. Klaus Epstein, *Matthias Erzberger and the Dilemma of German Democracy* (Princeton: Princeton University Press, 1959).

22. After 1918 Alfred Hugenberg indeed became both: From his propagandistic basis in the newspaper and movie industry he went on to head the rightwing *Deutsch-Nationale Partei* in 1928 and to join Hitler's first cabinet as minister of economics in 1933, in the completely mistaken expectation that he could manipulate Hitler.

23. This is a reference to a much-used proverb, "In monetary matters *Gemütlichkeit* finds its limits"; it is said to have been first stated by the industrialist and liberal leader David Hansemann in the Prussian diet on June 8, 1847.

24. Bismarck was Prussian minister to the loosely organized Federal Diet in Frankfurt, in which Austria still played a dominant role, from 1851 till 1859. Cf. Arnold Oskar Meyer, *Bismarcks Kampf mit Österreich am Bundestag zu Frankfurt (1851–1859)* (Berlin: Koehler, 1927).

25. Richard von Kühlmann (1873–1948), a career diplomat appointed secretary of state in August 1917, had angered the military (Ludendorff) through a relatively conciliatory position on some procedural issues at the Brest-Litovsk peace negotiations late in December; this resulted in a press campaign and other pressures directed by the Great Headquarters for his dismissal—a goal which Ludendorff attained only in July 1918, when Kühlmann was forced to resign and was replaced by an admiral, Paul von Hintze. Cf. Erich Matthias and Rudolf Morsey (eds.), *Der Interfraktionelle Ausschuss 1917/18* (2 vols.; "Quellen zur Geschichte des Parlamentarismus und der politischen Parteien," first series, vols. 1/I–II; Düsseldorf: Droste, 1959), II, 77ff.

26. The *Hauptausschuss* was formed in October 1916. It was in fact the Budget Committee, empowered to sit even when the *Reichstag* was not in session, with the specific purpose of debating foreign affairs and war matters; it comprised representatives of all parties on a proportional basis. Cf. Matthias and Morsey (eds.), *op. cit.*, I, xivff.

27. After the fall of Chancellor Bethmann-Hollweg (on which see below, n. 29), an advisory committee of seven parliamentarians was forced by the mistrustful *Reichstag* upon the new chancellor, Georg Michaelis, to consult with him on the German response to the Papal peace note of August 1917. This was the first time parliament explicitly participated in foreign policy formulation, and thus an important step toward parliamentarization. Cf. Epstein, *Erzberger, op. cit.*, 216ff.; also Matthias and Morsey (eds.), *op.* cit., I, 119–213, where the prehistory and course of the negotiations is extensively documented in protocols of committee sessions.

28. Between December 1917 and March 1918 Trotsky negotiated with German diplomatic and military representatives at Brest-Litovsk. Wilson's Fourteen Points date from January 1918.

29. On July 6, 1917 Erzberger in a sensational speech revealed in the *Hauptausschuss* the failure of the unlimited submarine campaign and, with the backing of a new parliamentary coalition (usually referred to by Weber as the "majority parties"), pressed for a peace resolution of the *Reichstag* and speedy parliamentary reform. With the help of the military authorities, who were playing their own game, these moves resulted in the fall of Chancellor Bethmann-Hollweg a few days later. However, parliament had no influence upon the

selection of the new chancellor, the Prussian Food Administrator Dr. Georg Michaelis; even to its own ambiguous formula of "peace without forcible territorial acquisitions" it obtained his grudging adherence only with the reservation "As I interpret it."

Consequently, the *Reichstag* had no confidence in the new chancellor, and a second crisis occured in August, at the occasion of the Papal peace note, which resulted in the establishment of the Committee of Seven to supervise the drafting of the German response.

In October, finally, after the government had announced its intention to suppress the left-wing Independent Socialist party because of its alleged (but poorly documented) fomenting of a naval mutiny, the joint committee of the majority parties (the *Interfraktionelle Ausschuss*) demanded and secured Michaelis' dismissal. In the ensuing negotiations the *Reichstag* insisted successfully that his aged and infirm successor, the Bavarian Prime Minister Count Hertling, a conservative member of the Center party and himself a former *Reichstag* deputy, come to an agreement with it on policy and personnel matters before taking office in November. For a convenient summary of these "parliamentarizing" developments in 1917, see Epstein, *Matthias Erzberger*, *op. cit.*, chs. VIII–IX.

30. In August 1917 two important parliamentarians joined the Michaelis ministry. Paul von Krause, a National-Liberal deputy in the Prussian diet, was appointed Imperial secretary of justice, and the Center leader in the *Reichstag* Peter Spahn, became Prussian minister of justice. In October the National Liberal deputy Eugen Schiffer was appointed undersecretary of state in the Imperial treasury.

31. In the Hertling government, the parliamentarians obtained for the first time policy-making positions. The Progressive leader in the *Reichstag*, Friedrich von Payer, was given the Imperial vice-chancellorship, and the left-wing National Liberal Robert Friedberg was made vice premier in Prussia.

32. The January 1918 crisis arose out of disputes between the civilian and the military leadership over the conduct of the Brest-Litovsk peace negotiations with Russia. Cf. also n. 25 above.

33. Early in January 1896 William II sent a telegram to the President of Transvaal, Paul Krüger, congratulating him on the repulsion of Jameson's raid which had been backed by Cecil Rhodes. The Emperor acted upon the recommendation of the secretary of state, Baron Marschall von Bieberstein, who thereby hoped to prevent him from ill-advised intervention. The maneuver was part of a German attempt to isolate England diplomatically, but it actually increased Germany's isolation. — During the first Morocco crisis of 1905/6 the German government tried to oppose French colonial designs on Morocco. William II visited Tangier, but the subsequent international conference at Algeçiras ended with a severe diplomatic defeat for Germany. During the second Morocco crisis in 1911 the German gunboat "Panther" was dispatched to Agadir, but in the end Germany lost another diplomatic round.

34. For William II's doubts about the advisability of a trip to Tangier in 1905, which he then undertook *"contre coeur,"* see his *Ereignisse und Gestalten 1878–1918* (Leipzig: Koehler, 1922), 90f.

35. On a rather conciliatory conversation between Rhodes and William II, see *op. cit.*, 72f.

36. On the Emperor's version of his opposition to the telegram and his anticipation of English public protest, see *op. cit.*, 69f.

37. At the time Russia, France and Germany—which professed to be

alarmed about the "Yellow Peril"—prevented Japan from annexing the Liaotung peninsula in the wake of her military triumph over China (treaty of Shimonoseki, April 1895). For the German aspects of these negotiations, cf. Emperor William II's autobiography, *op. cit.*, 68, and Johannes Ziekursch, *Das Zeitalter Wilhelms II*, vol. III of *Politische Geschichte des neuen deutschen Kaiserreiches* (Frankfurt: Sozietätsverlag, 1930), 92ff.

38. The Emperor's Christmas present for Tsar Nicholas in 1895 was an allegorical drawing, executed on his design by the painter Knackfus but represented as his own work. It depicted the Archangel Michael gathering a cohort of ironclad ladies, recognizable by their coats-of-arms as Germania, Britannia, Russia, etc., for a crusade against the Yellow Peril, shown as a blood-thirsty moloch brooding on a cloud over Europe's peaceful cities. The gift and its title, "Nations of Europe, safeguard your most sacred goods," soon became known and was widely ridiculed, but the Emperor believed he had achieved a diplomatic success when his ambassador reported that the hapless recipient had framed and hung the work of art. "It really works! How very satisfying" he wrote on the margin of the report. Cf. Erich Eyck, *Das persönliche Regiment Wilhelms II.* (Zürich: Rentsch, 1948), 119; Emil Ludwig, *Kaiser Wilhelm II*, trans. Ethel C. Mayne (London: Putnam's, 1926), 223f.

39. On July 27, 1900, William II made his infamous "Hun" speech, whence derived the epithet commonly applied to the German soldiers in the Anglo-Saxon countries during World War I. In sending off the troops that were to participate in the crushing of the Boxer Rebellion, with Count Waldersee as the nominal commander-in chief of the international expeditionary force of Russian, Japanese and English troops, William said among other things: "No pardon shall be given, no prisoners shall be taken. Whoever falls into your hands shall be at your mercy. Just as the Huns under King Attila made a name for themselves a thousand years ago which still awes us in traditions and tales, you shall impress the name of the Germans upon China for a thousand years to come so that no Chinaman will ever again dare even to look *scheel* at a German"—a bad pun implying both an evil and a slit-eyed look. In his naval addresses, William employed such terms as that of the "mailed fist" which Germany wanted to apply in the world. Cf. Eyck, *op. cit.*, 200, 272.

40. On April 13, 1906, William II sent a telegram to the Austrian foreign minister, Count A. Goluchowski, in which he said: "You have proven yourself a brilliant second in the duel and can be sure that I shall reciprocate in case of need." This contributed to Goluchowski's downfall a few months later. The German ambassador in Paris, Prince Radolin, remarked in a letter to Friedrich von Holstein (May 8, 1906): "We are, after all, completely isolated in the world, and everybody hates us, even Austria, which is absolutely furious about the Goluchowski telegram." See Norman Rich and M. H. Fisher (eds.), *The Holstein Papers*, IV (Cambridge: At the University Press, 1963), 421f.

41. See above, n. 34. On the Daily Telegraph Affair, see Wilhelm Schüssler, *Die Daily-Telegraph-Affaire. Fürst Bülow, Kaiser Wilhelm und die Krise des Zweiten Reiches* 1908 (Göttingen: Musterschmidt, 1952).

42. Apparently a pejorative term for the Reichstag majority of Progressives, Majority Social Democrats and members of the Center party which in the summer of 1917 adopted a resolution for a peace without territorial aggrandizement and political, economic or financial exploitation. —In a 1917 letter the National-Liberal deputy Gustav Stresemann, who was to become the outstanding foreign minister of the Weimar Republic but was a strong annexationist during most of the war, provides an illustration for the kind of duplicity that Weber derides

here: "If today even conservative secretaries of state tell us behind closed doors that they desire parliamentarization because they fear that the personal conduct of politics by the Emperor may cause Germany immeasurable harm, then one can talk about this in confidential circles, but as a monarchic man one can never bring this most serious justification for parliamentarization before the public." Cf. Matthias and Morsey (eds.), *Der Interfraktionelle Ausschuss*, *op. cit.*, I, 157 n. 10.

43. Late in 1917 newspapers bought up by Big Business accused the *Frankfurter Zeitung* and a *Reichstag* deputy of having been bribed with English money. My name and that of a National-Liberal colleague were likewise linked to bribes by Lloyd George. And such assertions were believed in literary circles! This fact is indeed sufficient for judging the political maturity of this stratum. The doings of these sycophants prove that in Germany demagoguery *without* parliamentarism and *without* democracy operates fully on the French level. (Weber's note.)

44. Paul Singer (1844–1911), a Berlin factory owner, was a leading member of the Social-Democratic party, whose *Reichstag* delegation he headed from 1885 on.

45. This is exactly what later happened in the Weimar Republic, where proportional representation also led to a proliferation of parties based purely on the interest representation of specific groups.

46. As late as 1967, two deputies in the *Bundestag* of the German Federal Republic had to share a single small room; the research staffs of the parliamentary factions were too small and completely overburdened. It was still difficult for parliament and the individual parties to recruit academic and other "in and outers," as they are familiar on the staffs of Congressional committees in the United States.

47. August Bebel (1840–1913) was the leader of the Social Democratic party from its foundation in 1869.

48. For Richter and Erzberger, see earlier notes. Ernst Lieber (1838–1902), a liberal member of the Center party, directed his party's parliamentary delegation after Windthorst's death in 1891.

49. Sec. vi of the essay, entitled "Parliamentarization and the Role of the States" (*GPS*, 394–431), has not been included in this translation because of its more technical character.

INDEX

The index is divided into three parts: (*i*) An index of contemporary scholars cited by Weber; (*ii*) an index of other names mentioned in the text, mainly historical; and (*iii*) a subject index. The Introduction and the editorial notes have not been indexed.
